the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, for additional information about potential hydrogeologic impacts in the Angeles National Forest. For information about tunneling impacts to animals and special-status plant species, see Section 3.7 of the EIR/EIS for detailed discussion of the impacts from the Build Alternatives on wildlife and special-status plant species. The methods for evaluating impacts to biological resources are provided in Section 3.7.4 of the Draft EIR/EIS, and the detailed analysis of the affected environment is provided in Section 3.7.5. Mitigation measures are provided in Section 3.7.7. For further details related to impacts and mitigation to wildlife, domestic animals and special-status plant species, please see standard response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife.

### 4480-8223

Refer to Standard Response PB-Response-AQ-1: Construction-Period Emissions, PB-Response-N&V-4: Tunneling Impacts (Noise and Vibration) under Homes and Businesses, PB-Response-N&V-5: Impacts of Spoils Hauling (Noise), PB-Response-TRA-1: Temporary Traffic Associated with Construction, PB-Response-TRA-2: Impacts of Tunnel Spoils Off-Haul/Deposition.

The commenter expresses concerns related to the location of construction staging areas as well as construction impacts related to noise, air quality, and traffic. The commenter also expresses concerns regarding the impacts of spoils hauling trips. Regarding the commenters' concern about the location of construction staging areas, please note that the staging areas may differ between the Build Alternatives. For a complete list of the construction staging areas by Build Alternative that were assumed in the Final EIR/EIS analysis, please refer to Table 2-37 in Chapter 2.0, Alternatives. Figure 2-82 through Figure 2-95 in Chapter 2.0, Alternatives also provide visual illustrations of the construction staging areas within the ANF.

Regarding the commenters concern regarding the impacts of spoils hauling trips, Appendix 2.0-I: Spoils Disposal Assumptions presents the construction spoils activities for each Build Alternative, including the anticipated duration of activities and number of outbound trucks per hour for each spoils generation site. As stated in Section 3.2.6.3 of the Draft EIR/EIS, spoils hauling is anticipated to take up to 6.4 years in total, depending on location and Build Alternative. However, the activity and duration of construction would vary depending on the spoils removal location and the means of off-hauling the spoils. In other words, not all spoil generation sites would be active during the entire construction period. For additional discussion about the potential impacts of spoils hauling trips, please refer to Standard Responses PB-Response-TRA-2: Impacts of Tunnel Spoils Off-Haul/Deposition and PB-Response-N&V-5: Impacts of Spoils Hauling (Noise). In addition, since publication of the Draft EIR/EIS, the Authority has updated the assumptions regarding hazardous spoils, which has resulted in an overall reduction in total spoils generated. Please refer to Impact HMW#1: Hazards Due to the Routine Transport, Use, or Disposal of Hazardous Materials during Construction, which provides further detail on these assumptions. Table 3.10-8 and Section 3.10.8.3 were also revised to be consistent with these updated volumes.

## Response to Submission 4480 (Andrea Howe, December 1, 2022) - Continued

### 4480-8223

To address the commenters' concern regarding impacts related to noise, air quality, and traffic, please refer to Standard Responses PB-Response-N&V-4: Tunneling Impacts (Noise and Vibration) under Homes and Businesses, PB-Response-AQ-1: Construction-Period Emissions, PB-Response-TRA-2: Impacts of Tunnel Spoils Off-Haul/Deposition, and PB-Response-TRA-1: Temporary Traffic Associated with Construction which address these issues. In addition, please refer to Section 3.2, Transportation; Section 3.3, Air Quality; and Section 3.4, Noise and Vibration in the Draft EIR/EIS. Each of these sections include a list of IAMFs and mitigation measures that address impacts on noise, dust, vibration, exhaust from truck trips, increased traffic. For example, as described in Impact AQ#2, AQ-IAMF#1 and AQ-IAMF#6 would be implemented as part of the project to reduce fugitive dust during construction.

### 4480-8224

Refer to Standard Response PB-Response-ALT-2: Unique Tunnel Elements – Windows, Adits, Tunnel Boring Machines, etc., PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only), PB-Response-PR-2: Impacts on Big Tujunga Wash – Recreational Uses, Equestrian Use, PB-Response-S&S-1: Wildfire.

The commenter expresses concerns for impacts to the Angeles National Forest (ANF) from introduction of “manmade” structures and encroachments.

To address the commenters concerns regarding impacts from the introduction of “manmade” structures, please see Standard Responses PB-Response-ALT-2: Unique Tunnel Elements –Windows, Adits, Tunnel Boring Machines, etc., PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-PR-2: Impacts on Big Tujunga Wash –Recreational Uses, Equestrian Use, and PB-Response-S&S-1: Wildfire.

Regarding the commenters' concern about the Pacific Crest Trail (PCT), the only Build Alternative that would cross the Pacific Crest Trail (PCT) at grade and impact the trail is the Refined SR14 Alternative. This is not the Authority's preferred alternative. The Authority's preferred alternative is the SR14A which would cross the PCT underground in a bored tunnel and would not have an impact the existing trail. For additional discussion about impacts to the PCT please refer to Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only). For more information regarding the Preferred Alternative, please refer to Chapter 8 of the Draft EIR/EIS. Additionally, IAMF and mitigation measures will be implemented to reduce impacts where possible.

Regarding the commenters concern about the San Gabriel Mountain National Monument (SGMNM), construction of the bored tunnel through the ANF, including the SGMNM, would require the use of adits. The locations of the adits options in all six Build Alternatives would be located within a private in-holding near existing roadways within

## Response to Submission 4480 (Andrea Howe, December 1, 2022) - Continued

### **4480-8224**

the ANF, including the SGMNM, boundary. Private in-holding refers to properties within the ANF that are privately owned, may currently have existing structures on them (e.g., houses) and are not accessible to the public. The Build Alternatives cross areas of the ANF that have other encroachments within the forest such as major electrical transmission lines and roadways. For additional discussion about impacts to parks and recreational resources, including the PCT, Rim of the Valley Trail, and SGMNM, please refer to Table 3.15-4 in Section 3.15, Parks, Recreation and Open space.

Regarding the commenters' concern about the Rim of the Valley Trail, the Refined SR 14 and SR14 Build alternatives would utilize an approximately 330-foot segment of the trail but would not result in permanent acquisitions of the proposed trail. Similarly, the E2 and E2A build alternatives would temporarily utilize an approximately 400-foot segment of the trail but would not result in permanent acquisitions of the trail. The Rim of the Valley trail is outside the RSA of the E1 and E1A Build Alternatives and would therefore not be impacted under those Build Alternatives.

### **4480-8225**

Refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

The commenter expresses concern related to seismicity due to the HSR Palmdale to Burbank Project Section crossing fault lines. Please refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, which addresses concerns related to seismicity.

### **4480-8226**

The commenter states that construction will generate more greenhouse gases than it will recoup in 70 years of operation. The commenter also says that California High-Speed Rail Authority will have to purchase offset credits during construction because pollution levels exceed AQMD standards, and thus is not a green project.

Table 3.3-44 in Section 3.3 of the Draft EIR/EIS shows the Payback of Greenhouse Gas Emissions for the six Build Alternatives. Depending on the Build Alternative and Ridership Scenario, construction-related GHGs would be paid back in 4 to 6 months of project operation. As discussed in Section 3.3.7, construction emissions will be offset via agreements with the applicable air districts.

### **4480-8227**

Refer to Standard Response PB-Response-AVQ-1: Impacts to Scenic Vistas and Scenic Drives, PB-Response-AVQ-2: Visual Effects on Big Tujunga Wash, PB-Response-AVQ-3: Effects on Visual Quality during Construction.

The commentor is concerned about the visual effects of the Project during construction on Scenic corridors and the Big Tujunga Wash area. These topics are discussed in PB-Response-AVQ-1, PB-Response-AVQ-2, and PB-Response-AVQ-3.

## Response to Submission 4480 (Andrea Howe, December 1, 2022) - Continued

### 4480-8228

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding, PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter expressed their concerns relating to the budget as well as the loss of properties due to relocations or displacements. The commenter also expressed concern that only 15 percent of the projects design is needed to receive approval. Regarding to the commenters concern about only 15 percent of the projects design being required for approval, the Staged Project Delivery process allows for designs to be further refined, additional stakeholder and third-party issues to be identified and right-of-way requirements to be mapped and risks to be identified while the project continues to navigate the environmental review process. To address the commenters other concerns regarding the project's budget and loss of properties due to relocations, please refer to Standard Response PB-Response-GEN-2: Project Cost and Funding, and PB-Response-SOCIO-1: Parcel Acquisitions and Relocations. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration, Procedures for Considering Environmental Impacts, section 14(s), 64 Fed. Reg. 28548, 28556 (May 26, 1999)). The commenter has not provided a comment on environmental issues. This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### 4480-8229

Commenter is concerned with availability of water and potential dewatering impacts. Section 3.8.6.3 of the EIR/EIS indicates that while project construction could temporarily affect groundwater conditions in certain High Risk Areas, the Authority does not reasonably foresee this effect interfering substantially with groundwater recharge such that the project may impede sustainable groundwater recharge in a groundwater basin. Additionally, groundwater intrusion into tunnels would be mitigated by HYD-IAMF#5 (tunnel boring machine design features), HYD-IAMF#6 (tunnel lining systems), and HYD-IAMF#7 (grouting), therefore, mitigating the depletion of groundwater resources due to tunnel construction. In the unlikely event that water supplies are adversely impacted, the Authority will implement an Adaptive Management and Monitoring Plan (AMMP) as required by mitigation measure HWR-MM#4. The AMMP includes groundwater monitoring requirements, provisions for augmenting water supplies, and actions to restore affected resources, if necessary.

## Response to Submission 4480 (Andrea Howe, December 1, 2022) - Continued

### 4480-8230

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter asked how deforestation would be mitigated and how the loss of wildlife habitat would be prevented. Most of the alignment for the Build Alternatives consist of tunneling, as shown in Figure 3.7-4 of the Draft EIR/EIS. Given this, tree and vegetation removal and impacts to wildlife habitat would be minimized. However, the Authority understands that there are risks affecting groundwater, and associated indirect effects to species habitat, with undergoing tunnel construction. Construction of tunnels in the Angeles National Forest (ANF) has the potential to alter hydrogeological conditions, resulting in inflows of groundwater into the tunnel and the subsequent change in groundwater levels. Changes in groundwater levels for aquifers could affect the hydrology of groundwater-dependent ecosystems, resulting in effects on habitat. The project tunnel alignments would be constructed consistent with engineering design features to address and minimize these risks. These risks and impacts in the ANF are analyzed in detail in Section 3.8, Hydrology and Water Resources, specifically in Impact HWR#5 (Changes in Hydrogeologic Conditions Associated with Tunnel Construction Beneath the ANF which May Affect Surface and Subsurface Water Resources). While actions would be implemented during construction to reduce the indirect impacts on special-status species and to minimize the loss of habitat resulting from tunnel construction, the project could result in loss and degradation of habitat. To address this impact, the Authority would implement an Adaptive Management and Monitoring Plan (AMMP). BIO-MM#93 (Adaptive Management Plan for Groundwater Effects on Species and Habitat) will involve implementation of the bioresource portions of the AMMP prepared under HYD-MM#4 (Implement a Water Resources Adaptive Management and Monitoring Plan Including Compensatory Mitigation Measures as Necessary), which will require monitoring of groundwater-dependent surface water resources and associated habitat within the tunnel construction Resource Study Area, providing supplemental water where needed, and remediating or compensating for any adverse effects identified during monitoring in a timely manner. If the Authority determines, through direct monitoring or data interpretation, that substantial disruption (i.e., loss of 0.5 acre or greater; which would include deforestation) to habitat supporting special-status species has likely occurred during or after construction and that habitat restoration efforts did not

### 4480-8230

achieve success criteria or that restoration was determined unfeasible, compensatory mitigation to offset the loss of habitat would be provided. In addition, the following measures would reduce impacts on trees: BIO-MM#6 (Prepare and Implement a Restoration and Revegetation Plan), BIO-MM#35 (Implement Transplantation and Compensatory Mitigation Measures for Protected Trees), BIO-MM#50 (Implement Measures to Minimize Impacts During Off-Site Habitat Restoration, or Enhancement, or Creation on Mitigation Sites), BIO-MM#54 (Prepare and Implement an Annual Vegetation Control Plan), BIO-MM#55 (Prepare and Implement a Weed Control Plan), and BIO-MM#58 (Environmentally Sensitive Areas, and Non-Disturbance Zones). Please refer to PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, which provides additional information about potential tunneling impacts to groundwater dependent surface water, impacts to resources such as wildlife habitat that are dependent on surface water, and the Adaptive Management and Monitoring Plan (AMMP).

### 4480-8231

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter expressed concern regarding water usage during times of drought. PUE-MM#1 (described in Section 3.6.7, Mitigation Measures) will require the Authority to prepare an updated water supply analysis for the selected Build Alternative that details and describes the minimum adequate water supply for the RSA during normal, dry, and multiple dry years based on a more detailed project design. Additionally, PUE-MM#1 will require the Authority to utilize non-potable water from regional water utility service providers for construction activities where feasible, as well as recycling/reusing water used for tunnel construction, further minimizing demand for water supplies to avoid impacting residents' water availability during the construction of the project. For additional information regarding water supply, please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage. As to the question about the Authority justifying the water used during construction, please refer to the discussion above, which indicated sufficient water supply. The Authority has identified the benefits of the California HSR System in Section 1.2.5 of the Draft EIR/EIS. Moreover, when the Authority makes a decision on the project, it will decide whether the benefits of the project justify the environmental costs.

## Response to Submission 4480 (Andrea Howe, December 1, 2022) - Continued

### 4480-8232

Refer to Standard Response PB-Response-TRA-1: Temporary Traffic Associated with Construction.

The commenter asks about mitigation during spoils hauling, including for noise, vibration, dust, exhaust, and traffic. Refer to Response to Comment #8200.

### 4480-8233

Refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, PB-Response-S&S-1: Wildfire.

The commenter expressed concern on the potential for wildfire hazards, and risk and impacts associated with fault lines and seismic events from the project. These topics are further discussed in Standard Responses PB-Response-S&S-1: Wildfire, which describes the evaluation of and measures to minimize and avoid wildfire effects from the project, and PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, which includes discussion of the effects of seismic events and fault rupture on the project, and measures to minimize these effects.

The HSR system project design includes several components that minimize the effects of seismic events and the potential safety risks from seismic events (GEO-IAMF#6). These include a train control system with earthquake early warning detection systems and operational responses to notification of a seismic event including stopping or slowing of trains and inspection of infrastructure. This would help identify situations where fault creep or rupture have the potential to damage facilities and enable control of trains in a manner that would reduce the potential for accidents. GEO-IAMF#7 will require evaluation of fault rupture potential and GEO-IAMF#10 will implement engineering and safety protocols to limit fault rupture and ground shaking hazards during construction. These risks and impacts are analyzed in detail in Section 3.9, Geology, Soils, Seismicity and Paleontological Resources, specifically in Impact GSSP#7 (Fault Rupture and Seismic Ground Shaking Could Endanger People or Structures During Construction) and Impact GSSP#16 (Effects of Geologic Hazards During Operations).

As described under Impact S&S#3, each of the Build Alternatives will include provisions for emergency service access to the access-controlled right-of-way, including passenger walkways to allow emergency access and evacuation routes for tracks in trenches and tunnels, during an emergency event. Passenger walkways would be located along the trench/tunnel walls on the same side as the access/egress points, where possible, and would be illuminated to provide safe passage in the event of an emergency. Tunnel design would also include a central, fire-rated dividing wall that would separate the two tracks of each single tunnel into two independently ventilated railways to allow access in

## Response to Submission 4480 (Andrea Howe, December 1, 2022) - Continued

### **4480-8233**

the event of an emergency. Safety egress would be achieved via fire-rated doorways through the tunnel dividing wall. The Access Control for High-Speed Rail Right-of-Way and Facilities Technical Memorandum (available online at: [https://hsr.ca.gov/wp-content/uploads/docs/programs/eir\\_memos/Proj\\_Guidelines\\_TM2\\_8\\_2R00.pdf](https://hsr.ca.gov/wp-content/uploads/docs/programs/eir_memos/Proj_Guidelines_TM2_8_2R00.pdf)) prepared for the HSR System, assesses the guidance and regulatory requirements from local and national agencies on access control and summarizes available information on access control methods used by other highspeed train systems and by rail transit operators, and is used as the basis for recommending appropriate infrastructure features for access control for high-speed train trackways and facilities, including HSR tunneled trackway, in the case of an emergency event including earthquakes.

### **4480-8234**

Refer to Standard Response PB-Response-AQ-1: Construction-Period Emissions, PB-Response-AQ-4: Greenhouse Gas Emissions.

The commenter asks about the justification for promoting HSR as a “green project” when they indicate it will take 70 years to recoup the GHG emissions created by construction activities.

The Authority has calculated the payback of Greenhouse Gas (GHG) Emissions for the six Build Alternatives at 4 to 6 months of project operation (Draft EIR/EIS Chapter 3.3, Table 3.3-44). In other words, the Authority determined it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions, not 70 years. After that, the project will produce net benefits by reducing GHGs (Draft EIR/EIS page 3.3-126).

CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

 palmdale\_burbank@hsr.ca.gov

November 30, 2022

RE: California High Speed Rail Authority Palmdale to Burbank Draft EIR/EIS Comments

This letter is submitted on behalf of Lockheed Martin Corporation (“Lockheed Martin”) to provide comments on the September 2, 2022 California High Speed Rail Authority Palmdale to Burbank Draft EIR/EIS (“Palmdale to Burbank Draft EIR/EIS” or “EIR/EIS”) for the California High Speed Rail Project (“Project”) for consideration in this California Environmental Quality Act (“CEQA”) and National Environmental Policy Act (“NEPA”) proceeding. Lockheed Martin objects to the approval of the Project and its implementation to the extent that the California High Speed Rail Authority (“Rail Authority” or “Authority”) does not consider the potentially significant environmental impacts to Lockheed Martin’s remedial activities in the San Fernando Valley and the underlying soil and groundwater conditions in the cleanup area nor plan for avoidance/mitigation of such impacts as discussed below. The impacts of the Project to and the location of the referenced remediation infrastructure are included in the attached letter from Lockheed Martin’s technical consultant, CDM Smith (Exhibit A).

Lockheed Martin is and has been conducting remediation activities in the San Fernando Valley under the oversight of the United States Environmental Protection Agency (“EPA”), pursuant to the Comprehensive Environmental Response, Compensation and Liability Act, 42 U.S.C. §§ 9606 and 9607 (“CERCLA”), as amended by the Superfund Amendments and Reauthorization Act of 1986 (“SARA”) and the Los Angeles Regional Water Quality Control Board (“Regional Board”), pursuant to the Porter-Cologne Water Quality Control Act, California Water Code section 13000 et seq. The Palmdale to Burbank Draft EIR/EIS does not disclose or evaluate potential significant impacts of the Project to soil and groundwater subject to Lockheed Martin’s remediation activities and to the related supply of safe drinking water to local communities. Nor does the draft EIR/EIS identify alternatives or mitigation efforts that may be able to avoid or reduce such impacts. Lockheed Martin suggests that the EIR/EIS should disclose or consider these potentially significant environmental impacts and analyze how such impacts could be avoided or reduced by alternatives to the proposed Project path or through mitigation efforts.

EPA has issued a Record of Decision (“ROD”) prescribing an interim remedy for the San Fernando Valley Burbank Operable Unit (“BOU”) (Exhibit B) and entered into a Consent Decree with Lockheed Martin to implement the remedy (Exhibit C). The interim groundwater remedy includes extraction wells and pipelines that extract and convey groundwater to a

520 Newport Center Drive, Suite 750, Newport Beach, CA 92660  
 MAIN 949.432.3500 | FAX 949.432.3494 |

4483-9099

November 30, 2022  
California High Speed Rail Authority

treatment plant in Burbank to remove contaminants and ultimately provide clean drinking water to citizens in the Burbank area.

There are 70 active groundwater monitoring wells within one mile of either side of the Project's centerline and southern terminus, some of which could be damaged or may need to be removed or moved because of the Project, at significant cost and impact to Lockheed Martin's remediation. In addition, vapor intrusion barriers are in place in existing building slabs in zones that are in the pathway of the Project's construction. The Draft EIR/EIS does not address the potential that Project activities could compromise the integrity of these barriers, which if damaged will need to be reinstalled. The Project's footprint, which will cover permeable land with impermeable improvements, also will result in the inability to conserve as much of the storm and other waters as practicable in spreading grounds, which permit water to percolate into groundwater basins for later pumping. This may result in a significant drop in groundwater levels. Declining groundwater levels would have a significant negative impact on the effectiveness and long-term sustainability of the BOU groundwater remedy and would require installing deeper, replacement extraction wells that would increase the cost of the remedy. Lockheed Martin understands and expects that the Authority, and not Lockheed Martin will be responsible for any costs that are related to the Project, including the above-referenced costs.

Additionally, certain Project activities, such as tunneling and excavation, could cause migration of contaminants in soil and groundwater. If such migration occurs, or if soil or groundwater conditions are exacerbated as a result of the Project's tunneling or excavation activities or any other aspect of the Project's work, the Authority will be considered a potentially responsible party under CERCLA and will be responsible for costs, including costs of disposal of contaminated soil.

Please see the attached letter from CDM Smith for additional specific comments regarding potential impacts from the Project to the BOU remediation effort. Lockheed Martin submits that these potential adverse impacts should be avoided by the Project (and/or mitigated) to the greatest extent possible. All of these potential impacts of the Project should be fully evaluated in the Palmdale to Burbank Draft EIR/EIS, and alternatives or mitigation to avoid or reduce such impacts should be analyzed and presented to the public or decision-makers for review.

The fundamental purpose of an EIR is "to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment." (Public Resources Code § 21061.) An EIR must include detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project. (Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal.3d 376, 405.) An EIR must contain facts and analysis, not just the agency's bare conclusions or opinions. (Concerned Citizens of Costa Mesa, Inc. v. 32nd Dist. Agricultural Assn. (1986) 42 Cal.3d 929, 935.)

The Palmdale to Burbank Draft EIR/EIS, as currently drafted, does not identify or discuss alternatives and/or mitigation that could avoid or reduce the costs and likely adverse impacts on Lockheed Martin's remediation efforts at the San Fernando Valley Superfund Sites, Area 1,

4483-9099

November 30, 2022  
California High Speed Rail Authority

including: impacts on contaminant plume containment and potential mobilization of contaminants as a result of the Project; impacts to wells that are in the pathway of the Project; impacts from Project tunneling creating accumulation of vapor causing vapor exposure to humans; costs of disposal of contaminated soil and costs of additional groundwater treatment due to migration of contaminants; loss of spreading grounds impacting the sustainability of the remedy; and impacts on the supply of drinking water to local communities. This results in an inadequate and deficient environmental document inconsistent with both CEQA and NEPA. Lockheed Martin requests that the Rail Authority fully consider the costs and impacts of the Project on the ongoing remediation efforts in the San Fernando Valley and evaluate alternatives and mitigation efforts that could avoid or reduce such costs and impacts.

By this letter, Lockheed Martin formally makes these comments, including all attachments, part of the Administrative Record for this CEQA and NEPA proceeding for consideration by the Rail Authority.

Thank you,

Kimberly L. Bick

November 28, 2022

**Subject:** Comments on the California High-Speed Rail Project  
Draft Environmental Impact Report/Environmental Impact Statement  
Palmdale to Burbank Project Section

CDM Smith has conducted a review of Sections 3.8, 3.9 and 3.10 of the Draft Environmental Impact Report/Environmental Impact Statement (Draft EIR/EIS) for the California High-Speed Rail Project (HSR Project), Palmdale to Burbank Project Section, prepared by the California High-Speed Rail Authority (Authority). This review focuses primarily on elements of the HSR Project within the Burbank Operable Unit (BOU) and vicinity of the Burbank Airport Station. Lockheed Martin's August 2020 comment letter to the Authority, with an attached CDM Smith comment letter, addressed potential impacts to the BOU Superfund Site remedy, Burbank's groundwater extraction wells, and soil and soil vapor conditions associated with the Burbank to Los Angeles Section of the HSR Project.

### Background

Between approximately 1925 and 1990 Lockheed Martin and other companies conducted aircraft and component manufacturing and testing in the City of Burbank. All former Lockheed Martin facilities have been closed and redeveloped by others. Figure 1 identifies former Lockheed Martin and other manufacturing facilities with potential contamination activities (PCAs) in and near the BOU. One former site, Plant B-6, was located at the location of the proposed HSR Burbank Airport Station, and another, former Plant A-1 North, was located just south of the Burbank Airport Station. Both sites will be traversed by underground HSR alignments. Additional former Lockheed Martin and non-Lockheed Martin industrial properties with PCAs are located within one-mile of the centerline of the Palmdale to Burbank section. The soil and groundwater conditions associated with the two closest facilities are described below.

**Former Plant B-6, Soil:** B-6 was approximately 132 acres in size and was located along the northeastern section of the Burbank Airport. The property was sold by Lockheed Martin to the Burbank-Glendale-Pasadena Airport Authority in 1997, and most of the site was subsequently redeveloped for private commercial, industrial, retail and office use.

Prior to its sale remediations were conducted and roughly 6,000 tons of metals-, petroleum hydrocarbon- and volatile organic compound (VOC)-impacted soil were removed. The work was conducted in accordance with the Regional Water Quality Control Board Los Angeles Region (Water Board), Cleanup and Abatement Order No. 87-161. The Water Board subsequently issued 12 No Further Requirements (NFR) letters for plant B-6 cleanup actions, and the soil remediations were completed by 1996.

## Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

Kimberly L. Bick  
November 28, 2022  
Page 2

In 2013 the Water Board issued Order No. R4-2013-0063 requiring the reevaluation of subsurface conditions at the former plants, including B-6 and A-1 North, primarily for the presence of potential residual hexavalent chromium in soil at specific areas of concern they identified. Based on the results the investigations, the Water Board concurred in 2015 that additional soil remediation was not necessary for former plants B-6 and A-1 North.

To safeguard against potential vapor intrusion (VI) from residual VOCs at the B-6 site, all recent buildings constructed as part of the commercial/retail development (i.e., the Avion Burbank and Amazon structures) were constructed with sub slab vapor barrier systems consisting of geotextile, geomembrane, and sprayed vapor barrier layers, as well as available passive vapor collection/vent systems. The barriers are maintained and any alterations resulting from tenant improvements are repaired and leak tested.

**Former Plant A-1 North Soil:** This facility was approximately 32 acres in size and was located southeast of the Burbank Airport property. Aircraft manufacturing operations were performed at the site between 1941 to 1991. Lockheed Martin sold the property in 2000 for development and use by Burbank Airport and private developers.

Environmental cleanup activities conducted by Lockheed Martin under Order No. 87-161 removed 13,000 tons of soil between 1989 and 1996, and the Water Board issued NFR letters to Lockheed Martin for chemical compounds and metals in soil in 2001. VOC cleanup was then performed between 1999 and 2009 using a soil vapor extraction system (SVE). Following the completion of the VOC remediation, the Water Board issued a NFR determination and the SVE system was dismantled. The Water Board also requested that the new property owners sign land use covenants to assure the State and owners that the properties would be used in a manner consistent with their zoning and former manufacturing history.

**Burbank Groundwater:** After the discovery of impacts to groundwater in the area, the US Environmental Protection Agency (USEPA) designated the regional groundwater plume as the BOU, within Area 1 of the San Fernando Valley Superfund Site. Under the USEPA 1989 Record of Decision, remediation is conducted by extracting groundwater to remove contaminant mass, restrict the migration of the impacted groundwater, and restore drinking water resources. The BOU groundwater extraction wells VO1 through VO8 are identified on Figure 1. Seven of the wells are adjacent to or within the planned HSR Burbank to Los Angeles Project Section and must be protected, as per the comments provided by Lockheed Martin to the Authority in August 2020.

In addition to the extraction wells and their infrastructure, approximately 70 groundwater monitoring wells are located within the one-mile buffer zone on either side and terminus of the Palmdale to Burbank section in BOU (Figure 1). These wells are part of the BOU monitoring

PMD-BUR California HSR Comments 11-28-2022

4483-9099

Kimberly L. Bick  
November 28, 2022  
Page 3

program required by USEPA to document the effectiveness of the groundwater remedy, monitor changes to the plumes, and provide early warning of new contaminants.

In April 2022 the depth to groundwater in the vicinity of the planned HSR Burbank Airport Station was roughly 240 to 250 feet below ground surface. According to the general Station profile provided in the Draft EIR/EIS, the invert of the station will be roughly 90 feet below ground surface, therefore groundwater dewatering should not be required, although there is potential for localized perched groundwater.

#### Palmdale to Burbank Station Draft EIR/EIS Comments

Comments about potential impacts and mitigation measures associated with the BOU area of the Palmdale to Burbank Section are summarized below.

- CDM Smith agrees with the hazardous materials and wastes impact avoidance and minimization features (IAMFs) identified in Section 3.10.4.
- **Impact HWR#4, Section 3.8:** The Refined SR14, SR14A, E1 and E1A alternatives would cross the Hansen Spreading Grounds, and new impervious surfaces could interfere with groundwater recharge within the San Fernando Groundwater Basin. Loss of spreading would be a significant impact not only from a drinking water resource perspective but also to the sustainability of the BOU groundwater remedy, which is intended to restore the quality of water in the aquifers in the eastern San Fernando Groundwater Basin. Mitigation measure HWR-MM#3 should be further developed to identify replacement land for spreading upgradient of BOU to ensure continued groundwater recharge is available for the San Fernando Groundwater Basin remedies.
- The Draft EIR/EIS identifies between 22 and 30 (depending on the build alternative) active groundwater monitoring wells within a one-mile zone on either side of the Palmdale to Burbank corridor in the Project Summary, Section 3.8, and Figures 3.8-A-21 through 3.8-A-23. As shown on the attached Figure 1, there are about 70 active groundwater monitoring wells located within one mile of either side of the HSR centerline and southern terminus, in the BOU only. Damage to or loss of groundwater monitoring wells used to assess progress of the USEPA and Water Board remedies would be significant. Damage could result from not only tunneling and excavation but resurfacing or loss of access due to site reconfiguration. The Draft EIR/EIS should identify any monitoring wells potentially impacted and include mitigation measures for their replacement or protection.
- The Draft EIR/EIS identifies the approximate locations of medium- and high-priority Potential Environmental Concern (PECs) on figures in Appendix 3.10-A but does not

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

Kimberly L. Bick  
November 28, 2022  
Page 4

identify the sites by name or type of PEC. The document would be more effective if the identification and type of PEC sites were tabulated in the Draft EIR/EIS.

- HMW#1, Section 3.10 – Hazards Due to Transport. Construction of the HSR may generate an estimated 3.0 – 9.2 million cubic yards of hazardous spoils, depending on the build alternative. Per Appendix 2.0-I it is conservatively assumed that 100% of the spoils from the 1) trench and cut-and-cover, 2) Burbank Airport Station Tunnel, and 3) Burbank Airport Station excavation would be contaminated and would need to be off-hauled to a suitable treatment site. The Draft EIS/EIR should also include a statement that the Authority would be the responsible generator for the transport and treatment or disposal of spoils.
- GEO-IAMF#3 and #4, Section 3.9 provides protections against explosive or natural gas via monitoring and ventilation. There should also be discussion regarding protection against potential exposure to VOCs that may be present at low levels in the soil and soil vapor adjacent to the Burbank Airport Station and tunnels. Prevention of vapor exposure risk, including mitigation of potential vapor intrusion pathways and appropriate tunnel/station vapor lining and/or ventilation requirements, should also be discussed in Section 3.10.
- Should the HSR plans include retention of the existing structures at the proposed Burbank Airport Station (i.e., Avion Burbank and/or Amazon buildings) the integrity of their VI barriers must also be preserved. Modifications or damage to the building slabs would require repair, smoke testing, and documentation of the VI barrier integrity.

Lockheed Martin has completed remediation of the soil properties described herein and does not anticipate a need for additional investigation or remediation. In cases where a NFR has been issued the Water Board has determined that the contamination has been reduced to levels that are protective of human health for the current land uses. Should land uses change however, those decisions may need to be reconsidered by the appropriate agencies and the Authority. Additional actions associated with land use changes or newly discovered conditions should be the responsibility of the Authority to mitigate.

RECORD OF DECISION  
DECLARATION

#SNL

SITE NAME AND LOCATION

SAN FERNANDO VALLEY BASIN AREA 1  
BURBANK OPERABLE UNIT  
LOS ANGELES COUNTY, CALIFORNIA

#DR

STATEMENT OF BASIS AND PURPOSE

THIS DECISION DOCUMENT PRESENTS THE SELECTED REMEDIAL ACTION FOR THE SAN FERNANDO VALLEY BASIN AREA 1, BURBANK OPERABLE UNIT, IN LOS ANGELES COUNTY, CALIFORNIA, DEVELOPED IN ACCORDANCE WITH THE COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION, AND LIABILITY ACT (42 USC SECTION 9601 ET. SEQ.) AND THE NATIONAL CONTINGENCY PLAN (40 CFR SECTION 300 ET. SEQ.). THIS DECISION IS BASED ON THE ADMINISTRATIVE RECORD FOR THESE SITES.

THE STATE OF CALIFORNIA CONCURS ON THE SELECTED REMEDY.

#DE

DECLARATION

THE SELECTED REMEDY IS PROTECTIVE OF HUMAN HEALTH AND THE ENVIRONMENT, ATTAINS FEDERAL AND STATE REQUIREMENTS THAT ARE APPLICABLE OR RELEVANT AND APPROPRIATE FOR THIS REMEDIAL ACTION, AND IS COST-EFFECTIVE. THIS REMEDY SATISFIES THE STATUTORY PREFERENCE FOR REMEDIES WHICH EMPLOY TREATMENT THAT REDUCES TOXICITY, MOBILITY, OR VOLUME AS A PERMANENT SOLUTION AND ALTERNATIVE TREATMENT (OR RESOURCE RECOVERY) TECHNOLOGIES TO THE MAXIMUM EXTENT PRACTICABLE. AS PART OF THE REMEDY, GROUNDWATER MONITORING WILL BE CONDUCTED TO TRACK CONTAMINANT LEVELS IN THE BURBANK WELL FIELD AND TO MONITOR THE PERFORMANCE OF THE EXTRACTION AND TREATMENT SYSTEM TO ENSURE ADEQUATE PROTECTION OF HUMAN HEALTH AND THE ENVIRONMENT. PERIODIC REVIEWS WILL BE CONDUCTED TO ANALYZE THE EFFECTIVENESS OF THE SYSTEM.

DATE	DANIEL W. MCGOVERN

4483-9099

RECORD OF DECISION  
DECISION SUMMARY

#SLD

1.0 SITE LOCATION AND DESCRIPTION

THE AREA AROUND THE BURBANK WELL FIELD, LOCATED IN THE SAN FERNANDO AREA 1 (NORTH HOLLYWOOD) NPL SITE WITHIN THE SAN FERNANDO VALLEY BASIN (SFVB), HAS BEEN DESIGNATED AN OPERABLE UNIT (OU). FIGURE 1 SHOWS THE LOCATION OF THE NORTH HOLLYWOOD NPL SITE WITHIN THE SFVB. FIGURE 2 SHOWS THE BOUNDARY OF THE STUDY AREA FOR THE OU WITHIN THE NORTH HOLLYWOOD NPL SITE AND THE APPROXIMATE LOCATION OF THE PROPOSED EXTRACTION WELLS. THE ENTIRE BURBANK WELL FIELD LIES WITHIN THE POLITICAL BOUNDARIES OF THE CITY OF BURBANK, CALIFORNIA.

THE SFVB IS LOCATED IN THE UPPER LOS ANGELES RIVER AREA (ULARA), WHICH CONSISTS OF THE ENTIRE WATERSHED OF THE LOS ANGELES RIVER AND ITS TRIBUTARIES. THE ULARA ENCOMPASSES APPROXIMATELY 328,500 ACRES, OF WHICH 122,800 ACRES ARE ALLUVIAL DEPOSITS WHICH FILL THE SFVB. THE SFVB IS BOUNDED ON THE NORTH AND NORTHWEST BY THE SANTA SUSANA MOUNTAINS, ON THE NORTHEAST BY THE SAN GABRIEL MOUNTAINS, ON THE WEST BY THE SIMI HILLS, AND ON THE SOUTH BY THE SANTA MONICA MOUNTAINS. THESE MOUNTAIN RANGES ARE SHOWN IN FIGURE 1.

FOUR DISTINCT GROUNDWATER BASINS ARE LOCATED WITHIN THE ULARA: THE SAN FERNANDO (WITH 91.2 PERCENT OF THE TOTAL VALLEY FILL, THE VERDUGO (WITH 3.6 PERCENT OF THE TOTAL VALLEY FILL), THE SYLMAR (WITH 4.6 PERCENT OF THE TOTAL VALLEY FILL), AND THE EAGLE ROCK (WITH 0.6 PERCENT OF THE TOTAL VALLEY FILL). BECAUSE THE SFVB AREA 1 NPL SITE IS LOCATED WITHIN THE SAN FERNANDO GROUNDWATER BASIN, THE FOLLOWING DISCUSSION FOCUSES ON THE SAN FERNANDO GROUNDWATER BASIN.

THE GEOLOGY OF THE SFVB GENERALLY CONSISTS OF ALLUVIAL DEPOSITS COMPOSED OF UNCONSOLIDATED GRAVELS AND SAND INTERBEDDED WITH LENSES OF SILT AND CLAY. THE OVERLYING ALLUVIAL DEPOSITS RANGE IN THICKNESS FROM A FEW INCHES AT THE BASE OF THE MOUNTAINS TO AS MUCH AS 1,500 FEET IN THE CENTER OF THE SFVB. THE BURBANK WELL FIELD IS LOCATED IN THE EASTERN PORTION OF THE SAN FERNANDO VALLEY BASIN (SFVB), WHICH CONTAINS COARSER SEDIMENTS THAT TRANSMIT WATER AT HIGHER RATES THAN THE WESTERN AREA OF THE SFVB. MOST OF THE PRODUCTION WELLS IN THE SFVB ARE LOCATED IN THIS EASTERN AREA. RESULTS OF AQUIFER TESTING IN THE SFVB HAVE SHOWN THAT GROUNDWATER VELOCITIES IN THE EASTERN PORTION OF THE BASIN ARE MUCH GREATER THAN IN THE WESTERN PORTION. WITHIN THE EASTERN PORTION OF THE SFVB, THE VELOCITIES ARE ESTIMATED TO BE BETWEEN 300 TO 500 FEET PER YEAR WITH LOCALIZED VELOCITIES OF MORE THAN THREE FEET PER DAY NEAR WELL FIELDS.

HISTORICALLY, GROUNDWATER RECHARGE TO THE SFVB HAS OCCURRED THROUGH BOTH NATURAL RECHARGE FROM PRECIPITATION AND ARTIFICIAL RECHARGE FROM APPLIED WATER AND TREATED WASTEWATER EFFLUENT. THE TOTAL STORAGE CAPACITY OF THE SFVB IS APPROXIMATELY 3 MILLION ACRE-Feet (ACRE-FT), TWO-THIRDS OF WHICH IS LOCATED IN THE EASTERN PORTION OF THE BASIN. IN 1979, THE STATE SUPREME COURT GRANTED THE CITY OF BURBANK THE RIGHT TO EXTRACT 20 PERCENT OF THE IMPORTED AND RECLAIMED WATER FOR DOMESTIC USE. CURRENTLY, THIS 20 PERCENT AMOUNTS TO AN AVERAGE OF 4,700 ACRE-FT PER YEAR. THE CITY OF BURBANK ALSO HAS LIMITED RIGHTS TO PHYSICAL SOLUTION WATER, THAT IS, WATER NORMALLY SUPPLIED TO OTHER PARTIES BUT WHICH MAY BE USED BY THE CITY OF BURBANK UPON PAYMENT OF SPECIFIED CHARGES. IN ADDITION, THE CITY OF BURBANK IS ENTITLED TO STORE WATER IN THE SFVB AND RECEIVES A CREDIT FOR RECHARGING TREATED WASTEWATER EFFLUENT. AS OF MARCH 1989, BURBANK'S WATER CREDITS WERE APPROXIMATELY 38,000 ACRE-Feet.

THE CITY OF BURBANK'S PRODUCTION WELLS HAVE BEEN SHUT DOWN BECAUSE THE WATER THEY PRODUCE CONTAINS TRICHLOROETHYLENE (TCE) AND PERCHLOROETHYLENE (PCE) IN CONCENTRATIONS EXCEEDING STATE AND FEDERAL GUIDELINES. CONSEQUENTLY, THE CITY OF BURBANK NOW IMPORTS 100 PERCENT OF ITS WATER FROM THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA (MWD). IN 1987, THE CITY OF BURBANK IMPORTED APPROXIMATELY 23,100 ACRE-Feet OF WATER.

#SH

2.0 SITE HISTORY

IN JUNE 1986, AT THE REQUEST OF THE LOS ANGELES DEPARTMENT OF WATER AND POWER (DWP) AND THE CALIFORNIA DEPARTMENT OF HEALTH SERVICES (DHS), EPA DESIGNATED FOUR WELL FIELDS WITHIN THE SAN FERNANDO AND VERDUGO GROUNDWATER BASINS AS NATIONAL PRIORITIES LIST (NPL) HAZARDOUS WASTE SITES. INDUSTRIAL CHEMICALS HAVE BEEN DETECTED IN GROUNDWATER FROM THESE AREAS. ALTHOUGH EACH WELL FIELD IS LISTED SEPARATELY ON THE NPL, EPA AND DWP ARE MANAGING THE INVESTIGATION OF THE FOUR

## Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

SITES AS IF THEY ARE ONE SINGLE, LARGE SITE.

THE SFVB REPRESENTS AN IMPORTANT SOURCE OF DRINKING WATER FOR THE CITIES OF LOS ANGELES, BURBANK, GLENDALE, AND LA CRESCENTA, AND PROVIDES THESE COMMUNITIES WITH ENOUGH WATER TO SERVE APPROXIMATELY 600,000 RESIDENTS.

GROUNDWATER FROM THE AQUIFERS IN THE SFVB IS USED FOR COMMERCIAL, INDUSTRIAL AND RESIDENTIAL PURPOSES, AND IS ESPECIALLY IMPORTANT DURING YEARS OF DROUGHT. THE GROUNDWATER THAT HAS BECOME CONTAMINATED IS DIFFICULT TO REPLACE. THE CURRENT WATER SUPPLY FROM SURFACE WATER VIA THE METROPOLITAN WATER DISTRICT (MWD) MAY NOT ALWAYS BE AVAILABLE IN THE FUTURE BECAUSE OF PERIODIC DROUGHT CONDITIONS AND STATE AND FEDERAL WATER RIGHTS ISSUES.

IN LATE 1979, AS A RESULT OF THE PASSAGE OF ASSEMBLY BILL 1803, DHS REQUESTED THAT ALL MAJOR WATER PURVEYORS USING GROUNDWATER CONDUCT TESTS FOR THE PRESENCE OF CERTAIN INDUSTRIAL CHEMICALS AS PART OF A STATEWIDE GROUNDWATER QUALITY SURVEILLANCE EFFORT. THESE INITIAL TESTS, COMPLETED IN SPRING 1980, INDICATED THAT HAZARDOUS SUBSTANCES SUCH AS TRICHLOROETHYLENE (TCE) AND PERCHLOROTHYLENE (PCE), WERE PRESENT IN CONCENTRATIONS ABOVE STATE ACTION LEVELS (SALS) AND MAXIMUM CONTAMINANT LEVELS (MCLS) IN A NUMBER OF WATER PRODUCTION WELLS IN THE SAN FERNANDO VALLEY BASIN. CONCENTRATION LEVELS IN THE WELLS HAVE BEEN INCREASING SINCE 1980.

IN 1987, THE PRIMARY CONTAMINANT, TCE, WAS FOUND AT CONCENTRATIONS EXCEEDING THE STATE ACTION LEVEL (SAL) IN 48% OF THE SFVB'S 120 PRODUCTION WELLS. IN ADDITION, PCE LEVELS ABOVE STATE ACTION LEVEL WERE PRESENT IN 18% OF THE SFVB WELLS.

AT PRESENT, THE CITY OF LOS ANGELES ADDRESSES WELL CONTAMINATION BY EITHER SHUTTING DOWN HEAVILY CONTAMINATED WELLS AND PROVIDING ALTERNATE SOURCES OF DRINKING WATER, OR BLENDING CONTAMINATED WATER WITH OTHER SOURCES TO ACHIEVE TCE AND PCE CONCENTRATIONS IN THE SERVED WATER THAT ARE BELOW STATE ACTION LEVELS AND FEDERAL MCLS. OTHER COMMUNITIES, LIKE THE CITY OF BURBANK, HAVE TURNED TO THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA FOR SURFACE WATER TO AUGMENT THEIR SUPPLIES.

IN SEPTEMBER 1987, EPA SIGNED THE NORTH HOLLYWOOD OU RECORD OF DECISION TO CONSTRUCT AN EXTRACTION AND AERATION FACILITY, TO PUMP AND TREAT CONTAMINATED GROUNDWATER IN THE NORTH HOLLYWOOD AREA WITHIN THE SFVB AREA I NPL SITE. EPA PROVIDED FUNDS TO DWP THROUGH A COOPERATIVE AGREEMENT TO IMPLEMENT THIS PROJECT. ALSO, EPA HAS JOINED WITH DWP AND DHS IN A THREE PARTY AGREEMENT THAT DEFINES SPECIFIC AGENCY RESPONSIBILITIES, COST SHARING, AND OTHER APPLICABLE PROVISIONS FOR CONSTRUCTION, OPERATION, AND MAINTENANCE OF THIS TREATMENT SYSTEM. THE PLANT BECAME OPERATIONAL IN MARCH, 1989.

THE BURBANK OPERABLE UNIT (OU) WILL BE THE SECOND OU IN THE SFVB AREA 1.

### 3.0 ENFORCEMENT

THE SFVB NPL SITES WERE FIRST LISTED BECAUSE OF CONTAMINATED PUBLIC SUPPLY WELLS. AT THE TIME OF LISTING, THE SOURCES OF CONTAMINATION WERE UNKNOWN. EPA AND THE LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD (RWQCB) HAVE AND ARE CONTINUING TO CONDUCT NUMEROUS ACTIVITIES TO IDENTIFY SOURCES OF GROUNDWATER CONTAMINATION IN THE SAN FERNANDO VALLEY BASIN. THE TWO AGENCIES ARE WORKING COOPERATIVELY IN SOURCE IDENTIFICATION AND ENFORCEMENT ACTIVITIES.

THE RWQCB BEGAN SOURCE INVESTIGATION ACTIVITIES IN 1987 UNDER THE AB 1803 PROGRAM. UNDER THIS PROGRAM, AN AREA (TYPICALLY ONE SQUARE MILE) SURROUNDING CONTAMINATED PUBLIC WATER SUPPLY WELLS IS ESTABLISHED WITHIN WHICH A DOOR-TO-DOOR INDUSTRIAL SURVEY IS COMPLETED. INSPECTIONS ARE CONDUCTED AT ALL FACILITIES POTENTIALLY USING SOLVENTS. FACILITIES THAT MAY HAVE HAD A RELEASE DUE TO THEIR HANDLING OR STORAGE PRACTICES ARE REQUESTED TO CONDUCT A SITE ASSESSMENT FOR THEIR FACILITY. IF SOIL CONTAMINATION IS FOUND, EXPANDED SOIL AND/OR GROUNDWATER INVESTIGATIONS ARE REQUIRED. LATER, A CLEANUP AND ABATEMENT ORDER MAY BE ISSUED REQUIRING THE SITE TO BE REMEDIATED.

IN ADDITION, THE RWQCB CONDUCTS SOURCE IDENTIFICATION AND CLEANUP ACTIVITIES UNDER THE UNDERGROUND STORAGE TANK, SOLID WASTE ASSESSMENT TESTING (SWAT), AND WASTE DISCHARGE REQUIREMENTS PROGRAMS.

BETWEEN AUGUST 1987 AND 1988, EPA ISSUED 145 RCRA SECTION 3007/ CERCLA SECTION 104 INFORMATION

4483-9099

REQUEST LETTERS TO FACILITIES SUSPECTED OF BEING USERS OF CHLORINATED SOLVENTS IN THE SAN FERNANDO VALLEY BASIN. BASED ON THE RESPONSES RECEIVED AND INFORMATION IN STATE AGENCY FILES, EPA ISSUED 34 GENERAL NOTICE LETTERS INFORMING COMPANIES OF THEIR POTENTIAL LIABILITY FOR THE CLEANUP OF THE SFVB AREA 1 AND 2 NPL SITES. ON SEPTEMBER 13, 1988 EPA HELD AN INFORMATION MEETING FOR FACILITIES IDENTIFIED AS PRP'S FOR THE BURBANK WELL FIELD. TO BEGIN NEGOTIATIONS FOR CLEANUP OF THE BURBANK OU AREA, EPA SENT SPECIAL NOTICE LETTERS PURSUANT TO CERCLA SECTION 122 IN MAY 1989. NEGOTIATIONS WITH PRP'S ARE EXPECTED TO END IN SEPTEMBER 1989. EPA AND THE RWQCB WILL CONTINUE BASINWIDE SOURCE IDENTIFICATION AND ENFORCEMENT ACTIVITIES THROUGHOUT THE BASINWIDE RI/FS PROCESS.

#CR

### 4.0 COMMUNITY RELATIONS

THE COMMENT PERIOD FOR THE OUPS REPORT AND THE PROPOSED PLAN OPENED ON OCTOBER 19, 1988 AND CLOSED DECEMBER 2, 1988. A PUBLIC MEETING WAS HELD ON NOVEMBER 9, 1988 AT THE THOMAS JEFFERSON ELEMENTARY SCHOOL IN BURBANK AND WAS ATTENDED BY APPROXIMATELY 65 PEOPLE.

PRIOR TO THE BEGINNING OF THE PUBLIC COMMENT PERIOD, EPA AND THE CITY OF BURBANK PUBLISHED A NOTICE BOTH IN THE LOS ANGELES TIMES AND THE BURBANK LEADER. THE NOTICE BRIEFLY DESCRIBED THE PROPOSED PLAN AND ANNOUNCED THE PUBLIC COMMENT PERIOD AND THE PUBLIC MEETING. THE NOTICE ALSO ANNOUNCED THE AVAILABILITY OF FORMATION REPOSITORIES ESTABLISHED AT THE BURBANK PUBLIC LIBRARY, CALIFORNIA STATE UNIVERSITY - NORTHRIDGE LIBRARY, LOS ANGELES DEPARTMENT OF WATER AND POWER LIBRARY AND THE UNIVERSITY OF CALIFORNIA - LOS ANGELES (UCLA) RESEARCH LIBRARY. (SEE FACT SHEET #1 OR #2 FOR THE LOCATIONS.)

A FACT SHEET DESCRIBING THE PROPOSED PLAN WAS DELIVERED TO THE INFORMATION REPOSITORIES. COPIES OF THE FACT SHEET WERE ALSO MAILED TO THE EPA GENERAL MAILING LIST FOR THE SAN FERNANDO VALLEY BASIN SITES, WHICH INCLUDED ABOUT 800 MEMBERS OF THE GENERAL PUBLIC, ELECTED OFFICIALS, AGENCY, AND MEDIA REPRESENTATIVES. FACT SHEETS WERE ALSO HAND-DELIVERED TO RESIDENTS NEAR THE PROPOSED TREATMENT FACILITY LOCATION. IN ADDITION, THE BURBANK WATER SYSTEM MANAGER MADE AN ANNOUNCEMENT OF THE PUBLIC MEETING AND PRESENTED THE PROPOSED PLAN ON LOCAL CABLE TELEVISION. HE ALSO HAD FACT SHEETS AVAILABLE FOR DISTRIBUTION AT THE BURBANK PUBLIC SERVICE DEPARTMENT (PSD) ADDITIONALLY, NEWS STORIES APPEARED IN THE LOCAL NEWSPAPER, THE BURBANK LEADER, AND THE LOS ANGELES TIMES AND THE DAILY NEWS.

FROM MARCH 1987 TO THE PRESENT, EPA AND DWP HAVE MET BIMONTHLY OR QUARTERLY WITH MEMBERS OF THE COMMUNITY WORKGROUP (CWG). THE MEMBERS INCLUDE ELECTED OFFICIALS, INDUSTRY REPRESENTATIVES, COMMUNITY-BASED PUBLIC INTEREST REPRESENTATIVES, AND RESIDENTS FROM THE SAN FERNANDO VALLEY/LOS ANGELES AREA. THE PURPOSE OF THE CWG MEETINGS HAVE BEEN TO DISCUSS TECHNICAL ISSUES AND MANAGEMENT STRATEGIES INVOLVING THE SAN FERNANDO VALLEY BASIN SUPERFUND PROJECT. CWG MEMBERS HAVE BEEN UPDATED ON AGENCY ACTIVITIES AND HAVE HAD THE OPPORTUNITY TO EXPRESS THEIR CONCERNS ABOUT THE BURBANK OPERABLE UNIT THROUGHOUT THE REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS) PROCESS. EPA TRANSMITTED COPIES OF THE OUPS REPORT TO CWG MEMBERS FOR THEIR REVIEW AND COMMENT.

THE MINUTES OF THE COMMUNITY MEETING WERE TRANSCRIBED. THE TRANSCRIPT AND THE ATTACHED RESPONSE SUMMARY PROVIDE RESPONSES TO THE COMMUNITY COMMENTS SUBMITTED IN WRITING DURING THE PUBLIC COMMENT PERIOD, AS WELL AS ORAL COMMENTS MADE AT THE NOVEMBER 9, 1988 PUBLIC MEETING. THE PUBLIC TRANSCRIPT AND RESPONSE SUMMARY ARE PART OF THE ADMINISTRATIVE RECORD.

### 5.0 SCOPE AND ROLE OF THE OU WITHIN THE BASINWIDE SITE STRATEGY

AS DISCUSSED IN THE SITE HISTORY SECTION, EPA IS TREATING THE SFVB AREA 1 - 4 NPL SITES AS ONE LARGE SITE. EPA AND DWP ARE CONDUCTING ONE BASINWIDE RI/FS FOR THE 4 NPL SITES. THE RI/FS FOR THE SAN FERNANDO SITES WAS INITIATED IN 1987. THE MAJOR GOAL OF THE RI IS TO IDENTIFY THE SOURCES, PATHWAYS AND RECEPTORS OF THE CONTAMINANTS AND TO CHARACTERIZE THE NATURE AND EXTENT OF THE PUBLIC HEALTH AND ENVIRONMENTAL PROBLEMS PRESENTED BY THE CONTAMINATION. MAJOR COMPONENTS OF THE RI INCLUDE SOIL GAS SURVEYS, INSTALLATION OF MONITORING WELLS, REGIONAL AND SITE SPECIFIC GROUNDWATER FLOW AND SOLUTE TRANSPORT MODELING OF THE BASIN AND SAMPLING OF THE GROUNDWATER AND SOIL. THE FS WILL EVALUATE THE NECESSITY FOR AND PROPOSED EXTENT OF REMEDIAL ACTIONS. DWP HAS THE LEAD FOR THE RI AND EPA HAS THE LEAD FOR THE FS.

EPA PREVIOUSLY SELECTED A REMEDY TO ADDRESS THE PUBLIC HEALTH THREAT POSED BY CONTAMINATION OF THE PUBLIC WATER SUPPLY WELLS LOCATED IN THE CITY OF NORTH HOLLYWOOD WHICH LIES WITHIN THE SFVB

# Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

AREA 1 NPL SITE. THE NORTH HOLLYWOOD OU PROJECT WAS DESIGNED TO CONTROL THE MIGRATION OF CONTAMINANTS IN THE GROUNDWATER, WHILE INITIATING AQUIFER RESTORATION IN THE AREA. THE CONTAMINANT PLUME HAS ALREADY AFFECTED NUMEROUS GROUNDWATER PRODUCTION WELLS IN AREA 1 OF THE SFVB AND HAS PRECLUDED THEIR USE FOR PUBLIC WATER SUPPLY. CONSTRUCTION AND OPERATION OF THE BURBANK PROJECT IS INTENDED TO FURTHER ADDRESS THE IMMEDIATE PROBLEM IN AREA 1 WHILE A MORE COMPLETE INVESTIGATION OF THE VALLEY'S OVERALL GROUNDWATER PROBLEM IS BEING DONE THROUGH THE OVERALL REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS) PROCESS.

THE BURBANK RESPONSE ACTION IS DESIGNED TO ACHIEVE TWO OBJECTIVES;

- TO PARTIALLY CONTROL THE MOVEMENT AND SPREAD OF GROUNDWATER CONTAMINANTS IN THE BURBANK OPERABLE UNIT AREA, WHILE CONTRIBUTING TO AQUIFER RESTORATION IN THE SAN FERNANDO VALLEY BASIN AREA 1 NPL SITE.
- TO ADDRESS THE PUBLIC HEALTH THREAT POSED BY CONTAMINATION OF THE CITY OF BURBANK'S PUBLIC WATER SUPPLY WELLS BY PROVIDING RESIDENTS IN THE AREA WITH A WATER SUPPLY THAT MEETS STATE AND FEDERAL DRINKING WATER STANDARDS.

ALL OF THE CITY OF BURBANK'S PSD WELLS ARE SHUT DOWN DUE TO THE VOC CONTAMINATION. MOREOVER, OTHER DOWNGRADE PUBLIC WATER SUPPLY WELLS ARE POTENTIALLY THREATENED BY CONTAMINATION IN THE BURBANK OU AREA. THE RESPONSE ACTION SELECTED IN THIS DECISION DOCUMENT WILL BE INCORPORATED INTO THE EPA RESPONSE ACTION FOR THE ENTIRE SAN FERNANDO SUPERFUND AREAS 1-4.

AS THE OPERABLE UNITS ARE ADDRESSING PART OF THE OVERALL PROBLEM, THE RI/FS AND SUBSEQUENT ROD ARE INTENDED TO ADDRESS THE 4 SFVB NPL SITES AND THE AREAS WHICH IMPACT THESE SITES.

**#SBSC**

**6.0 SUMMARY OF THE BURBANK OU SITE CHARACTERISTICS**

CONTAMINATION OF GROUNDWATER FROM THE SAN FERNANDO VALLEY BASIN WELLS WAS FIRST DISCOVERED IN 1980. SINCE THEN, VARIOUS MONITORING PROGRAMS HAVE BEEN IMPLEMENTED. RESULTS OF LADWP'S GROUNDWATER MONITORING PROGRAM CONDUCTED FROM 1981 THROUGH 1987 REVEALED THAT TCE AND PCE HAD CONTAMINATED APPROXIMATELY 50 PERCENT OF THE WATER SUPPLY WELLS IN THE EASTERN PORTION OF THE SFVB AT CONCENTRATIONS EXCEEDING STATE AND FEDERAL DRINKING WATER STANDARDS. FIGURE 3 PRESENTS THE APPROXIMATE LOCATION OF THE TCE AND PCE PLUMES IN 1987.

THE CITY OF BURBANK'S WELLS ARE SAMPLED ROUTINELY AS PART OF THE MONITORING OF 112 WELLS IN THE SAN FERNANDO VALLEY BASIN. THE CONCENTRATION RANGES OF TCE AND PCE FOUND IN THE BURBANK WELLS ARE PRESENTED IN TABLES 1 AND 2. SEVERAL OTHER VOCS HAVE ALSO BEEN DETECTED IN THE BURBANK WELLS, INCLUDING ACETONE, TOLUENE, METHYLETHYLKETONE, CARBON TETRACHLORIDE AND TRIHALOMETHANES (THMS) WHICH INCLUDE CHLOROFORM, BROMODICHLOROMETHANE, DIBROMOCHLOROMETHANE, AND BROMOFORM. THE CONCENTRATIONS OF THESE OTHER VOCS HAVE NOT EXCEEDED STATE ACTION LEVELS (SALS) OR FEDERAL MCLS. THE BURBANK WELLS HAVE ALSO BEEN SAMPLED FOR TRACE METALS AND OTHER WATER QUALITY PARAMETERS. ALTHOUGH GROUNDWATER FROM ONE WELL HAD ELEVATED CONCENTRATIONS OF IRON, THE QUALITY OF THE TREATED WATER FROM THESE WELLS IS EXPECTED TO MEET TITLE 22 DRINKING WATER STANDARDS FOR METALS.

THE TABLES CAN BE SUMMARIZED AS FOLLOWS:

- TCE AND PCE ARE THE PRINCIPAL CONTAMINANTS OF CONCERN. TCE AND PCE ARE INDUSTRIAL SOLVENTS COMMONLY USED IN THE METAL DEGREASING AND DRY-CLEANING INDUSTRIES. BOTH ARE ANIMAL CARCINOGENS AND ARE SUSPECTED OF BEING CARCINOGENIC TO HUMANS. THE FEDERAL MCL FOR TCE IS 5.0 UG/L. THE SAL FOR PCE IS 4.0 UG/L AND THE PROPOSED STATE MCL IS 5 UG/L.
- OTHER VOCS DETECTED IN TRACE QUANTITIES INCLUDE METHYLENE CHLORIDE, TOLUENE, ACETONE, CARBON TETRACHLORIDE, METHYLETHYLKETONE, AND THE THMS (CHLOROFORM, BROMODICHLORO-METHANE AND DIBROMOCHLOROMETHANE). METHYLENE CHLORIDE IS AN INDUSTRIAL SOLVENT COMMONLY USED IN LABORATORIES. IT IS CARCINOGENIC IN ANIMALS AND IS ALSO A SUSPECTED HUMAN CARCINOGEN. THE SAL FOR METHYLENE CHLORIDE IS 40 UG/L. TOLUENE IS AN INDUSTRIAL SOLVENT AND A GASOLINE ADDITIVE. IT IS CARCINOGENIC IN ANIMALS AND IS ALSO A SUSPECTED HUMAN CARCINOGEN. THE SAL FOR TOLUENE IS 100 UG/L. ACETONE IS USED AS AN INDUSTRIAL SOLVENT AND IN THE PRODUCTION OF LUBRICATING OILS. A SAL FOR ACETONE HAS NOT BEEN ESTABLISHED. CARBON TETRACHLORIDE IS AN INDUSTRIAL

4483-9099

SOLVENT. IT IS CARCINOGENIC IN ANIMALS AND IS A SUSPECTED HUMAN CARCINOGEN. THE FEDERAL MCL FOR CARBON TETRACHLORIDE IS 5.0 UG/L AND THE FEDERAL MCLG IS SET AT 0 UG/L. METHYLETHYLKETONE IS USED AS A SOLVENT IN NITROCELLULOSE COATINGS AND VINYL FILM MANUFACTURING AND IN CEMENTS AND ADHESIVES. A SAL HAS NOT BEEN ESTABLISHED FOR METHYLETHYLKETONE. MOST THMS FOUND IN FINISHED DRINKING WATER ARE UNWANTED BY-PRODUCTS CAUSED BY THE CHLORINATION PROCESS. THMS ARE FORMED BY THE CHEMICAL ATTACK OF HYPOCHLORITE ON FULVIC AND HUMIC ACIDS. CHLOROFORM ALSO HAS A VARIETY OF INDUSTRIAL USES, INCLUDING USE AS A SOLVENT IN LACQUER MANUFACTURE. CHLOROFORM IS A SUSPECTED HUMAN CARCINOGEN. THE MCL FOR THE SUM OF THMS IS 100 UG/L.

- THE WELLS WITH THE SHALLOWEST PERFORATED INTERVALS (PSD 10 AND PSD 12) AND THE ONES THAT ARE THE FURTHEST UPGRADIENT (PSD 9, PSD 10, PSD LLA, PSD 13, PSD 14A, PSD 17) HAVE HISTORICALLY HAD THE HIGHEST CONCENTRATIONS OF TCE AND PCE. IN CONTRAST, PSD 6, PSD 7 AND PSD 15 HAVE LOW OR NONDETECTED CONCENTRATIONS OF VOCS. PSD 6 IS LIKELY AT THE EDGE OF THE LATERAL EXTENT OF THE VOC PLUME, AND PSD 7 AND PSD 15 ARE LIKELY AT THE LEADING EDGE OF THE PLUME. FOR RELATIVE LOCATION OF WELLS SEE FIGURE 2.

**#SSR**

**7.0 SUMMARY OF SITE RISKS**

THE PURPOSE OF THE RISK ASSESSMENT IS TO EVALUATE THE PUBLIC HEALTH AND ENVIRONMENTAL RISKS POSED BY THE BURBANK OU SITE. FOR THE RISK ASSESSMENT EVALUATION, BOTH A BASELINE RISK ASSESSMENT AND A RISK ASSESSMENT FOR ALTERNATIVE 5, PHASE 1 WERE CONDUCTED. THIS SECTION DESCRIBES THE RISK ASSESSMENT PROCESS AND RESULTS.

BASELINE RISK ASSESSMENT: ANALYTICAL RESULTS FROM GROUNDWATER SAMPLES COLLECTED FROM CITY OF BURBANK PRODUCTION WELLS (PSD 6, 7, 10, 12, 15, AND 18) BETWEEN MAY 1987 AND JUNE 1988 FORM THE GROUNDWATER DATABASE THAT WERE USED IN THE BASELINE RISK ASSESSMENT. IN THE BASELINE RISK ASSESSMENTS THE CURRENT RISKS POSED BY DOMESTIC USE OF GROUNDWATER FROM THE BURBANK WELL FIELD WERE ESTIMATED. THE WELL FIELD IS CURRENTLY NOT IN USE AS A WATER SUPPLY. AS A RESULT, NO RECEPTORS ARE CURRENTLY BEING EXPOSED.

A QUANTITATIVE RISK ASSESSMENT WAS DEVELOPED FOR TWO EXPOSURE SOURCE TERMS. ONE SOURCE TERM, "THE POTENTIAL AVERAGE EXPOSURE," OR THE "MOST LIKELY CASE" ASSUMES THAT GROUNDWATER CONCENTRATIONS IN THE BURBANK WELL FIELD ARE AT THE GEOMETRIC MEAN LEVELS (AVERAGED BY WELL) AND AVERAGED ACROSS WELLS (ARITHMETIC MEAN OF GEOMETRIC MEANS). THE OTHER SOURCE TERM IS A "PLAUSIBLE WORSE-CASE" AND ASSUMES THAT THE RECEPTOR IS EXPOSED TO THE MAXIMUM CONTAMINANT LEVEL DETECTED IN ANY ONE WELL.

ASSUMING THAT GROUNDWATER FROM THE WELL FIELD IS USED FOR A LIFETIME, AN INDIVIDUAL RECEPTOR WOULD BE EXPOSED TO AN EXCESS CANCER RISK RANGE (I.E. ABOVE THE NATURAL BACKGROUND RISK) OF APPROXIMATELY  $2.0 \times 10^{-4}$  TO  $1.7 \times 10^{-3}$ . THESE RISK VALUES ARE AT THE HIGHEST RANGE ALLOWED BY MOST REGULATORY AGENCIES. FOR COMPARISON, A LOWER EXCESS RISK RANGE OF  $1.0 \times 10^{-4}$  TO  $1.0 \times 10^{-7}$  WITH 10-6 DEPARTURE, IS USED IN CERCLA AS A SITE REMEDIATION TARGET.

THE BASELINE RISK ASSESSMENT CONCLUDED THAT, UNDER THE CONDITIONS POSTULATED IN THE EXPOSURE ASSESSMENT, THE USE OF UNTREATED GROUNDWATER FROM THE BURBANK WELL FIELD AS A DOMESTIC WATER SUPPLY FOR A LIFETIME WOULD PRESENT AN UNACCEPTABLY HIGH CANCER RISK. THIS CONCLUSION ASSUMES THAT THE EXISTING CHEMICAL ANALYTICAL DATABASE SUFFICIENTLY CHARACTERIZED THE GROUNDWATER CONTAMINATION PRESENT.

IT SHOULD BE NOTED THAT THE HIGHEST CONCENTRATION LEVELS FOUND IN THE AREA WERE NOT USED FOR THE BASELINE RISK ASSESSMENT. IN 1987, MONITORING WELLS LOCATED NEAR THE BURBANK WELL FIELD SHOWED CONCENTRATIONS AS HIGH AS 18,000 UG/L FOR PCE AND 3600 UG/L FOR TCE. MOREOVER, IN FEBRUARY 1989, LOCKHEED AERONAUTICAL SYSTEMS COMPANY (LASC) WAS EXTRACTING GROUNDWATER WITH CONCENTRATIONS AS HIGH AS 10,000 PPB FOR PCE AND 2000 PPB FOR TCE AT THEIR TREATMENT FACILITY LOCATED WITHIN THE BURBANK OU AREA. IF THESE CONCENTRATIONS OBSERVED AT LASC HAD BEEN USED, THE BASELINE RISK ASSESSMENT WOULD HAVE SHOWN EVEN HIGHER RISK.

ALTERNATIVE 5, PHASE 1 RISK ASSESSMENT: A RISK ASSESSMENT WAS PERFORMED FOR ALTERNATIVE 5, PHASE 1 (EXTRACTING AND TREATING 12,000 GPM WITH DUAL STAGE AIR STRIPPING AND VAPOR PHASE GAC). BOTH LASC MONITORING WELL DATA AND BURBANK PRODUCTION WELL DATA WERE USED. (SEE THE BURBANK OUFV REPORT FOR TABLES AND MORE INFORMATION.) THE CONTAMINANT MASS WAS CALCULATED FROM ESTIMATES OF

## Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

THE CONCENTRATIONS IN THE GROUNDWATER (UG/M-) WHICH WOULD LIKELY BE EXTRACTED AND TREATED BY THE SYSTEM. THE EXPECTED CHEMICAL MASS DISCHARGED TO THE ATMOSPHERE (G/SEC) WAS CALCULATED WITH RESPECT TO THE THREE DIFFERENT AIR POLLUTION CONTROL OPTIONS. THE EXPECTED CHEMICAL MASS DISCHARGE WAS INPUT TO AN ATMOSPHERIC DISPERSION MODEL WHICH CALCULATED CONCENTRATIONS OF THE CHEMICALS IN THE AIR (UG/M3). THE CONCENTRATION IN THE AIR WAS MODELED TO BE SPATIALLY DISTRIBUTED IN A TWO-MILE RADIUS SURROUNDING THE PROPOSED AIR STRIPPER LOCATION (SEE FIGURE 2). THE POPULATION ESTIMATED TO RESIDE WITHIN TWO MILES OF THE SITE IN 1990 IS 94,195. THE 2010 POPULATION IS EXPECTED TO BE SLIGHTLY LOWER AT 93,765.

IN THE HEALTH RISK ASSESSMENT, THREE AIR STRIPPING AIR EMISSION CONTROL OPTIONS FOR PHASE I OF ALTERNATIVE 5 WERE EXAMINED;

- \* NO AIR POLLUTION CONTROL;
- \* AIR EMISSION CONTROLS LEADING TO 90 % REMOVAL OF VOCS; AND
- \* AIR EMISSIONS CONTROL LEADING TO 99 % REMOVAL OF VOCS.

TWO TYPES OF CARCINOGENIC RISK CALCULATIONS WERE PERFORMED. THE FIRST TYPE IS INDEPENDENT OF POPULATION AND IS TERMED THE MAXIMALLY EXPOSED INDIVIDUAL (MEI). THE MEI IS THE SITE OF HIGHEST ESTIMATED POTENTIAL EXPOSURE CALCULATED. THE MEI IS INDEPENDENT OF WHETHER THE SITE IS INHABITED. THE TOTAL CANCER RISK TO THE MEI IS EXAMINED BY THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (SCAQMD) TO ASCERTAIN IF A PROPOSED PROJECT IS EXPECTED TO EXCEED A TOTAL RISK OF  $1 \times 10^{-6}$ . THE AIR MODELING RESULTS CONCLUDE THAT THE MEI OCCURS AT A DISTANCE 0.1 TO 0.2 MILES FROM THE SITE. THE TOTAL EXCESS ESTIMATED CANCER RISK (TO THE MEI) FOR THE THREE DIFFERENT AIR EMISSION CONTROL OPTIONS ARE AS FOLLOWS;

- \* NO AIR POLLUTION CONTROL:  $5.98 \times 10^{-6}$
- \* 90 % REMOVAL OF VOCS:  $4.07 \times 10^{-7}$
- \* 99 % REMOVAL OF VOCS:  $4.07 \times 10^{-8}$

THE SECOND TYPE OF RISK CALCULATION PRESENTED WAS FOR A POPULATION. FOR THE POPULATION RISK, THE INDIVIDUAL RISK LEVEL IS MULTIPLIED BY THE SIZE OF THE POTENTIALLY EXPOSED POPULATION. THE AIR CONCENTRATIONS GENERATED BY THE AIR MODEL, EXPRESSED AS THE ASSOCIATED RISK, ARE SUPERIMPOSED ON THE 1990 AND YEAR 2010 POPULATION DATA FOR A TWO-MILE RADIUS. THE PREDICTED TOTAL EXCESS POPULATION CANCER BURDEN IN A TWO-MILE ZONE UNDER CONDITIONS OF THE VARIOUS AIR EMISSION CONTROL OPTIONS ESTIMATED FOR THE 1990 POPULATION DATA ARE AS FOLLOWS;

- \* NO AIR POLLUTION CONTROL: 0.04 CANCERS/POPULATION;
- \* 90% REMOVAL OF VOCS: 0.003 CANCERS/POPULATION; AND
- \* 99% REMOVAL OF VOCS: 0.0003 CANCERS/POPULATION.

THUS, LESS THAN ONE EXCESS CANCER WOULD BE EXPECTED TO OCCUR IN THE POPULATION DUE TO THE EMISSIONS FROM THE PROJECT.

NON-CARCINOGENIC RISKS OR THE "HAZARD INDEX" (HI) WERE CALCULATED BY AN APPROACH SIMILAR TO THAT USED FOR CARCINOGENS. THE RULE OF THUMB IS THAT HI SHOULD NOT EXCEED ONE. THE HIS CALCULATED ARE SEVERAL ORDERS OF MAGNITUDE LESS THAN ONE, FOR ANY OF THE THREE AIR EMISSION CONTROL OPTIONS EXAMINED. AS A RESULT, THE PREDICTED EXPOSURE TO RECEPTORS DUE TO THE NON-CARCINOGENS EMITTED FROM THE AIR STRIPPING TOWERS WERE CONCLUDED TO BE INSIGNIFICANT FROM A HUMAN HEALTH PERSPECTIVE. (SEE THE BURBANK OUF5 REPORT FOR MORE DETAIL ON THE RISK ASSESSMENT ANALYSIS.)

ALTHOUGH UNCONTROLLED EMISSIONS ARE NEAR EPA'S ACCEPTABLE EXCESS CANCER RISK NUMBER OF  $1 \times 10^{-6}$ , IT IS UNACCEPTABLE TO NOT CONTROL EMISSIONS BECAUSE OF THE POOR AIR QUALITY IN THE BURBANK AREA. MOREOVER, EMISSION CONTROLS WOULD BE NEEDED TO COMPLY WITH REQUIREMENTS OF THE SCAQMD REGULATION 13. SEE SECTION 9, COMPLIANCE WITH ARARS FOR A MORE DETAILED EXPLANATION OF THE ARARS AND OTHER INFORMATION TO BE CONSIDERED (TBC).

#DA

**8.0 DESCRIPTION OF ALTERNATIVES**

MANY TECHNOLOGIES WERE EVALUATED BASED ON THESE CRITERIA DURING THE FEASIBILITY STUDY. TREATMENT TECHNOLOGIES THAT MAY BE APPLICABLE TO GROUNDWATER CONTAMINATED WITH VOLATILE ORGANIC COMPOUNDS, PRIMARILY TCE AND PCE, WERE SCREENED BASED ON TWO CRITERIA: (1) THEIR ABILITY TO MEET THE REMEDIAL RESPONSE OBJECTIVES; AND, (2) THE APPLICABILITY AND FEASIBILITY OF THE

4483-9099

TECHNOLOGY TO THE SITE CONDITIONS.

AFTER THE INITIAL SCREENING, SIX ALTERNATIVES WERE EVALUATED USING THE FOLLOWING SUPERFUND GUIDANCE CRITERIA: TECHNICAL AND ADMINISTRATIVE FEASIBILITY, CAPITAL COSTS, OPERATION AND MAINTENANCE COSTS, ENVIRONMENTAL IMPACTS, PROTECTION OF PUBLIC HEALTH AND THE ENVIRONMENT, COMPLIANCE WITH FEDERAL AND STATE REGULATIONS, AND COMMUNITY AND STATE ACCEPTANCE.

THE FOLLOWING IS A LIST OF THE ALTERNATIVES ANALYZED AND COMPARED DURING THE FS AND FOUND IN THE BURBANK OUF5 REPORT;

- ALT 1 - NO ACTION
- ALT 2 - EXTRACT FROM EXISTING WELLS/TREAT/REINJECT AND REUSE
- ALT 3 - EXTRACT FROM NEW WELLS/TREAT/REINJECT AND REUSE
- ALT 4 - EXTRACT FROM NEW AND EXISTING WELLS/TREAT/SPREAD AND REUSE
- ALT 5 - EXTRACT FROM NEW AND EXISTING WELLS/TREAT/REUSE
- ALT 6 - EXTRACT FROM EXISTING WELLS/TREAT/REUSE.

THE FOLLOWING DESCRIPTIONS GIVE A SUMMARY OF THE ALTERNATIVE FEATURES. SEE THE BURBANK OUF5 REPORT FOR MORE DETAIL.

**ALTERNATIVE 1 - NO ACTION ALTERNATIVE**

THE NO ACTION ALTERNATIVE SERVED AS A BASIS FOR COMPARING THE OTHER REMEDIAL ALTERNATIVES. THIS ALTERNATIVE IS EVALUATED TO DETERMINE THE RISKS THAT WOULD BE POSED TO PUBLIC HEALTH AND THE ENVIRONMENT IF NO ACTION WERE TAKEN TO TREAT OR CONTAIN THE CONTAMINATION. THIS ALTERNATIVE WOULD INCLUDE QUARTERLY MONITORING OF THE TEN EXISTING BURBANK PUBLIC SERVICE DEPARTMENT (PSD) WELLS. THE MONITORING PROGRAM WOULD HELP TO ENSURE THAT GROUNDWATER WOULD NOT BE USED WHEN CONCENTRATIONS OF VOCS EXCEED MCLS AND SALS. IT SHOULD BE NOTED THAT CURRENTLY ALL OF THE CITY OF BURBANK'S WELLS HAVE BEEN SHUT DOWN DUE TO THE VOC CONTAMINATION AND THE CITY BUYS ALL ITS WATER FROM THE METROPOLITAN WATER DISTRICT (MWD).

THE FEDERAL AND STATE MCLS ARE RELEVANT AND APPROPRIATE IN THE AQUIFER.

**ALTERNATIVE 2 - 6**

ALTERNATIVES 2 THROUGH 6 INCLUDE EXTRACTION OF GROUNDWATER, TREATMENT WITH AIR STRIPPING WITH VAPOR PHASE GAC ADSORPTION UNITS, AND DISCHARGE OF THE TREATED GROUNDWATER. THE FOLLOWING IS A DESCRIPTION OF THE TREATMENT SYSTEM PROPOSED IN THE FEASIBILITY STUDY REPORT.

AIR STRIPPING (OR AERATION) IS A METHOD THAT REMOVES VOCS FROM WATER BY VOLATILIZATION AT THE AIR-WATER INTERFACE. THE PUMPED GROUNDWATER IS RUN DOWN THROUGH A VERTICAL COLUMN WHICH CONTAINS A PACKING MEDIUM. THE MEDIUM PROVIDES SURFACE AREA OVER WHICH A COUNTERCURRENT FLOW OF AIR IS INTRODUCED. THE CONTAMINANT IS TRANSFERRED FROM THE WATER TO THE AIR AND THUS REMOVED FROM THE WATER. THE EFFICIENCY OF THE PROCESS IS DEPENDENT ON THE NATURE OF THE CONTAMINANT, ITS INFLUENT CONCENTRATION, THE RATE OF AIR FLOW, AND THE AVAILABLE SURFACE AREA AFFORDED BY THE PACKING MATERIAL. FOR TCE AND PCE, REMOVAL EFFICIENCIES CAN EXCEED 99 PERCENT. AERATION IS A PROVEN METHOD AND IS COMMONLY USED TO TREAT GROUNDWATER.

DUAL STAGE AIR STRIPPING USES TWO AIRSTRIPPING TOWERS IN SERIES TO REMOVE CONTAMINANTS FROM WATER. TREATED WATER FROM THE BASE OF THE FIRST AIR STRIPPING TOWER IS PUMPED TO THE TOP OF THE SECOND AIR STRIPPING TOWER AND AERATED A SECOND TIME. DUAL STAGE AIR STRIPPING IS PREFERABLE TO SINGLE STAGE AIR STRIPPING BECAUSE THE CONTAMINATED WATER HERE IS EXPECTED TO HAVE HIGH LEVELS OF TCE AND PCE.

AIR STRIPPING HAS TWO DRAWBACKS WITH RESPECT TO PUBLIC HEALTH AND THE ENVIRONMENT. FIRST, THERE IS THE POSSIBILITY OF LOW-LEVEL, LONG-TERM CANCER RISK TO THE LOCAL POPULATION DUE TO THE RELEASE OF VOLATILIZED CONTAMINANTS INTO THE AIR. SECONDLY, THIS RELEASE OF CONTAMINANTS ALSO CONTRIBUTES TO AIR QUALITY DEGRADATION WHICH IN TURN AFFECTS HUMAN HEALTH AND THE ENVIRONMENT.

THEREFORE IF DUAL STAGE AIR STRIPPERS ARE USED AS THE TREATMENT TECHNOLOGY, VAPOR PHASE GAC ADSORPTION UNITS WILL BE INSTALLED TO REMOVE 90 - 99% OF THE VOCS DISCHARGED TO THE AIR. AIR EMISSION CONTROLS WOULD MINIMIZE THE NEGATIVE IMPACT ON PUBLIC HEALTH AND THE ENVIRONMENT. (SEE SECTION 9, COMPLIANCE WITH ARARS, COMMUNITY ACCEPTANCE AND STATE ACCEPTANCE, FOR MORE DETAILED

# Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

SUPPORT DOCUMENTATION.)

IT HAS BEEN DETERMINED THAT PURE PRODUCT IN THE FORM OF TCE AND PCE (U210 AND U228) ARE CONTAINED IN THE GROUNDWATER MAKING RCRA SECTION 261.33 APPLICABLE FOR THIS ACTION. THE GROUNDWATER ALSO CONTAINS SPENT TCE AND PCE THAT WAS USED IN DEGREASING. THE LISTING IN 40 CFR SUBPART D SECTION 261.31 THAT PERTAINS TO SPENT HALOGENATED SOLVENTS USED IN DEGREASING IS F001. THIS LISTING REQUIRES KNOWLEDGE OF THE PERCENT SOLVENT BY VOLUME BEFORE USE. THIS INFORMATION IS UNAVAILABLE FOR THE BURBANK OU MAKING THE RCRA F001 LISTING NOT APPLICABLE BUT RELEVANT AND APPROPRIATE FOR THIS ACTION.

IN ALTERNATIVES 2-6, THE SPENT CARBON IS CONSIDERED A RCRA WASTE OR IT IS A MIXTURE OF THE SOLID WASTE CARBON AND THE RCRA LISTED WASTES F001, U210, AND U228 (40 CFR SECTION 261.3(A)(2)(IV)). THEREFORE THE CARBON MUST SATISFY THE REQUIREMENTS OF 40 CFR PART 263 TO BE SHIPPED OFF SITE FOR REGENERATION.

THE FEDERAL AND STATE MCLS ARE RELEVANT AND APPROPRIATE IN THE AQUIFER. MOREOVER, THE MCLS ARE THE ARARS THAT WILL BE MET IN THE TREATED WATER. THIS WATER WILL BE EITHER REINJECTED, SPREAD, OR REUSED AS A DRINKING WATER SOURCE.

ALTERNATIVE 2 - EXTRACT FROM EXISTING WELLS, TREAT, REINJECT AND REUSE

THIS ALTERNATIVE INCLUDES PUMPING 16,000 GPM OF WATER FROM EIGHT BURBANK PSD WELLS (LOCATED WEST OF THE HIGHEST KNOWN TCE AND PCE CONTAMINATION) TO AN EXISTING EQUALIZATION BASIN, WHICH WOULD BE RETROFITTED, TO PROVIDE A UNIFORM FEED TO THE TREATMENT FACILITY. THE WATER WOULD BE TREATED BY EIGHT SETS OF DUAL STAGE AIR STRIPPERS (AS) WITH VAPOR PHASE GAC ADSORPTION UNITS FOR THE OFF-GAS.

TREATMENT EFFICIENCY COULD PRODUCE EFFLUENT WATER OF A QUALITY THAT MEETS OR EXCEEDS ALL FEDERAL AND STATE APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS (ARARS). FOUR THOUSAND GALLONS PER MINUTE (4000 GPM) OF THE TREATED WATER WOULD BE INTRODUCED INTO BURBANK'S EXISTING DISTRIBUTION SYSTEM FOR REUSE. THE REMAINDER OF THE TREATED WATER WOULD BE INJECTED INTO THE AQUIFER DOWNGRADIENT OF THE VOC PLUME TO REDUCE VOC MOVEMENT. THE REINJECTION WOULD HELP ENHANCE PLUME CONTAINMENT AND AQUIFER RESTORATION. THE TREATED WATER WOULD BE DELIVERED TO THE INJECTION FIELD BY A NEW PIPELINE TO BE CONSTRUCTED ALONG VICTORY BOULEVARD.

AFTER 20 YEARS OF EXTRACTION, CONCENTRATIONS OF TCE AND PCE IN THE GROUNDWATER WOULD STILL EXCEED MCLS. SINCE THE PLUME MIGRATION WOULD BE DIVERTED FROM ITS CURRENT PATH TOWARDS BURBANK'S PRODUCTION WELLS, THE PSD WELLS COULD PRODUCE GROUNDWATER WITH HIGHER CONCENTRATIONS OF PCE AND TCE.

THIS ALTERNATIVE WOULD BE EXPECTED TO REDUCE TCE CONCENTRATIONS IN THE AQUIFER FROM 3,200 PPB TO 590 PPB IN 20 YEARS. THIS ALTERNATIVE WOULD PARTIALLY ARREST THE MIGRATION OF THE TCE AND PCE PLUMES.

SIX MONITORING WELLS WOULD BE INSTALLED TO MONITOR THE PERFORMANCE OF THE SYSTEM.

SINCE THE GROUNDWATER HAS BEEN DETERMINED TO CONTAIN RCRA LISTED WASTES, IT MUST SATISFY THE REQUIREMENTS OF RCRA LAND DISPOSAL RESTRICTIONS (LDR), 40 CFR SECTION 268. THE LDR DEFINES THE REQUIREMENTS FOR REINJECTION OR LAND DISPOSAL. THEREFORE, THE WATER MUST BE TREATED TO MEET THE BEST DEMONSTRATED AVAILABLE TREATMENT TECHNOLOGY (BDAT) STANDARDS FOR SPENT PCE AND TCE WHICH ARE NEEDED FROM THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD - LOS ANGELES REGION.

APPROVAL FOR REUSE WOULD BE REQUIRED BY CALIFORNIA DEPARTMENT OF HEALTH SERVICES (DHS) AND THE CITY OF BURBANK. EPA, DHS, AND THE CITY HAVE ALREADY BEGUN DISCUSSIONS OVER THE POSSIBILITY OF THE CITY'S REUSE OF THE WATER.

THERE ARE SOME TECHNICAL CONCERNS OVER THE OPERATION OF INJECTION WELLS DUE TO THE UNCERTAINTIES OF THE CONTAMINATION PLUMES AND OPERATIONAL EFFECTIVENESS OF INJECTION WELLS.

ALTERNATIVE 3 - EXTRACT FROM NEW WELLS, TREAT, REINJECT AND REUSE

THIS ALTERNATIVE IS SIMILAR TO ALTERNATIVE 2 EXCEPT THAT TEN NEW EXTRACTION WELLS WOULD BE CONSTRUCTED TO EXTRACT THE 16,000 GPM OF CONTAMINATED GROUNDWATER. ALTHOUGH THE COST OF

4483-9099

INSTALLING EXTRACTION WELLS WOULD BE GREATER THAN PUMPING THE EXISTING WELLS, THE NEW WELLS WOULD BE OPTIMALLY LOCATED TO MAXIMIZE THE REMOVAL OF CONTAMINANTS FROM THE GROUNDWATER. THE TREATMENT, DISPOSAL, AND MONITORING TECHNOLOGIES WOULD BE THE SAME AS THOSE EMPLOYED IN ALTERNATIVE 2.

THIS ALTERNATIVE IS ESTIMATED TO REDUCE TCE CONCENTRATIONS FROM 3200 PPB TO 81 PPB IN THE FIRST 10 YEARS, AND MORE THEREAFTER. IT IS ESTIMATED IT WOULD REDUCE PCE CONCENTRATIONS FROM OVER 4000 PPB TO 30 PPB IN 20 YEARS. ALTERNATIVE 3 WOULD BE SUCCESSFUL IN HALTING PLUME MIGRATION AND IN MITIGATING THE VOC CONTAMINATION (CONTRIBUTING TO AQUIFER RESTORATION).

SINCE THE GROUNDWATER HAS BEEN DETERMINED TO CONTAIN RCRA LISTED WASTES, IT MUST SATISFY THE REQUIREMENTS OF RCRA LAND DISPOSAL RESTRICTIONS (LDR), 40 CFR SECTION 268. THE LDR DEFINES THE REQUIREMENTS FOR REINJECTION OR LAND DISPOSAL. THEREFORE, THE WATER MUST BE TREATED TO MEET THE BEST DEMONSTRATED AVAILABLE TREATMENT TECHNOLOGY (BDAT) STANDARDS FOR SPENT PCE AND TCE WHICH ARE .079 PPM PCE AND .062 PPM TCE (40 CFR PART 268.42). APPROVAL FOR REINJECTION WOULD ALSO BE NEEDED FROM THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD - LOS ANGELES REGION.

APPROVAL FOR REUSE WOULD BE REQUIRED BY CALIFORNIA DEPARTMENT OF HEALTH SERVICES (DHS) AND THE CITY OF BURBANK. EPA, DHS, AND THE CITY HAVE ALREADY BEGUN DISCUSSIONS OVER THE POSSIBILITY OF THE CITY'S REUSE OF THE WATER.

THERE WOULD BE SIGNIFICANT GAINS IN AQUIFER RESTORATION AND CONTROL OF THE PLUME MIGRATION WITH THIS ALTERNATIVE.

ALTERNATIVE 4 - EXTRACT FROM NEW AND EXISTING WELLS/TREAT/SPREAD AND REUSE.

THE MAJOR FEATURES OF THIS ALTERNATIVE INCLUDE EXTRACTION OF 16,000 GPM FROM 10 NEW WELLS AND 6,000 GPM FROM 5 EXISTING WELLS, TREATMENT WITH EITHER DUAL STAGE OR SINGLE STAGE AS WITH VAPOR PHASE GAC, REUSE OF 4000 GPM BY THE CITY OF BURBANK AND DISCHARGE OF 18,000 GPM TO SPREADING GROUNDS FOR RECHARGE. SIX MONITORING WELLS WOULD BE INSTALLED TO ASSESS THE EFFECTIVENESS OF THE SYSTEM.

ALTERNATIVE 4 WAS DEVELOPED TO COMPARE THE OPTION OF GROUNDWATER RECHARGE BY SPREADING WITH GROUNDWATER RECHARGE BY INJECTION. THIS COMPARISON ADDRESSES UNCERTAINTIES ASSOCIATED WITH THE CAPACITY, OPERATION AND MAINTENANCE OF INJECTION WELLS USED IN ALTERNATIVES 2 AND 3, AND THE OVERALL UNCERTAINTIES ASSOCIATED WITH THE CHARACTERIZATION OF PLUME CONTAMINATION.

BECAUSE THE TREATED WATER WOULD NOT BE REINJECTED INTO THE AQUIFER DOWNGRADIENT OF THE VOC PLUME AS IN ALTERNATIVES 2 AND 3, THE EXTRACTION RATE OF CONTAMINATED GROUNDWATER WOULD HAVE TO BE HIGHER TO ACHIEVE A SIMILAR GRADIENT REVERSAL. IN THIS ALTERNATIVE, THE WATER FROM TEN NEW EXTRACTION WELLS AND FIVE EXISTING BURBANK PSD WELLS WOULD BE PUMPED TO AN EXISTING EQUALIZATION BASIN, WHICH WOULD BE RETROFITTED, TO DELIVER TWO TREATMENT STREAMS TO THE TREATMENT FACILITY. THE WATER WOULD BE TREATED BY SIX SETS OF DUAL STAGE CARBON AIR FILTERING UNITS AND FIVE SINGLE-STAGE AIR STRIPPERS WITH CARBON AIR FILTERING UNITS, DEPENDING ON THE AMOUNT OF WATER FLOWING INTO THE SYSTEM. EACH TREATMENT MODULE WOULD BE DESIGNED TO TREAT THE WATER AND AIR TO MEET THE ARARS AND TBGS (SEE SECTION 9, COMPLIANCE WITH ARARS).

SINCE THE GROUNDWATER HAS BEEN DETERMINED TO CONTAIN THE RCRA LISTED WASTES F001, U210 AND U228, IT MUST BE TREATED TO "NO LONGER CONTAIN" THESE LISTED WASTES BEFORE BEING SPREAD FOR RECHARGE. (SEE MEMORANDUM FROM MARCIA E. WILLIAMS, OFFICE OF SOLID WASTE DIRECTOR, TO PATRICK TOBIN, WASTE MANAGEMENT DIVISION DIRECTOR, REGARDING RCRA REGULATORY STATUS OF CONTAMINATED GROUND WATER, NOVEMBER 13, 1986.)

APPROVAL FOR REUSE WOULD BE REQUIRED BY CALIFORNIA DEPARTMENT OF HEALTH SERVICES (DHS) AND THE CITY OF BURBANK. EPA, DHS, AND THE CITY HAVE ALREADY BEGUN DISCUSSIONS OVER THE POSSIBILITY OF THE CITY'S REUSE OF THE WATER.

THIS ALTERNATIVE IS ESTIMATED TO REDUCE TCE CONCENTRATIONS FROM 3,200 PPB TO 122 PPB IN 10 YEARS AND MORE THEREAFTER. PCE CONCENTRATIONS ARE ESTIMATED TO REDUCE FROM OVER 4000 PPB TO 39 PPB IN 20 YEARS. THERE WOULD BE SIGNIFICANT GAINS IN AQUIFER RESTORATION AND CONTROL OF THE PLUME MIGRATION WITH THIS ALTERNATIVE.

THE CUEFS REPORT DETERMINED THAT SPREADING BASINS MAY BE MORE RELIABLE THAN INJECTION WELLS.

## Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ALTERNATIVE 5 - EXTRACT FROM NEW AND EXISTING WELLS/TREAT/REUSE

THIS ALTERNATIVE USES THE SAME EXTRACTION, TREATMENT, AND MONITORING TECHNOLOGIES AS THOSE SPECIFIED IN ALTERNATIVE 4. THIS ALTERNATIVE IS UNIQUE IN THAT ALL OF THE TREATED WATER WOULD BE USED FOR POTABLE WATER SUPPLY. THE TREATED WATER WOULD BE AT OR BELOW THE FEDERAL AND STATE MCLs AND SALS (ARARS).

A PORTION OF THE TREATED WATER WOULD BE INTRODUCED INTO THE BURBANK PSD'S EXISTING DISTRIBUTION SYSTEM FOR REUSE, WHICH WOULD MEET THE CITY OF BURBANK'S CURRENT AVERAGE DAILY DEMAND (12,000 GPM). THE REMAINDER OF THE TREATED WATER (10,000 GPM) COULD BE INTRODUCED INTO THE METROPOLITAN WATER DISTRICT (MWD) DISTRIBUTION LINES.

UNDER THIS ARRANGEMENT, THE PARTIES INVOLVED WOULD HAVE TO ENTER INTO AGREEMENTS FOR THIS EXCHANGE BECAUSE THE SAN FERNANDO VALLEY GROUNDWATER BASIN IS AN ADJUDICATED BASIN AND THE NET EXTRACTION OF GROUNDWATER IN THIS ALTERNATIVE WOULD EXCEED THE BURBANK PSD'S PUMPING RIGHTS. ALSO, MWD DOES NOT HAVE ANY PUMPING RIGHTS. HOWEVER, INSTITUTIONAL ARRANGEMENTS COULD BE WORKED OUT BETWEEN THE LADWP AND THE OTHER PARTIES, SINCE LADWP DOES HAVE PUMPING RIGHTS. PRELIMINARY DISCUSSIONS WITH THE CITY OF BURBANK AND LADWP HAVE BEEN INITIATED AND THE PARTIES ARE IN AGREEMENT THAT ADMINISTRATIVE AGREEMENTS COULD BE ARRANGED (FOR THE REUSE OF 12,000 GPM).

ALTERNATIVE 5 COULD BE IMPLEMENTED IN TWO PHASES. PHASE 1 WOULD CONSIST OF EXTRACTING 12,000 GPM FROM NEW WELLS, TREATING WITH DUAL STAGE AS WITH VAPOR PHASE GAC, AND REUSING THE TREATED WATER BY THE CITY OF BURBANK. PHASE 2 COULD CONSIST OF EXTRACTING THE REMAINDER 10,000 GPM (TOTAL 22,000 GPM) FROM NEW AND EXISTING WELLS, TREATING WITH AS WITH VAPOR PHASE GAC ADSORPTION UNITS AND REUSING BY MWD CUSTOMERS.

IT IS ESTIMATED THAT PHASE 1 WOULD CONTROL MOST OF THE PLUME MIGRATION (100 UG/L TCE PLUME BOUNDARY AND 5 UG/L PCE PLUME BOUNDARY) WHILE AIDING WITH AQUIFER RESTORATION AND THE TOTAL PROJECT (PHASE 1 AND PHASE 2) WOULD REDUCE CONCENTRATIONS TO THE SAME LEVELS AS ALTERNATIVE 4.

DUE TO THE LARGE SIZE OF THE TOTAL PROJECT, AND THE UNCERTAINTIES ASSOCIATED WITH THE MODELING AND EXTENT OF CONTAMINATION, EPA BELIEVED IT WAS IMPORTANT TO LOOK AT PHASING ALTERNATIVE 5; THEREBY, INITIATING THE NECESSARY REMEDIATION, WHILE CONDUCTING FURTHER EVALUATIONS TO REFINE TECHNICAL FEATURES IN ORDER TO MAXIMIZE THE EFFECTIVENESS OF THE TOTAL PROJECT.

ALTERNATIVE 6 - EXTRACT FROM EXISTING WELLS/TREAT/REUSE

THE TECHNICAL FEATURES OF THIS ALTERNATIVE INCLUDE EXTRACTING 4000 GPM FROM TWO EXISTING BURBANK PSD WELLS, TREATING THE WATER WITH DUAL STAGE AS WITH VAPOR PHASE GAC ADSORPTION UNITS, AND REUSING THE TREATED WATER BY THE CITY OF BURBANK.

THIS ALTERNATIVE WOULD NOT RESTRICT THE PLUME'S MIGRATION, NOR WOULD IT SIGNIFICANTLY AID IN AQUIFER RESTORATION.

**#SCAA****9.0 SUMMARY OF COMPARATIVE ANALYSIS OF ALTERNATIVES**

THIS SECTION PROVIDES A SUMMARY OF THE ADVANTAGES AND DISADVANTAGES OF EACH OF THE ALTERNATIVES' PERFORMANCE UNDER THE NINE EVALUATION CRITERIA.

TABLE 3 PROVIDES A SUMMARY OF THE ANALYSES OF ALTERNATIVES. THE ALTERNATIVES WERE EVALUATED BASED ON THE FOLLOWING CRITERIA FOR CONDUCTING FEASIBILITY STUDIES:

- (1) OVERALL PROTECTION OF HUMAN HEALTH AND THE ENVIRONMENT,
- (2) SHORT TERM EFFECTIVENESS IN PROTECTING HUMAN HEALTH AND THE ENVIRONMENT,
- (3) LONG-TERM EFFECTIVENESS AND PERMANENCE IN PROTECTING HUMAN HEALTH AND THE ENVIRONMENT,
- (4) COMPLIANCE WITH ARARS,
- (5) REDUCTION OF TOXICITY, MOBILITY, AND VOLUME OF CONTAMINANTS,
- (6) TECHNICAL AND ADMINISTRATIVE FEASIBILITY OF IMPLEMENTATION,
- (7) STATE ACCEPTANCE,
- (8) COMMUNITY ACCEPTANCE, AND
- (9) CAPITAL AND OPERATION AND MAINTENANCE COSTS.

4483-9099

THE NINE CRITERIA AND THE RELATIVE PERFORMANCE OF THE ALTERNATIVES IN RELATION TO EACH CRITERION AND EACH OTHER IS SUMMARIZED BELOW.

OVERALL PROTECTION OF HUMAN HEALTH AND THE ENVIRONMENT

ALTERNATIVES 3, 4, AND 5 PROVIDE THE BEST PROTECTION TO HUMAN HEALTH AND THE ENVIRONMENT. ENVIRONMENTAL DEGRADATION WOULD BE REDUCED SINCE THE PLUME OF GROUNDWATER CONTAMINATION WOULD BE REDUCED IN CONCENTRATION AND EXTENT. INSTITUTIONAL CONTROLS WOULD CONTROL THE RISK OF INGESTION OF CONTAMINATED GROUNDWATER, SINCE ONLY TREATED WATER WOULD BE SERVED. DRINKING WATER WOULD BE PROVIDED VIA SURFACE WATER FROM THE MWD AND/OR TREATED GROUNDWATER FROM THE STRIPPING UNITS.

ALTERNATIVES 1, 2 AND 6 ARE NOT AS PROTECTIVE OF THE ENVIRONMENT BECAUSE ENVIRONMENTAL DEGRADATION WOULD INCREASE OVER TIME. ALTERNATIVE 1, THE NO ACTION ALTERNATIVE, WOULD ALLOW THE CONTAMINATION TO CONTINUE SPREADING. ALTHOUGH ALTERNATIVES 2 AND 6 EXTRACT AND TREAT SOME OF THE CONTAMINATED GROUNDWATER, THE EXTRACTION WELLS WOULD NOT BE STRATEGICALLY LOCATED TO CAPTURE THE HIGHER GROUNDWATER CONTAMINANT CONCENTRATIONS. INSTITUTIONAL CONTROLS IN ALTERNATIVES 1, 2, AND 6 FOR THE PROTECTION OF DRINKING WATER WOULD BE THE SAME AS IN ALTERNATIVES 3, 4, AND 5.

COMPLIANCE WITH ARARS

THIS SECTION WILL OUTLINE THE APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS (ARARS) AND OTHER INFORMATION THAT EPA CONSIDERED FOR THIS SITE. THEN IT WILL COMPARE THE ALTERNATIVES WITH ONE ANOTHER REGARDING THESE ARARS AND TO BE CONSIDEREDS (TBCS).

THERE ARE ARARS AND TBCS THAT APPLY TO BOTH THE WATER AND AIR FOR THIS RESPONSE ACTION. THESE CAN BE SEPARATED INTO CHEMICAL SPECIFIC AND PRIMARY ACTION SPECIFIC ARARS AND TBCS.

WATER ARARS AND TBCS: THERE ARE CHEMICAL SPECIFIC ARARS AND TBCS FOR WATER WHICH WILL BE DESCRIBED HERE. FIRST, THE ARARS FOR THE WATER ARE THE SAFE DRINKING WATER ACT MAXIMUM CONTAMINANT LEVELS (MCLs). IN ACCORDANCE WITH THE EPA "INTERIM GUIDANCE ON COMPLIANCE WITH APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS (OSWER DIRECTIVE 9234.0-05)," THE MCLs ARE CONSIDERED THE CHEMICAL-SPECIFIC ARARS BECAUSE THEY ARE THE ENFORCEABLE DRINKING WATER STANDARDS. THEY ARE REQUIRED TO BE SET AS CLOSE TO THE MAXIMUM CONTAMINANT LEVEL GOALS (MCLGS) AS IS FEASIBLE, TAKING INTO CONSIDERATION THE BEST AVAILABLE TECHNOLOGY, TREATMENT TECHNIQUES AND OTHER FACTORS (INCLUDING COST). THEY ARE ALSO PROTECTIVE OF PUBLIC HEALTH TO WITHIN EPA'S ACCEPTABLE CARCINOGEN RISK RANGE OF 10<sup>-4</sup> TO 10<sup>-7</sup>. THE MCL OF PARTICULAR IMPORTANCE FOR THIS RESPONSE ACTION IS THE MCL OF 5 PPB FOR TCE.

MCLGS, WHICH ARE BASED ONLY UPON HEALTH CRITERIA, ARE NOT DIRECTLY APPLICABLE AS CHEMICAL-SPECIFIC REQUIREMENTS BECAUSE THEY ARE NOT ENFORCEABLE STANDARDS.

EPA ALSO CONSIDERED THE CALIFORNIA DHS'S ACTION LEVELS FOR VOCS, A FEW OF WHICH ARE MORE STRINGENT THAN THE MCLs OR FOR WHICH NO MCL HAS BEEN ESTABLISHED. WHILE THE DHS ACTION LEVELS ARE NOT PROMULGATED STANDARDS AND ARE NOT, THEREFORE, ARARS, THEY HAVE BEEN TAKEN INTO CONSIDERATION DURING DEVELOPMENT OF REMEDIAL ACTION ALTERNATIVES AS ALLOWED FOR IN THE NATIONAL CONTINGENCY PLAN (NCP). IN ADDITION, DHS HAS RECENTLY PROPOSED MCLs FOR A NUMBER OF VOCS. OF PARTICULAR SIGNIFICANCE, THE PROPOSED MCL FOR PCE IS 5 PPB, WHICH IS JUST SLIGHTLY HIGHER THAN THE CURRENT DHS ACTION LEVEL OF 4 PPB.

TABLE 4 LISTS THE FEDERAL MCLs, MCLGS AND SALS FOR THE PRIMARY CONTAMINANTS DETECTED IN THE BURBANK OPERABLE UNIT AREA. THE REMEDIAL ACTION SELECTED WILL MEET THE FEDERAL MCL FOR TCE (LESS THAN 5 PPB) AND THE SAL FOR PCE (LESS THAN 4 PPB).

IT HAS BEEN DETERMINED THAT PURE PRODUCT IN THE FORM OF TCE AND PCE (U210 AND U228) ARE CONTAINED IN THE GROUNDWATER MAKING RCRA SECTION 261.33 APPLICABLE FOR THIS ACTION. THE GROUNDWATER ALSO CONTAINS SPENT TCE AND PCE THAT WAS USED IN DEGREASING. THE LISTING IN 40 CFR SUBPART D SECTION 261.31 THAT PERTAINS TO SPENT HALOGENATED SOLVENTS USED IN DEGREASING IS F001. THIS LISTING REQUIRES KNOWLEDGE OF THE PERCENT SOLVENT BY VOLUME BEFORE USE. THIS INFORMATION IS UNAVAILABLE FOR THE BURBANK OU MAKING THE RCRA F001 LISTING NOT APPLICABLE BUT RELEVANT AND APPROPRIATE FOR THIS ACTION.

AIR ARARS AND TBCS: THERE ARE PRIMARY ACTION-SPECIFIC ARARS AND TBCS FOR THE AIR DISCHARGE WHICH WILL AFFECT THIS RESPONSE ACTION. IN CALIFORNIA, THE AUTHORITY TO REGULATE STATIONARY

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

SOURCES OF EMISSIONS HAS BEEN DELEGATED TO LOCAL AIR QUALITY MANAGEMENT DISTRICTS. THE BURBANK OU IS LOCATED IN THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (SCAQMD). THEREFORE, SCAQMD REGULATIONS CONSTITUTE GENERALLY APPLICABLE, PROMULGATED STATE REQUIREMENTS UNDER STATE ENVIRONMENTAL LAW, AS SET FORTH IN SECTION 121(D) OF THE SUPERFUND AMENDMENTS AND REAUTHORIZATION ACT OF 1986 (SARA).

FPA CONSIDERED SCAQMD REGULATION XIII (COMPRISING RULES 1300 TO 1313), WHICH REQUIRES THAT STATIONARY SOURCES OF AIR EMISSIONS MEET BEST AVAILABLE CONTROL TECHNOLOGY (BACT) STANDARDS. REGULATION 13 STATES THAT NEW STATIONARY SOURCES OF AIR CONTAMINANTS IN THE AIR BASIN THAT EMIT REACTIVE ORGANIC GASES MUST EMPLOY BACT AIR POLLUTION CONTROL DEVICES. THESE BACT DEVICES ARE DEFINED AS "THE MOST STRINGENT EMISSION...CONTROL TECHNIQUE WHICH... IS FOUND... TO BE TECHNOLOGICALLY FEASIBLE AND COST EFFECTIVE..." (SEE THE ADMINISTRATIVE RECORD FOR THE BURBANK OU FOR A COPY OF REGULATION XIII.) IT IS ESTIMATED THAT, IF THERE ARE NO EMISSIONS CONTROLS, THE AIR STRIPPERS CONTEMPLATED FOR THE BURBANK OU WOULD EMIT OVER 168 POUNDS PER DAY OF REACTIVE ORGANIC GASES TO THE ATMOSPHERE. FOR AIR STRIPPERS, SCAQMD CONSIDERS VAPOR PHASE GAC (WITH 90 TO 99% REMOVAL EFFICIENCY) DEVICES TO BE BACT.

FPA ALSO CONSIDERED SCAQMD RULES 1401 AND 1167 AS "OTHER INFORMATION TO BE CONSIDERED," PURSUANT TO THE NCP.

PROPOSED RULE 1401 - NEW SOURCE REVIEW OF CARCINOGENIC AIR CONTAMINANTS - SPECIFIES LIMITS FOR INDIVIDUAL CANCER RISK AND EXCESS CANCER CASES FROM NEW STATIONARY SOURCES WHICH EMIT CARCINOGENIC AIR CONTAMINANTS. THE RULE REQUIRES BACT FOR TOXIC AIR DISCHARGE FOR NEW STATIONARY SOURCES WHERE A LIFETIME MAXIMUM INDIVIDUAL CANCER RISK OF ONE IN ONE MILLION OR GREATER IS ESTIMATED TO OCCUR. TCE IS A LISTED CARCINOGENIC AIR CONTAMINANT. RESULTS FROM THE PUBLIC HEALTH ASSESSMENT SHOW THAT TCE EMISSIONS AFTER TREATMENT ON THE VAPOR PHASE WOULD MEET RULE 1401'S REQUIREMENTS.

RULE 1167'S PURPOSE IS TO CONTROL VOCs AS PRECURSOR EMISSIONS TO OZONE FORMATION IN THE SOUTH COAST AIR BASIN. THE SOUTH COAST AIR BASIN IS CURRENTLY IN NON-ATTAINMENT STATUS WITH RESPECT TO THE NATIONAL AMBIENT AIR QUALITY STANDARDS (NAAQS) FOR OZONE, AND VOCs ARE KNOWN PRECURSORS TO OZONE FORMATION. RULE 1167 IS DESIGNED TO REDUCE VOC EMISSIONS FROM NEW AND EXISTING AIR STRIPPING EQUIPMENT USED FOR TREATMENT OF CONTAMINATED WATER. THE RULE REQUIRES THAT ALL AIR STRIPPING FACILITIES TREATING CONTAMINATED GROUNDWATER THAT EMIT MORE THAN ONE POUND PER DAY OF TOTAL VOC EMISSIONS INSTALL AIR EMISSION CONTROLS CAPABLE OF REDUCING AIR EMISSIONS BY 90%.

ALTHOUGH RULE 1167 WAS STAYED BY THE CALIFORNIA SUPERIOR COURT UNTIL AN ENVIRONMENTAL IMPACT REPORT IS COMPLETED, IT IS CONSIDERED IN THE REMEDY SELECTION PROCESS AS A TBC SINCE SCAQMD FULLY INTENDS TO MEET THE REQUIREMENTS SET BY THE COURT JUDGMENT AND PROCEED TOWARD ADOPTION OF THIS RULE AS A PROMULGATED, LEGALLY ENFORCEABLE, GENERALLY APPLICABLE REQUIREMENT IN THE NEAR FUTURE.

INSTALLATION OF AN AIR STRIPPING SYSTEM WITH AIR EMISSION CONTROLS IS MORE PROTECTIVE OF THE ENVIRONMENT IN THAT IT WILL REDUCE OZONE PRECURSOR EMISSIONS TO THE ATMOSPHERE BY 90 TO 99% AND WILL SUPPORT EFFORTS BY SCAQMD TO REACH ATTAINMENT STATUS FOR OZONE IN THE SOUTH COAST AIR BASIN.

COMPARISON OF ALTERNATIVES: ALTERNATIVE 1, THE NO ACTION ALTERNATIVE, WOULD MEET THE DRINKING WATER ARARS BECAUSE INSTITUTIONAL CONTROLS WOULD CONTINUE TO ASSURE THAT THE PUBLIC WAS PROVIDED WITH DRINKING WATER THAT MEETS THE FEDERAL AND STATE MCLS AND SALS. ALSO SINCE NO SYSTEM WOULD BE IN PLACE, THE SCAQMD'S RULES WOULD NOT BE VIOLATED. WATER TREATED AND DISCHARGED FROM ALTERNATIVES 2 - 6 WOULD MEET THE FEDERAL AND STATE MCLS AND SALS BEFORE REUSE, INJECTION OR SPREADING. AIR STRIPPING SYSTEMS WOULD HAVE VAPOR PHASE GAC ADSORPTION UNITS TO CONTROL AIR EMISSIONS TO 90 - 99% REMOVAL EFFICIENCY TO MEET THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT'S RULES. STEAM STRIPPING WOULD RECOVER THE VOCs FOR RECYCLING SO NO AIR EMISSION CONTROL SYSTEM WOULD BE NECESSARY.

HOWEVER, ALTERNATIVES 1, 2, AND 6 DO NOT DO AS MUCH AS ALTERNATIVES 3, 4, AND 5 TO MEET FEDERAL AND STATE MCLS IN THE AQUIFER. ALTERNATIVES 3, 4, AND 5 MORE EFFECTIVELY AID IN RESTORING THE AQUIFER (TO VOC CONCENTRATIONS AT OR BELOW THE MCLS AND SALS) AND CONTROLLING THE PLUME MIGRATION.

BY MEETING THE FEDERAL AND STATE MCLS AND SALS BEFORE REINJECTION, ALTERNATIVES 2 AND 3 WILL

4483-9099

SATISFY THE RCRA LAND DISPOSAL RESTRICTIONS REQUIREMENTS. BY MEETING THE FEDERAL MCLS AND SALS, THE GROUNDWATER WILL NO LONGER CONTAIN THE LISTED WASTES WHEN IT IS SPREAD FOR RECHARGE IN ALTERNATIVE 4.

FOR ALTERNATIVES 1 - 6, THE MCLS ARE RELEVANT AND APPROPRIATE IN THE AQUIFER. UPON COMPLETION OF THE FINAL REMEDIAL ACTION FOR THE SITE, THIS ARAR WILL BE SATISFIED.

LONG-TERM EFFECTIVENESS AND PERMANENCE

ALTERNATIVES 3, 4, AND 5 WOULD HAVE THE GREATEST ABILITY TO MAINTAIN RELIABLE PROTECTION OF HUMAN HEALTH AND THE ENVIRONMENT OVER TIME. AFTER 20 YEARS OF EXTRACTION, CONCENTRATIONS OF TCE AND PCE IN THE GROUNDWATER ARE EXPECTED TO STILL EXCEED THE FEDERAL MCLS AND SALS, HOWEVER THEY WOULD BE GREATLY REDUCED AS DISCUSSED IN THE PREVIOUS SECTION. PLUME MIGRATION WOULD BE CONTROLLED AND AQUIFER RESTORATION WOULD CONTINUE AS LONG AS THE SYSTEM KEPT OPERATING.

ALTERNATIVES 1, 2, AND 6 DO NOT OFFER LONG TERM EFFECTIVENESS OR PERMANENCE. IN FACT, THESE ALTERNATIVES MIGHT ALLOW CONTAMINATION TO SPREAD TO CLEAN ZONES WITHIN THE SFVB.

ALTERNATIVE 1 RELIES SOLELY ON INSTITUTIONAL CONTROLS TO PREVENT EXPOSURE TO THE CONTAMINATED GROUNDWATER. THE CURRENT WATER SUPPLY FROM SURFACE WATER VIA THE MWD MAY NOT ALWAYS BE AVAILABLE IN THE FUTURE BECAUSE OF PERIODIC DROUGHT CONDITIONS AND STATE AND FEDERAL WATER RIGHTS ISSUES.

REDUCTION OF TOXICITY, MOBILITY, OR VOLUME

ALTERNATIVES 3, 4 AND 5 OFFER THE MOST REDUCTION OF TOXICITY, MOBILITY, AND/OR VOLUME OF THE CONTAMINATION. THE MOST CONTAMINATED GROUNDWATER IN THE BURBANK OU AREA WOULD BE EXTRACTED AND TREATED TO REMOVE THE VOCs FROM THE GROUNDWATER, THUS THE VOC CONTAMINATION IN THE GROUNDWATER WOULD BE GREATLY REDUCED IN TOXICITY, VOLUME AND MOBILITY. MOREOVER, THE AIR EMISSION CONTROL UNITS WOULD REDUCE THE MOBILITY OF THE VOCs TO THE AIR.

ALTERNATIVE 1 WOULD HAVE NO REDUCTION IN TOXICITY, MOBILITY, OR VOLUME SINCE NO TREATMENT IS EMPLOYED.

ALTERNATIVE 2 WOULD REDUCE THE VOLUME OF CONTAMINATION BY EXTRACTING AND TREATING 16,000 GPM. ALTERNATIVE 6 WOULD REDUCE THE VOLUME OF CONTAMINATION BY EXTRACTING AND TREATING 4000 GPM. HOWEVER, THE EXISTING WELLS USED FOR ALTERNATIVES 2 AND 6 WOULD NOT BE STRATEGICALLY LOCATED TO CONTROL MIGRATION OR CAPTURE THE CONTAMINATION. THEREFORE, CONTINUED CONTAMINANT MIGRATION WOULD OCCUR AND A LESSER AMOUNT OF CONTAMINATION WOULD BE CAPTURED THEN FOR ALTERNATIVES 3, 4, AND 5.

SHORT TERM EFFECTIVENESS

FOR ALTERNATIVES 3, 4, AND 5, NO ADVERSE IMPACTS WOULD BE EXPECTED DURING THE CONSTRUCTION AND IMPLEMENTATION PERIOD OR REMEDIATION. DRINKING WATER SUPPLIES WOULD BE PROVIDED FROM TREATED GROUNDWATER AND/OR SURFACE WATER FROM THE MWD DURING THE INTERIM BEFORE CONSTRUCTION COMPLETE AND DURING REMEDIATION. INSTITUTIONAL CONTROLS WOULD ASSURE THAT ALL DRINKING WATER WOULD MEET DRINKING WATER STANDARDS. THE PLUME MIGRATION WOULD BE EFFECTIVELY CONTROLLED WITH THESE ALTERNATIVES AND AQUIFER RESTORATION WOULD BE INITIATED IN THIS AREA.

ALTERNATIVE 1, THE NO ACTION ALTERNATIVE, WOULD NOT BE EFFECTIVE IN CONTROLLING MIGRATION OR AQUIFER RESTORATION. IT WOULD ALLOW THE CONTAMINATED GROUNDWATER TO SPREAD TO UNCONTAMINATED DOWNGRADE WELLS. THERE WOULD BE SOLE RELIANCE ON INSTITUTIONAL CONTROLS TO PREVENT EXPOSURE VIA DRINKING WATER INGESTION.

ALTERNATIVE 2 AND 6 WOULD BE MORE EFFECTIVE THAN ALTERNATIVE 1. THERE WOULD BE LESS RELIANCE ON INSTITUTIONAL CONTROLS FOR DRINKING WATER, SINCE TREATED GROUNDWATER THAT MEETS MCLS AND SALS WOULD BE SERVED, AS A PORTION OF THE TOTAL DRINKING WATER SUPPLY FOR THE AFFECTED AREAS. HOWEVER, THESE ALTERNATIVES WOULD NOT BE AS EFFECTIVE IN CONTROLLING PLUME MIGRATION AND IN AQUIFER RESTORATION AS ALTERNATIVES 3, 4, AND 5.

IMPLEMENTABILITY

## Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ALTERNATIVES 1 - 6 WOULD ALL BE TECHNICALLY IMPLEMENTABLE. HOWEVER, ALTERNATIVE 5 APPEARS THE EASIEST TO IMPLEMENT WITH THE CURRENT INFORMATION, DUE TO THE PRACTICAL UNCERTAINTIES ASSOCIATED WITH INJECTION AND SPREADING AND THE TECHNICAL UNCERTAINTIES ASSOCIATED WITH PLUME LOCATION AND MIGRATION.

CONSTRUCTION OF MONITORING WELLS FOR ALL ALTERNATIVES IS STRAIGHT FORWARD, USING WELL KNOWN TECHNOLOGY. THERE ARE MANY MONITORING WELLS IN THE SFVB.

ALTERNATIVES 2 - 6 WOULD EMPLOY AIR STRIPPING WITH VAPOR PHASE GAC ADSORPTION UNITS (OR STEAM STRIPPING\*) WHICH IS A PROVEN TREATMENT TECHNOLOGY AND RELATIVELY EASY TO IMPLEMENT. ADMINISTRATIVE AGREEMENTS WOULD BE NEEDED FOR THE USE OF TREATED GROUNDWATER. APPROVAL FOR HOOKUP TO THE CITY OF BURBANK WOULD ALSO NEED TO BE ARRANGED PRIOR TO DISTRIBUTION. PRELIMINARY DISCUSSIONS HAVE ALREADY TAKEN PLACE AND NO SIGNIFICANT PROBLEMS HAVE BEEN IDENTIFIED.

ALTERNATIVE 5 WOULD REQUIRE AGREEMENTS BETWEEN THE CITY OF BURBANK, LA DWP, AND MWD TO ACCOMMODATE THE EXCHANGE OF WATER BEYOND THE CITY OF BURBANK'S EXTRACTION CREDITS. HOWEVER, PRELIMINARY DISCUSSIONS BETWEEN EPA AND THE AFFECTED PARTIES REGARDING THE REUSE OF THE WATER HAVE SHOWN THAT THE AGREEMENTS COULD BE ARRANGED.

THE USE OF INJECTION WELLS IN ALTERNATIVES 2 AND 3 COULD BE DIFFICULT TO IMPLEMENT TECHNICALLY DUE TO OPERATIONAL PROBLEMS ENCOUNTERED WITH INJECTION WELLS AND THE UNKNOWN ASSOCIATED WITH EXTENT OF CONTAMINATION. FURTHER SPREAD OF CONTAMINATION COULD OCCUR IF THE INJECTION WELLS WERE IMPROPERLY PLACED.

SPREADING IN ALTERNATIVE 4. COULD BE MORE RELIABLE THAN THE INJECTION WELLS. HOWEVER, THERE ARE ALSO UNCERTAINTIES ASSOCIATED WITH POSSIBLE CONTAMINATION IN THE AREA OF THE SPREADING GROUNDS. AN ADDITIONAL LOAD FROM DISCHARGING THE WATER BY SPREADING COULD CAUSE FURTHER CONTAMINATION OF THE AREA BY ENHANCING MOVEMENT OF THE CONTAMINANTS IN THE SOIL AND/OR GROUNDWATER.

ALTERNATIVES 1 AND 6 WOULD ALLOW THE CONTAMINATION TO SPREAD AND THUS MAKE REMEDIATION MORE DIFFICULT IN THE FUTURE.

[\* STEAM STRIPPING IS DISCUSSED IN SECTION 10, DOCUMENTATION OF SIGNIFICANT CHANGES.]  
COST

ALTERNATIVE 1 WOULD BE THE LEAST EXPENSIVE WITH AN EXPECTED PRESENT WORTH VALUE OF \$500,000. (PRESENT WORTH EVALUATIONS ASSUME 10% ANNUAL INTEREST RATE AND 20 YEARS FOR THE PROJECT LIFE.)

ALTERNATIVE 2 HAS AN ESTIMATED CAPITAL COST OF \$36.6 MILLION AND TOTAL O&M OF \$45.2 MILLION. THE EXPECTED PRESENT TOTAL WORTH VALUE IS \$81.8 MILLION.

ALTERNATIVE 3 HAS AN ESTIMATED CAPITAL COST OF \$43.4 MILLION AND TOTAL O&M OF \$44.7 MILLION. THE EXPECTED PRESENT TOTAL WORTH VALUE IS \$88.1 MILLION.

ALTERNATIVE 4 HAS AN ESTIMATED CAPITAL COST OF \$42.3 MILLION AND TOTAL O&M OF \$52.9 MILLION. THE EXPECTED PRESENT TOTAL WORTH VALUE IS \$95.2 MILLION.

ALTERNATIVE 5 HAS AN ESTIMATED CAPITAL COST OF \$32.1 MILLION (\$25.1 M FOR PHASE 1 AND \$7.0 M FOR PHASE 2) AND TOTAL O&M OF \$54.2 MILLION (\$43.9 M FOR PHASE 1 AND \$10.3 M FOR PHASE 2). THE EXPECTED PRESENT WORTH VALUE IS \$86.3 MILLION (\$69.0 M FOR PHASE 1 AND \$17.3 M FOR PHASE 2).

ALTERNATIVE 6 IS ASSUMED TO BE 25% OF THE COST OF ALTERNATIVE 2, OR \$20.5 MILLION.

THE COST SUMMARIES CAN BE FOUND IN GREATER DETAIL IN THE BURBANK OUF'S REPORT.

COMMUNITY ACCEPTANCE

ALTERNATIVES 3, 4, AND 5 RECEIVED THE MOST COMMUNITY ACCEPTANCE. THE COMMUNITY GENERALLY WANTS THE AQUIFER RESTORED FOR BENEFICIAL USE AND THE PLUME MIGRATION HALTED AS SOON AS POSSIBLE.

COMMUNITY WORKGROUP MEMBERS EXPRESSED SOME CONCERN OVER REINJECTION AND SPREADING DUE TO THE UNCERTAINTIES ASSOCIATED WITH THE EXTENT OF CONTAMINATION. THEIR CONCERN WAS THAT REINJECTION OR SPREADING COULD CONTRIBUTE TO THE SPREAD OF CONTAMINATION IF THE WELLS OR SPREADING AREAS

4483-9099

WERE IMPROPERLY LOCATED. THEREFORE ALTERNATIVE 5, THE WATER REUSE OPTION, WAS MOST ATTRACTIVE TO THE COMMUNITY WORKGROUP.

THE COMMUNITY FEELS STRONGLY THAT AIR EMISSION CONTROLS MUST BE EMPLOYED DUE TO THE POOR AIR QUALITY IN THE BURBANK AREA. EPA ADDRESSES THIS CONCERN WITH THE REQUIREMENT THAT VAPOR PHASE GAC ADSORPTION UNITS WOULD BE INSTALLED IF AIR STRIPPING IS USED.

THE RESPONSE SUMMARY (ATTACHED) ADDRESSES MORE SPECIFIC CONCERNS AND COMMENTS RAISED DURING THE PUBLIC COMMENT PERIOD.

STATE ACCEPTANCE

LIKE THE COMMUNITY, THE STATE (DHS AND RWQCB) WANTS AQUIFER RESTORATION AND CONTROL OF THE PLUME MIGRATION INITIATED AS SOON AS POSSIBLE.

THEY PREFER ALTERNATIVE 5 BECAUSE THEY (LIKE THE COMMUNITY) HAVE CONCERNS WITH REGARDS TO THE REINJECTION AND SPREADING OPTIONS ASSOCIATED WITH ALTERNATIVES 3 AND 4. (SEE PREVIOUS DISCUSSION.)

THEY ALSO BELIEVE IT IS IMPORTANT TO HAVE AIR EMISSION CONTROLS ON THE AIR STRIPPERS. MOREOVER, THE SCAQMD INSISTS THAT IF AERATION IS USED TO TREAT THE WATER THAT VAPOR PHASE GAC ADSORPTION UNITS (OR COMPARABLE BACT) BE INSTALLED.

CALIFORNIA DHS HAS CONCURRED WITH THE BURBANK OU REMEDY SELECTION.

#### 10. DOCUMENTATION OF SIGNIFICANT CHANGES

THE PROPOSED PLAN WAS RELEASED FOR PUBLIC COMMENT IN OCTOBER 1988. THE PROPOSED PLAN IDENTIFIED ALTERNATIVE 5, PHASE 1, EXTRACTION, TREATMENT, AND REUSE, AS THE PREFERRED ALTERNATIVE.

DUAL STAGE AIR STRIPPERS WITH VAPOR PHASE GAC ADSORPTION UNITS WERE CHOSEN AS THE PREFERRED TREATMENT TECHNOLOGY. DURING THE PUBLIC COMMENT PERIOD, A POTENTIALLY RESPONSIBLE PARTY, LOCKHEED AERONAUTICAL SYSTEMS COMPANY (LASC), PRESENTED EPA WITH A SIMILAR TREATMENT TECHNOLOGY - STEAM STRIPPING, MORE SPECIFICALLY, THE AQUADETOX SYSTEM.

IN THE BURBANK OUF'S REPORT, CONVENTIONAL STEAM STRIPPING WAS SCREENED OUT BECAUSE TCE AND PCE ARE HIGHLY VOLATILE COMPOUNDS WHICH ARE EASILY REMOVED FROM WATER WITHOUT INPUT OF HEAT. FURTHERMORE, THE EXPECTED CONCENTRATIONS OF TCE AND PCE WERE NOT HIGH ENOUGH TO WARRANT THE ADDED ENERGY INPUT. THEREFORE, STEAM STRIPPING WAS NOT CONSIDERED COST EFFECTIVE AND WAS NOT CONSIDERED FURTHER IN THE OUF'S.

STEAM STRIPPING WITH THE AQUADETOX SYSTEM WAS ALSO SCREENED OUT DURING THE BURBANK OUF'S ON THE BASIS THAT ADEQUATE EXPERIENCE DID NOT EXIST EITHER FOR AQUADETOX SYSTEMS WITHOUT EXTERNAL STEAM SUPPLY OR FOR THE EFFLUENT TO BE USED AS DRINKING WATER.

THE AQUADETOX PROCESS IS A PROPRIETARY AND PATENTED STEAM STRIPPING TECHNOLOGY DEVELOPED BY AWD TECHNOLOGIES, INC., WHICH USES STEAM STRIPPING UNDER MODERATE OR DEEP VACUUM PRESSURE. WHILE CONVENTIONAL STEAM STRIPPING WAS CONSIDERED NOT APPLICABLE BECAUSE OF ITS HIGHER COST THAN AIR STRIPPING, THE AQUADETOX SYSTEM, MAY BE COST-EFFECTIVE DUE TO THE LOWER ENERGY REQUIREMENTS. OTHER CLAIMED ADVANTAGES OF THE SYSTEM ARE: (1) THE VOC'S CAN BE RECOVERED FOR RECYCLING INSTEAD OF DISCHARGED TO THE AIR OR CARBON, AND (2) IT IS A CLOSED LOOP SYSTEM AND THEREFORE THERE IS MINIMAL VOC DISCHARGE TO THE AIR (LESS THAN 1 LB/DAY, GIVEN ESTIMATED GROUNDWATER VOC CONCENTRATIONS).

THE AQUADETOX SYSTEM UNDER MODERATE VACUUM PRESSURE WAS SELECTED BY LASC FOR GROUNDWATER TREATMENT AT A SITE WITHIN THE BURBANK OU AREA. THIS 1200 GPM EXTRACTION AND TREATMENT FACILITY BEGAN OPERATION IN JANUARY 1989 AND SHOULD PROVIDE PERFORMANCE DATA RELATIVE TO THE USE OF THIS TECHNOLOGY IN THE REMOVAL OF THE VOC'S.

INFORMATION ON THE INFLUENT FROM THE LASC AQUADETOX EXTRACTION AND TREATMENT SYSTEM IS SHOWING HIGHER CONCENTRATION LEVELS FOR TCE AND PCE THAN ESTIMATED IN THE BURBANK OUF'S REPORT. LASC'S TREATMENT FACILITY IS EXTRACTING GROUNDWATER WITH CONCENTRATIONS UP TO 12,000 PPB PCE AND TCE COMBINED (AS OF FEBRUARY 1989). THEREFORE STEAM STRIPPING MAY BE MORE APPLICABLE (E.G.

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ECONOMICAL) THAN ORIGINALLY THOUGHT DUE TO THE HIGHER CONCENTRATIONS AND ADDED STRIPPING EFFICIENCY OF STEAM STRIPPING.

SINCE AIR AND STEAM STRIPPING FALL UNDER THE SAME CLASS OF TREATMENT - STRIPPING - EITHER TECHNOLOGY CAN BE EMPLOYED TO MEET THE PERFORMANCE STANDARDS, THEREFORE ACHIEVING THE STATED BURBANK OPERABLE UNIT OBJECTIVES.

AIR STRIPPING WAS USED DURING THE DISCUSSION OF THE DESCRIPTION OF ALTERNATIVES AND COMPARISON ANALYSIS. HOWEVER, THE SELECTED REMEDY WILL BE EITHER AIR OR STEAM STRIPPING, AS LONG AS THE STEAM STRIPPING MEETS THE PERFORMANCE STANDARDS AND IS AS EFFECTIVE AS THE AIR STRIPPING IN MEETING THE EVALUATION CRITERIA. THIS ALLOWS FLEXIBILITY DURING THE REMEDIAL DESIGN TO PROCURE THE MOST COST-EFFECTIVE UNIT THAT ALSO PROTECTS HUMAN HEALTH AND THE ENVIRONMENT.

**#SR**  
**11.0 THE SELECTED REMEDY**

ALTERNATIVE 5, PHASE 1, USING EITHER STEAM OR AIR STRIPPING FOR TREATMENT, IS THE SELECTED REMEDY FOR THE BURBANK OPERABLE UNIT. THE REMEDY INCLUDES EXTRACTION OF CONTAMINATED GROUNDWATER, TREATMENT BY STRIPPING, AND REUSE OF THE WATER BY THE CITY OF BURBANK FOR DRINKING WATER. IF AIR STRIPPING IS CHOSEN DURING THE REMEDIAL DESIGN, VAPOR PHASE GAC ADSORPTION UNITS WILL BE NEEDED TO COMPLY WITH THE ARARS AND TBCS.

THE EXTRACTION SYSTEM WILL BE DESIGNED TO CAPTURE GROUNDWATER CONTAINING 100 PPB OR GREATER OF TCE AND 5 PPB OR GREATER OF PCE. THE EXTRACTION FLOW RATE IS CURRENTLY PROJECTED TO BE 12,000 GPM.

THE FEDERAL AND STATE MCLS ARE RELEVANT AND APPROPRIATE IN THE AQUIFER. UPON THE COMPLETION OF THE FINAL REMEDIAL ACTION FOR THE SITE, THIS ARAR WILL BE SATISFIED.

ALTHOUGH IT WAS ESTIMATED IN THE BURBANK OUPS REPORT THAT EXTRACTION AT A RATE OF 16,000 GPM COUPLED WITH INJECTION WELLS FOR A PERIOD OF 20 YEARS WAS NECESSARY TO FULLY REMEDIATE THE BURBANK OU AREA (I.E. REMOVING GROUNDWATER UNTIL THAT LEFT CONTAINED CONTAMINANTS TO CONCENTRATION LEVELS AT OR BELOW MCLS AND SALS), THE DECISION TO PUMP AND TREAT 12,000 GPM WAS DETERMINED TO BE THE MOST APPROPRIATE GIVEN THE AMOUNT OF TECHNICAL INFORMATION CURRENTLY AVAILABLE. MORE INFORMATION WILL BE GATHERED DURING THE BASINWIDE RI, NORTH HOLLYWOOD OU REMEDY OPERATION, LASC'S EXTRACTION AND TREATMENT SYSTEM, BURBANK OU REMEDIAL DESIGN, AND THE OPERATION OF THE BURBANK OU TREATMENT SYSTEM TO DETERMINE WHETHER MORE EXTRACTION IS NECESSARY TO CONTINUE AQUIFER RESTORATION AND CONTROLLING THE MIGRATION OF THE PLUME. IF ADDITIONAL EXTRACTION IS DETERMINED NECESSARY, EPA WOULD AGAIN GO OUT FOR PUBLIC COMMENT WITH A PROPOSED PLAN BEFORE SIGNING ANOTHER RECORD OF DECISION.

EXTRACTION WELLS WILL BE STRATEGICALLY PLACED (BOTH Laterally AND VERTICALLY) TO MAXIMIZE THE EFFECTIVENESS OF THE SYSTEM. THE LOCATIONS PRESENTED IN THE OU MAY BE MODIFIED IF WARRANTED BY NEW DATA. STRIPPING IS THE CHOSEN TREATMENT. LASC IS CONDUCTING A TREATABILITY STUDY WITH ITS AQUADETOX SYSTEM. THIS WILL HELP DETERMINE WHETHER STEAM STRIPPING WILL BE USED FOR THE OU REMEDY. AIR STRIPPING WITH VAPOR PHASE GAC ADSORPTION UNITS WILL BE USED UNLESS STEAM STRIPPING IS SHOWN TO MEET OR EXCEED THE TREATMENT ADVANTAGES OF AIR STRIPPING WITH VAPOR PHASE GAC. EPA MAY ALSO DECIDE TO USE THE TWO TECHNOLOGIES TOGETHER IF THAT WOULD MAXIMIZE EFFICIENCY.

THE VOCS - PARTICULARLY THE PRIMARY CONTAMINANTS, TCE AND PCE - IN THE GROUNDWATER MUST BE REMOVED FROM THE GROUNDWATER SUCH THAT TREATMENT PLANT EFFLUENT CONCENTRATIONS ARE BELOW THE FEDERAL MCLS AND SALS (TCE - 5 PPB AND PCE - 4 PPB). THE WATER MUST ALSO MEET ALL DRINKING WATER STANDARDS. THIS MAY REQUIRE FURTHER TREATMENT LIKE CHLORAMINATION FOR DISINFECTION PURPOSES, OR REVERSE OSMOSIS OR ION EXCHANGE FOR NITRATES.

THE TREATED WATER WILL BE FED DIRECTLY INTO BURBANK'S DISTRIBUTION SYSTEM FOR REUSE BY THE CITY'S RESIDENTS.

MONITORING WELLS WILL BE INSTALLED DOWNGRADIENT TO MONITOR THE PERFORMANCE OF THE SYSTEM.

THE EXTRACTION OF CONTAMINATED GROUNDWATER FROM THE BURBANK OU AREA, TREATMENT OF GROUNDWATER TO DRINKING WATER STANDARDS, AND DISTRIBUTION OF THE WATER TO THE BURBANK RESIDENTS IS THE MOST COST EFFECTIVE AND TECHNICALLY SOUND MEANS OF MEETING THE OU OBJECTIVES.

4483-9099

THE SELECTED REMEDY PERMANENTLY AND SIGNIFICANTLY REDUCES THE TOXICITY, MOBILITY, AND VOLUME OF HAZARDOUS SUBSTANCES WITH RESPECT TO THEIR PRESENCE IN THE GROUNDWATER -- THE CONTAMINANTS ARE REMOVED FROM THE GROUNDWATER, THEREBY REDUCING CONTAMINANT MIGRATION IN THE VICINITY OF THE BURBANK OU AREA.

STRIPPING WILL RESULT IN A SMALL INCREASE IN THE TOXICITY, MOBILITY, AND VOLUME OF HAZARDOUS SUBSTANCES WITH RESPECT TO THEIR PRESENCE IN THE AIR. HOWEVER, THE USE OF STEAM STRIPPING RECOVERS MOST OF THE VOCS FOR RECYCLING. IF DUAL STAGE AIR STRIPPING IS USED FOR TREATMENT, VAPOR PHASE GAC ADSORPTION UNITS WILL BE INSTALLED TO MINIMIZE THE AMOUNT OF VOCS DISCHARGED TO THE AIR.

THE AIR EMISSIONS ARE ESTIMATED TO ADD A MINIMAL RISK TO THE PROJECT VIA AIRBORNE CONTAMINANTS, BECAUSE THE AIR EMISSION CONTROLS WILL REMOVE 90 - 99% OF THE CONTAMINANTS BEFORE THEY ARE DISCHARGED TO THE AIR. THE ADDITION OF VAPOR PHASE GAC ADSORPTION UNITS MEETS THE ARARS AND TBCS DISCUSSED IN SECTION 9, COMPLIANCE OF ARARS.

THE SPENT CARBON FROM THE VAPOR PHASE GAC ADSORPTION SYSTEM IS CONSIDERED A RCRA WASTE OR IT IS A MIXTURE OF THE SOLID WASTE CARBON AND THE RCRA LISTED WASTES F001, U210, AND U228 (40 CFR SECTION 261.3(A)(2)(IV)). THEREFORE THE CARBON MUST SATISFY THE REQUIREMENTS OF 40 CFR PART 263 TO BE SHIPPED OFF SITE FOR REGENERATION.

THE PUMP AND TREAT SYSTEM WILL OPERATE FOR AN ESTIMATED 20 YEARS. GROUNDWATER MONITORING AND GROUNDWATER LEVEL MEASURING WILL BE CONDUCTED AS PART OF THE REMEDY TO TRACK CONTAMINANT CONCENTRATIONS IN THE BURBANK OU AREA, TO MONITOR THE PERFORMANCE OF THE TREATMENT SYSTEM AND TO DETERMINE THE EFFICIENCY OF THE SYSTEM IN RESTORING THE AQUIFER. THE SYSTEM WILL BE EVALUATED PERIODICALLY TO DETERMINE THE EFFICIENCY AND NECESSITY OF THE REMEDIATION IN ACHIEVING THE STATED GOALS. THE REVIEWS WILL ALLOW FOR MODIFICATION IN THE SYSTEM AS REQUIRED.

FOR REFERENCE, THE ESTIMATED COST OF THE SELECTED REMEDY WITH THE USE OF DUAL STAGE AIR STRIPPING WITH VAPOR PHASE GAC ADSORPTION UNITS IS \$69M (SEE TABLE 5). LASC'S REMEDIAL ACTION ALTERNATIVE FOR THE BURBANK WELL FIELD OPERABLE UNIT GIVES A COST ESTIMATE OF \$50.1 MILLION NET PRESENT VALUE FOR THE BURBANK OU REMEDY USING THE AQUADETOX SYTEM INSTEAD OF THE AS WITH VAPOR PHASE GAC ADSORPTION UNITS. ALTHOUGH LASC'S ALTERNATIVE IS SIMILAR TO ALTERNATIVE 5, PHASE 1 IN THE BURBANK OUPS REPORT, LASC'S ALTERNATIVE DOES HAVE SOME DIFFERENT FEATURES. (LASC'S REPORT CAN BE FOUND IN THE ADMINISTRATIVE RECORD.)

**#SD**  
**12.0 STATUTORY DETERMINATIONS**

THE SELECTED REMEDY IS PROTECTIVE OF HUMAN HEALTH AND THE ENVIRONMENT -- AS REQUIRED BY SECTION 121 OF CERCLA -- IN THAT IT TREATS THE EXTRACTED GROUNDWATER SO THAT REMAINING CONTAMINANTS ARE AT OR BELOW THE MCLS AND SALS FOR THE CONTAMINANTS OF CONCERN.

STRIPPING HAS BEEN SHOWN TO BE THE MOST COST EFFECTIVE TECHNOLOGY FOR TREATING THE CONCENTRATIONS OF VOCS FOUND IN THE GROUNDWATER FROM THE BURBANK OU AREA. ALTHOUGH THE ADDITION OF AIR EMISSION CONTROLS (GAC) TO THE DUAL STAGE AIR STRIPPERS (IF STEAM STRIPPING FAILS TO PASS THE TREATABILITY STUDIES) WILL INCREASE THE COST OF THE SELECTED REMEDY, IT IS DETERMINED TO BE JUSTIFIED AS A COST-EFFECTIVE MEASURE FOR THE FOLLOWING REASONS:

(1) IT MEETS THE REQUIREMENTS OF SCAQMD REGULATION XIII, THE ARAR FOR AIR DISCHARGE FROM THE AIR STRIPPING TREATMENT; (2) IT REDUCES OZONE PRECURSOR EMISSIONS IN A NONATTAINMENT AREA (THE SOUTH COAST AIR BASIN) THAT HAS THE WORST AIR QUALITY IN THE NATION; AND (3) IT RESPONDS TO PUBLIC COMMENTS REQUESTING AIR EMISSION CONTROLS TO MINIMIZE THE INCREASE IN EXISTING AIR QUALITY PROBLEMS REGARDLESS OF LEGAL REQUIREMENTS.

THE SELECTED REMEDY (EITHER AIR OR STEAM STRIPPING) MEETS THE ARARS AND TBCS THAT APPLY TO THIS RESPONSE ACTION. THE SELECTED REMEDY WILL MEET THE SAFE DRINKING WATER ACT MCLS AND THE CA DHS STATE ACTION LEVELS IN THE EXTRACTED GROUNDWATER THAT IS TREATED FOR REUSE. UPON THE COMPLETION OF THE FINAL REMEDIAL ACTION FOR THE SITE, THE MCLS WILL BE MET IN THE AQUIFER.

IT WILL ALSO MEET THE SCAQMD'S REGULATION XIII AND RULES 1167 AND 1401 BY ADDING AIR EMISSION CONTROLS TO THE AIR STRIPPERS OR USING STEAM STRIPPING.

# Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

FINALLY, IT WILL MEET THE RCRA REQUIREMENTS AS SPECIFIED IN 40 CFR SECTION 261 AND 263. RCRA SUBPART B, 40 CFR 261 - CRITERIA FOR IDENTIFYING LISTED HAZARDOUS WASTE - IDENTIFIES THE WASTE AS RELEVANT AND APPROPRIATE TO FOOL AND APPLICABLE FOR U210 AND U228. RCRA PART 263 - STANDARDS APPLICABLE TO TRANSPORTERS OF HAZARDOUS WASTE - SPECIFIES COMPLIANCE WITH THE MANIFEST SYSTEM FOR SHIPMENT OF THE SPENT CARBON OFF-SITE FOR REGENERATION.

THE SOLVENT PRODUCT GENERATED FROM STEAM STRIPPING IS NOT CONSIDERED A RCRA WASTE IF IN ACCORDANCE WITH 40 CFR SECTION 261.2(E) (I) (II) MATERIALS ARE NOT SOLID WASTES WHEN THEY CAN BE SHOWN TO BE RECYCLED BY BEING USED OR REUSED AS EFFECTIVE SUBSTITUTES FOR COMMERCIAL PRODUCTS.

THE SELECTED REMEDY PERMANENTLY AND SIGNIFICANTLY REDUCES THE TOXICITY, MOBILITY AND VOLUME OF HAZARDOUS SUBSTANCES WITH RESPECT TO THEIR PRESENCE IN GROUNDWATER. THE CONTAMINANTS ARE REMOVED FROM THE GROUNDWATER, THEREBY REDUCING CONTAMINANT MIGRATION AND RESTORING THE AQUIFER IN THE VICINITY OF THE BURBANK OU AREA. THE STRIPPING TECHNOLOGY WILL RESULT IN A VERY SLIGHT INCREASE IN THE TOXICITY, MOBILITY, AND VOLUME OF HAZARDOUS SUBSTANCES WITH RESPECT TO THEIR PRESENCE IN THE AIR.

AIR STRIPPING WITH VAPOR PHASE GAC INCREASES THE VOLUME OF CONTAMINATION IN THE AIR BY TRANSFERRING THAT VOLUME, WHICH IS NOT TRAPPED INTO THE CARBON FOR REGENERATION, FROM THE WATER TO THE AIR. STEAM STRIPPING SLIGHTLY INCREASES THE VOLUME OF CONTAMINATION IN THE AIR BY TRANSFERRING THAT VOLUME, WHICH IS NOT RECOVERED AS PRODUCT FOR RECYCLING, FROM THE WATER TO THE AIR. THE VOC VOLUMES RELEASED BY EITHER METHOD WILL NOT EXCEED THE SCAQMD'S LIMITS.

THE INCLUSION OF AIR EMISSIONS CONTROL (VAPOR PHASE GAC ADSORPTION UNITS) IN THE SELECTED REMEDY (IF AIR STRIPPING IS USED) REDUCES THE IMPACT OF THE AIR EMISSIONS IN A COST-EFFECTIVE MANNER TO THE MAXIMUM EXTENT POSSIBLE. THE AIR EMISSIONS ARE ESTIMATED TO ADD A MINIMAL RISK TO THE PROJECT VIA AIRBORNE CONTAMINANTS. THE MINIMAL RISK ADDITION IS DUE LARGELY TO THE CAPABILITIES OF THE VAPOR PHASE GAC ADSORPTION UNITS TO REMOVE 90 TO 99% OF THE CONTAMINANTS IN THE AIR DISCHARGED TO THE ATMOSPHERE FROM THE STRIPPER. WITH THE ADDITION OF AIR EMISSION CONTROLS, THE SELECTED REMEDY REDUCES THE POTENTIAL FOR OZONE FORMATION.

BOTH AIR AND STEAM STRIPPING MEET THE STATUTORY PREFERENCE FOR REMEDIES THAT USE ALTERNATIVE TREATMENT OR RESOURCE RECOVERY TECHNOLOGIES TO THE MAXIMUM EXTENT PRACTICABLE. STEAM STRIPPING UNDER VACUUM PRESSURE IS AN INNOVATIVE TECHNOLOGY THAT RECOVERS THE VOCs FOR REUSE. IF THE DUAL STAGE AIR STRIPPING WITH VAPOR PHASE GAC ADSORPTION UNITS IS USED, THE SPENT CARBON FROM THE GAC OFF-GAS TREATMENT SYSTEM WILL BE REGENERATED, INSTEAD OF BEING DISPOSED OF IN A LANDFILL. THEREFORE, THE VOCs WILL BE COLLECTED FOR REUSE OR DESTROYED.

CONSENT DECREE

I. BACKGROUND

A. Summary of Site Background.

The following is a summary of the Site background as alleged by the United States which, for the purposes of this Consent Decree, Settling Defendants neither admit nor deny:

1. The United States of America ("United States"), on behalf of the Administrator of the United States Environmental Protection Agency ("EPA"), and the State of California Department of Toxic Substances Control ("State") have filed concurrently with this Consent Decree a supplemental complaint pursuant to Sections 106 and 107 of the Comprehensive Environmental Response, Compensation, and Liability Act, 42 U.S.C. §§ 9606 and 9607 ("CERCLA"), as amended by the Superfund Amendments and Reauthorization Act of 1986 ("SARA").

2. The United States and the State in the supplemental complaint, seek, *inter alia*: (1) reimbursement of costs of response incurred by EPA, the Department of Justice, and the State for response actions at the Burbank Operable Unit Site ("Site") of the San Fernando Valley Superfund sites, with accrued interest; and (2) performance of response work by the Defendants at the Site consistent with the National Contingency Plan, 40 C.F.R. Part 300 (as amended) ("NCP").

3. This is the second complaint the United States has filed in this action. Pursuant to the first complaint, a consent decree ("First Consent Decree") was entered by this Court on

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 March 25, 1992. A copy of the First Consent Decree is included  
 2 as Exhibit 1 to this Consent Decree. Under Section XXIII  
 3 (Continuing Jurisdiction) of the First Consent Decree, this Court  
 4 retained jurisdiction over both the subject matter and the  
 5 parties to the original action for the duration of the First  
 6 Consent Decree and for the purpose of issuing such further orders  
 7 or directions as may be necessary or appropriate to construe,  
 8 implement, modify, enforce, terminate or reinstate the terms of  
 9 the First Consent Decree or for any further relief as the  
 10 interest of justice may require.

11 4. The First Consent Decree provided for the  
 12 defendants to the first complaint, Lockheed Corporation (now  
 13 Lockheed Martin Corporation, hereinafter "Lockheed Martin"), the  
 14 City of Burbank, and Weber Aircraft, Inc. ("Weber"), to fund  
 15 and/or to perform certain response actions at the Site, and for  
 16 Lockheed Martin and Weber to pay certain costs of response  
 17 incurred by EPA and the Department of Justice with respect to the  
 18 Site. This consent decree ("Second Consent Decree" or "this  
 19 Consent Decree") provides for the defendants that have entered  
 20 into this Consent Decree (collectively, "Settling Defendants") to  
 21 fund and/or to perform the remainder of the response actions and  
 22 to pay part of EPA's, the Department of Justice's, and the  
 23 State's remaining costs of response for the Site. In general,  
 24 the Second Consent Decree provides for the continued operation  
 25 and maintenance of (1) the facilities constructed under the First  
 26 Consent Decree, and (2) the facilities constructed under EPA  
 27 Unilateral Administrative Order No. 92-12 ("UAO 92-12") by the  
 28

4483-9099

1 parties to UAO 92-12 ("UAO Parties"), during the final eighteen  
 2 years of the interim remedy operating period. The Second Consent  
 3 Decree further provides for: (a) the performance of the UAO  
 4 Remedial Action Work by the UAO Parties (who are all Settling  
 5 Defendants), pursuant to UAO 92-12, to the extent that work has  
 6 not been completed at the time the Second Consent Decree is  
 7 entered; and (b) the possible dismantling or decommissioning of  
 8 these facilities upon completion of the interim remedy.

9 5. Tests conducted on San Fernando Valley groundwater  
 10 in the early 1980's revealed significant concentrations of  
 11 volatile organic compounds ("VOCs") in San Fernando Valley basin  
 12 ("Basin") groundwater. The primary VOCs found in the Basin  
 13 groundwater were trichloroethylene ("TCE") and perchloroethylene  
 14 ("PCE"), which were widely used solvents in machinery degreasing,  
 15 metal plating and dry cleaning. TCE and PCE have been found at  
 16 the Site at levels that exceed the Maximum Contaminant Levels  
 17 ("MCLs") for these hazardous substances. MCLs are safe drinking  
 18 water standards established under the Safe Drinking Water Act of  
 19 1974, as amended, 42 U.S.C. § 300f et seq. The Federal MCL for  
 20 TCE and PCE is 5 parts per billion ("ppb").

21 B. Based on investigations of Basin groundwater, and  
 22 pursuant to Section 105 of CERCLA, 42 U.S.C. § 9605, in June 1986  
 23 EPA placed four well field sites in the San Fernando Valley on  
 24 the National Priorities List, set forth at 40 C.F.R. Part 300,  
 25 Appendix B, by publication in the Federal Register (see 51 Fed.  
 26 Reg. 21054): (1) the North Hollywood Superfund site (Area 1);  
 27 (2) the Crystal Springs Superfund site (Area 2); (3) the Pollock  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 Superfund site (Area 3); and (4) the Verdugo Superfund site (Area  
2 4).

3 C. EPA is conducting a Basin-wide Remedial Investigation  
4 and Feasibility Study ("RI/FS") for the San Fernando Valley  
5 Superfund sites, which EPA manages as one large Superfund site.  
6 EPA has also entered into a multi-site cooperative agreement with  
7 the California Department of Health Services ("DHS") which funds  
8 DHS participation in remedial activities at many California  
9 Superfund sites, including the San Fernando Valley sites. In  
10 September of 1989, EPA entered into a cooperative agreement with  
11 the California State Water Resources Control Board ("SWRCB").  
12 Under that cooperative agreement, SWRCB funds the Los Angeles  
13 Regional Water Quality Control Board's ("RWQCB") ongoing source  
14 investigation and source control work in the Basin.

15 D. EPA has designated four operable units within the San  
16 Fernando Valley Superfund sites known as the North Hollywood,  
17 Burbank, Glendale North and Glendale South operable units. This  
18 Site, the Burbank Operable Unit Site, is one of those four  
19 operable units.

20 E. EPA has issued interim Records of Decision ("RODs")  
21 prescribing interim remedies for each of these operable units.

22 F. The Site is part of the North Hollywood (Area 1)  
23 Superfund site, and is the second operable unit in the Basin for  
24 which EPA has issued an interim ROD. The Site includes the  
25 northeast corner of the North Hollywood Superfund site, as well  
26 as the areas to which the plume of TCE and PCE has spread beyond  
27 the original boundaries drawn at the time the North Hollywood  
28

4483-9099

1 Superfund site was listed on the NPL.

2 G. EPA completed an Operable Unit Feasibility Study  
3 ("OU/FS") Report on the Site in October 1988.

4 H. The comment period on the OU/FS Report and the Proposed  
5 Plan for the Site opened on October 19, 1988 and closed December  
6 2, 1988. Pursuant to Section 117 of CERCLA, 42 U.S.C. § 9617,  
7 EPA published notice of the completion of the OU/FS and of the  
8 Proposed Plan in two major local newspapers of general  
9 circulation, the Los Angeles Times and the Burbank Leader. EPA  
10 provided an opportunity for written and oral comments from the  
11 public on the Proposed Plan for remedial action. A copy of the  
12 transcript of the public meeting is available to the public as  
13 part of the Administrative Record upon which the Regional  
14 Administrator based the selection of the interim response actions  
15 selected for the Site.

16 I. EPA issued an interim ROD for the Site on June 30, 1989,  
17 which the State had a reasonable opportunity to review. A copy  
18 of the ROD is appended as Appendix A to the First Consent Decree.  
19 The ROD included a responsiveness summary responding to the  
20 public comments received at the public meeting. Notice of the  
21 Final Plan was published in accordance with Section 117(b) of  
22 CERCLA. The remedy described in the ROD was modified by EPA's  
23 Explanation of Significant Differences issued by EPA on November  
24 21, 1990 ("ESD 1"). A copy of ESD 1 is included as Appendix B to  
25 the First Consent Decree. Furthermore, EPA included in the First  
26 Consent Decree certain modifications to the interim remedy, as  
27 provided in Subpart F of Section VII of that decree (Work To Be  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 Performed). Those modifications did not represent a fundamental  
2 change to the remedy selected in the ROD and ESD1. The remedy  
3 described in the ROD was further modified by EPA's second  
4 Explanation of Differences executed by EPA on February 12, 1997  
5 ("ESD2"). Those modifications also did not represent a  
6 fundamental change to the remedy selected in the ROD and ESD1. A  
7 copy of EPA's ESD2 is included as Appendix 5 to this Consent  
8 Decree.

9 J. In 1989, pursuant to Section 122(e) of CERCLA, 42 U.S.C.  
10 § 9622(e), EPA issued Special Notice for Remedial Design and  
11 Remedial Action to potentially responsible parties for the Site.  
12 By its 1989 Special Notice, EPA sought the construction,  
13 operation and maintenance of the interim remedy for the Site. As  
14 more fully described in the ROD, that remedy consists of  
15 groundwater extraction and treatment facilities, a blending  
16 facility, and systems for delivering the treated groundwater to  
17 the public water supply. The treated, blended groundwater  
18 delivered to the public water supply shall meet all drinking  
19 water standards established by the United States and the State of  
20 California. The interim remedy is required to operate for twenty  
21 (20) years.

22 K. In the First Consent Decree, Lockheed Martin, Weber and  
23 the City of Burbank agreed to construct and/or to fund the  
24 construction of the treatment plant for the Burbank Operable  
25 Unit, and to operate and maintain and/or to fund the operation  
26 and maintenance of the treatment plant for two years after  
27 construction is complete. Lockheed Martin and Weber also agreed  
28

4483-9099

1 to pay part of EPA's and the Department of Justice's costs for  
2 the Site.

3 L. In March 1992, EPA issued UAO 92-12 to six potentially  
4 responsible parties who had received the 1989 Special Notice:  
5 Aeroquip Corporation, Crane Company, Inc., Janco Corporation,  
6 Sargent Industries, Incorporated, the Antonini Family Trust and  
7 Ocean Technology, Incorporated. Copies of UAO 92-12 and the  
8 April 28, 1992 Amendment to UAO 92-12 are included as Exhibit 2  
9 to this Decree. UAO 92-12 ordered these parties to construct a  
10 blending facility to receive and blend the treated groundwater  
11 with another source of water to reduce nitrate levels, and to  
12 deliver the water to the public water supply system.

13 M. In this action, EPA and the State seek reimbursement of  
14 past and future response costs, including Basin-wide Response  
15 Costs for the Site, which are not reimbursed pursuant to the  
16 First Consent Decree. EPA also seeks the performance of the  
17 Operation and Maintenance ("O&M") of the treatment and blending  
18 facilities for the period not provided by the First Consent  
19 Decree or UAO 92-12.

20 N. Based on the information presently available to EPA and  
21 the State, EPA and the State believe that this work will be  
22 properly and promptly conducted by the Settling Defendants if  
23 conducted in accordance with the requirements of this Consent  
24 Decree and its appendices.

25 O. The State is not a party to the First Consent Decree.  
26 In accordance with the NCP and Section 121(f)(1)(F) of CERCLA, 42  
27 U.S.C. § 9621(f)(1)(F), EPA notified the State on September 7,  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 1994 of negotiations with potentially responsible parties  
2 regarding the implementation of the remainder of the remedial  
3 action for the Site, and EPA has provided the State with an  
4 opportunity to participate in such negotiations and be a party to  
5 this Consent Decree.

6 P. The State has joined in the United States' supplemental  
7 complaint and is alleging that the defendants are liable to the  
8 State under Section 107 of CERCLA, 42 U.S.C. § 9607, and under  
9 Chapter 6.8, Section 25300 et seq., of the California Health &  
10 Safety Code, for the State's past and future response costs at  
11 the Site.

12 Q. In accordance with Section 122(j)(1) of CERCLA, 42  
13 U.S.C. § 9622(j)(1), EPA notified the United States Department of  
14 the Interior on September 15, 1994 of negotiations with  
15 potentially responsible parties regarding the release of  
16 hazardous substances that may have resulted in injury to natural  
17 resources under federal trusteeship and encouraged the trustee(s)  
18 to participate in the negotiation of this Consent Decree.

19 R. Settling Defendants deny any and all legal or equitable  
20 liability under any federal, state, or local statute, regulation  
21 or ordinance, or the common law, for any response costs, damages  
22 or claims caused by or arising out of conditions at or arising  
23 from the Burbank well field or the Site. By entering into this  
24 Consent Decree, or by taking any action in accordance with it,  
25 Settling Defendants do not admit any allegations contained herein  
26 or in the complaints, nor do Settling Defendants admit liability  
27 for any purpose or admit any issues of law or fact or any  
28

4483-9099

1 responsibility for releases of hazardous substances into the  
2 environment. Nothing in this Paragraph shall alter Settling  
3 Defendants' agreement not to challenge the Court's jurisdiction  
4 as set forth in Section II ("Jurisdiction"), or in any manner  
5 whatsoever affect Settling Defendants' obligations or rights  
6 under this Consent Decree, the First Consent Decree or UAO 92-12.

7 S. The Parties recognize, and the Court by entering this  
8 Consent Decree finds, that this Consent Decree has been  
9 negotiated by the Parties in good faith and implementation of  
10 this Consent Decree will expedite the cleanup of the Site and  
11 will avoid prolonged and complicated litigation between the  
12 Parties, and that this Consent Decree is fair, reasonable, and in  
13 the public interest.

14 T. Solely for the purposes of Section 113(j) of CERCLA, 42  
15 U.S.C. § 9613(j), the interim remedial action selected by the ROD  
16 and the work to be performed by the Settling Defendants shall  
17 constitute a response action taken or ordered by the President.  
18 NOW, THEREFORE, it is hereby Ordered, Adjudged, and Decreed:

19 II. JURISDICTION

20 This Court has jurisdiction over the subject matter of this  
21 action pursuant to 28 U.S.C. §§ 1331 and 1345, and 42 U.S.C. §§  
22 9606, 9607, and 9613(b). This Court also has personal  
23 jurisdiction over the Settling Defendants. Solely for the  
24 purposes of this Consent Decree and the underlying complaints,  
25 Settling Defendants waive all objections and defenses that they  
26 may have to jurisdiction of the Court or to venue in this  
27 District. Settling Defendants shall not challenge the terms of  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 this Consent Decree or this Court's jurisdiction to enter and  
 2 enforce this Consent Decree.

3 III. PARTIES BOUND

4 A. This Consent Decree applies to and is binding upon the  
 5 United States and the State and upon Settling Defendants and  
 6 their heirs, successors and assigns. Any change in ownership or  
 7 corporate status of a Settling Defendant including, but not  
 8 limited to, any transfer of assets or real or personal property  
 9 shall in no way alter such Settling Defendant's responsibilities  
 10 under this Consent Decree.

11 B. Settling Work Defendant (as defined below) shall  
 12 provide a copy of this Consent Decree to each contractor hired to  
 13 perform the O&M Activities (as defined below) required by this  
 14 Consent Decree and to each person representing Settling Work  
 15 Defendant with respect to the Site or the O&M Activities and  
 16 shall condition all contracts entered into hereunder upon  
 17 performance of the O&M Activities in conformity with the terms of  
 18 this Consent Decree. Settling Work Defendant or its contractor  
 19 shall provide written notice of this Consent Decree to all  
 20 subcontractors hired to perform any portion of the O&M Activities  
 21 required by this Consent Decree. Settling Work Defendant shall  
 22 nonetheless be responsible for ensuring that its contractors and  
 23 subcontractors perform the O&M Activities contemplated herein in  
 24 accordance with this Consent Decree. With regard to the  
 25 activities undertaken pursuant to this Consent Decree, each  
 26 contractor and subcontractor shall be deemed to be in a  
 27 contractual relationship with Settling Work Defendant within the  
 28

4483-9099

1 meaning of Section 107(b)(3) of CERCLA, 42 U.S.C. § 9607(b)(3).

2 IV. DEFINITIONS

3 A. Unless otherwise expressly provided herein, terms used  
 4 in this Consent Decree which are defined in CERCLA or in  
 5 regulations promulgated under CERCLA shall have the meaning  
 6 assigned to them in CERCLA or in such regulations. Whenever  
 7 terms listed below are used in this Consent Decree or in the  
 8 appendices attached hereto and incorporated hereunder, the  
 9 following definitions shall apply:

10 "Basin-wide Response Costs" shall mean all costs, including,  
 11 but not limited to, direct and indirect costs and interest,  
 12 payroll costs, contractor costs, travel costs, laboratory costs,  
 13 attorneys' fees and just compensation, that the United States or  
 14 the State has incurred or paid or will incur and pay with regard  
 15 to basin-wide non-operable unit-specific response actions.

16 "Blending Facility" shall mean the blending facility and  
 17 related pipeline designed and constructed by the UAO Parties  
 18 pursuant to UAO 92-12, beginning generally with the B-5  
 19 Connection and concluding with the Point of Interconnection, as  
 20 "B-5 Connection" and "Point of Interconnection" are defined in  
 21 the First Consent Decree.

22 "CERCLA" shall mean the Comprehensive Environmental  
 23 Response, Compensation, and Liability Act of 1980, as amended, 42  
 24 U.S.C. §§ 9601 et seq.

25 "City" or "City of Burbank" shall mean the City of Burbank,  
 26 California, as a charter city, and any of its divisions,  
 27 departments and other subdivisions. "City" or "City of Burbank"  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 shall not include any joint powers authority of which the City of  
2 Burbank is a member.

3 "Consent Decree" or "Second Consent Decree" shall mean this  
4 Consent Decree and all appendices attached hereto (listed in  
5 Section XXX). In the event of conflict between this Consent  
6 Decree and any appendix, this Consent Decree shall control.

7 "Date of Commencement" shall mean, in general, the date  
8 specified by EPA that Settling Work Defendant will assume the O&M  
9 responsibilities for the Burbank Operable Unit interim remedy,  
10 and Lockheed Martin and the UAO Parties shall cease their  
11 respective obligations to perform under the First Consent Decree  
12 or UAO 92-12. The parties anticipate that this date will be two  
13 years after the System Operation Date for phase two of the  
14 Remedial Action Work as specified in the First Consent Decree  
15 unless delays, including without limitation delays which any  
16 party attributes to a force majeure event, cause that date to be  
17 extended. Within thirty (30) days of the System Operation Date  
18 for phase two of the Remedial Action Work as specified in the  
19 First Consent Decree, EPA will specify the tentative Date of  
20 Commencement and notify the Settling Work Defendant, Lockheed  
21 Martin and the UAO Parties of the tentative Date of Commencement.  
22 EPA may revise the tentative Date of Commencement at any time  
23 during phase two of the Remedial Action Work as specified in the  
24 First Consent decree, and shall notify the Settling Work  
25 Defendant, Lockheed Martin and the UAO Parties of any such  
26 revision. EPA's specified tentative Date of Commencement shall  
27 control all reporting and similar requirements which are required  
28

4483-9099

1 to occur in relation to the Date of Commencement. However, in no  
2 event shall the Date of Commencement specified by EPA extend the  
3 amount of time the interim remedy is required to operate under  
4 the ROD.

5 "Day" shall mean a calendar day unless expressly stated to  
6 be a working day. "Working Day" shall mean a day other than a  
7 Saturday, Sunday, or federal or State of California holiday. In  
8 computing any period of time under this Consent Decree, where the  
9 last day would fall on a Saturday, Sunday, or federal or State of  
10 California holiday, the period shall run until the close of  
11 business of the next Working Day.

12 "Department of Health Services," or "DHS" shall mean the  
13 California pollution control agency of that name and any  
14 successor departments or agencies of the State of California with  
15 authority to implement the Safe Drinking Water Act.

16 "Department of Toxic Substances Control" or "DTSC" shall  
17 mean the California pollution control agency of that name and any  
18 successor departments or agencies of the State of California.

19 "Design Defect" shall mean a failure of any system required  
20 to be designed and constructed pursuant to the First Consent  
21 Decree or UAO 92-12 to perform as originally designed, which  
22 results from a failure by a design professional used by Lockheed  
23 Martin or the UAO Parties to adequately design the system to  
24 perform in the manner intended, and as described in the design  
25 specifications contained in the Final Remedial Design Reports  
26 prepared by Lockheed Martin pursuant to the First Consent Decree  
27 or the UAO Parties pursuant to UAO 92-12.  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 "Downstream Facilities" shall mean the Blending Facility  
2 constructed by the UAO Parties pursuant to UAO 92-12 and  
3 facilities constructed or repaired by the City of Burbank  
4 pursuant to the First Consent Decree. Downstream Facilities also  
5 shall mean additional facilities which may be constructed  
6 pursuant to this Consent Decree downstream of the Upstream  
7 Facilities, as defined in this Section. "Downstream" shall mean  
8 the flow of extracted, treated groundwater beginning generally  
9 with the Point of Delivery as "Point of Delivery" is defined by  
10 the First Consent Decree.

11 "EPA" shall mean the United States Environmental Protection  
12 Agency and any successor departments or agencies of the United  
13 States.

14 "Explanation of Significant Differences 1" or "ESD1" shall  
15 mean the document dated November 21, 1990, Appendix B to the  
16 First Consent Decree. "Explanation of Significant Differences 2"  
17 or "ESD2" shall mean the Explanation of Significant Differences  
18 dated February 12, 1997, Appendix 5 to this Consent Decree.

19 "First Consent Decree" shall mean the consent decree entered  
20 by this Court on March 25, 1992, resolving the underlying  
21 complaint filed by the United States against defendants Lockheed  
22 Martin, the City of Burbank and Weber, appended to this Consent  
23 Decree as Exhibit 1, and any amendments or modifications to that  
24 consent decree.

25 "Future Basin-wide Response Costs" shall mean all Basin-wide  
26 Response Costs incurred or paid by EPA after September 30, 1995  
27 or incurred or paid by the State after March 31, 1996.  
28

4483-9099

1 "Future Site-Specific Response Costs" shall mean all types  
2 of costs described in the definition of Basin-wide Response  
3 Costs, (e.g., payroll costs) above, incurred or paid by the  
4 United States after the Certification of Completion issues with  
5 respect to the First Consent Decree, or by the State after March  
6 31, 1996, with regard to Burbank Operable Unit-specific response  
7 actions.

8 "Interest" shall mean interest at the rate specified for  
9 interest on investments of the Hazardous Substance Superfund  
10 established under Subchapter A of Chapter 98 of Title 26 of the  
11 U.S. Code, compounded on October 1 of each year, in accordance  
12 with 42 U.S.C. § 9607(a).

13 "Los Angeles Department of Water and Power" or "LADWP" shall  
14 mean the department of the City of Los Angeles, and any successor  
15 agencies or departments, with which EPA has entered into  
16 cooperative agreements for the performance of the Basin-wide  
17 Remedial Investigation and Feasibility Study for the San Fernando  
18 Valley Superfund sites.

19 "National Contingency Plan" or "NCP" shall mean the National  
20 Oil and Hazardous Substances Pollution Contingency Plan  
21 promulgated pursuant to Section 105 of CERCLA, 42 U.S.C. § 9605,  
22 codified at 40 C.F.R. Part 300, including, but not limited to,  
23 any amendments thereto.

24 "Operation and Maintenance" or "O&M" or "O&M Activities"  
25 shall mean the activities required to operate, maintain and  
26 monitor the effectiveness of the interim remedial action as  
27 required under the Operation and Maintenance Plan(s) approved or  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 | developed by EPA in conformance with this Consent Decree, UAO 92-  
2 | 12, the Second Stage O&M Work Plan to be developed under this  
3 | Consent Decree, and the Second Stage Statement of Work attached  
4 | as Appendix 4 to this Consent Decree.

5 | "O&M Trust Account" shall mean the trust account which  
6 | Lockheed Martin shall be required to establish pursuant to  
7 | Section XIV (Funding of Response Activities), Paragraph D of this  
8 | Consent Decree.

9 | "Operations and Maintenance Contractor" or "O&M Contractor"  
10 | shall mean the principal contractor retained by the Settling Work  
11 | Defendant to perform the O&M Activities. The O&M Contractor  
12 | shall, inter alia: (1) provide the staff to operate and maintain  
13 | the Plant Facilities; (2) conduct the day-to-day physical tasks  
14 | of operating the Plant Facilities; (3) perform routine water  
15 | quality monitoring; (4) physically perform the routine and non-  
16 | routine maintenance of the Plant Facilities; and (5) maintain the  
17 | daily operational records of the Plant Facilities.

18 | "Owner Settling Defendants" shall mean the Settling  
19 | Defendants listed in Appendix 2.

20 | "Paragraph" shall mean a portion of this Consent Decree or  
21 | the First Consent Decree identified by an Arabic numeral or an  
22 | upper case letter.

23 | "Parties" shall mean the United States, the State of  
24 | California DTSC and the Settling Defendants.

25 | "Past Basin-wide Response Costs" shall mean all Basin-wide  
26 | Response Costs incurred and paid by EPA prior to September 30,  
27 | 1995, or incurred and paid by the State prior to March 31, 1996.  
28 |

4483-9099

1 | "Past Site-Specific Response Costs" shall mean all costs,  
2 | including, but not limited to, all types of costs described in  
3 | the definition of Basin-wide Response Costs, (e.g. payroll  
4 | costs), above, that the United States incurred and paid with  
5 | regard to the Burbank Operable Unit Site prior to the issuance of  
6 | the Certification of Completion for the First Consent Decree or  
7 | that the State incurred and paid prior to March 31, 1996.

8 | "Performance Standards" shall mean those operation and  
9 | maintenance standards, standards of control, and other  
10 | substantive requirements, criteria or limitations set forth in  
11 | the ROD, the First Consent Decree or this Consent Decree, the  
12 | Second Stage Statement of Work, Appendix 4 to this Consent  
13 | Decree, and any work plan established pursuant to the First  
14 | Consent Decree or this Consent Decree. In the event of any  
15 | conflict between the First Consent Decree and this Consent  
16 | Decree, or between any work plan established pursuant to the  
17 | First Consent Decree or this Consent Decree as to the Performance  
18 | Standards that apply to the O&M Activities, this Consent Decree  
19 | or the work plan established pursuant to this Consent Decree  
20 | shall control.

21 | "Plaintiffs" shall mean the United States and the State of  
22 | California DTSC.

23 | "Plant Facilities" shall mean all parts of the  
24 | infrastructure necessary to carry out the Burbank Operable Unit  
25 | interim remedy, as constructed pursuant to the First Consent  
26 | Decree and UAO 92-12, including without limitation the extraction  
27 | wellfield, treatment plant, disinfection facility, booster  
28 |

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 station, blending water interconnection and pipeline, connecting  
2 pipelines for extraction wells to treatment plant, and Blending  
3 Facility.

4 "Regional Water Quality Control Board" or "RWQCB" shall mean  
5 the California pollution control agency and any successor  
6 agencies or departments of the State of California, which  
7 performs ongoing source investigation and source control work in  
8 the San Fernando Valley Basin pursuant to a cooperative agreement  
9 between EPA and the State Water Resources Control Board.

10 "RCRA" shall mean the Solid Waste Disposal Act, as amended,  
11 42 U.S.C. §§ 6901 et seq., (also known as the Resource  
12 Conservation and Recovery Act).

13 "Record of Decision" or "ROD" shall mean the EPA Record of  
14 Decision relating to the Burbank Operable Unit, signed on June  
15 30, 1989, by the Regional Administrator, EPA Region IX, and all  
16 attachments thereto, as modified by the First Consent Decree,  
17 ESD1 and ESD2.

18 "Related Settling Defendants" shall mean entities related to  
19 Settling Cash Defendants and identified as such in Appendix 1.

20 "Released Parties" shall mean Settling Defendants and their  
21 officers, directors, employees and agents; where the Settling  
22 Defendant or other Released Party is a trust, Released Party also  
23 shall mean its trustees and successor trustees appointed to carry  
24 out the purposes of said trust; where the Settling Defendant or  
25 other Released Party is a corporate entity, Released Party also  
26 shall mean its corporate successors to potential liability for  
27 the Site; and where the Settling Defendant or other Released  
28

4483-9099

1 Party is a partnership, Released Party also shall mean its  
2 partners. "Released Parties" also shall mean the named entities  
3 described in Appendix 1 as Released Parties related to one or  
4 more of the Settling Defendants.

5 "Remedial Action" or "Remedial Action Work" shall mean those  
6 activities, except for Operation and Maintenance, to be  
7 undertaken or which have been undertaken by any of the Settling  
8 Defendants to implement the final plans and specifications  
9 submitted by certain of the Settling Defendants pursuant to the  
10 Remedial Design Work Plan under the First Consent Decree or the  
11 UAO Remedial Design Work Plan under UAO 92-12 and approved by  
12 EPA.

13 "Remedial Action Work Plan" shall mean the documents  
14 submitted by Lockheed Martin and/or the City of Burbank pursuant  
15 to the Statement of Work, Appendix D to the First Consent Decree.

16 "Remedial Design" shall mean those activities which were  
17 undertaken by Lockheed Martin and/or the City of Burbank pursuant  
18 to the Statement of Work ("SOW"), Appendix D to the First Consent  
19 Decree, to develop the final plans and specifications for the  
20 Remedial Action pursuant to the Remedial Design Statement of  
21 Work, or by the UAO Parties pursuant to the Work Schedule,  
22 Appendix A to UAO 92-12, to develop the final plans and  
23 specifications for the Blending Facility.

24 "Remedial Design Statement of Work" or "SOW" shall mean the  
25 document appended as Appendix D to the First Consent Decree.

26 "Remedial Design Work Plan" shall mean the work plans  
27 prepared by Lockheed Martin and/or the City of Burbank pursuant  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 to the SOW, Appendix D to the First Consent Decree, to describe  
2 the final plans and specifications for the Remedial Action.  
3 "Second Consent Decree Trust Account" pertains to the trust  
4 account which Lockheed Martin shall be required to establish  
5 pursuant to Section XIV (Funding of Response Activities),  
6 Paragraph C of this Consent Decree.  
7 "Second Stage Operation and Maintenance Work Plan" or  
8 "Second Stage O&M Work Plan" shall mean the document prepared  
9 pursuant to Section VI of this Consent Decree (Performance of the  
10 Work), which shall describe certain Settling Defendants'  
11 obligations to operate and maintain, and to dismantle,  
12 decommission or otherwise dispose of the Plant Facilities.  
13 "Second Stage Statement of Work" or "Second Stage SOW" shall  
14 mean the statement of work for implementation of the O&M  
15 Activities, attached as Appendix 4 to this Consent Decree.  
16 "Section" shall mean a portion of this Consent Decree or the  
17 First Consent Decree identified by a Roman numeral.  
18 "Settling Cash Defendants" shall mean those Settling  
19 Defendants who have funded, in whole or in part, the Second  
20 Consent Decree Trust Account described in Section XIV (Funding of  
21 Response Activities), via a settlement with Lockheed Martin in  
22 the action Lockheed Martin Corporation v. Crane Company et al.,  
23 United States District Court, Central District of California,  
24 Case No. CV 94 2717 MRP (Tx). This term includes each of the UAO  
25 Parties.  
26 "Settling Defendants" shall mean Lockheed Martin, Settling  
27 Cash Defendants, Related Settling Defendants and Settling Work  
28

4483-9099

1 Defendant.  
2 "Settling Work Defendant" shall mean the Settling Defendant  
3 that is obligated to perform the Operation and Maintenance  
4 Activities pursuant to this Consent Decree, except as to Design  
5 Defects as provided in Section VI (Performance of the Work),  
6 capital expenditures that are not integral to the Upstream  
7 Facilities as provided in Section XIV (Funding Obligations),  
8 Paragraph K (Capital Expenditures), and as provided for in  
9 Section XIV (Funding Obligations), Paragraph M (Funding  
10 Obligation for Design Defects). The City of Burbank is the sole  
11 Settling Work Defendant pursuant to this Consent Decree.  
12 "Site" shall mean the areal extent of hazardous substance  
13 groundwater contamination that is presently located in the  
14 vicinity of the Burbank well field and includes any areas to  
15 which and from which such hazardous substance groundwater  
16 contamination migrates.  
17 "State" shall mean the Department of Toxic Substances  
18 Control and any successor agencies or departments of the State.  
19 "State Water Resources Control Board" or "SWRCB" shall mean  
20 the California pollution control agency and any successor  
21 agencies or departments of the State of California, with which  
22 EPA has entered into a series of cooperative agreements for the  
23 ongoing source identification and source control in the Basin  
24 conducted by the RWQCB.  
25 "Statement of Work" or "SOW" shall mean the statement of  
26 work for implementation of the Remedial Action, and the first two  
27 years of Operation and Maintenance at the Site, as set forth in  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 Appendix D to the First Consent Decree and any modifications made  
2 pursuant to the First Consent Decree.

3 "Supervising Contractor" shall mean the principal contractor  
4 retained or otherwise selected by the Settling Work Defendant,  
5 and approved by EPA, to (1) develop the Second Stage O&M Work  
6 Plan; (2) prepare the Project Time Line and Staffing Plan  
7 required by Section VI, Paragraph C.8 of this Consent Decree; (3)  
8 prepare bid documents to select the O&M Contractor; and (4)  
9 conduct periodic oversight, including engineering oversight of  
10 the O&M Contractor, and submit reports on such periodic oversight  
11 to EPA.

12 "UAO 92-12" shall mean the unilateral administrative order  
13 executed by EPA on March 26, 1992 as amended by a letter of April  
14 28, 1992, from Jeffrey Zelikson to the UAO Parties, appended as  
15 Exhibit 2 to this Consent Decree.

16 "UAO Parties" shall mean the Respondents as defined in  
17 Section VII.V of UAO 92-12: Aeroquip Corporation, Crane Company,  
18 Inc., Janco Corporation, Sargent Industries, Incorporated,  
19 Antonini Family Trust, and Ocean Technology, Incorporated.

20 "UAO Remedial Action Work Plan" shall mean the document  
21 submitted by the UAO Parties pursuant to Attachment A to UAO 92-  
22 12.

23 "UAO Remedial Design" shall mean those activities which were  
24 undertaken by the recipients of UAO 92-12 to develop the final  
25 plans and specifications for the Blending Facility pursuant to  
26 Attachment A to UAO 92-12.

27 "UAO Remedial Design Statement of Work" or "UAO SOW" shall  
28

4483-9099

1 mean the remedial design document prepared by the recipients of  
2 UAO 92-12 and submitted pursuant to Attachment A to UAO 92-12.

3 "UAO Remedial Design Work" shall mean the activities to be  
4 undertaken by the UAO Parties as defined in Section VII.T of UAO  
5 92-12.

6 "UAO Remedial Design Work Plan" shall mean the work plan  
7 prepared by the UAO Parties pursuant to the Work Schedule,  
8 Appendix A to UAO 92-12, to describe the final plans and  
9 specifications for the Blending Facility.

10 "Upstream Facilities" pertains to all facilities designed  
11 and constructed by Lockheed Martin pursuant to the First Consent  
12 Decree and modifications thereto, and to additional facilities  
13 which may be constructed pursuant to this Consent Decree upstream  
14 of the Blending Facility as originally constructed by the UAO  
15 Parties pursuant to UAO 92-12. "Upstream" pertains to the flow  
16 of extracted, treated groundwater beginning with its extraction  
17 from the aquifer and generally concluding with the Point of  
18 Delivery as "Point of Delivery" is defined in the First Consent  
19 Decree.

20 "United States" shall mean the United States of America.

21 "Waste Material" shall mean (1) any "hazardous substance"  
22 under Section 101(14) of CERCLA, 42 U.S.C. § 9601(14); (2) any  
23 pollutant or contaminant under Section 101(33), 42 U.S.C.  
24 § 9601(33); (3) any "solid waste" under Section 1004(27) of RCRA,  
25 42 U.S.C. § 6903(27); and (4) any "hazardous material" under  
26 California Health & Safety Code Section 25100 et seq.

27 "Working Day" shall mean a day other than a Saturday, Sunday  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 or federal or State of California holiday.

2 V. GENERAL PROVISIONS

3 A. Purpose.

4 The purposes of this Consent Decree are to protect public  
5 health, welfare or the environment at the Site by the  
6 implementation of response actions at the Site, to reimburse part  
7 of the Plaintiffs' response costs related to the Site, and to  
8 resolve amicably the claims asserted against Settling Defendants  
9 in the underlying complaints filed in this matter.

10 B. Commitments by Settling Defendants.

11 1. Lockheed Martin, the City of Burbank, the UAO  
12 Parties and the other Settling Cash Defendants shall finance  
13 and/or perform the O&M Activities and other obligations, if any,  
14 described in Sections VI, (Performance of the Work), VII  
15 (Additional Response Actions), VIII (EPA Periodic Review) and XIV  
16 (Funding of Response Activities) herein in accordance with this  
17 Consent Decree and all plans, standards, specifications, and  
18 schedules set forth in or developed or approved by EPA pursuant  
19 to this Consent Decree. Lockheed Martin shall also reimburse the  
20 United States and the State for Past and Future Site-Specific and  
21 Past Basin-wide Response Costs as provided in Section XVII of  
22 this Consent Decree (Reimbursement of Response Costs).

23 2. The obligations of Lockheed Martin, the City of  
24 Burbank, the UAO Parties and the other Settling Cash Defendants  
25 to finance and/or to perform the O&M Activities, and other  
26 obligations, if any, and to pay amounts owed to the United States  
27 and the State under this Consent Decree are several, except with  
28

4483-9099

1 respect to the UAO Parties' obligation to fund response actions  
2 pursuant to Section XIV (Funding of Response Activities),  
3 Paragraph M, which is joint and several as among the UAO Parties,  
4 and the Settling Cash Defendants' obligation to fund response  
5 actions pursuant to Section XIV, Paragraph N, which is joint and  
6 several among the Settling Cash Defendants.

7 3. Compliance With Applicable Law.

8 All response activities undertaken by any Settling  
9 Defendants pursuant to this Consent Decree shall be performed in  
10 accordance with the requirements of all applicable federal and  
11 State of California laws and regulations. Settling Defendants  
12 who perform response activities also shall comply with all  
13 applicable or relevant and appropriate requirements of all  
14 federal and State of California environmental laws as set forth  
15 in the ROD, the Explanations of Significant Differences, the SOW,  
16 the First Consent Decree, this Consent Decree, and any  
17 deliverables developed or approved by EPA under the First Consent  
18 Decree, UAO 92-12 or this Consent Decree. The activities  
19 conducted in accordance with this Consent Decree shall be  
20 considered to be consistent with the NCP.

21 C. Permits.

22 1. As provided in Section 121(e) of CERCLA, 42 U.S.C.  
23 § 9621(e) and Section 300.5 of the NCP, no permit shall be  
24 required for any portion of the O&M Activities conducted entirely  
25 on-site. Where any portion of the O&M Activities requires a  
26 federal or State of California permit or approval, Settling Work  
27 Defendant shall submit timely and complete applications and take  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 all other reasonable actions necessary to obtain all such permits  
2 or approvals. Nothing in this Paragraph shall require the City  
3 of Burbank to exercise condemnation, eminent domain, or similar  
4 powers or authorities.

5 2. Settling Work Defendant may seek relief under the  
6 provisions of Section XIX (Force Majeure) of this Consent Decree  
7 for any delay in the performance of the O&M Activities resulting  
8 from a failure to obtain, or a delay in obtaining, any permit  
9 required for the O&M Activities.

10 3. This Consent Decree is not, and shall not be  
11 construed to be, a permit issued pursuant to any federal or State  
12 of California statute or regulation.

13 D. Notice of Obligations to Successors-in-Title.

14 1. The obligations of each Owner Settling Defendant  
15 with respect to the properties it owns which are identified in  
16 Appendix 2 to this Consent Decree, and the provision of access  
17 under Section X (Access) shall be binding upon such Owner  
18 Settling Defendant and any and all persons who subsequently  
19 acquire by conveyance any fee ownership interest in such property  
20 or portion thereof within the Site, hereinafter "Successors in  
21 Title." Each Owner Settling Defendant warrants and represents  
22 that to the best of its knowledge and belief, the properties it  
23 owns which are identified in Appendix 2 to this Consent Decree  
24 are the only properties it owns within the Site, and the United  
25 States relies upon such representations with respect to the  
26 mutual agreements in this Consent Decree concerning properties  
27 within the Site which are owned by any Settling Defendant.  
28

4483-9099

1 2. In the event of any conveyance of such fee  
2 ownership or portion thereof, each such Owner Settling  
3 Defendant's obligations under this Consent Decree, including its  
4 obligations to provide or secure access pursuant to Section X,  
5 shall continue to be met by such Owner Settling Defendant. In no  
6 event shall the conveyance of an interest in property that  
7 includes, or is a portion of, the Site release or otherwise  
8 affect the liability of such Owner Settling Defendant to comply  
9 with this Consent Decree.

10 3. Any Owner Settling Defendant and any Successor-in-  
11 Title shall, at least thirty (30) days prior to the conveyance of  
12 any fee ownership interest in such property, give written notice  
13 of this Consent Decree to the grantee. The City shall, at least  
14 thirty (30) days prior to the conveyance of any such interest in  
15 the real property it owns at 164 West Magnolia Boulevard in the  
16 City of Burbank, as depicted in Appendix 8 to this Consent  
17 Decree, give written notice of this Consent Decree to the  
18 grantee. No later than thirty (30) days after the conveyance of  
19 any such interest, such Owner Settling Defendant, Successor-in-  
20 Title, or the City shall give written notice to EPA and the State  
21 of the conveyance, including the name and address of the grantee,  
22 and the date on which notice of the Consent Decree was given to  
23 the grantee, and evidence such action by providing a copy of its  
24 notice to the grantee.

25 E. The obligation to provide notice pursuant to this  
26 Section shall terminate upon issuance of the Certification of  
27 Completion pursuant to Section XV (Certification of Completion)  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 of this Consent Decree.

2 F. In the event of any such conveyance by the City of the  
3 property at 164 West Magnolia Boulevard in the City of Burbank,  
4 the City's obligations under this Consent Decree shall continue  
5 to be met by the City. In no event shall the conveyance of an  
6 interest in the property release or otherwise affect the  
7 liability of the City to comply with the Consent Decree. Any  
8 Successor-in-Title to the real property at 164 West Magnolia  
9 Boulevard shall be bound by the provisions of Paragraph D.1  
10 through D.3 of this Section.

11 VI. PERFORMANCE OF THE WORK

12 A. Selection of Supervising Contractor.

13 1. All aspects of the O&M Activities to be performed  
14 by Settling Work Defendant pursuant to Sections VI (Performance  
15 of the Work), VII (Additional Response Actions), VIII (U.S. EPA  
16 Periodic Review), and IX (Quality Assurance, Sampling and Data  
17 Analysis) of this Consent Decree shall be under the direction and  
18 supervision of the Supervising Contractor, the selection of which  
19 shall be subject to disapproval by EPA after a reasonable  
20 opportunity for review and comment by the State. Within one  
21 hundred and eighty (180) days after the entry of this Consent  
22 Decree, Settling Work Defendant shall notify EPA and the State in  
23 writing of the name, title, and qualifications of any contractor  
24 proposed to be the Supervising Contractor. Settling Work  
25 Defendant may submit a list of contractors for pre-qualification  
26 prior to engaging in any bidding process. Settling Work  
27 Defendant may also propose to directly serve in the role of  
28

4483-9099

1 Supervising Contractor, subject to EPA's review and approval.  
2 EPA will issue a notice of approval or disapproval of the  
3 Supervising Contractor. Upon its approval of the Supervising  
4 Contractor, EPA will issue an authorization to proceed. If at  
5 any time thereafter, Settling Work Defendant proposes to change a  
6 Supervising Contractor, Settling Work Defendant shall give such  
7 notice to EPA and the State and must obtain an authorization to  
8 proceed from EPA, after a reasonable opportunity for review and  
9 comment by the State, before the new Supervising Contractor  
10 performs, directs, supervises or implements any O&M Activities  
11 under this Consent Decree. In addition, if the Supervising  
12 Contractor proposes to subcontract any portion of the  
13 supervision, direction or implementation of the O&M Activities  
14 under this Consent Decree, Settling Work Defendant shall give  
15 such notice to EPA and the State and must obtain an authorization  
16 to proceed from EPA, after a reasonable opportunity for review  
17 and comment by the State, before the subcontractor supervises,  
18 directs, or implements any O&M Activities under this Consent  
19 Decree.

20 2. If EPA disapproves a proposed Supervising  
21 Contractor, EPA will notify Settling Work Defendant in writing.  
22 Settling Work Defendant shall submit to EPA and the State a list  
23 of contractors, including the qualifications of each contractor,  
24 that would be acceptable to it within thirty (30) days of receipt  
25 of EPA's disapproval of the contractor previously proposed. EPA  
26 will provide written notice of the names of any contractor(s)  
27 that it disapproves and an authorization to proceed with respect  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 to any of the other contractors. Settling Work Defendant may  
2 select any contractor from that list that is not disapproved and  
3 shall notify EPA and the State of the name of the contractor  
4 selected within twenty-one (21) days of EPA's authorization to  
5 proceed.

6 3. If EPA fails to provide written notice of its  
7 approval, authorization to proceed or disapproval as provided in  
8 this Paragraph, and this failure prevents Settling Work Defendant  
9 from meeting one or more deadlines pursuant to this Consent  
10 Decree, Settling Work Defendant may seek relief under the  
11 provisions of Section XIX (Force Majeure) hereof.

12 B. Selection of O&M Contractor.

13 1. The day-to-day conduct of the O&M Activities will  
14 be performed by the O&M Contractor as defined in Section IV  
15 (Definitions) of this Consent Decree. The selection of the O&M  
16 Contractor shall be subject to disapproval by EPA after a  
17 reasonable opportunity for review and comment by the State.  
18 Within one hundred and eighty (180) days after the System  
19 Operation Date for Phase Two of the Remedial Action Work as  
20 specified in the First Consent Decree, Settling Work Defendant  
21 shall notify EPA and the State in writing of the name, title and  
22 qualifications of any contractor proposed to be the O&M  
23 Contractor. EPA will issue a notice of approval or disapproval.  
24 Upon issuance of a notice of approval, EPA shall issue an  
25 authorization to proceed. If at any time thereafter, Settling  
26 Work Defendant proposes to change the O&M Contractor, Settling  
27 Work Defendant shall give such notice to EPA and the State and  
28

4483-9099

1 must obtain an authorization to proceed from EPA, after a  
2 reasonable opportunity for review and comment by the State,  
3 before the new O&M Contractor performs, directs, supervises or  
4 implements any O&M Activities under this Consent Decree. In  
5 addition, if the O&M Contractor proposes to subcontract any  
6 portion of O&M Activities under this Consent Decree, Settling  
7 Work Defendant shall give such notice to EPA and the State and  
8 must obtain an authorization to proceed from EPA, after a  
9 reasonable opportunity for review and comment by the State,  
10 before the subcontractor supervises, directs, or implements any  
11 O&M Activities under this Consent Decree.

12 2. EPA's approval or disapproval of Settling Work  
13 Defendant's selection of an O&M Contractor shall be governed by  
14 the procedures set forth in Section VI (Performance of the Work),  
15 Paragraphs A.2 and A.3 of this Consent Decree.

16 C. Completion of the Response Action.

17 1. Under Section VII of the First Consent Decree,  
18 Lockheed Martin, Weber and the City of Burbank submitted to EPA,  
19 inter alia, a work plan for the Remedial Design ("Remedial Design  
20 Work Plan"), a work plan for the Remedial Action at the Site  
21 ("Remedial Action Work Plan") and a plan for the first two years  
22 of the Operation & Maintenance ("O&M Work Plan") of the interim  
23 remedy. The Remedial Design, Remedial Action and O&M Work Plans  
24 provided for design and implementation of part of the interim  
25 remedy set forth in the ROD in accordance with the SOW and, upon  
26 approval by EPA, were incorporated into and became enforceable  
27 under the First Consent Decree. Under Section VII, Paragraph H.1  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 of the First Consent Decree, the City of Burbank agreed to accept  
2 the treated, blended groundwater for distribution to the public  
3 water supply.

4 2. Lockheed Martin, Weber and the City of Burbank are  
5 performing their obligations under the First Consent Decree.  
6 Unless otherwise stated in this Consent Decree, these parties'  
7 obligations under the First Consent Decree are not altered in any  
8 manner by this Consent Decree.

9 3. Under Section X of UAO 92-12, the UAO Parties were  
10 required to submit, inter alia, a Remedial Design Work Plan and  
11 Remedial Action Work Plan for the design, construction and  
12 operation of the Blending Facility.

13 4. The UAO Parties are performing their obligations  
14 under UAO 92-12. Unless otherwise stated in this Consent Decree,  
15 these parties' obligations under UAO 92-12 are not altered in any  
16 manner by this Consent Decree. The UAO Parties agree to perform  
17 and complete their obligations under UAO 92-12.

18 5. Settling Work Defendant shall begin conducting the  
19 Operation and Maintenance of the Plant Facilities, beginning on  
20 the Date of Commencement and concluding upon EPA's issuance of a  
21 Certification of Completion in accordance with Section XV  
22 (Certification of Completion) of this Consent Decree.  
23 Specifically, Settling Work Defendant shall operate and maintain  
24 the Plant Facilities and monitor the effectiveness of such  
25 facilities, for the duration of the time required by the ROD.

26 6. Lockheed Martin shall perform all work necessary to  
27 dismantle and decommission the Plant Facilities upon EPA's  
28

4483-9099

1 determination pursuant to Paragraph A.1 of Section XV  
2 (Certification of Completion) of this Consent Decree that  
3 dismantling and/or decommissioning is required.

4 7. As provided in Section XIV (Funding of Response  
5 Activities), Paragraphs D and M, Lockheed Martin shall fund the  
6 O&M Activities for the Upstream Facilities and any response  
7 activities required because of a Design Defect in the Upstream  
8 Facilities. As is also provided in Section XIV (Funding of  
9 Response Activities), Paragraph C, the Settling Cash Defendants  
10 shall fund the Second Consent Decree Trust Account according to  
11 their respective shares as set forth in Appendix 6 to this  
12 Consent Decree, which is submitted under seal. As provided in  
13 Section XIV, Paragraph M.2(c)(2), the UAO Parties also shall fund  
14 any response activities required because of a Design Defect in  
15 the Blending Facility. Lockheed Martin, the City of Burbank, and  
16 the Settling Cash Defendants shall fund any response activities  
17 required because of an earthquake or Uninsurable Force Majeure  
18 Event, as defined in Section XIV, Paragraph N, as provided in  
19 that Paragraph. The City of Burbank shall fund the Operation and  
20 Maintenance of the Downstream Facilities except insofar as the  
21 UAO Parties may be required to fund such activities because of a  
22 Design Defect, or Lockheed Martin or the Settling Cash Defendants  
23 may be required to fund such activities because of an earthquake  
24 or Uninsurable Force Majeure Event.

25 8. Within one year after the Effective Date of this  
26 Consent Decree, as defined in Section XXVIII (Effective Date),  
27 Settling Work Defendant shall submit to EPA:  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 a. A Staffing Plan indicating lines of  
2 responsibility and communication for day-to-day operations, and  
3 designating the person or persons responsible for oversight of  
4 the O&M Activities on behalf of Settling Work Defendant. Such  
5 person or persons may be a member or members of Settling Work  
6 Defendant's staff or a member of Settling Work Defendant's  
7 Supervising or O&M Contractors' staffs. Settling Work Defendant  
8 shall also designate a single contact for communications with EPA  
9 for the O&M Activities from the Effective Date of this Consent  
10 Decree, as defined in Section XXVIII (Effective Date), through  
11 completion of the Remedial Action.

12 b. A Time Line and Schedule describing the timing  
13 of the O&M Activities which will be carried out during the period  
14 of time covered by the First Consent Decree, including but not  
15 limited to any transitions in operations responsibility to take  
16 place between Lockheed Martin and the City of Burbank prior to or  
17 at the Date of Commencement.

18 9. Within two (2) years after the Effective Date of  
19 this Consent Decree, as defined in Section XXVIII (Effective  
20 Date), the Settling Work Defendant shall submit to EPA a Second  
21 Stage O&M Work Plan describing in detail the tasks to be  
22 performed to operate and maintain the Plant Facilities.

23 D. Settling Defendants acknowledge and agree that nothing  
24 in the First Consent Decree, this Consent Decree, the Second  
25 Stage O&M Work Plan or in any plan approved pursuant to the First  
26 Consent Decree or this Consent Decree constitutes a warranty or  
27 representation of any kind by Plaintiffs that compliance with the  
28

4483-9099

1 work requirements set forth in the O&M Second Stage Work Plan and  
2 completion of the O&M Activities will achieve the Performance  
3 Standards. Settling Work Defendant's compliance with the  
4 requirements of Section VI (Performance of the Work) shall not  
5 foreclose Plaintiffs from seeking achievement of all requirements  
6 of the ROD including, but not limited to, the applicable  
7 Performance Standards.

8 E. Settling Work Defendant shall, prior to any off-site  
9 shipment of Waste Material from the Site to an out-of-state waste  
10 management facility, provide written notification to the  
11 appropriate state environmental official in the receiving  
12 facility's state and to the EPA Project Coordinator of such  
13 shipment of Waste Material. However, this notification  
14 requirement shall not apply to any off-site shipments when the  
15 total volume of all such shipments will not exceed 10 cubic  
16 yards.

17 1. The Settling Work Defendant shall include in the  
18 written notification the following information, where available:  
19 (1) the name and location of the facility to which the Waste  
20 Material(s) are to be shipped; (2) the type and quantity of the  
21 Waste Material to be shipped; (3) the expected schedule for the  
22 shipment of the Waste Material; and (4) the method of  
23 transportation. The Settling Work Defendant shall notify the  
24 state in which the planned receiving facility is located of major  
25 changes in the shipment plan, such as a decision to ship the  
26 Waste Material to another facility within the same state, or to a  
27 facility in another state.  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1           2. The Settling Work Defendant shall provide the  
2 information required by this Section, Paragraph E.1 as soon as  
3 practicable and before the Waste Material is actually shipped.

4           F. Miscellaneous Standards of Control.

5           1. Settling Work Defendant may discharge extracted  
6 water to any offsite conveyance(s) leading to any Publicly Owned  
7 Treatment Works ("POTW") or to any off-site conveyance(s) leading  
8 to any water(s) of the United States for a period of up to five  
9 (not necessarily consecutive) days during any month, if the water  
10 is not accepted by the City and cannot be vended, provided that  
11 the following requirements are met for such discharge:

12           a. All substantive and procedural requirements  
13 applicable to such discharge at the time of such discharge shall  
14 be met, including any limits on the quantity of water to be  
15 discharged;

16           b. The total combined amount of any discharge(s)  
17 of extracted water to any off-site conveyance(s) leading to any  
18 POTW(s) at any time shall not exceed 6,000 gpm; and

19           c. The total combined amount of extracted water  
20 discharged to any off-site conveyance(s) leading to any POTW(s)  
21 and to any off-site conveyance(s) leading to any water(s) of the  
22 United States at any time shall not exceed 9,000 gpm.  
23 Nothing in this Paragraph shall excuse Settling Work Defendant  
24 from stipulated penalties for failure to comply with any other  
25 requirements of this Consent Decree.

26           2. Settling Work Defendant may discharge development  
27 and purge water from wells to any off-site conveyance(s) leading  
28

4483-9099

1 to any POTW or to any offsite conveyance(s) leading to any  
2 water(s) of the United States, provided that any such discharge  
3 is in compliance with all substantive and procedural requirements  
4 applicable to such discharge at the time of such discharge.

5 Water discharged pursuant to this Section, Paragraph F.2 shall  
6 not be included in the limits on the amount of water allowed to  
7 be discharged pursuant to this Section, Paragraph F.1.

8           3. Any water containing hazardous constituents and  
9 stored onsite for more than ninety (90) days shall be handled as  
10 a hazardous waste onsite. Such storage shall be accomplished in  
11 compliance with the substantive requirements of 40 C.F.R. Part  
12 264, Subparts I and J, and 22 California Code of Regulations,  
13 Chapter 30, Article 24 ("Use and Management of Containers") and  
14 Article 25 ("Tank Systems"). These requirements are applicable  
15 or relevant and appropriate requirements for the O&M Activities.

16           4. With respect to requirements for the operation of  
17 the groundwater treatment plant's VOC-stripper (i.e., air  
18 stripper with vapor phase granulated activated carbon absorption  
19 units), South Coast Air Quality Management District ("SCAQMD")  
20 Rule 1167 was rescinded in December of 1988 and Settling Work  
21 Defendant is not required to comply with this Rule despite any  
22 other language in this Consent Decree. Furthermore, some of the  
23 regulations cited in the ROD have been changed by the SCAQMD.  
24 The only requirements of the SCAQMD that Settling Work Defendant  
25 is required to comply with in performing Work onsite are the  
26 substantive requirements of the following applicable or relevant  
27 and appropriate requirements for the groundwater treatment plant  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 VOC stripper:

2 a. SCAQMD Regulation XIII, as amended through

3 June 28, 1990; and

4 b. SCAQMD Rule 1401, as adopted on June 1, 1990.

5 G. System Operation Minimum Standards. The work to be

6 performed shall achieve the Performance Standards and shall, at a

7 minimum, achieve the following standards during system operation:

8 1. All groundwater to be extracted shall be treated by

9 Settling Work Defendant to a level such that the following chemi-

10 cals do not exceed their respective MCL:

11 <u>Chemical</u>	<u>MCL</u>
12 PCE	5.0 micrograms/liter
13 TCE	5.0 micrograms/liter

14 2. All treated groundwater shall be disinfected and

15 then blended by the Settling Work Defendant to meet all legal

16 requirements for introduction of the blended water into the

17 City's water supply system, including, but not limited to, the

18 MCL for nitrate.

19 3. Settling Work Defendant shall operate and maintain

20 the facilities it is required to operate and maintain in such a

21 way as to ensure that failure to attain drinking water standards

22 promulgated and in effect on the date of delivery (other than the

23 MCL for nitrate), regardless of when any such standards were

24 promulgated, shall result in the immediate, and, in all cases

25 where possible, automatic shut-down of the groundwater treatment

26 plant and water delivery system. Such a shut-down shall not, in

27 and of itself, release Settling Work Defendant from any other

28

4483-9099

1 requirement of this Consent Decree and specifically shall not, in

2 and of itself, affect the requirement that Settling Work

3 Defendant pay stipulated penalties for failure to extract and

4 deliver water in the amounts and of the quality required by

5 Paragraphs G.3 and H.1 of this Section.

6 H. Extraction Requirements.

7 1. The Settling Work Defendant shall extract and treat

8 an annual average of 9,000 g.p.m. of contaminated groundwater

9 except as otherwise provided in this Section. Settling Work

10 Defendant shall purvey all treated groundwater which satisfies

11 the treatment standards established by Paragraphs G and H of this

12 Section up to an amount which, when blended with the blending

13 water, will meet the City's Water Demand (as defined in the

14 Second Stage Statement of Work) without resulting in a nitrate

15 concentration in the blended water that exceeds the promulgated

16 MCL for nitrate in effect at that time; provided however that, in

17 order to maximize the Settling Work Defendant's use of treated

18 groundwater while providing a margin of safety in achieving

19 compliance with the MCL for nitrate, the Settling Work Defendant

20 shall be deemed to be in compliance with this Paragraph if it

21 a. Achieves at all times a level of nitrate in

22 the blended water which is no greater than eighty-nine percent

23 (89%) of the promulgated MCL for nitrate that is in effect at the

24 time of the blending;

25 b. Extracts contaminated groundwater at an annual

26 average rate of 9,000 g.p.m. at all times when the nitrate level

27 in the extracted groundwater does not exceed 50 mg/l as nitrate;

28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 and

2 c. Maximizes the use of the extracted groundwater

3 to the degree possible when the nitrate level in the extracted

4 groundwater exceeds 50 mg/l as nitrate.

5 2. Notwithstanding the requirements of Paragraph H.1

6 of this Section, the Settling Work Defendant shall not be charged

7 a stipulated penalty for failure to meet a nitrate level

8 specified in that Paragraph except where the nitrate

9 concentrations of the blended water exceed the promulgated MCL

10 for nitrate in effect at the time of the blending.

11 3. Settling Work Defendant shall maximize the amount

12 of extraction from the Phase I and Phase II extraction wells and

13 shall preferentially extract groundwater from these wells to meet

14 its Water Demand as limited by the amount of water the Settling

15 Work Defendant is required to accept pursuant to Paragraph H.1 of

16 this Section.

17 4. Settling Work Defendant shall extract, treat and

18 use its best efforts to vend or discharge, in compliance with

19 Paragraphs F and G of this Section, additional groundwater such

20 that the total amount of water extracted, treated and then

21 delivered by the Settling Work Defendant, or vended or discharged

22 by the Settling Work Defendant, equals or exceeds 9,000 g.p.m. on

23 an annual average. Extraction from the City's liquid phase GAC

24 wellfield located at 164 West Magnolia Boulevard, Burbank,

25 California, as depicted in the plot plan attached as Appendix 8

26 to this Consent Decree, may be counted towards Settling Work

27 Defendant's achievement of the 9,000 g.p.m. annual average

28

4483-9099

1 extraction requirement. Settling Work Defendant shall be subject

2 to stipulated penalties if it fails to achieve the 9,000 g.p.m.

3 annual average extraction requirement, unless such failure is due

4 to nitrate levels in the extracted groundwater which exceed 50

5 mg/l as nitrate.

6 I. Settling Work Defendant shall not be obligated to meet

7 the requirements of this Section, Paragraph H.1 if a new drinking

8 water standard is promulgated after March 1, 1997, EPA has

9 identified such standard as applicable or relevant and

10 appropriate for the treated groundwater and necessary to protect

11 public health or the environment and such standard cannot be met

12 without modifying the facilities constructed pursuant to Section

13 VII, Subpart A of the First Consent Decree or changing their

14 operation.

15 VII. ADDITIONAL RESPONSE ACTIONS

16 A. In the event that EPA determines or the Settling Work

17 Defendant proposes that additional response actions are necessary

18 to meet the Performance Standards or to carry out the interim

19 remedy selected in the ROD, notification of such additional

20 response actions shall be provided to EPA and to each of the

21 Settling Defendants.

22 B. Within thirty (30) days of receipt of notice from EPA or

23 Settling Work Defendant pursuant to Paragraph A of this Section

24 that additional response actions are necessary (or such longer

25 time as may be specified by EPA), Settling Work Defendant shall

26 submit for approval by EPA, after reasonable opportunity for

27 review and comment by the State, a work plan for the additional

28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 response actions. The plan shall conform to the applicable  
2 requirements under law or EPA guidance. Upon approval of the  
3 plan pursuant to Section XII (Submissions Requiring Agency  
4 Approval), Settling Work Defendant shall implement the plan for  
5 additional response actions in accordance with the schedule  
6 contained therein.

7 C. Any additional response actions that Settling Work  
8 Defendant proposes are necessary to meet the Performance  
9 Standards or to carry out the interim remedy selected in the ROD  
10 shall be subject to approval by EPA, after reasonable opportunity  
11 for review and comment by the State, and, if authorized by EPA,  
12 shall be completed by Settling Work Defendant in accordance with  
13 plans, specifications, and schedules approved or established by  
14 EPA pursuant to Section XII (Submissions Requiring Agency  
15 Approval).

16 D. Any Settling Defendant required to fund, perform, or  
17 operate and maintain completed additional response actions may  
18 invoke the procedures set forth in Section XX (Dispute  
19 Resolution) to dispute EPA's determination that additional  
20 response actions are necessary to meet the Performance Standards  
21 or to carry out the interim remedy selected in the ROD. Such a  
22 dispute shall be resolved pursuant to Section XX (Dispute  
23 Resolution), Paragraph F of this Consent Decree.

24 E. The United States and the State reserve all rights  
25 against Settling Defendants, pursuant to Paragraph E of Section  
26 XXII (Covenants Not to Sue by Plaintiffs), if any new  
27 requirement(s) are promulgated or if any requirement(s)  
28

4483-9099

1 promulgated on or before the Effective Date of this Consent  
2 Decree as defined in Section XXVIII (Effective Date) subsequently  
3 are changed and such requirement(s) are determined by EPA to be  
4 both (a) applicable or relevant and appropriate and (b) necessary  
5 to insure that the interim remedy is protective of human health  
6 and the environment and such standard cannot be met without  
7 modifying the Plant Facilities or significantly changing their  
8 operation.

9 F. If EPA determines that reinjection capacity is necessary  
10 for the remedy to meet the Performance Standards or to protect  
11 human health or the environment, the development of such capacity  
12 shall not be considered an additional response action under this  
13 Section. The United States and the State reserve all rights  
14 against Settling Defendants as provided in Paragraph E of Section  
15 XXII (Covenants Not to Sue by Plaintiffs) concerning installation  
16 of such capacity.

17 VIII. EPA PERIODIC REVIEW

18 A. Settling Work Defendant shall conduct any studies and  
19 investigations as requested by EPA in order to permit EPA to  
20 conduct reviews at least every five years as required by Section  
21 121(c), 42 U.S.C. § 9621(c) of CERCLA and any applicable  
22 regulations.

23 B. Settling Defendants and, if required by Sections  
24 113(k)(2) or 117 of CERCLA, 42 U.S.C. §§ 9613(k)(2) or 9617, the  
25 public will be provided with an opportunity to comment on any  
26 further response actions proposed by EPA as a result of the  
27 review conducted pursuant to Section 121(c), of CERCLA, 42 U.S.C.  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 § 9621(c), and to submit written comments for the record during
2 the public comment period. After the period for submission of
3 written comments is closed, the Regional Administrator, EPA
4 Region IX, or his/her delegate will determine in writing whether
5 further response actions are appropriate.

6 C. The United States reserves the right pursuant to Section
7 XXII, Paragraphs A and E of this Consent Decree (Covenants Not to
8 Sue by Plaintiffs) to institute proceedings in this action or in
9 a new action, or to issue an administrative order seeking to
10 compel Settling Defendants or any of them (1) to perform further
11 response actions relating to the Site or (2) to reimburse the
12 United States for additional costs of response if the Regional
13 Administrator, EPA Region IX, or his/her delegate determines that
14 information received, in whole or in part, during the review
15 conducted pursuant to Section 121(c) of CERCLA, 42 U.S.C.
16 § 9621(c), indicates that the Remedial Action or the O&M
17 Activities are not protective of human health or the
18 environment.

19 IX. QUALITY ASSURANCE, SAMPLING, AND DATA ANALYSIS

20 A. Settling Work Defendant shall use quality assurance,
21 quality control, and chain of custody procedures for all
22 treatability, design, compliance and monitoring samples in
23 accordance with EPA's "Interim Guidelines and Specifications For
24 Preparing Quality Assurance Project Plans," December 1980, (QAMS-
25 005/80); "Data Quality Objective Guidance," (EPA/540/G87/003 and
26 004); "EPA NEIC Policies and Procedures Manual," May 1978,
27 revised November 1984, (EPA 330/9-78-001-R); and subsequent
28

4483-9099

1 amendments to such guidelines upon notification by EPA to
2 Settling Work Defendant of such amendment. Amended guidelines
3 shall apply only to procedures conducted after such notification.
4 Prior to the commencement of any monitoring project under this
5 Consent Decree, Settling Work Defendant shall submit to EPA for
6 approval, after a reasonable opportunity for review and comment
7 by the State, a Quality Assurance Project Plan ("QAPP") that is
8 consistent with the Second Stage O&M Work Plan, the NCP and
9 applicable guidance documents. If relevant to the proceeding,
10 the Parties agree that validated sampling data generated in
11 accordance with the QAPP(s) and reviewed and approved by EPA
12 shall be admissible as evidence, without objection, in any
13 proceeding under this Consent Decree. Settling Work Defendant
14 shall ensure that EPA and State personnel and their authorized
15 representatives are allowed access at reasonable times to all
16 laboratories utilized by Settling Work Defendant in implementing
17 this Consent Decree. In addition, Settling Work Defendant shall
18 ensure that such laboratories shall analyze all samples submitted
19 by EPA pursuant to the QAPP for quality assurance monitoring.
20 Settling Work Defendant shall ensure that the laboratories it
21 utilizes for the analysis of samples taken pursuant to this
22 Consent Decree perform all analyses according to accepted EPA
23 methods. Accepted EPA methods consist of those methods which are
24 documented in the "Contract Lab Program Statement of Work for
25 Inorganic Analysis" and the "Contract Lab Program Statement of
26 Work for Organic Analysis," dated February 1988, and any
27 amendments made thereto during the course of the implementation
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 of this Consent Decree. Settling Work Defendant shall ensure  
2 that all laboratories it uses for analysis of samples taken  
3 pursuant to this Consent Decree participate in an EPA or EPA-  
4 equivalent QA/QC program.

5 B. Upon request, Settling Work Defendant shall allow split  
6 or duplicate samples to be taken by EPA and the State or their  
7 authorized representatives. Settling Work Defendant shall  
8 include in the O&M Second Stage Work Plan a schedule of routine,  
9 pre-scheduled sampling events, for example those required by the  
10 California Department of Health Services under the operating  
11 permit for the Plant Facilities, or under existing regulations.  
12 As regulations or permit conditions change and affect this  
13 schedule, Settling Work Defendant shall submit revised schedules  
14 as amendments to the Second Stage O&M Work Plan. For  
15 non-routine, non-emergency sampling events, for example, an  
16 unscheduled performance evaluation study of the Plant Facilities,  
17 Settling Work Defendant shall notify EPA and the State not less  
18 than fourteen (14) days in advance of any sample collection  
19 activity unless shorter notice is agreed to by EPA. In addition,  
20 EPA and the State shall have the right to take any additional  
21 samples that EPA or the State deem necessary. Upon request, EPA  
22 and the State shall allow any Settling Defendant to take split or  
23 duplicate samples of any samples either Plaintiff takes as part  
24 of either Plaintiff's oversight of the implementation of the O&M  
25 activities.

26 C. Settling Work Defendant shall submit to EPA three (3)  
27 copies each of the results of all sampling and/or tests  
28

4483-9099

1 performed, or data gathered pursuant to the implementation of  
2 this Consent Decree unless EPA agrees otherwise. Such results  
3 and other data may be submitted as part of the progress reports  
4 required pursuant to Paragraph A.1 of Section XI (Reporting  
5 Requirements). EPA will provide to Settling Work Defendant's  
6 Project Coordinator results of analyses conducted by EPA pursuant  
7 to Section IX, (Quality Assurance, Sampling and Data Analysis),  
8 Paragraph B of this Consent Decree.

9 D. Notwithstanding any provision of this Consent Decree,  
10 the United States and the State hereby retain all of their  
11 information gathering and inspection authorities and rights,  
12 including enforcement actions related thereto, under CERCLA, RCRA  
13 and any other applicable statutes or regulations.

14 E. Settling Work Defendant may deviate from EPA guidance on  
15 Quality Assurance/Quality Control ("QA/QC") as referenced in  
16 Section IX, Paragraph A of this Consent Decree under the  
17 following circumstances. For compliance monitoring required  
18 under federal and/or State of California drinking water  
19 regulations, Settling Work Defendant may follow QA/QC procedures  
20 required under those regulations so long as EPA determines that  
21 such procedures are equally protective of human health and the  
22 environment as EPA QA/QC procedures.

23 X. ACCESS

24 A. Commencing upon the Effective Date of this Consent  
25 Decree and terminating upon issuance of a final ROD for the Site,  
26 each Owner Settling Defendant agrees to provide the United  
27 States, the State, and their representatives, including EPA and  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 its contractors, access at all reasonable times to real property  
2 to which EPA informs such Owner Settling Defendant access is  
3 required for the implementation of this Consent Decree, to the  
4 extent access to the property is controlled by such Owner  
5 Settling Defendant, for the purposes of conducting any activity  
6 related to this Consent Decree including, but not limited to:

- 7 a. Monitoring the O&M Activities;
- 8 b. Verifying any data or information submitted to the  
9 United States;
- 10 c. Conducting investigations relating to contamination  
11 at or near the Site;
- 12 d. Obtaining samples;
- 13 e. Assessing the need for, planning, or implementing  
14 additional response actions at or near the Site;
- 15 f. Inspecting and copying records, operating logs,  
16 contracts, or other documents maintained or generated by Settling  
17 Defendants or their agents, pursuant to Section XXV (Access to  
18 Information); and
- 19 g. Assessing Settling Defendants' compliance with this  
20 Consent Decree.

21 B. Except to the extent Plaintiffs deem necessary to  
22 protect human health or the environment, Plaintiffs will provide  
23 the affected Settling Defendant with twenty-four (24) hours  
24 notice prior to entry to properties accessed pursuant to this  
25 Consent Decree. In exercising their rights to access under this  
26 Paragraph, Plaintiffs shall to the extent practicable not  
27 unreasonably interfere with Settling Defendants' business or  
28

4483-9099

1 municipal activities. However, nothing in this Paragraph shall  
2 provide Settling Defendants with any claim or cause of action  
3 whatsoever against Plaintiffs, including without limitation any  
4 claim for injunctive relief. In addition, it shall not  
5 constitute an unreasonable interference for Plaintiffs to take  
6 any action they deem necessary to avoid endangerment to human  
7 health or the environment or to respond to an emergency.

8 C. To the extent that any other real property to which  
9 access is required for the implementation of this Consent Decree  
10 is owned or controlled by persons other than Owner Settling  
11 Defendants, Settling Work Defendant shall use best efforts to  
12 secure from such persons access for Settling Work Defendant, as  
13 well as for the United States and the State and their  
14 representatives, including, but not limited to, their  
15 contractors, as necessary to effectuate this Consent Decree. For  
16 purposes of this Paragraph, "best efforts" may include the  
17 payment of reasonable sums of money in consideration of access.  
18 "Best efforts" does not include the exercise of eminent domain,  
19 condemnation or similar authorities. Settling Defendants shall  
20 coordinate and cooperate with Settling Work Defendant as  
21 appropriate and necessary to obtain such access to properties  
22 which they own, control, or to which they otherwise have access.  
23 If any access required to effectuate this Consent Decree is not  
24 obtained within forty-five (45) days of the date of lodging of  
25 this Consent Decree, or within forty-five (45) days of the date  
26 EPA notifies the Settling Work Defendant in writing that  
27 additional access beyond that previously secured is necessary,  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 Settling Work Defendant shall promptly notify the United States,  
2 and shall include in that notification a summary of the steps  
3 Settling Work Defendant, or other Settling Defendants in  
4 coordination and cooperation with Settling Work Defendant, have  
5 taken pursuant to this Section to attempt to obtain access. The  
6 United States or the State may, as either deems appropriate,  
7 assist Settling Work Defendant in obtaining access. Lockheed  
8 Martin shall reimburse the United States or the State, in  
9 accordance with the procedures in Section XVII (Reimbursement of  
10 Response Costs), for all costs incurred by the United States or  
11 the State in obtaining access pursuant to this Section.

12 D. Notwithstanding any provision of this Consent Decree,  
13 the United States and the State retain all of their access  
14 authorities and rights, including enforcement authorities related  
15 thereto, under CERCLA, RCRA and any other applicable statute or  
16 regulations.

17 XI. REPORTING REQUIREMENTS

18 A. In addition to any other requirement of this Consent  
19 Decree, Settling Work Defendant shall submit to EPA and the  
20 State, with the frequency described below, three (3) copies each  
21 of written progress reports that: (a) describe the actions which  
22 have been taken toward achieving compliance with this Consent  
23 Decree during the previous reporting period; (b) include a summary  
24 of all results of sampling and tests and all other data received  
25 or generated by Settling Work Defendant or its contractors or  
26 agents in the previous reporting period; (c) identify all work  
27 plans, plans and other deliverables required by this Consent  
28

4483-9099

1 Decree completed and submitted during the previous period; (d)  
2 describe all actions, including, but not limited to, data  
3 collection and implementation of work plans, which are scheduled  
4 for the subsequent two reporting periods, (e) include information  
5 regarding unresolved delays encountered or anticipated that may  
6 affect the future schedule for implementation of the O&M  
7 Activities, and a description of efforts made to mitigate those  
8 delays or anticipated delays; (f) include any modifications to  
9 the O&M Second Stage Work Plan or other schedules that Settling  
10 Work Defendant has proposed to EPA or that have been approved by  
11 EPA; (g) describe all activities undertaken in support of the  
12 Community Relations Plan during the period dating from the  
13 submission of the last progress report and those to be undertaken  
14 prior to the submission of the next progress report, and (h)  
15 report any out-of-state shipments of Waste Materials that  
16 occurred during the previous reporting period. Settling Work  
17 Defendant shall submit these progress reports to EPA with the  
18 frequency described below, commencing from the Effective Date of  
19 this Consent Decree until EPA notifies the Settling Work  
20 Defendant pursuant to Paragraph A.5 of Section XV (Certification  
21 of Completion). If requested by EPA or the State, Settling Work  
22 Defendant shall also provide briefings for EPA and the State to  
23 discuss the progress of the work.

- 24 1. The progress reports shall be submitted with the  
25 following frequency:  
26 a. Semi-annually from the Effective Date of this  
27 Consent Decree until one year prior to the Date of Commencement;  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1                   b. Quarterly during the year prior to the Date of  
2 Commencement;  
3                   c. Monthly commencing with the Date of  
4 Commencement for a period of three years ("the Monthly Reporting  
5 Requirement").  
6                   d. Quarterly from completion of the Monthly  
7 Reporting Requirement until EPA notifies the Settling Work  
8 Defendant pursuant to Paragraph A.5 of Section XV (Certification  
9 of Completion) of this Consent Decree.

10                2. The Settling Work Defendant shall notify EPA of  
11 any change in the schedule described in the progress reports for  
12 the performance of any activity, including, but not limited to,  
13 data collection and implementation of work plans, no later than  
14 seven (7) days prior to the performance of the activity.

15                B. Upon the occurrence of any event during performance of  
16 the O&M Activities that Settling Work Defendant is required to  
17 report pursuant to Section 103 of CERCLA, 42 U.S.C. § 9603, or  
18 Section 304 of the Emergency Planning and Community Right-to-Know  
19 Act (EPCRA), 42 U.S.C. § 11004, Settling Work Defendant shall  
20 within twenty-four (24) hours of the onset of such event orally  
21 notify the EPA Project Coordinator or the Alternate EPA Project  
22 Coordinator (in the event of the unavailability of the EPA  
23 Project Coordinator), or, in the event that neither the EPA  
24 Project Coordinator or Alternate EPA Project Coordinator is  
25 available, the Emergency Response Section, Region IX, United  
26 States Environmental Protection Agency. These reporting  
27 requirements are in addition to the reporting required by CERCLA  
28

4483-9099

1 Section 103, 42 U.S.C. § 9603 or EPCRA Section 304, 42 U.S.C.  
2 § 11004.  
3                C. Within twenty (20) days of the onset of such an event,  
4 Settling Work Defendant shall furnish to Plaintiffs a written  
5 report, signed by the Settling Work Defendant's Project  
6 Coordinator, setting forth the events which occurred and the  
7 measures taken, and to be taken, in response thereto. Within  
8 thirty (30) days of the conclusion of such an event, Settling  
9 Work Defendant shall submit a report setting forth all actions  
10 taken in response thereto.  
11                D. Settling Work Defendant shall submit three (3) copies of  
12 all plans, reports, and data required by the Second Stage O&M  
13 Work Plan to EPA. Settling Work Defendant shall simultaneously  
14 submit three (3) copies of all such plans, reports and data to  
15 the State.  
16                E. All reports and other documents submitted by Settling  
17 Work Defendant to EPA (other than the progress reports referred  
18 to above) which purport to document Settling Work Defendant's  
19 compliance with the terms of this Consent Decree shall be signed  
20 by an authorized representative of the Settling Work Defendant.  
21                F. Settling Work Defendant shall immediately notify EPA of  
22 any failure to attain MCLs or State of California Action Levels  
23 ("SALs") when such failures occur at a point of compliance as  
24 defined under federal or State of California drinking water  
25 regulations.

XII. SUBMISSIONS REQUIRING AGENCY APPROVAL

A. After review of the Second Stage O&M Work Plan or other item which is required to be submitted for approval pursuant to this Consent Decree, EPA, after reasonable opportunity for review and comment by the State, shall: (1) approve, in whole or in part, the submission; (2) approve the submission upon specified conditions; (3) modify the submission to cure the deficiencies; (4) disapprove, in whole or in part, the submission, directing that the Settling Work Defendant modify the submission; or (5) any combination of the above.

B. In the event of approval, approval upon conditions, modification, disapproval or partial disapproval by EPA, pursuant to this Section, Paragraph A, Settling Work Defendant shall proceed to take any action required by the Second Stage O&M Work Plan or other item, as approved or modified by EPA, subject only to its right to invoke the dispute resolution procedures set forth in Section XX (Dispute Resolution) with respect to the modifications or conditions made by EPA. However, in the event that EPA modifies the submission pursuant to this Section, Paragraphs A and D, to cure continued deficiencies, and the submission has a material defect not cured upon resubmittal, EPA retains its right to impose stipulated penalties, as provided in Section XXI (Stipulated Penalties), retroactive to the date of the initial submittal.

C. Upon receipt of a notice of disapproval of a resubmitted Second Stage O&M Work Plan or other item, or portion

28

thereof, pursuant to this Section, Paragraph C or D, Settling Work Defendant shall, within fourteen (14) days or such other time as specified by EPA in such notice, correct the remaining deficiencies and resubmit the Second Stage O&M Work Plan or other item for approval. Any disapproval by EPA shall include an explanation of why the deliverable is inadequate. If the resubmitted deliverable is inadequate, Settling Work Defendant shall be deemed to be in violation of this Consent Decree. Any stipulated penalties applicable to the submission, as provided in Section XXI (Stipulated Penalties), shall accrue during the fourteen-day (14-day) period or otherwise specified period but shall not be payable unless the resubmission is disapproved or modified due to a material defect as provided in this Section, Paragraph E.

Notwithstanding the receipt of an initial notice of disapproval pursuant to this Section, Paragraph A, D or E, Settling Work Defendant shall proceed, at the direction of EPA, to take any action required by any non-deficient portion of the submission. Implementation of any non-deficient portion of a submission shall not relieve Settling Work Defendant of any liability for stipulated penalties under Section XXI (Stipulated Penalties).

D. In the event that a resubmitted Second Stage O&M Work Plan or other item, or portion thereof, is disapproved by EPA, EPA may again require the Settling Work Defendant to correct the deficiencies, in accordance with the preceding Paragraphs. EPA also retains the right to amend or develop the Second Stage O&M

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

1 Work Plan or other item. Settling Work Defendant shall implement  
2 the Second Stage O&M Work Plan or other item as amended or  
3 developed by EPA, subject only to its right to invoke the  
4 procedures set forth in Section XX (Dispute Resolution).

5 E. If upon resubmission, the Second Stage O&M Work Plan or  
6 other item is disapproved or modified by EPA due to a material  
7 defect, Settling Work Defendant shall be deemed to have failed to  
8 submit the Second Stage O&M Work Plan or other item timely and  
9 adequately unless Settling Work Defendant invokes the dispute  
10 resolution procedures set forth in Section XX (Dispute  
11 Resolution) and EPA's action is overturned pursuant to that  
12 Section. The provisions of Section XX (Dispute Resolution) and  
13 Section XXI (Stipulated Penalties) shall govern the  
14 implementation of the O&M Activities and accrual and payment of  
15 any stipulated penalties during dispute resolution. If EPA's  
16 disapproval or modification is upheld, stipulated penalties shall  
17 accrue for such violation from the date on which the initial  
18 submission was originally required, as provided in this Section,  
19 Paragraph C.

20 F. The Second Stage O&M Work Plan and other items required  
21 to be submitted to EPA under this Consent Decree shall, upon  
22 approval or modification by EPA, be enforceable under this  
23 Consent Decree. In the event EPA approves or modifies a portion  
24 of the Second Stage O&M Work Plan or other item required to be  
25 submitted to EPA under this Consent Decree, the approved or  
26 modified portion shall be enforceable under this Consent Decree.

27 G. Items required to be submitted for approval by EPA  
28

1 pursuant to this Consent Decree are set forth in the Second Stage  
2 Statement of Work, Appendix 4 to this Consent Decree.

3 XIII. PROJECT COORDINATORS

4 A. Within thirty (30) days of the Effective Date of this  
5 Consent Decree, Settling Work Defendant, Lockheed Martin, the UAO  
6 Parties, the State and EPA will notify each other, in writing, of  
7 the name, address and telephone number of their respective  
8 designated Project Coordinators and Alternate Project  
9 Coordinators. If a Project Coordinator or Alternate Project  
10 Coordinator initially designated is changed, the identity of the  
11 successor will be given to the other parties at least five (5)  
12 working days before the change occurs, unless impracticable, but  
13 in no event later than the actual day the change is made. The  
14 Settling Work Defendant's Project Coordinator shall be subject to  
15 disapproval by EPA and shall have the technical expertise  
16 sufficient to adequately oversee all aspects of the O&M  
17 Activities. The Settling Work Defendant's Project Coordinator  
18 shall not be an attorney for any of the Settling Defendants in  
19 this matter. He or she may assign other representatives,  
20 including other contractors, to serve as a Site representative  
21 for oversight of performance of daily operations during O&M  
22 Activities.

23 B. Plaintiffs may designate other representatives,  
24 including, but not limited to, EPA and State employees, and  
25 federal and State contractors and consultants, to observe and  
26 monitor the progress of any activity undertaken pursuant to this  
27 Consent Decree. EPA's Project Coordinator and Alternate Project  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 Coordinator shall have the authority lawfully vested in a  
 2 Remedial Project Manager (RPM) and an On-Scene Coordinator (OSC)  
 3 by the National Contingency Plan, 40 C.F.R. Part 300. In  
 4 addition, EPA's Project Coordinator or Alternate Project  
 5 Coordinator shall have authority, consistent with the National  
 6 Contingency Plan, to halt any O&M Activities required by this  
 7 Consent Decree and to take any necessary response action when the  
 8 Project Coordinator determines that conditions at the Site  
 9 constitute an emergency situation or may present an immediate  
 10 threat to public health or welfare or the environment due to  
 11 release or threatened release of Waste Material.

12 C. EPA's Project Coordinator and the Defendants' Project  
 13 Coordinators will meet on a regular basis as deemed appropriate  
 14 by EPA's Project Coordinator.

15 XIV. FUNDING OF RESPONSE ACTIVITIES

16 A. Within sixty (60) days of the Effective Date, Lockheed  
 17 Martin shall establish and maintain financial security in the  
 18 amount of \$ 48 million, in one or a combination of the following  
 19 forms:

- 20 1. A surety bond guaranteeing performance of the O&M
- 21 Activities for the Upstream Facilities;
- 22 2. One or more irrevocable letters of credit;
- 23 3. A trust fund or combination of trust funds;
- 24 4. A guarantee to fund the O&M Activities for the
- 25 Upstream Facilities by one or more parent corporations or
- 26 subsidiaries, or by one or more unrelated corporations that have
- 27 a substantial business relationship with Lockheed Martin;
- 28

4483-9099

1 5. A demonstration that Lockheed Martin satisfies the  
 2 requirements of 40 C.F.R. Part 264.143(f); or

3 6. A demonstration, by submittal of its annual report  
 4 on Form 10-K filed with the Securities and Exchange Commission,  
 5 that Lockheed Martin possesses the requisite financial ability to  
 6 assure completion of the O&M Activities for the Upstream  
 7 Facilities.

8 B. The amount of financial security that Lockheed Martin is  
 9 required to maintain shall be decreased in the following  
 10 increments:

11 1. Nine years after the Date of Commencement,  
 12 Lockheed Martin shall maintain financial security in the amount  
 13 of \$ 39 million.

14 2. Twelve years after the Date of Commencement,  
 15 Lockheed Martin shall maintain financial security in the amount  
 16 of \$ 31 million.

17 3. Fifteen years after the Date of Commencement,  
 18 Lockheed Martin shall maintain financial security in the amount  
 19 of \$ 18 million.

20 4. Upon decreasing the amount of financial security  
 21 as provided by this Paragraph, Lockheed shall make a new  
 22 demonstration of such financial security in the manner described  
 23 in Paragraph A.1 through A.6 of this Section.

24 C. Within sixty (60) days of the Effective Date, each  
 25 Settling Cash Defendant shall cause the funds in the escrow  
 26 account established pursuant to the settlement agreement reached  
 27 in the action entitled Lockheed Corporation v. Crane Company,  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 United States District Court, Central District of California No.  
2 CV 94-2717 MRP (Tx) ("Escrow Account") to be transferred into a  
3 segregated account ("Second Consent Decree Account"), which shall  
4 be used to satisfy Lockheed Martin's obligations as required by  
5 this Consent Decree.

6 D. Within thirty (30) days prior to the Date of  
7 Commencement, Lockheed Martin shall establish a trust account  
8 ("O&M Trust Account"). The O&M Trust Account shall be used to  
9 satisfy Lockheed Martin's obligation to fund the O&M Activities  
10 for the Upstream Facilities and other obligations as required by  
11 this Section XIV (Funding of Response Activities), Section VI  
12 (Performance of the Work), Paragraph C.7, and Section XVIII  
13 (Indemnification and Insurance), of this Consent Decree.

14 Lockheed Martin also shall fund transition activities and the  
15 Settling Work Defendant's preparation of an integrated O&M manual  
16 for the combined Plant Facilities as agreed to in a separate  
17 agreement between Lockheed Martin and Settling Work Defendant.

18 1. The costs of O&M Activities with respect to the  
19 Upstream Facilities, including but not limited to the costs of  
20 rectifying any construction defect in the Upstream Facilities,  
21 all costs of additional response actions required by EPA pursuant  
22 to Section VII (Additional Response Actions) related to the  
23 Upstream Facilities, and costs incurred for the Site pursuant to  
24 Section VIII (EPA Periodic Review) shall be paid from the O&M  
25 Trust Account subject to the limitations and in accordance with  
26 the provisions set forth in this Section.

27 2. All costs of O&M Activities with respect to the  
28

4483-9099

1 Downstream Facilities, including but not limited to the costs of  
2 rectifying any construction defect in the Downstream Facilities,  
3 and all costs of additional response actions required by EPA  
4 pursuant to Section VII (Additional Response Actions) related to  
5 the Downstream Facilities shall be paid directly by the City and  
6 shall not be subject to reimbursement from the O&M Trust Account.  
7 The City's contracting and accounting systems shall be  
8 established so as to clearly distinguish between costs incurred  
9 for O&M Activities or other activities associated with the  
10 Upstream Facilities and costs incurred for O&M Activities or  
11 other activities associated with the Downstream Facilities.

12 3. Prior to the Date of Commencement and  
13 contemporaneously with the execution of appropriate documents  
14 under Section XIV, Paragraph L of this Consent Decree, the UAO  
15 Parties shall execute such agreements as are necessary to assign  
16 to the City of Burbank any and all express and implied  
17 warranties, rights, claims or causes of action they have or may  
18 have as against their construction contractors related to the  
19 construction of the Blending Facility, specifically including,  
20 but not limited to, claims for defects in the construction of the  
21 Blending Facility, but not including claims arising from delays  
22 in or excess costs of construction.

23 E. Lockheed Martin and the City shall, by January 1, 1999,  
24 jointly retain an independent cost estimating consultant ("Cost  
25 Consultant") acceptable to both parties and EPA, whose  
26 responsibilities shall include preparation of the annual budgets  
27 and audit reports for O&M Activities with respect to the Upstream  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

1 Facilities required by this Section. The Cost Consultant may be  
2 replaced by mutual agreement of Lockheed Martin and the City upon  
3 thirty (30) days written notice to EPA and the Cost Consultant,  
4 subject to approval by EPA. Either the City or Lockheed Martin  
5 may petition EPA for the replacement of the Cost Consultant.

6 1. If Lockheed Martin, the City and EPA are unable to  
7 agree upon a Cost Consultant by January 1, 1999, Lockheed Martin  
8 and the City shall, within thirty (30) days thereafter, each  
9 submit a list of three (3) cost estimating consultants to the  
10 other party and to EPA, along with information regarding the  
11 qualifications of each cost estimating consultant on its list.  
12 Within ten (10) days after both lists have been submitted, the  
13 City and Lockheed Martin may each veto one cost estimating  
14 consultant from the other's list. EPA shall select the Cost  
15 Consultant from the cost estimating consultants remaining on one  
16 or both of the lists, unless all such consultants are  
17 unacceptable to EPA.

18 2. The Cost Consultant may retain a subcontractor to  
19 perform some of his or her functions, as described herein. Any  
20 such subcontractor shall be approved by the City, Lockheed Martin  
21 and EPA prior to performing any work.

22 3. In the event of the resignation of the Cost  
23 Consultant, the City, Lockheed Martin and EPA shall attempt to  
24 agree upon the selection of a replacement. If the parties cannot  
25 agree upon a replacement, the procedures described in Paragraph  
26 E.1 above shall be employed to select a replacement. The lists  
27 of three (3) cost estimating consultants referred to in Paragraph  
28

1 E.1 shall be submitted forty-five (45) days prior to the  
2 effective date of resignation of the Cost Consultant or such  
3 other date as may be mutually agreed upon by the City, Lockheed  
4 Martin and EPA.

5 4. The Cost Consultant's fees shall be paid from the  
6 O&M Trust Account.

7 F. It shall be the Cost Consultant's responsibility to  
8 independently use his or her best technical judgment to prepare  
9 an annual budget for O&M Activities with respect to the Upstream  
10 Facilities for each of the years during which such O&M Activities  
11 are required by this Consent Decree ("Annual Budget"). The  
12 Annual Budget shall be developed in the following manner:

13 1. No later than one hundred and twenty (120) days  
14 prior to the Date of Commencement, Lockheed Martin shall provide  
15 the Cost Consultant and the City with non-proprietary information  
16 regarding its operation and maintenance costs with respect to the  
17 Upstream Facilities for the prior year.

18 2. Ninety (90) days prior to the Date of Commencement,  
19 and annually thereafter, the City may submit to the Cost  
20 Consultant, Lockheed Martin and EPA its estimate of the cost of  
21 O&M Activities with respect to the Upstream Facilities for the  
22 one-year period beginning on the Date of Commencement or on the  
23 anniversary thereof for the upcoming year. Such an estimate may  
24 be submitted by the City in advance of each of the eighteen (18)  
25 years for which O&M Activities are required by this Decree.

26 3. Sixty (60) days prior to the Date of Commencement,  
27 and annually thereafter, Lockheed Martin and EPA may submit  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

1 comments to the Cost Consultant on the City's estimate submitted  
2 pursuant to Paragraph F.2 of this Section.

3 4. Thirty (30) days prior to the Date of Commencement,  
4 and annually thereafter, the Cost Consultant shall establish the  
5 Annual Budget based on: (1) O&M Activities expenditures with  
6 respect to the Upstream Facilities during prior years; (2) the  
7 City of Burbank's estimate; (3) Lockheed Martin's comments  
8 thereon, if any; (4) EPA's comments thereon, if any; and (5) any  
9 other cost estimating factors deemed relevant by the Cost  
10 Consultant.

11 5. The Annual Budget shall contain the following cost  
12 categories relating to the Upstream Facilities: direct labor,  
13 contracted-for labor, power, natural gas, liquid phase carbon,  
14 vapor phase carbon, laboratory costs, supplies and materials,  
15 disposal costs, permitting costs, replacement costs, insurance  
16 (including but not limited to insurance described solely in  
17 Exhibit 3 to this Consent Decree), fees of the Cost Consultant  
18 and any other cost categories related to the O&M Activities with  
19 respect to the Upstream Facilities that the Cost Consultant deems  
20 appropriate for cost accounting purposes. In addition, costs of  
21 compliance with the provisions of Sections VII (Additional  
22 Response Actions) with respect to the Upstream Facilities and  
23 VIII (EPA Periodic Review) of this Consent Decree shall be deemed  
24 to be O&M Activities and may be included in the Annual Budget.

25 6. The Cost Consultant shall include a 10% contingency  
26 for each cost category in the Annual Budget.

27 7. Lockheed Martin, the City and EPA shall each have  
28

1 the right to invoke dispute resolution pursuant to Section XX  
2 (Dispute Resolution) of this Consent Decree regarding the total  
3 budgeted amount set forth in any Annual Budget, the amount  
4 budgeted for any cost item, the inclusion or exclusion of any  
5 item from the Annual Budget, or any other matter related to the  
6 establishment of the Annual Budget.

7 G. Lockheed Martin shall ensure that the O&M Trust Account  
8 contains funds equal to or in excess of the Annual Budget  
9 established for the upcoming year as of the Date of Commencement,  
10 and as of each anniversary of that date, by causing funds from  
11 the Second Consent Decree Account or its own funds to be  
12 transferred to the O&M Trust Account. The City shall have no  
13 obligation to undertake O&M Activities with respect to the  
14 Upstream Facilities if the O&M Trust Account has not been funded  
15 in the manner required by this Paragraph.

16 H. The City shall submit monthly statements to the trustee  
17 of the O&M Trust Account ("Trustee") for payment. Each statement  
18 shall be broken down into the same cost categories as set forth  
19 in the Annual Budget. The statement shall include copies of all  
20 relevant documentation, including purchasing documents, backup  
21 documentation for all internal costs, and all invoices, including  
22 backup documentation to support all invoiced contracted-for  
23 costs, and a declaration by an authorized representative of the  
24 City that each amount requested in the statement is due and  
25 payable to a party who provided materials or services for O&M  
26 Activities with respect to the Upstream Facilities conducted in  
27 accordance with the Second Consent Decree and the Second Stage  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 O&M Work Plan. The City shall simultaneously provide a copy of  
2 each monthly statement to the Cost Consultant, Lockheed Martin  
3 and EPA.

4 1. Any monthly statement seeking payment for an  
5 expenditure outside a cost category in the Annual Budget and any  
6 statement which will cause the applicable Annual Budget cost  
7 category amount to be exceeded must be accompanied by an  
8 explanation of the necessity for that expenditure.

9 2. Disbursements by the Trustee.

10 a. The Trustee shall promptly pay all amounts  
11 requested in a monthly statement that satisfies the requirements  
12 of this Section. Lockheed Martin and EPA shall have the right to  
13 invoke dispute resolution pursuant to Section XX (Dispute  
14 Resolution) of this Consent Decree with regard to the necessity  
15 for any expenditure for which an explanation is required, within  
16 thirty (30) days of receipt of the monthly statement. If either  
17 Lockheed Martin or EPA invokes dispute resolution as to any  
18 amount included in a monthly statement, EPA shall make a  
19 preliminary determination, within ten (10) working days of  
20 dispute resolution being invoked, concerning whether the disputed  
21 amount should be paid. Such amount shall be promptly reimbursed  
22 to Lockheed Martin if Lockheed Martin thereafter prevails in  
23 dispute resolution.

24 b. In the event that EPA decides to take over  
25 some or all of the work related to the Upstream Facilities  
26 required to be performed by the Settling Work Defendant pursuant  
27 to Section XXII (Covenants Not to Sue by Plaintiffs), Paragraph  
28

4483-9099

1 F, or Section XVIII (Indemnification and Insurance), Paragraph B,  
2 the Trustee shall reimburse EPA within thirty (30) days of EPA's  
3 written demand for EPA's costs not inconsistent with the National  
4 Contingency Plan which are incurred to take over and/or to  
5 perform such work. In the alternative, EPA may elect to be  
6 reimbursed for some or all of such costs as Future Site-Specific  
7 Response Costs pursuant to Section XVII (Reimbursement of  
8 Response Costs).

9 c. Notwithstanding whether EPA elects to be  
10 reimbursed for such costs pursuant to this Section or pursuant to  
11 Section XVII (Reimbursement of Response Costs), EPA shall not be  
12 subject to the requirements of this Section, including but not  
13 limited to Annual Budget and audit requirements, concerning such  
14 costs.

15 d. As is set forth in Section XXII (Covenants Not  
16 to Sue by Plaintiffs), Paragraph F of this Consent Decree, and  
17 subject to the limitations described in that Section and  
18 Paragraph, Lockheed Martin shall have the right to be reimbursed  
19 by Settling Work Defendant for that portion of such costs which  
20 is caused by the necessity for EPA to take over such work. As is  
21 set forth in Section XVIII (Indemnification and Insurance),  
22 Paragraph B, and subject to the limitations described in that  
23 Section and Paragraph, the City of Burbank shall not be required  
24 to reimburse Lockheed Martin for any portion of such costs if EPA  
25 takes over the work pursuant to that Section and Paragraph.

26 3. The Cost Consultant shall audit the City's  
27 requests for payments for expenditures on O&M Activities with  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 respect to the Upstream Facilities on an annual basis. The audit  
2 shall cover the one-year period ending one hundred eighty (180)  
3 days prior to the beginning of the period covered by the next  
4 Annual Budget and the Cost Consultant's audit report ("Audit  
5 Report") shall be provided to the City, Lockheed Martin and EPA  
6 at least one hundred fifty (150) days prior to the beginning of  
7 the period covered by the next Annual Budget. The purpose of the  
8 audit is to: (1) assist the Cost Consultant in preparing the  
9 Annual Budget; and (2) allow the parties to determine whether any  
10 unnecessary costs have been incurred.

11 4. Within sixty (60) days of receipt of an annual  
12 Audit Report, the City shall reimburse the O&M Trust Account for  
13 expenditures found to be unnecessary during the audited period.

14 5. Lockheed Martin, the City and EPA shall each have  
15 the right to invoke dispute resolution with respect to any  
16 finding in an Audit Report.

17 6. The Cost Consultant shall perform a final audit of  
18 the City's request for payments for O&M Activities with respect  
19 to the Upstream Facilities within ninety (90) days following  
20 EPA's approval of the Certificate of Completion pursuant to  
21 Section XV of this Decree. Lockheed and the City shall settle  
22 all accounts with the O&M Trust Account within thirty (30) days  
23 of the issuance of the Cost Consultant's final Audit Report. At  
24 that time, the Cost Consultant shall direct the Trustee and the  
25 Trustee shall be required to pay over all remaining funds in the  
26 O&M Trust Account, if any, to Lockheed Martin. Lockheed Martin,  
27 the City and EPA shall have the right to invoke dispute  
28

4483-9099

1 resolution with regard to the final accounting or the final Audit  
2 Report.

3 I. The City of Burbank shall utilize a competitive bidding  
4 process to secure all services and materials required to perform  
5 O&M Activities with respect to the Upstream Facilities that are  
6 susceptible to contract. Award of any contract to other than the  
7 "lowest responsible bidder" within the meaning of Burbank  
8 Municipal Code § 9-122 (Section 54 of the Charter of the City of  
9 Burbank, as amended January 14, 1971), shall require a  
10 justification by the City pursuant to applicable state and local  
11 law. Lockheed Martin hereby reserves all of its rights under  
12 state or local law concerning award of any such contract to any  
13 person or persons except the "lowest responsible bidder" within  
14 the meaning of Burbank Municipal Code § 9-122.

15 J. For operation of the Upstream Facilities, the City of  
16 Burbank shall utilize the lowest cost power source available  
17 under any of the following options: (1) under ordinances or  
18 resolutions of general application adopted by the City, (2)  
19 mandated by federal law, or (3) in accordance with Public  
20 Utilities Code section 9602 or other applicable state law.  
21 Should a separate power generation facility, or any other capital  
22 improvement not integral to the Upstream Facilities, be proposed  
23 by Lockheed Martin as a capital expenditure under Paragraph K  
24 below, the city will consider such a proposal on the same fair  
25 and equitable basis as it would treat any similar proposal by any  
26 other industrial power consumer in the City. Power for operating  
27 the Upstream Facilities, when provided by the City, shall be  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 billed by the City of Burbank at the lowest rate then charged by  
2 the City for comparable service conditions. As of September 1,  
3 1996, "comparable service conditions" for the Upstream Facilities  
4 are Rate Class "Industrial" and Rate Code "P." If the City  
5 adopts a rate for "comparable service conditions" other than the  
6 rate charged by the City to any public or private school, or  
7 charged to any user under an agreement entered into in  
8 conjunction with a "redevelopment project" pursuant to the  
9 California Redevelopment Act, Health & Safety Code § 33000 et  
10 sec., which provides power at lower cost than Rate Code "P," the  
11 lower rate shall apply to power sold to the Upstream Facilities.

12 K. Lockheed Martin may at any time propose that a capital  
13 expenditure be incurred to reduce O&M expenditures with respect  
14 to the Upstream Facilities. Any such proposal shall be  
15 simultaneously submitted to the Cost Consultant, the City and  
16 EPA. Any such proposal shall be limited to facilities that can  
17 be fully accommodated within "Area F" (except necessary  
18 utilities) as shown on Appendix F to the First Consent Decree.

19 1. Settling Work Defendant shall have no obligation  
20 to operate any separate power generation facility. Nor shall  
21 Settling Work Defendant have any obligation to operate any  
22 capital improvement constructed pursuant to this Paragraph K,  
23 where such capital improvement is not integral to the Upstream  
24 Facilities. It shall be the obligation of Lockheed Martin to  
25 operate any such capital improvement.

26 2. A capital improvement shall be considered to be  
27 "integral to the Upstream Facilities" if such capital improvement  
28

4483-9099

1 either (a) would effectively replace a facility or portion of a  
2 facility constructed by Lockheed Martin pursuant to the First  
3 Consent Decree, or (b) would be intrinsically linked to a  
4 facility or portion of a facility constructed by Lockheed Martin  
5 pursuant to the First Consent Decree.

6 3. The Cost Consultant shall review the proposal and  
7 any comments submitted by the City and/or the O&M Contractor,  
8 and/or EPA, and determine, based on generally accepted cost  
9 engineering principles, whether the capital expenditure is  
10 economically justified based on the size of the expenditure, the  
11 projected O&M savings and the remaining life of the project. The  
12 Cost Consultant may meet with Lockheed Martin, the City and/or  
13 the O&M Contractor, and/or EPA, with respect to the proposal and  
14 comments thereon.

15 4. If the Cost Consultant determines that the capital  
16 expenditure is economically justified, Lockheed Martin may submit  
17 the proposal and a conceptual design of the proposed work to EPA  
18 for approval. The City and/or the O&M Contractor may submit  
19 comments to EPA regarding the proposal and the conceptual design.

20 5. EPA shall review the proposal and the conceptual  
21 design, and any comments submitted by the City and/or the O&M  
22 Contractor, and determine based on relevant regulations and  
23 policies (which may include but shall not be limited to the  
24 remedy selection criteria set forth in the National Contingency  
25 Plan), whether the proposed capital expenditure may be  
26 incorporated into the remedy. EPA shall document its decision in  
27 accordance with applicable laws and regulations. EPA may meet  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 with Lockheed Martin and/or the City and/or the O&M Contractor  
 2 with respect to the proposal and conceptual design and any  
 3 comments thereon. Nothing contained in this Paragraph shall be  
 4 deemed or construed to limit or abrogate in any way the City's  
 5 exercise of its police powers or EPA's authority under CERCLA.

6 6. If EPA approves the conceptual design, Lockheed  
 7 Martin shall submit a final design for the proposed work. If EPA  
 8 approves the final design, Lockheed Martin shall proceed to  
 9 implement the capital improvement. Lockheed Martin shall be  
 10 solely responsible for funding and constructing the capital  
 11 improvement.

12 7. Lockheed Martin shall take reasonable measures to  
 13 minimize any noise and other disruptions that may be associated  
 14 with the construction of any capital improvements.

15 8. Lockheed Martin shall defend, indemnify and hold  
 16 harmless the City of Burbank with respect to actions against the  
 17 City based upon disturbances related to the installation of  
 18 capital improvements.

19 L. With the exception of the four extraction wells (VO-1,  
 20 2, 3 and 4) located at the former Lockheed Martin Plant B-1 in  
 21 Burbank, California, as depicted in Appendix 8 to this Consent  
 22 Decree, both the Upstream Facilities and the Downstream  
 23 Facilities shall be acknowledged by the City as its property for  
 24 all purposes; provided, however, that any capital improvement  
 25 constructed pursuant to Paragraph K of this Section that is not  
 26 integral to the Upstream Facilities, including but not limited to  
 27 any separate power generation facility, shall not be considered  
 28

4483-9099

1 or deemed to be the property of the City. Any such capital  
 2 improvement shall be the property of Lockheed Martin, unless the  
 3 City or a third party agrees to own the improvement. On or  
 4 before the Date of Commencement, the UAO Parties, Lockheed Martin  
 5 and the City shall execute appropriate writings documenting the  
 6 City's ownership interest in such property. As to the extraction  
 7 wells located on Lockheed Martin property, there shall be a  
 8 recorded right of access.

9 M. Commencing from the Date of Commencement, and for a  
 10 period not to exceed the applicable state statutes of limitations  
 11 or statutes of repose under which Lockheed Martin may bring such  
 12 an action against its design contractors less sixty (60) days,  
 13 the Settling Work Defendant may assert as against Lockheed Martin  
 14 that any of the Upstream Facilities' failure (if any) to perform  
 15 as originally designed is due to a Design Defect. Commencing  
 16 upon the Effective Date of this Consent Decree (as defined in  
 17 Section XXVIII), and for a period not to exceed the applicable  
 18 state statutes of limitations or statutes of repose under which  
 19 the UAO Parties may bring such an action against their design  
 20 contractors less sixty (60) days, the Settling Work Defendant may  
 21 assert as against the UAO Parties that the Blending Facility's  
 22 failure (if any) to perform as originally designed is due to a  
 23 Design Defect. The Parties agree that the date of substantial  
 24 completion of the Upstream Facilities was March 1, 1994 and the  
 25 date of the substantial completion of the Blending Facility was  
 26 January 6, 1996.

27 1. The Settling Work Defendant, Lockheed, the UAO  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 Parties and EPA agree to the following procedures for the  
 2 resolution of disputes arising from claims that the Upstream  
 3 Facilities or the Blending Facility have failed to perform as  
 4 originally designed due to a Design Defect. These disputes may  
 5 include but are not limited to a determination as to whether or  
 6 not a failure to perform as originally designed occurred, whether  
 7 the failure (if any) was due to a Design Defect, the nature,  
 8 extent and scope of the repair or other work required to cause  
 9 the facility in question to meet designated operating standards,  
 10 the reasonableness and necessity of the costs incurred or to be  
 11 incurred for such work, and the reasonableness, necessity and  
 12 timeliness of steps taken to address or mitigate such damage  
 13 claims.

14 a. Upon the occurrence of a facility's failure to  
 15 perform as originally designed which the Settling Work Defendant  
 16 alleges to be due, in whole or in part, to a Design Defect in the  
 17 Upstream Facilities or the Blending Facility:

18 (1) If the alleged occurrence or failure  
 19 causes or threatens a release of Waste Material from the Site  
 20 that constitutes an emergency situation or may present an  
 21 immediate threat to public health or welfare or the environment,  
 22 the Settling Work Defendant shall take all actions and provide  
 23 notifications required by Section XVI (Emergency Response). If  
 24 the alleged occurrence or failure does not come within the  
 25 provisions of Section XVI (Emergency Response), Settling Work  
 26 Defendant shall immediately advise the EPA of the alleged  
 27 occurrence or failure, by telephone or facsimile transmission.  
 28

4483-9099

1 (2) Settling Work Defendant shall provide a  
 2 written Notice of Design Defect to EPA within ten (10) days of  
 3 the date when Settling Work Defendant knew, or reasonably should  
 4 have known that the alleged occurrence or failure was caused by  
 5 an alleged Design Defect. The written Notice of Design Defect  
 6 shall include the basis for the allegation. The Settling Work  
 7 Defendant shall concurrently provide a copy of the written Notice  
 8 of Design Defect to either: 1) Lockheed Martin if the alleged  
 9 Design Defect relates to the Upstream Facilities, or 2) the UAO  
 10 Parties if the alleged Design Defect relates to the Blending  
 11 Facility.

12 b. The Settling Work Defendant shall take such  
 13 steps as EPA directs to commence repairs to the facility, and  
 14 shall take reasonable steps to mitigate all damages and costs  
 15 incurred as a result of the alleged Design Defect. Within five  
 16 (5) days of undertaking such steps, the Settling Work Defendant  
 17 shall advise EPA and all interested Parties, in writing and by  
 18 facsimile transmission, of the repairs and steps it has taken or  
 19 intends to undertake.

20 c. The Parties shall cooperate with one another  
 21 and immediately make available to each other: all facilities  
 22 pertaining to the failure and the alleged Design Defect; all  
 23 records pertaining to the failure and the alleged Design Defect;  
 24 all records pertaining to the operations and maintenance of the  
 25 facility including all repair records, all work plans or designs  
 26 for repair or mitigation of damages; all persons with information  
 27 about the failure and the alleged Design Defect; and all systems  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 that are claimed to be defective. The information to be made  
 2 available by the UAO Parties and Lockheed Martin shall include  
 3 but shall not be limited to applicable contracts and  
 4 correspondence with Lockheed Martin's or the UAO Parties' design  
 5 contractors, internal documentation relating to the design of the  
 6 facility with the alleged Design Defect, and "as-builts" of the  
 7 facility with the alleged Design Defect. The Parties shall make  
 8 good faith efforts to preserve evidence and information. The  
 9 Settling Work Defendant's good faith efforts may include but  
 10 shall not be limited to maintaining a videotape record or log of  
 11 the status or condition of the facility prior to the performance  
 12 of repairs or alterations, where practicable.

13 2. Not less than fifteen (15) nor more than thirty  
 14 (30) days after receipt of the Settling Work Defendant's written  
 15 Notice of Design Defect, the EPA shall make a Preliminary  
 16 Finding.

17 a. Lockheed Martin or the UAO Parties may submit  
 18 a written or oral response to the Settling Work Defendant's  
 19 allegation within the fifteen (15) days.

20 b. The EPA's Preliminary Finding shall include a  
 21 preliminary determination as to whether the affected facility or  
 22 facilities failed to perform as originally designed; whether that  
 23 failure was, in whole or in part, due to a Design Defect; a  
 24 preliminary allocation of financial responsibility among the  
 25 Settling Work Defendant, Lockheed Martin and the UAO Parties; and  
 26 a preliminary finding as to the reasonableness and necessity of  
 27 any repairs or other work done or proposed by the Settling Work  
 28

4483-9099

1 Defendant as a result of the alleged Design Defect.

2 c. According to the preliminary allocation of  
 3 financial responsibility in the EPA Preliminary Finding, the  
 4 Settling Work Defendant, Lockheed Martin, and/or the UAO Parties  
 5 shall finance the work deemed necessary by EPA to cause the  
 6 affected facility to perform as originally designed, as follows.

7 (1) If EPA determines that the failure was  
 8 caused, in whole or in part, by a Design Defect in any of the  
 9 Upstream Facilities, Lockheed Martin shall, within twenty-five  
 10 (25) days of receipt of the EPA Preliminary Finding, or within  
 11 twenty-five (25) days of receipt of an itemized statement by the  
 12 Settling Work Defendant of all repairs or other work performed or  
 13 to be undertaken as a result of the alleged Design Defect,  
 14 whichever is later, remit to the Settling Work Defendant the cost  
 15 of all such work which Lockheed is required to finance pursuant  
 16 to the preliminary allocation of financial responsibility.

17 (2) If EPA determines that the failure was  
 18 caused, in whole or in part, by a Design Defect in the Blending  
 19 Facility, the UAO Parties shall, within twenty-five (25) days of  
 20 receipt of the EPA Preliminary Finding, or within twenty-five  
 21 (25) days of receipt of an itemized statement by the Settling  
 22 Work Defendant of all repairs or other work performed or to be  
 23 undertaken as a result of the alleged Design Defect, whichever is  
 24 later, remit to the Settling Work Defendant the cost of all such  
 25 work which the UAO Parties are required to finance pursuant to  
 26 the preliminary allocation of financial responsibility. Among  
 27 the UAO Parties, the obligations of this Paragraph shall be joint  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 and several.

2 (3) If EPA determines that the failure of  
3 the affected facility was not caused, in whole or in part, by a  
4 Design Defect in the Upstream Facilities or the Blending  
5 Facility, the Settling Work Defendant and Lockheed Martin shall  
6 finance such work as these parties are required to finance  
7 pursuant to this Section, Paragraphs A-L.

8 (4) The Settling Work Defendant shall use  
9 such funds as are remitted by Lockheed Martin or the UAO Parties  
10 pursuant to the Preliminary Finding to pay for work necessary to  
11 cause the facility with the alleged Design Defect to perform as  
12 originally designed and for no other purpose.

13 (5) The Preliminary Finding may require a  
14 party whose facility has been determined to have a Design Defect  
15 to provide for advance or ongoing funding of any work necessary  
16 to cause the affected facility to perform as originally designed.

17 (6) The Preliminary Finding also may require  
18 the Settling Work Defendant to account for expenditures of funds  
19 remitted to it under this Paragraph, and to reimburse any party  
20 who has remitted such funds if the amount remitted exceeds the  
21 expenditures necessary to perform the work necessary to cause the  
22 affected facility to perform as originally designed.

23 (7) EPA shall have continuing jurisdiction  
24 over the implementation of the Preliminary Finding.

25 d. Subject to EPA's approval, the Settling Work  
26 Defendant shall perform such work as is necessary to cause the  
27 affected facility to perform as originally designed. EPA may  
28

4483-9099

1 require the Settling Work Defendant to submit a schedule and work  
2 plan for such work within a specified period of time. Such  
3 schedule(s) and work plan(s) shall be submitted, approved and  
4 implemented in accordance with Section XII (Submissions Requiring  
5 Agency Approval).

6 3. Not less than ninety (90) nor more than one hundred  
7 twenty (120) days after receipt of the Settling Work Defendant's  
8 Notice of Design Defect, the EPA shall make a further evaluation  
9 and issue a Further Determination based upon the following  
10 procedure:

11 a. The Settling Work Defendant, Lockheed Martin  
12 and/or the UAO Parties, upon receipt of a copy of a Notice of  
13 Design Defect pursuant to Paragraph M.1.a.2 of this Section shall  
14 have sixty (60) days from receipt of the statement to further  
15 inspect the facilities and submit a written statement to EPA.  
16 Any such Settling Defendant may request the opportunity to make  
17 an oral presentation to the EPA by sending written notice of such  
18 intent to EPA and other Settling Defendants who receive a copy of  
19 the Notice of Design Defect. EPA shall set a reasonable date,  
20 time and location for the presentation. The EPA, in its  
21 discretion, may require oral presentations from the affected  
22 Settling Defendants.

23 b. If any party submits a written statement as  
24 described in Paragraph M.3.a of this Section, EPA shall issue a  
25 Further Determination. In the Further Determination, if any, EPA  
26 shall determine whether or not a failure to perform as originally  
27 designed occurred; whether the failure (if any) was due, in whole  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 or in part, to a Design Defect; the nature, extent and scope of
2 any repairs or other work required to cause the facility to
3 perform as originally designed; the reasonableness and necessity
4 of the costs incurred or to be incurred for such work; the
5 reasonableness, necessity and timeliness of steps taken to
6 address or mitigate damage claims; the comparative fault of
7 Settling Work Defendant, Lockheed Martin and/or the UAO Parties;
8 and an allocation of financial responsibility among Settling Work
9 Defendant, Lockheed Martin and/or the UAO Parties. EPA shall
10 provide written notice of its decision to the parties..

11 c. According to the allocation of financial
12 responsibility in the EPA Further Determination:

13 (1) If EPA determines that the failure was
14 caused, in whole or in part, by a Design Defect in any of the
15 Upstream Facilities, Lockheed Martin shall, within twenty-five
16 (25) days of receipt of the EPA Further Determination, or within
17 twenty-five (25) days of receipt of an itemized statement by the
18 Settling Work Defendant of all repairs or other work performed or
19 to be undertaken as a result of the alleged Design Defect,
20 whichever is later, 1) remit to the Settling Work Defendant the
21 cost of all such work which Lockheed Martin is required to
22 finance by the Further Determination, less any portion of such
23 amounts previously remitted to the Settling Work Defendant
24 pursuant to the Preliminary Finding, and 2) reimburse other
25 Settling Defendant(s) if required by the Further Determination.

26 (2) If EPA determines that the failure was
27 caused, in whole or in part, by a Design Defect in the Blending
28

4483-9099

1 Facility, the UAO Parties shall, within twenty-five (25) days of
2 receipt of the EPA Further Determination, or within twenty-five
3 (25) days of receipt of an itemized statement by the Settling
4 Work Defendant of all repairs or other work performed or to be
5 undertaken as a result of the alleged Design Defect, whichever is
6 later, 1) remit to the Settling Work Defendant the cost of all
7 such work which the UAO Parties are required to finance pursuant
8 to the Further Determination, less any portion of such amounts
9 previously remitted to the Settling Work Defendant pursuant to
10 the Preliminary Finding, and 2) reimburse other Settling
11 Defendant(s) if required by the Further Determination. Among the
12 UAO Parties, the obligations of this Paragraph shall be joint and
13 several.

14 (3) If EPA determines that the failure of
15 the affected facility was not caused, in whole or in part, by a
16 Design Defect, the Settling Work Defendant and Lockheed Martin
17 shall finance such work as these parties are required to finance
18 pursuant to this Section, Paragraphs A-L. If required by the
19 Further Determination, Settling Work Defendant shall reimburse
20 Lockheed Martin or the UAO Parties for amounts advanced pursuant
21 to the Preliminary Finding.

22 (4) The Settling Work Defendant shall use
23 such funds as are remitted by Lockheed Martin or the UAO Parties
24 pursuant to the Further Determination to pay for work necessary
25 to cause the facility with the alleged Design Defect to perform
26 as originally designed and for no other purpose.

27 (5) The Further Determination may require a
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 party whose facility has been determined to have a Design Defect  
2 to provide for advance or ongoing funding of any work necessary  
3 to cause the affected facility to perform as originally designed.

4 (6) The Further Determination shall require  
5 the Settling Work Defendant to account for expenditures of funds  
6 remitted to it under this Paragraph M, and to reimburse any  
7 party who has remitted such funds if the amount remitted exceeds  
8 the expenditures necessary to perform the work necessary to cause  
9 the affected facility to perform as originally designed. The  
10 Further Determination also shall require that the Settling Work  
11 Defendant make any such reimbursement within a reasonable,  
12 specified period of time.

13 (7) EPA shall have continuing jurisdiction  
14 over the Further Determination.

15 4. If a dispute exists among Settling Work Defendant,  
16 Lockheed Martin and/or the UAO Parties as to the EPA Further  
17 Determination, the Parties' participation in or satisfaction of  
18 the terms or conditions set forth in the EPA Preliminary Finding  
19 or Further Determination shall not act as a waiver of any claims  
20 or defenses by any party, and the Settling Work Defendant,  
21 Lockheed Martin and/or the UAO Parties may proceed to seek  
22 judicial review of such a dispute as follows:

23 a. The Settling Work Defendant, Lockheed Martin  
24 or the UAO Parties may seek a final resolution of the dispute  
25 between or among them concerning the EPA Further Determination by  
26 filing suit against one another in a court of competent  
27 jurisdiction. Nothing in this Section shall be construed to  
28

4483-9099

1 provide any party with a claim or cause of action against the  
2 United States or the State.

3 b. The court shall determine all issues regarding  
4 the dispute among the Settling Work Defendant, Lockheed Martin,  
5 and/or the UAO Parties concerning the EPA Further Determination  
6 *de novo*. Discovery and evidence as to such dispute(s) shall not  
7 be limited to the Administrative Record, except that nothing in  
8 this Paragraph shall be construed to affect the restrictions on  
9 judicial review set forth in CERCLA section 113 (j) and (k), 42  
10 U.S.C. § 9613(j)-(k) or California Health & Safety Code section  
11 25356.1(g), Cal. Health & Safety Code § 25356.1(g).

12 c. Upon the entry of a final judgment by the  
13 court or upon final resolution of the dispute as agreed upon by  
14 the parties, if the court's determination and allocation or the  
15 parties' final resolution differs from that set forth in the  
16 EPA's Further Determination, then each party shall be reimbursed  
17 or the responsible party shall pay another party's previous  
18 allocation so that each party's final share of total costs shall  
19 correspond to the court's judgment or the parties' final  
20 resolution. Any such reimbursement may include pre-judgment  
21 interest pursuant to California Civil Code section 3287, Cal.  
22 Civ. Code § 3287, unless otherwise agreed by the parties. The  
23 court's final judgment or the parties' final resolution shall  
24 supersede EPA's Further Determination. Should additional costs  
25 be incurred relating to the Design Defect(s) at issue after the  
26 court's final judgment or the parties' final resolution, the  
27 court's final judgment or the parties' final resolution shall be  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 followed by the parties and EPA.

2 N. Funding of Repairs Required by Earthquakes or Other

3 Force Majeure Events

4 1. Definition of "Major Damage" As used in this

5 Paragraph, "Major Damage" shall mean physical damage which EPA

6 has determined was caused by a force majeure event pursuant to

7 Section XIX (Force Majeure) of this Consent Decree and will cost

8 more than the following amounts to repair or rebuild with respect

9 to the affected Plant Facilities:

10 a. more than one million dollars (\$ 1,000,000)

11 with respect to the Upstream Facilities; or

12 b. more than one hundred and fifty thousand

13 dollars (\$ 150,000) with respect to the Blending Facility.

14 2. Definition of "Uninsurable Force Majeure Event"

15 "Uninsurable Force Majeure Event" shall mean a force majeure

16 event as defined in Section XIX (Force Majeure) of this Consent

17 Decree, other than an earthquake or damage resulting from an

18 earthquake, that causes physical damage to any of the Plant

19 Facilities which is not covered by any insurance maintained by

20 the Settling Work Defendant, the O&M Contractor or its

21 subcontractors, including but not limited to insurance maintained

22 pursuant to this Consent Decree or Exhibit 3 hereto, and which

23 EPA has determined such persons could not have insured at a

24 commercially reasonable cost.

25 3. Earthquake

26 In the event of an earthquake which causes damage to any of

27 the Plant Facilities, including but not limited to Major Damage

28

4483-9099

1 to the Upstream Facilities and/or the Blending Facility, and EPA

2 determines that the damage should be repaired:

3 a. Lockheed Martin shall fund the repair and/or

4 rebuilding of the affected Upstream Facilities up to the first

5 one million dollars (\$ 1,000,000) of necessary expenditure,

6 and/or the repair and/or rebuilding of the Blending Facility up

7 to the first one hundred and fifty thousand dollars (\$ 150,000)

8 of necessary expenditure; and

9 b. The City of Burbank shall fund the repair

10 and/or rebuilding of the other affected Downstream Facilities.

11 4. Uninsurable Force Majeure Event

12 In the event of an Uninsurable Force Majeure Event that

13 causes damage, including but not limited to Major Damage to the

14 Upstream Facilities and/or the Blending Facility, and EPA

15 determines that the damage should be repaired:

16 a. Lockheed Martin shall fund the repair and/or

17 rebuilding of the affected Upstream Facilities;

18 b. The Settling Cash Defendants shall fund the

19 repair and/or rebuilding of the Blending Facility up to the first

20 one hundred and fifty thousand dollars (\$ 150,000) of necessary

21 expenditure. The obligations of this Paragraph shall be joint

22 and several among the Settling Cash Defendants; and

23 c. The City of Burbank shall fund the repair

24 and/or rebuilding of the other affected Downstream Facilities.

25 5. Force Majeure Events Other Than Earthquake or

26 Uninsurable Force Majeure Events

27 In the event of a force majeure event (as is defined in

28 Section XIX (Force Majeure)), other than an earthquake or

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 Uninsurable Force Majeure Event, which causes damage, including  
 2 but not limited to Major Damage to the Upstream Facilities and/or  
 3 the Blending Facility, Lockheed Martin and/or the City of Burbank  
 4 shall fund the repair and/or rebuilding of the affected Plant  
 5 Facilities pursuant to their respective funding obligations as  
 6 described in this Section (Funding of Response Activities), and  
 7 otherwise in accordance with this Consent Decree, including but  
 8 not limited to Sections VI (Performance of the Work), VII  
 9 (Additional Work), and XIX (Force Majeure).

10 6. In the event of Major Damage to the Upstream  
 11 Facilities and/or the Blending Facility as the result of an  
 12 earthquake or to the Blending Facility as the result of an  
 13 Uninsurable Force Majeure Event, and except as to those Settling  
 14 Defendants described in Appendix 3 to this Consent Decree, EPA  
 15 reserves all of its rights against Settling Defendants pursuant  
 16 to Section XXII (Covenants Not to Sue by Plaintiffs), including  
 17 but not limited to the right to issue an administrative order to  
 18 require the complete repair and/or rebuilding of the affected  
 19 Plant Facilities.

20 7. If EPA exercises its rights pursuant to Paragraph  
 21 N.6 of this Section, the Settling Defendants agree between and  
 22 among themselves that:

23 a. In the event of an earthquake, Lockheed  
 24 Martin and the Settling Cash Defendants shall not seek funding,  
 25 contribution or reimbursement from the City of Burbank for  
 26 funding any repairs and/or rebuilding that EPA determines should  
 27 be made to the Upstream Facilities and/or the Blending Facility;  
 28

4483-9099

1 and the City shall not seek funding, contribution or  
 2 reimbursement from Lockheed Martin or the Settling Cash  
 3 Defendants for funding any repairs and/or rebuilding that EPA  
 4 determines should be made to the Downstream Facilities; and  
 5 b. In the event of an Uninsurable Force Majeure  
 6 Event, the Settling Cash Defendants shall not seek funding,  
 7 contribution or reimbursement from the City of Burbank or  
 8 Lockheed Martin for funding any repairs and/or rebuilding that  
 9 EPA determines should be made to the Blending Facility; the City  
 10 shall not seek funding, contribution or reimbursement from  
 11 Lockheed Martin or the Settling Cash Defendants for any repairs  
 12 and/or rebuilding that EPA determines should be made to the  
 13 Downstream Facilities; and Lockheed Martin shall not seek  
 14 funding, contribution or reimbursement from the Settling Work  
 15 Defendant or the Settling Cash Defendants for any repair and/or  
 16 rebuilding that EPA determines should be made to the Upstream  
 17 Facilities.

18 8. Lockheed Martin's, the City of Burbank's, and/or  
 19 the Settling Cash Defendants' obligations to make repairs or to  
 20 rebuild pursuant to this Paragraph shall cease if EPA notifies  
 21 the affected party that EPA does not intend to require the repair  
 22 and/or rebuilding of the affected Plant Facilities.

23 9. Any repairs that EPA determines should be made to  
 24 the Plant Facilities pursuant to this Paragraph shall be  
 25 performed by the City of Burbank and funded as provided in this  
 26 Paragraph.

27 10. Any disputes between EPA and any of the Parties,  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 or between or among any of the Settling Defendants concerning the  
2 cause, cost or necessity for any repairs and/or rebuilding of the  
3 affected Plant Facilities pursuant to this Paragraph shall be  
4 subject to dispute resolution pursuant to Section XX of this  
5 Consent Decree (Dispute Resolution). Notwithstanding the  
6 foregoing:

7 a. If the City of Burbank claims that an  
8 earthquake or Uninsurable Force Majeure Event necessitates the  
9 repair and/or rebuilding of the Plant Facilities, and EPA  
10 determines that the repair and/or rebuilding should be made, EPA  
11 shall make an initial determination whether such work is required  
12 as the result of an earthquake or Uninsurable Force Majeure  
13 Event. As appropriate, EPA may also make an initial  
14 determination as to the means and manner of funding to be  
15 provided by the designated Party or Parties responsible for  
16 funding such work pursuant to this Paragraph.

17 b. The Parties shall fund and/or perform such  
18 repairs as EPA determines are necessary according to EPA's  
19 initial determination, and otherwise in accordance with their  
20 respective obligations under this Section (Funding Of Response  
21 Activities). If a Party prevails in dispute resolution on the  
22 contention that it should not have been required to fund repairs  
23 pursuant to this Paragraph, such Party shall be promptly  
24 reimbursed by the appropriate Party or Parties determined to be  
25 responsible for funding such repairs in accordance with the final  
26 decision in the Dispute Resolution.

27  
28

4483-9099

1 XV. CERTIFICATION OF COMPLETION

2 Defendants' obligations for performance of the work pursuant  
3 to Section VI of this Consent Decree and Funding of Response  
4 Activities pursuant to Section XIV of this Consent Decree shall  
5 be deemed satisfied upon issuance of the Certification of  
6 Completion. It is anticipated by the Parties that the  
7 certification process set forth below will occur eighteen (18)  
8 years after the Date of Commencement.

9 A. Completion of the O&M Activities.

10 1. At least ninety (90) days prior to the date that  
11 Settling Work Defendant anticipates that the work will have been  
12 fully performed, Settling Work Defendant shall submit a written  
13 report requesting certification to EPA for approval, with a copy  
14 to the State, pursuant to Section XII (Submissions Requiring  
15 Agency Approval). During the 90-day period, EPA shall determine  
16 whether dismantling and/or decommissioning of any facilities  
17 constructed pursuant to the First Consent Decree or UAO 92-12 is  
18 required pursuant to Section VI (Work to be Performed), Paragraph  
19 C.6 of this Consent Decree.

20 2. In the Settling Work Defendant's report seeking  
21 Certification of Completion, a registered professional engineer  
22 and the Settling Work Defendant's Project Coordinator shall state  
23 that the O&M Activities, except for dismantling and/or  
24 decommissioning activities, will be complete in full satisfaction  
25 of the requirements of this Consent Decree. The written report  
26 shall include all appropriate and necessary information to a  
27 determination of completion, including the date upon which  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 completion is anticipated, and if appropriate, drawings signed  
2 and stamped by a professional engineer. The report shall contain  
3 the following statement, signed by the Settling Work Defendant's  
4 authorized Project Coordinator:

5 "To the best of my knowledge, after thorough  
6 investigation, I certify that the information contained  
7 in or accompanying this submission is true, accurate  
8 and complete. I am aware that there are significant  
9 penalties for submitting false information, including  
10 the possibility of fine and imprisonment for knowing  
11 violations."

12 3. If EPA deems necessary, EPA may conduct a pre-  
13 certification inspection concerning completion of the O&M  
14 Activities. If, after review of the written report and  
15 conducting a pre-certification inspection, if EPA deems such an  
16 inspection necessary, and after reasonable opportunity to review  
17 and comment by the State, EPA determines that the O&M Activities  
18 or any portion thereof except dismantling and/or decommissioning  
19 activities will not be completed in accordance with this Consent  
20 Decree on the date anticipated by Settling Work Defendant, EPA  
21 will notify the Settling Work Defendant in writing of the  
22 activities that must be undertaken to complete the O&M Activities  
23 except dismantling and/or decommissioning activities.

24 4. EPA will set forth in the notice to the Settling  
25 Work Defendant a schedule for performance of such activities  
26 consistent with this Consent Decree and the Second Stage O&M Work  
27 Plan or require the Settling Work Defendant to submit a schedule  
28 to EPA for approval pursuant to Section XII (Submissions  
Requiring Agency Approval). Settling Work Defendant shall  
perform all activities described in the notice in accordance with

4483-9099

1 the specifications and schedules established pursuant to this  
2 Paragraph, subject to its right to invoke the dispute resolution  
3 procedures set forth in Section XX (Dispute Resolution).

4 5. If EPA concludes, based on the initial or any  
5 subsequent report(s) requesting Certification of Completion and  
6 after a reasonable opportunity for review and comment by the  
7 State, that the O&M Activities, except for dismantling or  
8 decommissioning activities, have been fully performed in  
9 accordance with this Consent Decree, EPA will so certify in  
10 writing to all Settling Defendants. This certification shall  
11 constitute the Certification of Completion of the O&M Activities  
12 for purposes of this Consent Decree, including, but not limited  
13 to, Section XXII (Covenants Not to Sue by Plaintiffs).  
14 Certification of Completion of the O&M Activities shall not  
15 affect Settling Work Defendant's or any other Settling  
16 Defendant's other obligations under this Consent Decree,  
17 including, but not limited to, Lockheed Martin's obligation to  
18 dismantle or decommission the treatment and blending facilities,  
19 if such dismantling and/or decommissioning activities are not  
20 complete at the time the Certification of Completion issues.

21 6. As to Lockheed Martin, the Certification of  
22 Completion shall not apply until Lockheed Martin has completed  
23 any dismantling and/or decommissioning activities EPA may require  
24 pursuant to this Section.

25 B. Dismantling and/or Decommissioning of Facilities.

26 1. If, during the 90-day period referenced in  
27 Paragraph A.1 of this Section, EPA determines that dismantling  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 and/or decommissioning of the treatment and/or blending  
 2 facilities is required, Lockheed Martin shall, if requested by  
 3 EPA, submit a work plan for such activities to EPA, with a copy  
 4 to the State, in accordance with Section XII of this Consent  
 5 Decree (Submissions Requiring Agency Approval). At least ninety  
 6 (90) days prior to the date Lockheed Martin anticipates that  
 7 dismantling and/or decommissioning activities will have been  
 8 fully completed, Lockheed Martin shall submit a written report to  
 9 EPA requesting approval of such work, and confirmation that such  
 10 work is complete, with a copy to the State, pursuant to Section  
 11 XII (Submissions Requiring Agency Approval).

12 2. The report and EPA's response to the report,  
 13 including but not limited to an inspection of the work and/or a  
 14 notice concerning additional work to be performed, shall conform  
 15 to the applicable requirements, as determined by EPA, of  
 16 Paragraph A.2-5 of this Section.

17 3. If EPA has determined that dismantling and/or  
 18 decommissioning is required and confirms that such work is  
 19 complete, EPA shall promptly issue a Certificate of Completion to  
 20 Lockheed Martin, with a copy to the State. If EPA has determined  
 21 that dismantling and/or decommissioning is not required, it shall  
 22 issue a Certificate of Completion to Lockheed Martin promptly  
 23 upon making that determination.

4483-9099

1 XVI. EMERGENCY RESPONSE

2 In the event of any action or occurrence during the  
 3 performance of the O&M Activities which causes or threatens a  
 4 release of Waste Material from the Site that constitutes an  
 5 emergency situation or may present an immediate threat to public  
 6 health or welfare or the environment, Settling Work Defendant  
 7 shall, subject to this Section, immediately take all appropriate  
 8 action to prevent, abate, or minimize such release or threat of  
 9 release. Settling Work Defendant shall report such a situation  
 10 to the appropriate regulatory authorities as required by law. As  
 11 soon as possible and reasonable under the circumstances, but in  
 12 no event more than one Working Day after making the report  
 13 required by law, Settling Work Defendant shall notify EPA's  
 14 Project Coordinator, or if the Project Coordinator is  
 15 unavailable, EPA's Alternate Project Coordinator. If neither of  
 16 these individuals is available, Settling Work Defendant shall  
 17 notify the Emergency Response Unit, EPA, Region IX. Settling  
 18 Work Defendant shall take such actions in consultation with EPA's  
 19 Project Coordinator or other available authorized EPA officer and  
 20 in accordance with all applicable provisions of the Health and  
 21 Safety Plans, the Contingency Plans, and any other applicable  
 22 plans or documents developed pursuant to the Second Stage SOW or  
 23 the Second Stage O&M Work Plan. In the event that Settling Work  
 24 Defendant fails to take appropriate response action as required  
 25 by this Section, and EPA or, as appropriate, the State takes such  
 26 action instead, Settling Work Defendant shall reimburse EPA and  
 27 the State all costs of the response action not inconsistent with  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 the NCP pursuant to Section XVII (Reimbursement of Response  
 2 Costs).  
 3 Nothing in the preceding Paragraph or in this Consent  
 4 Decree shall be deemed to limit any authority of the United  
 5 States, or the State, to take, direct, or order all appropriate  
 6 action or to seek an order from the Court to protect human health  
 7 and the environment or to prevent, abate, respond to, or minimize  
 8 an actual or threatened release of Waste Material on, at, or from  
 9 the Site.

10 XVII. REIMBURSEMENT OF RESPONSE COSTS

11 A. Within sixty (60) days of the Effective Date of this  
 12 Consent Decree as defined in Section XXVIII (Effective Date),  
 13 Lockheed Martin shall:

14 1. Pay to the United States \$ 11,827,869 in the form  
 15 of an EFT to the U.S. Department of Justice Lockbox referencing  
 16 the San Fernando Valley Superfund Site/Burbank Operable Unit, and  
 17 referencing CERCLA Number SSID #59, DOJ Case Number 90-11-2-442  
 18 and USAO File No. 91-03-463 in reimbursement of Past Basin-wide  
 19 Response Costs.

20 2. Provide written verification to EPA regarding EFT  
 21 transfers pursuant to this Section as specified in Section XXVII  
 22 (Notices and Submissions).

23 3. Pay to the State \$ 22,348.60 in reimbursement of  
 24 Past Basin-wide Response Costs incurred by the State and  
 25 \$ 25,264.14 in reimbursement of Past Site-Specific Response Costs  
 26 incurred by the State in the form of a certified check or checks  
 27 made payable to the State of California, Department of Toxic  
 28

4483-9099

1 Substances Control, Project No. 300173. Lockheed Martin shall  
 2 send the certified check(s) to: Department of Toxic Substances  
 3 Control, Accounting Office, 400 P Street, 4th floor, Sacramento,  
 4 California, 95814.

5 B. Lockheed Martin shall reimburse the United States and  
 6 the State for all Future Site-Specific Response Costs not  
 7 inconsistent with the National Contingency Plan incurred by the  
 8 United States and the State. The United States and the State  
 9 will send Lockheed Martin bills for Future Site-Specific Response  
 10 Costs incurred by EPA, DOJ, the State and their contractors no  
 11 more frequently than annually; provided, however, that failure to  
 12 include all such costs in the submittal during any calendar year  
 13 will not preclude EPA or the State from submitting such costs in  
 14 any subsequent year. EPA's Agency Financial Management System  
 15 Summary Data (SCORES) Report or equivalent shall constitute  
 16 documentation of EPA's costs. Lockheed Martin shall make payment  
 17 within sixty (60) days of the date of each bill requiring  
 18 payment, except as otherwise provided in this Section, Paragraphs  
 19 C and D. Lockheed Martin shall make all payments required by  
 20 this Paragraph in the following manner: Lockheed Martin shall  
 21 transmit such amounts in the form of a EFT to the U.S. Department  
 22 of Justice Lockbox referencing the San Fernando Valley Superfund  
 23 Site/Burbank Operable Unit, and referencing CERCLA Number SSID #  
 24 L6, DOJ Case Number 90-11-2-442 and USAO File No. 91-03-463.

25 C. Lockheed Martin may contest a bill for Future Site-  
 26 Specific Response Costs under this Section and Paragraph if it  
 27 determines that the United States or the State has made an  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 accounting error or if it alleges that a cost item that is  
2 included represents costs that are inconsistent with the NCP.  
3 Such objection shall be made in writing within sixty (60) days of  
4 receipt of the bill and must be sent to the United States (if the  
5 United States' accounting is being disputed) or the State (if the  
6 State's accounting is being disputed) pursuant to Section XXVII  
7 (Notices and Submissions). Any such objection shall specifically  
8 identify the contested Future Site-Specific Response Costs and  
9 the basis for objection. In the event of such an objection,  
10 Lockheed Martin shall within the sixty (60) day period pay all  
11 uncontested Future Site-Specific Response Costs to the United  
12 States or the State in the manner described in this Section,  
13 Paragraph B. Simultaneously, Lockheed Martin shall establish an  
14 interest-bearing escrow account in a federally-insured bank duly  
15 chartered in the State of California and remit to that escrow  
16 account funds equivalent to the amount of the contested Future  
17 Site-Specific Response Costs. Lockheed Martin shall send to the  
18 United States, as provided in Section XXVII (Notices and  
19 Submissions), and the State a copy of the transmittal letter and  
20 check paying the uncontested Future Site-Specific Response Costs,  
21 and a copy of the correspondence that establishes and funds the  
22 escrow account, including, but not limited to, information  
23 containing the identity of the bank and bank account under which  
24 the escrow account is established as well as a bank statement  
25 showing the initial balance of the escrow account.  
26 Simultaneously with establishment of the escrow account, within  
27 the sixty (60) day period, Lockheed Martin shall initiate the  
28

4483-9099

1 dispute resolution procedures in Section XX (Dispute Resolution).  
2 If the United States or the State prevails in the dispute or  
3 concerning any aspect of the contested costs in dispute, within  
4 five (5) days of the resolution of the dispute, Lockheed Martin  
5 shall pay the sums due (with accrued interest) to the United  
6 States in the manner described in this Section, Paragraph B, or  
7 the State, if State costs are disputed, in the manner described  
8 in this Section, Paragraph A.3. If Lockheed Martin prevails  
9 concerning any aspect of the contested costs, Lockheed Martin  
10 shall pay that portion of the costs (plus associated accrued  
11 interest) as to which it did not prevail to the United States or  
12 the State, if State costs are disputed in the manner described in  
13 this Section, Paragraph A.3 or B, as applicable; Lockheed Martin  
14 shall be disbursed any balance of the escrow account. The  
15 dispute resolution procedures set forth in this Paragraph in  
16 conjunction with the procedures set forth in Section XX (Dispute  
17 Resolution) shall be the exclusive mechanisms for resolving  
18 disputes regarding Lockheed Martin's obligation to reimburse the  
19 United States and the State for their Future Site-Specific  
20 Response Costs, including without limitation allegations of  
21 accounting errors or allegations that costs billed are  
22 inconsistent with the NCP.  
23 D. In the event that any payment required by this Section,  
24 Paragraph A.1 is not made within sixty (60) days of the Effective  
25 Date of this Consent Decree (as defined by Section XXVIII),  
26 Lockheed Martin shall pay interest on the unpaid balance. The  
27 interest to be paid shall begin to accrue sixty (60) days after  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 the Effective Date of this Consent Decree. Interest shall accrue  
2 at the rate specified through the date of Lockheed Martin's  
3 payment. Payments of Interest made under this Paragraph shall be  
4 in addition to such other remedies or sanctions available to  
5 Plaintiffs by virtue of a failure to make timely payments under  
6 this Section.

7 XVIII. INDEMNIFICATION AND INSURANCE

8 The United States and the State do not assume any liability  
9 by entering into this Consent Decree or by virtue of any  
10 designation of Settling Work Defendant or any other defendant who  
11 performs work pursuant to this Consent Decree as EPA's authorized  
12 representative under Section 104(e) of CERCLA, 42 U.S.C.  
13 § 9604(e). Settling Work Defendant, with respect to response  
14 activities performed by Settling Work Defendant, and other  
15 Settling Defendants with respect to response activities performed  
16 by them, if any, shall indemnify, save and hold harmless the  
17 United States, the State and their officials, agents, employees,  
18 contractors, subcontractors, or representatives for or from any  
19 and all claims or causes of action arising from, or on account  
20 of, acts or omissions of such Settling Defendant, its officers,  
21 employees, agents, contractors, subcontractors, and any persons  
22 acting on its behalf or under its control, in carrying out  
23 activities pursuant to this Consent Decree, including, but not  
24 limited to, any claims arising from the designation of Settling  
25 Work Defendant or any other Settling Defendant as EPA's  
26 authorized representative under Section 104(e) of CERCLA, 42  
27 U.S.C. § 9604(e). Further, such Settling Defendant agrees to pay  
28

4483-9099

1 the United States and the State all costs they incur including,  
2 but not limited to, attorneys fees and other expenses of  
3 litigation and settlement arising from, or on account of, claims  
4 made against the United States or the State based on acts or  
5 omissions of such Settling Defendant, its officers, employees,  
6 agents, contractors, subcontractors, and any persons acting on  
7 its behalf or under its control, in carrying out activities  
8 pursuant to this Consent Decree. Neither the United States nor  
9 the State shall be held out as a party to any contract entered  
10 into by or on behalf of such Settling Defendant in carrying out  
11 activities pursuant to this Consent Decree. Neither such  
12 Settling Defendant nor any such contractor shall be considered an  
13 agent of the United States or the State.

14 A. Settling Defendants waive all claims against the United  
15 States and the State for damages or reimbursement or for set-off  
16 of any payments made or to be made to the United States or the  
17 State arising from or on account of any contract, agreement, or  
18 arrangement between such Settling Defendants and any person for  
19 performance of O&M Activities on or relating to the Site,  
20 including, but not limited to, claims on account of construction  
21 delays. In addition, such Settling Defendant shall indemnify and  
22 hold harmless the United States and the State with respect to any  
23 and all such claims for damages or reimbursement arising from or  
24 on account of any contract, agreement, or arrangement between any  
25 one or more of Settling Defendants and any person for performance  
26 of O&M Activities on or relating to the Site, including, but not  
27 limited to, claims on account of construction delays.  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

1 B. No later than thirty (30) days prior to the Date of  
2 Commencement, Settling Work Defendant shall secure, and shall  
3 maintain until the first anniversary of EPA's Certification of  
4 Completion pursuant to Section XV (Certification of Completion),  
5 comprehensive general liability insurance with limits of not less  
6 than \$ 20 million dollars (\$ 20,000,000) combined single limit  
7 each occurrence, and in the annual aggregate, ten million  
8 (\$ 10,000,000) of which is dedicated to the Interim Remedial  
9 Action, naming as additional insureds the United States and the  
10 State. In addition, for the duration of this Consent Decree,  
11 Settling Work Defendant shall satisfy, or shall ensure that its  
12 contractors or subcontractors satisfy, all applicable laws and  
13 regulations regarding the provision of worker's compensation  
14 insurance for all persons performing the O&M Activities on behalf  
15 of Settling Work Defendant in furtherance of this Consent Decree.  
16 Prior to commencement of the O&M Activities under this Consent  
17 Decree, Settling Work Defendant shall provide to EPA and the  
18 State certificates of such insurance and a copy of each insurance  
19 policy. Settling Work Defendant shall resubmit such certificates  
20 and copies of policies each year on the anniversary of the Date  
21 of Commencement. If Settling Work Defendant demonstrates by  
22 evidence satisfactory to EPA and the State that its contractor or  
23 subcontractor maintains insurance equivalent to that described  
24 above, or insurance covering the same risks but in a lesser  
25 amount, then, with respect to that contractor or subcontractor,  
26 Settling Work Defendant need provide only that portion of the  
27 insurance described above which is not maintained by the  
28

1 contractor or subcontractor. If Settling Work Defendant fails to  
2 submit proof of insurance as described in this Paragraph, and no  
3 other Settling Defendant submits such proof, EPA shall have the  
4 right to take over all of the work required by this Consent  
5 Decree with respect to the Upstream Facilities, and the City of  
6 Burbank shall continue to fund and perform all of the work  
7 required by this Consent Decree with respect to the Downstream  
8 Facilities. If EPA takes over the work required by this Consent  
9 Decree with respect to the Upstream Facilities pursuant to this  
10 Section and Paragraph, Lockheed Martin shall fund EPA's  
11 performance of such work pursuant to Section XIV (Funding of  
12 Response Activities), Paragraph H.2.b-c of this Consent Decree.  
13 If EPA takes over such work pursuant to this Section and  
14 Paragraph, the City of Burbank shall not be required to reimburse  
15 Lockheed Martin for any portion of the costs incurred by EPA to  
16 take over and/or to perform such work.

17 C. If Settling Work Defendant obtains insurance as  
18 described in this paragraph, and such insurance is subsequently  
19 cancelled, Settling Work Defendant shall so notify EPA within ten  
20 (10) days of Settling Work Defendant's receipt of notice that  
21 such insurance had been cancelled. Furthermore, in the event of  
22 such cancellation, equivalent insurance for the O&M Activities  
23 shall be obtained as soon as reasonably practicable, and proof of  
24 such insurance shall be submitted by Settling Work Defendant to  
25 EPA within ten (10) days of such insurance being obtained.  
26 Delays in the O&M Activities or EPA's decision to take over the  
27 work due to the failure to obtain or submit proof of insurance  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 shall not constitute a force majeure event under this Consent  
2 Decree.

3 D. In its bid documents, Settling Work Defendant shall  
4 require that all contractors submitting bids to become O&M  
5 Contractor agree to provide comprehensive general liability  
6 insurance in the amount specified in Paragraph B of this Section.  
7 Settling Work Defendant shall condition awarding the bid for O&M  
8 Contractor upon a contractor's ability to provide the  
9 comprehensive general liability insurance specified in Paragraph  
10 B of this Section. The contract entered into between the  
11 Settling Work Defendant and the O&M Contractor shall require the  
12 O&M Contractor to provide worker's compensation insurance in  
13 compliance with all applicable laws and regulations and  
14 comprehensive general liability insurance as specified in  
15 Paragraph B of this Section. Settling Work Defendant's  
16 compliance with this Paragraph shall constitute compliance with  
17 its obligation in Paragraph B of this Section to secure and  
18 retain insurance, provided the O&M Contractor complies with its  
19 obligations to provide the comprehensive general liability  
20 insurance specified in Paragraph B of this Section.

21 E. In addition to the insurance required by this Section,  
22 Lockheed Martin, the Settling Work Defendant, and the UAO Parties  
23 hereby agree among themselves that the Upstream Facilities and  
24 Blending Facility shall be insured by additional coverages as set  
25 forth in Exhibit 3 to this Consent Decree, and Lockheed Martin  
26 agrees to fund such coverages through the O&M Trust Fund.

27 1. The Settling Work Defendant will promptly and  
28

4483-9099

1 diligently make and pursue claims against any available insurance  
2 for reimbursement of costs and expenses of any repairs or other  
3 work required as a result of an alleged Design Defect as  
4 described in Section XIV, Paragraph M, will not receive  
5 reimbursement under Section XIV, Paragraph M for any such costs  
6 and expenses that are recovered from insurance, and will refund  
7 to Lockheed Martin and/or the UAO Parties any monies paid by  
8 Lockheed Martin and/or the UAO Parties for costs and expenses  
9 which are subsequently paid by insurance.

10 2. The obligations set forth in Paragraph E.1 of this  
11 Section shall not be the subject of stipulated penalties or  
12 enforceable by Plaintiffs.

13 3. EPA agrees that disputes arising with regard to  
14 Exhibit 3 to this Consent Decree may be submitted to dispute  
15 resolution under Section XX (Dispute Resolution), Paragraph G of  
16 this Consent Decree.

17 4. Nothing in this Paragraph shall affect the  
18 obligations of Lockheed Martin, Settling Work Defendant or the  
19 UAO Parties pursuant to Section XIV of this Consent Decree  
20 (Funding of Response Activities).

21 XIX. FORCE MAJEURE

22 A. "Force majeure," for purposes of this Consent Decree, is  
23 defined as any event arising from causes beyond the control of a  
24 Settling Defendant or of any entity controlled by such Settling  
25 Defendant, including, but not limited to, its contractors and  
26 subcontractors, that delays or prevents the performance of any  
27 obligation under this Consent Decree despite such Settling  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 Defendant's best efforts to fulfill the obligation. The  
 2 requirement that the Settling Defendant exercise "best efforts to  
 3 fulfill the obligation" includes using best efforts to anticipate  
 4 any potential force majeure event and best efforts to address the  
 5 effects of any potential force majeure event (1) as it is  
 6 occurring and (2) following the potential force majeure event,  
 7 such that the delay is minimized to the greatest extent possible.  
 8 "Force majeure" does not include financial inability to complete  
 9 the O&M Activities or a failure to attain the Performance  
 10 Standards.

11 B. If any event occurs or has occurred that may delay the  
 12 performance of any O&M Activities under this Consent Decree, or  
 13 any other response activities performed under this Consent  
 14 Decree, whether or not caused by a force majeure event, the  
 15 Settling Defendant responsible for performing the activities  
 16 shall notify orally EPA's Project Coordinator or, in his or her  
 17 absence, EPA's Alternate Project Coordinator or, in the event  
 18 both of EPA's designated representatives are unavailable, the  
 19 Director of the Superfund Division, EPA Region IX, as soon as  
 20 possible under the circumstances. It shall be presumed that  
 21 notice not made within two (2) Working Days of when such Settling  
 22 Defendant first knew or should have known that the event might  
 23 cause a delay is untimely unless evidence credible to EPA and to  
 24 the contrary is provided to EPA by the Settling Work Defendant.  
 25 Within ten (10) days thereafter, such Settling Defendant shall  
 26 provide in writing to EPA and the State an explanation and  
 27 description of the reasons for the delay; the anticipated  
 28

4483-9099

1 duration of the delay; all actions taken or to be taken to  
 2 prevent or minimize the delay; a schedule for implementation of  
 3 any measures to be taken to prevent or mitigate the delay or the  
 4 effect of the delay; the Settling Defendant's rationale for  
 5 attributing such delay to a force majeure event if it intends to  
 6 assert such a claim; and a statement as to whether, in the  
 7 opinion of the Settling Defendant, such event may cause or  
 8 contribute to an endangerment to public health, welfare or the  
 9 environment. The Settling Defendant shall include with any  
 10 notice all available documentation supporting its claim that the  
 11 delay was attributable to a force majeure. Unless the force  
 12 majeure event is a natural catastrophe or similar event which  
 13 inherently justifies departure from the above requirements,  
 14 failure to comply with the above requirements shall preclude  
 15 Settling Defendant from asserting any claim of force majeure for  
 16 that event. A Settling Defendant shall be deemed to have notice  
 17 of any circumstance of which its contractors or subcontractors  
 18 had or should have had notice.

19 C. If EPA, after a reasonable opportunity for review and  
 20 comment by the State, agrees that the delay or anticipated delay  
 21 is attributable to a force majeure event, the time for  
 22 performance of the obligations under this Consent Decree that are  
 23 affected by the force majeure event will be extended by EPA,  
 24 after a reasonable opportunity for review and comment by the  
 25 State, for such time as is necessary to complete those  
 26 obligations. An extension of the time for performance of the  
 27 obligations affected by the force majeure event shall not, of  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

1 itself, extend the time for performance of any other obligation.  
2 If EPA, after a reasonable opportunity for review and comment by  
3 the State, does not agree that the delay or anticipated delay has  
4 been or will be caused by a force majeure event, EPA will notify  
5 the Settling Defendant claiming force majeure in writing of its  
6 decision. If EPA, after a reasonable opportunity for review and  
7 comment by the State, agrees that the delay is attributable to a  
8 force majeure event, EPA will notify the Settling Defendant  
9 claiming force majeure in writing of the length of the extension,  
10 if any, for performance of the obligations affected by the force  
11 majeure event. Notification to EPA of any other claimed force  
12 majeure event affecting other obligations of parties to this  
13 Consent Decree shall be made by the party claiming force majeure  
14 in writing to EPA within five (5) Working Days of when such party  
15 knew or should have known that the event might cause a delay in  
16 such party's obligations. It shall be presumed that notice not  
17 made within such time is untimely unless evidence credible to EPA  
18 and to the contrary is provided to EPA by such party.

19 D. If the Settling Defendant claiming force majeure elects  
20 to invoke the dispute resolution procedures set forth in Section  
21 XX (Dispute Resolution), it shall do so no later than fifteen  
22 (15) days after receipt of EPA's notice. In any such proceeding,  
23 the Settling Defendant shall have the burden of demonstrating by  
24 a preponderance of the evidence that the delay or anticipated  
25 delay has been or will be caused by a force majeure event, that  
26 the duration of the delay or the extension sought was or will be  
27 warranted under the circumstances, that best efforts were  
28

1 exercised to avoid and mitigate the effects of the delay, and  
2 that the Settling Defendant complied with the requirements of  
3 this Section, Paragraphs A and B, above or was excused from such  
4 compliance under the terms of this Decree. If the Settling  
5 Defendant carries this burden, the delay at issue shall be deemed  
6 not to be a violation by such Settling Defendant of the affected  
7 obligation of this Consent Decree identified to EPA and the  
8 Court.

9 **XX. DISPUTE RESOLUTION**

10 A. Unless otherwise expressly provided for in this Consent  
11 Decree, the dispute resolution procedures of this Section shall  
12 be the exclusive mechanism to resolve disputes arising under or  
13 with respect to this Consent Decree. However, the procedures set  
14 forth in this Section shall not apply to actions by the United  
15 States to enforce obligations of a Settling Defendant that have  
16 not been disputed in accordance with this Section.

17 B. Any dispute which arises under or with respect to this  
18 Consent Decree shall in the first instance be the subject of  
19 informal negotiations between the parties to the dispute. The  
20 period for informal negotiations shall not exceed twenty (20)  
21 days from the time the dispute arises, unless it is modified by  
22 written agreement of the parties to the dispute. The dispute  
23 shall be considered to have arisen when one party sends the other  
24 party a written Notice of Dispute.

25 C. In the event that the parties cannot resolve a dispute  
26 by informal negotiations under the preceding Paragraph, then the  
27 position advanced by EPA shall be considered binding unless,  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

1 within ten (10) days after the conclusion of the informal  
 2 negotiation period, the Settling Defendant asserting that there  
 3 is a dispute invokes the formal dispute resolution procedures of  
 4 this Section by serving on the United States a written Statement  
 5 of Position on the matter in dispute, including, but not limited  
 6 to, any factual data, analysis or opinion supporting that  
 7 position and any supporting documentation relied upon by such  
 8 Settling Defendant. The Statement of Position shall specify the  
 9 Settling Defendant's position as to whether formal dispute  
 10 resolution should proceed under this Section XX, Paragraph F or  
 11 G.

12 D. Within fourteen (14) days after receipt of the Settling  
 13 Defendant's Statement of Position, EPA will serve on such  
 14 Settling Defendant its Statement of Position, including, but not  
 15 limited to, any factual data, analysis, or opinion supporting  
 16 that position and all supporting documentation relied upon by  
 17 EPA. EPA's Statement of Position shall include a statement as to  
 18 whether formal dispute resolution should proceed under this  
 19 Section XX, Paragraph F or G.

20 E. If there is disagreement between EPA and a Settling  
 21 Defendant asserting there is a dispute as to whether dispute  
 22 resolution should proceed under Section XX, Paragraph F or G, the  
 23 parties to the dispute shall follow the procedures set forth in  
 24 the Paragraph determined by EPA to be applicable. However, if  
 25 the Settling Defendant ultimately appeals to the Court to resolve  
 26 the dispute, the Court shall determine which Paragraph is  
 27 applicable in accordance with the standards of applicability set  
 28

1 forth in Section XX, Paragraphs F and G.

2 F. Formal dispute resolution for disputes pertaining to the  
 3 selection or adequacy of any response action and all other  
 4 disputes that are accorded review on the administrative record  
 5 under applicable principles of administrative law shall be  
 6 conducted pursuant to the procedures set forth in this Paragraph.  
 7 For purposes of this Paragraph, the adequacy of any response  
 8 action includes, without limitation: (1) the adequacy or  
 9 appropriateness of plans, procedures to implement plans, or any  
 10 other items requiring approval by EPA under this Consent Decree;  
 11 and (2) the adequacy of the performance of response actions taken  
 12 pursuant to this Consent Decree. Nothing in this Consent Decree  
 13 shall be construed to allow any dispute by Settling Defendants  
 14 regarding the validity of the ROD's provisions.

15 1. An administrative record of the dispute shall be  
 16 maintained by EPA and shall contain all Statements of Position,  
 17 including supporting documentation, submitted pursuant to this  
 18 Paragraph. Where appropriate, EPA may allow submission of  
 19 supplemental Statements of Position by the parties to the  
 20 dispute.

21 2. The Director of the Superfund Division, EPA Region  
 22 IX, will issue a final administrative decision resolving the  
 23 dispute based on the administrative record described in this  
 24 Section, Paragraph F.1. This decision shall be binding upon the  
 25 Settling Defendant asserting that there is a dispute, subject  
 26 only to the right to seek judicial review pursuant to this  
 27 Section, Paragraphs F.3 and F.4.  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1           3. Any administrative decision made by EPA pursuant to  
2 this Section, Paragraph F.2 shall be reviewable by this Court,  
3 provided that a notice of judicial appeal is filed by the  
4 Settling Defendant with the Court and served on all parties  
5 within thirty (30) days of receipt of EPA's decision. The notice  
6 of judicial appeal shall include a description of the matter in  
7 dispute, the efforts made by the parties to resolve it, the  
8 relief requested, and the schedule, if any, within which the  
9 dispute must be resolved to ensure orderly implementation of this  
10 Consent Decree. The United States may file a response to the  
11 Settling Defendant's notice of judicial appeal.

12           4. In proceedings on any dispute governed by this  
13 Paragraph, the Settling Defendant asserting that there is a  
14 dispute shall have the burden of demonstrating that the decision  
15 of the Superfund Division Director is arbitrary and capricious or  
16 otherwise not in accordance with law. Judicial review of EPA's  
17 decision shall be on the administrative record compiled pursuant  
18 to this Section, Paragraph F.1.

19           G. Formal dispute resolution for disputes that neither  
20 pertain to the selection or adequacy of any response action nor  
21 are otherwise accorded review on the administrative record under  
22 applicable principles of administrative law, shall be governed by  
23 this Paragraph.

24           1. Following receipt of the Settling Defendant's  
25 Statement of Position submitted pursuant to Section XX, Paragraph  
26 C, the Director of the Superfund Division, EPA Region IX, will  
27 issue a final written decision resolving the dispute. The  
28

4483-9099

1 Superfund Division Director's decision shall be binding on the  
2 Settling Defendant asserting that there is a dispute unless,  
3 within thirty (30) days of receipt of the decision, such Settling  
4 Defendant files with the Court and serves on the other party or  
5 parties a notice of judicial appeal setting forth the matter in  
6 dispute, the efforts made by the parties to resolve it, the  
7 relief requested, and the schedule, if any, within which the  
8 dispute must be resolved to ensure orderly implementation of the  
9 Consent Decree. The United States may file a response to  
10 Settling Defendant's notice of judicial appeal.

11           2. Notwithstanding Paragraph R of Section I  
12 (Background) of this Consent Decree, judicial review of any  
13 dispute governed by this Paragraph shall be governed by  
14 applicable provisions of law.

15           H. The invocation of formal dispute resolution procedures  
16 under this Section shall not extend, postpone or affect in any  
17 way any obligation not directly in dispute of the Settling  
18 Defendant asserting that there is a dispute under this Consent  
19 Decree, unless EPA or the Court agrees otherwise. If a Settling  
20 Defendant prevails, the deadlines for any requirements which it  
21 could not practicably meet because of the dispute resolution  
22 proceedings shall be extended to account for any delays because  
23 of such proceedings. Stipulated penalties with respect to the  
24 disputed matter shall continue to accrue but payment shall be  
25 stayed pending resolution of the dispute as provided in Section  
26 XXI (Stipulated Penalties), Paragraph I. Notwithstanding the  
27 stay of payment, stipulated penalties shall accrue from the first  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 day of noncompliance with any applicable provision of this  
2 Consent Decree. In the event that the Settling Defendant does  
3 not prevail on the disputed issue, stipulated penalties shall be  
4 assessed and paid as provided in Section XXI (Stipulated  
5 Penalties), unless EPA in its discretion elects not to assess  
6 some or all of such penalties.

7 XXI. STIPULATED PENALTIES

8 Unless excused by EPA or a force majeure event, a Settling  
9 Defendant shall be liable for stipulated penalties to the United  
10 States, as set forth in this Section, for each failure by such  
11 Settling Defendant to comply with the requirements of this  
12 Consent Decree. "Compliance" by the Settling Work Defendant  
13 shall include completion of the O&M activities under this Consent  
14 Decree or any work plan or deliverable approved under this  
15 Consent Decree or incorporated by this Consent Decree, in  
16 accordance with all applicable requirements of law, this Consent  
17 Decree, the Second Stage O&M Work Plan and any plans or other  
18 documents approved by EPA pursuant to this Consent Decree or any  
19 such work plan or deliverable, and within the specified time  
20 schedules established by and approved under this Consent Decree  
21 or any such work plan or deliverable.

22 A. Unless expressly stated otherwise in this Consent  
23 Decree, any reports, plans, specifications, schedules,  
24 deliverables, appendices, and attachments required by this  
25 Consent Decree, or implemented in whole or in part by this  
26 Consent Decree, are, upon approval by EPA, incorporated into this  
27 Consent Decree. A failure by the Settling Work Defendant to  
28

4483-9099

1 comply with applicable EPA-approved reports, plans, specifica-  
2 tions, schedules, deliverables, appendices or attachments shall  
3 be considered a failure to comply with this Consent Decree and  
4 shall subject such Settling Work Defendant to stipulated  
5 penalties as provided in Paragraphs D through F of this Section.

6 B. Failure to comply with this Consent Decree shall also  
7 include but is not limited to the following:

8 1. Failure by Settling Work Defendant to submit  
9 deliverables specified in this Consent Decree in an acceptable  
10 manner and by the date due pursuant to this Consent Decree;  
11 provided, however, that if the failure to comply results from a  
12 determination by EPA that a written deliverable is inadequate,  
13 the Settling Work Defendant shall have ten (10) working days from  
14 receipt of EPA's written notice of disapproval, or such other  
15 longer time period as provided by EPA in the notice of  
16 disapproval, within which to correct the inadequacy and resubmit  
17 the deliverable for approval. Any disapproval by EPA shall  
18 include an explanation of why the deliverable is inadequate. If  
19 the resubmitted deliverable is inadequate, the Settling Work  
20 Defendant shall be deemed to be in violation of this Consent  
21 Decree.

22 2. Failure by Settling Work Defendant to use best  
23 efforts to obtain any permits necessary for offsite work which  
24 Settling Work Defendant is required to perform or failure by  
25 Settling Work Defendant to use best reasonable efforts to obtain  
26 necessary access agreements.

27 3. Failure by Settling Work Defendant to comply with  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 any permit obtained for the purpose of implementing the  
2 requirements of this Consent Decree in any offsite location.

3 C. Stipulated penalties for failure to perform any require-  
4 ment of this Consent Decree for which a deadline is specified  
5 shall begin to accrue on the first day after the deadline.  
6 Stipulated penalties for any other violation of this Consent  
7 Decree shall begin to accrue on the first day after a Settling  
8 Defendant subject to penalties receives notice from EPA of such  
9 violation. For any violation, stipulated penalties shall  
10 continue to accrue up to and including the day on which the non-  
11 compliance is corrected. EPA, in its sole discretion, may waive  
12 or reduce stipulated penalties. If EPA does not waive stipulated  
13 penalties, EPA shall provide the Settling Defendant subject to  
14 penalties with written notice of the alleged deficiency in  
15 compliance with this Consent Decree, and accrued stipulated  
16 penalties shall become payable thirty (30) days after such  
17 Settling Defendant's receipt of EPA's written notice of  
18 deficiency; provided, however, that if EPA provides notice of an  
19 alleged deficiency, and that deficiency continues, EPA shall not  
20 be required to provide any additional notice in order for  
21 stipulated penalties to continue to accrue and become payable.

22 D. Stipulated penalties shall accrue in the following  
23 amounts for the violations described in this Paragraph, and a  
24 Settling Defendant subject to such penalties may not dispute the  
25 amount of stipulated penalties due per type of violation:

26 1. Monthly Progress Reports and Other Periodic Reports  
27 Settling Work Defendant shall pay a stipulated  
28

4483-9099

1 penalty of \$ 750 per day for the submission of a late or  
2 deficient periodic progress report.

3 2. MCL Effluent Violations  
4 a. At any time if the concentration of TCE in the  
5 treated water is greater than 5.0 parts per billion ("ppb"),  
6 Settling Work Defendant shall be considered to have been out of  
7 compliance for each day for which the representative treated  
8 water sample indicates that the concentration of TCE was greater  
9 than 5.0 ppb. Settling Work Defendant shall be subject to  
10 stipulated penalties in the amount of \$ 3,750 per day for each  
11 such day of noncompliance.

12 b. At any time if the concentration of PCE in the  
13 treated water is greater than 5.0 ppb, Settling Work Defendant  
14 shall be considered to have been out of compliance for each day  
15 for which the representative treated water sample indicates that  
16 the concentration of PCE was greater than 5.0 ppb. Settling Work  
17 Defendant shall be subject to stipulated penalties in the amount  
18 of \$ 3,750 per day for each such day of noncompliance.

19 c. At any time if the concentration of a volatile  
20 organic compound ("VOC") other than TCE or PCE in the treated  
21 water is greater than the MCL in effect at that time for such  
22 VOC, Settling Work Defendant shall be considered to have been out  
23 of compliance for each day for which the representative treated  
24 water sample indicates that the concentration of that VOC was  
25 greater than the MCL in effect, provided that the MCL in effect  
26 was promulgated on or before the Effective Date of this Consent  
27 Decree. Settling Work Defendant shall be subject to stipulated  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 penalties in the amount of \$ 3,750 per day for each such day of  
2 noncompliance.

3 d. At any time after the first sixty (60) days  
4 after an analytical sample result shows that the concentration of  
5 a contaminant in the treated water other than a VOC or nitrate is  
6 greater than the MCL in effect at that time for such contaminant,  
7 Settling Work Defendant shall be considered to have been out of  
8 compliance for each day for which the representative treated  
9 water sample indicates that the concentration of that contaminant  
10 was greater than the MCL in effect, provided that the MCL in  
11 effect was promulgated on or before the Effective Date of this  
12 Consent Decree. Settling Work Defendant shall be subject to  
13 stipulated penalties in the amount of \$ 2,250 per day for each  
14 such day of noncompliance.

15 E. Class I Violations

16 Stipulated penalties shall accrue in the following amounts  
17 for the violations described in this Paragraph, and a Settling  
18 Defendant subject to such penalties may not dispute the amount of  
19 stipulated penalties due per type of violation:

20	<u>Period of Noncompliance</u>	<u>Penalty Per Day Per Violation</u>
21	Days 1 - 5	\$ 750
22	Days 6 - 30	\$ 2,250
23	After 30 Days	\$ 3,750

24 1. Each failure to comply in a timely and adequate  
25 manner with the terms of this Consent Decree or any work plan  
26 implemented in whole or in part by this Consent Decree, that is  
27 not specifically listed as a violation elsewhere under this  
28

4483-9099

1 Section, and specifically including any failure to comply with  
2 the substantive standards of any applicable or relevant and  
3 appropriate requirement ("ARAR") identified in the ROD (as  
4 modified by the ESD and SOW) and not identified as a violation  
5 under Paragraphs D through F of this Section.

6 2. Failure by Settling Work Defendant to submit any  
7 of the following:

- 8 i. Draft Second Stage Operations and Maintenance Work  
9 Plan
- 10 ii. Draft Second Stage Operations and Maintenance  
11 Staffing Plan
- 12 iii. Draft Second Stage Operations and Maintenance Time  
13 Line and Schedule
- 14 iv. Draft Quality Assurance Project Plan
- 15 v. Draft Health and Safety Plan

16 3. Violation by Settling Work Defendant of ARARs,  
17 other than MCL violations, and South Coast Air Quality Management  
18 District Regulation XIII.

19 F. Class II Violations

20 Stipulated penalties shall accrue in the following amounts  
21 for the violations described in this Paragraph, and a Settling  
22 Defendant subject to such penalties may not dispute the amount of  
23 stipulated penalties due per type of violation:

24	<u>Period of Noncompliance</u>	<u>Penalty Per Day Per Violation</u>
25	Days 1 - 5	\$ 1,500
26	Days 6 - 30	\$ 3,500
27	After 30 Days	\$ 10,000

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 Each violation by Settling Work Defendant of the following:

2 i. Obligation to hold Final Inspection(s)

3 Failure by Settling Work Defendant to submit any of the

4 following:

5 i. Second Stage Operations and Maintenance Work Plan

6 ii. Second Stage Operations and Maintenance Staffing

7 Plan

8 iii. Second Stage Operations and Maintenance Time Line

9 and Schedule

10 iv. Notification of Selection of O&M

11 Contractors/Subcontractors

12 v. Quality Assurance Project Plan

13 vi. Health and Safety Plan

14 Failure by Settling Work Defendant to comply with any of the

15 following:

16 i. Quality Assurance Project Plan

17 ii. Health and Safety Plan

18 iii. Second Stage O&M Work Plan

19 G. Payments of stipulated penalties shall be made by a

20 Settling Defendant as follows:

21 1. Stipulated penalties assessed for failure to make

22 full and timely payment to the O&M Trust Account pursuant to

23 Section XIV (Funding of Response Activities) or to the United

24 States pursuant to Section XVII (Reimbursement of Response Costs)

25 shall be paid by Lockheed Martin. Lockheed Martin shall not be

26 subject to stipulated penalties for failure to fund insurance

27 costs for insurance coverages described solely in Exhibit 3 to

28

4483-9099

1 this Consent Decree.

2 2. Stipulated penalties for failure to make full and

3 timely payment pursuant to Paragraph M of Section XIV (Funding of

4 Response Activities) of this Consent Decree shall be paid by

5 Lockheed Martin or the UAO Parties according to the EPA

6 Preliminary Finding and/or Further Determination required by that

7 Section and Paragraph. Stipulated penalties for failure to make

8 payments pursuant to Paragraph N of Section XIV (Funding of

9 Response Activities) shall be paid by Lockheed Martin, the

10 Settling Cash Defendants or the City of Burbank in accordance

11 with their obligations under that Section and Paragraph.

12 3. Except for stipulated penalties which arise due to

13 Lockheed Martin's or the UAO Parties' failure to comply with

14 their obligations under Section XIV (Funding of Response

15 Activities) as described in this Paragraph, all other stipulated

16 penalties assessed for failure to comply with Section VI

17 (Performance of the Work By Settling Defendants) shall be the

18 responsibility of and be paid by the City of Burbank. No such

19 stipulated penalties shall be paid or reimbursed from the O&M

20 Trust Account.

21 H. If a Settling Defendant fails to pay stipulated

22 penalties in accordance with this Section, the United States may

23 institute proceedings in this action or a new action to collect

24 the penalties and any Interest due. Notwithstanding the

25 stipulated penalties provided for in this Section, and to the

26 extent authorized by law, EPA may elect to assess civil penalties

27 or bring an action in District Court to enforce the provisions of

28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 this Consent Decree. Payment of stipulated penalties shall not  
2 preclude EPA from electing to pursue any other remedy or sanction  
3 it may have to enforce this Consent Decree, and nothing in this  
4 Decree shall preclude EPA from seeking statutory penalties  
5 against a Settling Defendant who violates statutory or regulatory  
6 requirements, except that the total civil penalties (including  
7 stipulated penalties) collected by EPA for any such violation  
8 shall not exceed \$ 25,000 per day per violation.

9 I. A Settling Defendant may dispute any notice of  
10 deficiency issued to it. Penalties shall continue to accrue as  
11 provided in this Section but need not be paid until the  
12 following:

13 1. If the dispute is resolved by agreement or by  
14 decision or order of EPA which is not appealed to this Court,  
15 accrued penalties, plus Interest, shall be paid to EPA within  
16 thirty (30) days of the agreement or Settling Defendant's receipt  
17 of EPA's decision or order;

18 2. If the Settling Defendant appeals EPA's decision  
19 pursuant to Section XX (Dispute Resolution) and prevails upon  
20 final resolution of the dispute, no stipulated penalties or  
21 Interest thereon will be payable and any assessment of stipulated  
22 penalties and Interest thereon shall be set aside in writing by  
23 EPA;

24 3. If the Settling Defendant appeals EPA's decision  
25 pursuant to Section XX (Dispute Resolution) and does not prevail  
26 upon final resolution of the dispute, all accrued stipulated  
27 penalties, plus Interest shall be paid within thirty (30) days of  
28

4483-9099

1 a final Court order.

2 4. If a Settling Defendant appeals EPA's decision to  
3 this Court and the Court's decision is appealed by any Party, the  
4 Settling Defendant shall pay all accrued penalties determined by  
5 the District Court to be owing to the United States into an  
6 interest-bearing escrow account within sixty (60) days of receipt  
7 of the Court's decision or order. Penalties determined by the  
8 Court to be accruing shall be paid into this account as they  
9 continue to accrue, at least every sixty (60) days. Within  
10 fifteen (15) days of receipt of the final appellate court  
11 decision, the escrow agent shall pay the balance of the account  
12 to EPA or to the Settling Defendant to the extent that it  
13 prevails.

14 J. In the event that EPA assumes performance of a portion  
15 or all of the O&M Activities pursuant to Paragraph F of Section  
16 XXII (Covenants Not to Sue by Plaintiffs), Settling Work  
17 Defendant shall remain liable for any stipulated penalties that  
18 have accrued or that may accrue under this Consent Decree.

19 K. All penalties owed to the United States under this  
20 section shall be due and payable within thirty (30) days of the  
21 Settling Defendant's receipt from EPA of a demand for payment of  
22 the penalties, unless the Settling Defendant invokes the dispute  
23 resolution procedures under Section XX (Dispute Resolution). All  
24 payments under this Section shall be transmitted via EFT to the  
25 U.S. Department of Justice Lockbox, and shall reference CERCLA  
26 Number SSID # L6, DOJ Case Number 90-11-2-442 and USAO File NO.  
27 91-03-463. Written verification of EFTs pursuant to this Section  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

1 shall be sent to the United States as provided in Section XXVII  
2 (Notices and Submissions).

3 L. The payment of penalties shall not alter in any way the  
4 Settling Work Defendant's obligation to complete the performance  
5 of the O&M Activities required under this Consent Decree.

6 M. If a Settling Defendant fails to pay stipulated  
7 penalties when due, the United States may institute proceedings  
8 to collect the penalties, as well as Interest. The Settling  
9 Defendant shall pay Interest on the unpaid balance, which shall  
10 begin to accrue thirty (30) days after the date of demand made  
11 pursuant to this Section, Paragraph K.

12 N. Nothing in this Consent Decree shall be construed as  
13 prohibiting, altering, or in any way limiting the ability of the  
14 United States or the State to seek any other remedies or  
15 sanctions available by virtue of a Settling Defendant's violation  
16 of this Consent Decree or of the statutes and regulations upon  
17 which it is based, including, but not limited to, penalties  
18 pursuant to Section 122(1) of CERCLA, 42 U.S.C. § 9622(1).

19 XXII. COVENANTS NOT TO SUE BY PLAINTIFFS

20 In consideration of the actions that will be performed  
21 and/or the payments that will be made by the Settling Defendants  
22 under the terms of the Consent Decree, and except as specifically  
23 provided in this Section, the United States covenants not to sue  
24 or to take administrative action against Settling Defendants  
25 and/or the Released Parties pursuant to Sections 106 and 107(a)  
26 of CERCLA and Section 7003 of RCRA, and the State covenants not  
27 to sue or to take administrative action pursuant Section 107(a)  
28

1 of CERCLA, and to Chapters 6.5, Sections 25100 et seq., and 6.8  
2 Sections 25300 et seq. of the California Health and Safety Code  
3 for all Covered Matters expressly specified in Section XXIV  
4 (Effect of Settlement; Contribution Protection), Paragraph C. As  
5 to each Settling Defendant and its related Released Parties,  
6 these covenants not to sue are conditioned upon the complete and  
7 satisfactory performance by such Settling Defendant of its then-  
8 current obligations under this Consent Decree and shall remain in  
9 effect as to each Settling Defendant and its related Released  
10 Parties until and unless such Settling Defendant is not in  
11 compliance with the obligations imposed upon it by this Consent  
12 Decree. As to each Settling Defendant, Related Settling  
13 Defendant, or Related Released Party, as described in Appendix 1  
14 to this Consent Decree, these covenants not to sue are  
15 conditioned upon the complete and satisfactory performance by  
16 that party's principal Settling Defendant of its then-current  
17 obligations pursuant to Section XIV (Funding of Response Actions)  
18 of this Consent Decree. These covenants not to sue extend only  
19 to each Settling Defendant and its related Released Parties.  
20 These covenants not to sue do not extend to any other person. No  
21 person otherwise liable independent of liability associated with  
22 its status as a corporate or institutional predecessor or  
23 successor to a Settling Defendant or Related Released Party shall  
24 benefit from this provision.

25 A. United States' Pre-certification Reservations.

26 Except as to the parties listed in Appendix 3, and  
27 notwithstanding any other provision of this Consent Decree, the  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 United States reserves, and this Consent Decree is without  
 2 prejudice to, the right to institute proceedings in this action  
 3 or in a new action, or to issue an administrative order seeking  
 4 to compel Settling Defendants, Released Parties, or any of them  
 5 (1) to perform further response actions relating to the Site or  
 6 (2) to reimburse the United States for additional costs of  
 7 response if, prior to Certification of Completion of O&M  
 8 Activities pursuant to Section XV (Certification of Completion)  
 9 of this Consent Decree:

10 (i) conditions at the Site, previously unknown to EPA,  
 11 are discovered, or  
 12 (ii) information, previously unknown to EPA, is  
 13 received, in whole or in part,  
 14 and these previously unknown conditions or information together  
 15 with any other relevant information indicate that the Remedial  
 16 Action or the O&M Activities are not protective of human health  
 17 or the environment.

18 B. Except as to the parties listed in Appendix 3, the  
 19 United States also reserves the right to institute proceedings in  
 20 this action or in a new action, or to issue an administrative  
 21 order seeking to compel Settling Defendants, Released Parties, or  
 22 any of them to (1) perform further response actions relating to  
 23 the Site or (2) to reimburse the United States for additional  
 24 costs of response if, prior to Certification of Completion of the  
 25 O&M Activities, (a) the Settling Work Defendant substantially  
 26 fails and/or refuses to perform the O&M Activities, or (b) an  
 27 earthquake or Uninsurable Force Majeure Event causes Major Damage  
 28

4483-9099

1 (as defined in Section XIV (Funding of Response Activities),  
 2 Paragraph N) to the Plant Facilities, and EPA has reserved its  
 3 rights in such circumstances in that Section and Paragraph.

4 C. United States' Post-certification Reservations. Except  
 5 as to the parties listed in Appendix 3, and notwithstanding any  
 6 other provision of this Consent Decree, the United States  
 7 reserves, and this Consent Decree is without prejudice to, the  
 8 right to institute proceedings in this action or in a new action,  
 9 or to issue an administrative order seeking to compel Settling  
 10 Defendants, Released Parties, or any of them (1) to perform  
 11 further response actions relating to the Site or (2) to reimburse  
 12 the United States for additional costs of response if, subsequent  
 13 to Certification of Completion of the O&M Activities pursuant to  
 14 Section XV (Certification of Completion) of this Consent Decree:

15 (i) conditions at the Site, previously unknown to  
 16 EPA, are discovered, or  
 17 (ii) information, previously unknown to EPA, is  
 18 received, in whole or in part,  
 19 and these previously unknown conditions or this information  
 20 together with any other relevant information indicate that the  
 21 Remedial Action or the O&M Activities are not protective of human  
 22 health or the environment.

23 D. For purposes of this Section, Paragraph A, the  
 24 information and the conditions known to EPA shall include only  
 25 that information and those conditions set forth in the ROD for  
 26 the Site, the administrative record supporting the ROD, and  
 27 information required to be and actually submitted to EPA pursuant  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

1 to the First Consent Decree or UAO 92-12 prior to the date of  
 2 lodging of this Consent Decree. For purposes of this Section,  
 3 Paragraph C, the information received by and the conditions known  
 4 to EPA shall include only that information and those conditions  
 5 set forth in the ROD, the administrative record supporting the  
 6 ROD, and any information received by or required to be and  
 7 actually submitted to EPA pursuant to the requirements of the  
 8 First Consent Decree, this Consent Decree or UAO 92-12 prior to  
 9 Certification of Completion of the O&M Activities.

10 E. General Reservations of Rights. The covenants not to  
 11 sue set forth above do not pertain to any matters other than the  
 12 Covered Matters expressly specified in Section XXIV (Effect of  
 13 Settlement; Contribution Protection), Paragraph C. The United  
 14 States and the State reserve, and this Consent Decree is without  
 15 prejudice to, all rights against a Settling Defendant or a  
 16 Released Party with respect to all other matters, including but  
 17 not limited to, the following:

- 18 (1) claims based on a failure by such Settling  
 19 Defendant to meet a requirement of this Consent Decree;
- 20 (2) liability arising from the past, present, or  
 21 future disposal, release, or threat of release of hazardous  
 22 substances outside of the Site;
- 23 (3) liability for damages for injury to, destruction  
 24 of, or loss of natural resources;
- 25 (4) liability for response costs that have been or may  
 26 be incurred by any federal or State of California agency  
 27 which is the trustee for natural resources and which has, or  
 28

- 1 may in the future, spend funds relating to the Site;
- 2 (5) criminal liability;
- 3 (6) liability for violations of federal or State of  
 4 California law which occur during or after implementation of  
 5 the Remedial Action or O&M Activities;
- 6 (7) liability for additional response actions as may  
 7 be required pursuant to Section VII (Additional Response  
 8 Actions) or VIII (Periodic Review) of this Consent Decree,  
 9 to the extent Settling Defendants do not agree in this  
 10 Consent Decree to fund and/or perform such response actions  
 11 under this Consent Decree;
- 12 (8) liability for additional operable units or interim  
 13 remedies at the Site, for other operable units outside the  
 14 Site, or any interim or final Basin-wide response action;  
 15 and
- 16 (9) liability for Future Basin-wide Response Costs, and  
 17 any costs that the United States or the State will incur or  
 18 have incurred related to the Site which are not within the  
 19 definition of Past Site-Specific Response Costs, Future  
 20 Site-Specific Response Costs, or Past Basin-wide Response  
 21 Costs.

22 F. In the event EPA determines that Settling Work  
 23 Defendant has failed to implement any provisions of the O&M  
 24 Activities in an adequate or timely manner, EPA may perform any  
 25 and all portions of the O&M Activities as EPA determines  
 26 necessary. In such event, Lockheed Martin shall fund EPA's  
 27 performance of such O&M Activities pursuant to Section XIV  
 28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 (Funding of Response Activities), Paragraph H.2.b-c. Settling  
2 Work Defendant shall reimburse Lockheed Martin for that portion  
3 of EPA's costs incurred to fund EPA's takeover and/or performance  
4 of O&M Activities which is caused by the necessity for EPA to  
5 take over such O&M Activities from the Settling Work Defendant  
6 pursuant to this Section and Paragraph. If EPA takes over the  
7 performance of some or all of the O&M Activities pursuant to this  
8 Section and Paragraph, EPA shall issue a determination at the  
9 request of Settling Work Defendant or Lockheed Martin concerning  
10 which costs incurred by EPA were due to the necessity for EPA to  
11 take over such O&M Activities from the Settling Work Defendant.  
12 In no event shall the accounting of such costs for which the  
13 Settling Work Defendant may be required to reimburse Lockheed  
14 Martin pursuant to this Paragraph continue for a period longer  
15 than one year from EPA's takeover of such O&M Activities.  
16 Settling Work Defendant or Lockheed Martin may invoke the  
17 procedures set forth in Section XX (Dispute Resolution) to  
18 dispute EPA's determination concerning such costs.

19 G. Settling Work Defendant may invoke the procedures set  
20 forth in Section XX (Dispute Resolution) to dispute EPA's  
21 determination that the Settling Work Defendant failed to  
22 implement a provision of the O&M Activities in an adequate or  
23 timely manner as arbitrary and capricious or otherwise not in  
24 accordance with law. Such dispute shall be resolved on the  
25 administrative record. Except as is necessary to address an  
26 imminent and substantial endangerment to human health or the  
27 environment, EPA shall provide Settling Work Defendant with ten  
28

4483-9099

1 (10) days written notice of its intent to perform a portion or  
2 all of the O&M Activities. In the notice, EPA shall also  
3 describe the alleged deficiency. If the Settling Work Defendant  
4 disagrees with EPA's determination that it has failed to perform,  
5 in an adequate and timely manner, the O&M Activities required to  
6 be performed by this Consent Decree, and Settling Work Defendant  
7 desires to dispute EPA's determination in this regard, Settling  
8 Work Defendant shall invoke the dispute resolution provisions of  
9 Section XX (Dispute Resolution) within thirty (30) days of  
10 receiving written notice of EPA's intent. Invocation of dispute  
11 resolution shall not divest EPA of its right to perform the O&M  
12 Activities during the dispute. Upon receipt of notification that  
13 EPA intends to take over the performance of a portion or all of  
14 the O&M Activities, Settling Work Defendant's obligations to  
15 perform such O&M Activities pursuant to this Consent Decree shall  
16 terminate and stipulated penalties, if any are being incurred due  
17 to Settling Work Defendant's failure to perform such O&M  
18 Activities in a timely or adequate manner, shall cease to accrue  
19 against Settling Work Defendant for such failure.

20 H. Notwithstanding any other provision of this Consent  
21 Decree, the United States and the State retain all authority and  
22 reserve all rights to take any and all response actions  
23 authorized by law. However, the obligation, if any, of the  
24 Settling Defendants to reimburse the United States for taking  
25 such actions shall be governed by the provisions of this Consent  
26 Decree to the extent Settling Defendants comply with their  
27 obligations to fund or perform such response actions pursuant to  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 this Consent Decree.

2 XXIII. COVENANTS BY SETTLING DEFENDANTS

3 A. Settling Defendants hereby covenant not to sue and agree
4 not to assert any claims or causes of action against the United
5 States with respect to the Site or this Consent Decree,
6 including, but not limited to, any direct or indirect claim for
7 reimbursement from the Hazardous Substance Superfund (established
8 pursuant to the Internal Revenue Code, 26 U.S.C. § 9507) through
9 CERCLA Sections 106(b)(2), 111, 112, 113, 42 U.S.C.
10 §§ 9606(b)(2), 9611, 9612, and 9613, or any other provision of
11 law, any claim against the United States, including any
12 department, agency or instrumentality of the United States under
13 CERCLA Sections 107 or 113, 42 U.S.C. §§ 9607 or 9613, related to
14 the Site except as expressly reserved in this Section, Paragraphs
15 (A)(1), (2), or (3) of this Consent Decree or Section XVII.
16 Paragraph B of the First Consent Decree, or any claims arising
17 out of response activities at the Site. However, the Settling
18 Defendants reserve, this Consent Decree is without prejudice to,
19 and nothing in this Consent Decree shall be interpreted as
20 waiving, abrogating or resolving:

21 (1) any claims which any Settling Defendant has or may
22 have based upon any alleged liability of the United States
23 Department of Defense, any branch or division thereof ("DOD"), or
24 any predecessor agency to DOD for conditions at the Site pursuant
25 to CERCLA Sections 106, 107, 113, 120 or 310, 42 U.S.C. §§ 9606,
26 9607, 9613, 9620 or 9659 or RCRA Section 7002, 42 U.S.C. § 6972;

27 (2) any claims which any Settling Defendant has or may
28

4483-9099

1 have with respect to the Site against the United States pursuant
2 to any contract between any Settling Defendant and the United
3 States or between any Settling Defendant and any government
4 contractor(s) related to the Site; or

5 (3) actions against the United States based on
6 negligent actions taken directly by the United States (not
7 including oversight or approval of the Settling Defendants' plans
8 or activities) that are brought pursuant to any statute other
9 than CERCLA and for which the waiver of sovereign immunity is
10 found in a statute other than CERCLA.

11 (4) actions against the State based on negligent
12 actions taken directly by the State (not including oversight or
13 approval of the Settling Defendants' plans or activities) that
14 are brought pursuant to any statute or law other than CERCLA,
15 RCRA, and Chapters 6.5, Sections 25100 et seq., and 6.8, Sections
16 25300 et seq. of the California Health & Safety Code.

17 B. In agreeing to these reservations, the United States and
18 the State do not admit liability on any such claims and expressly
19 reserve any and all defenses that either of them may have to any
20 such claims.

21 C. Except as expressly set forth in this Consent Decree,
22 Settling Defendants do not waive any claim against and do not
23 release or covenant not to sue the United States or the State
24 with respect to any matter. Nothing in this Consent Decree shall
25 be deemed to constitute preauthorization of a claim within the
26 meaning of Section 111 of CERCLA, 42 U.S.C. § 9611, or 40 C.F.R.
27 § 300.700(d).
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 D. Settling Defendants hereby covenant not to sue and agree  
2 not to assert any claims or causes of action against the State  
3 with respect to the Site or this Consent Decree, including, but  
4 not limited to, (1) any direct or indirect claim for  
5 reimbursement from the Hazardous Waste Control Account, Hazardous  
6 Substance Account, or Hazardous Substance Cleanup Fund through  
7 Health and Safety Code section 25375 or any other provision of  
8 law; (2) any claim against the State under Sections 107 or 113 of  
9 CERCLA, 42 U.S.C. §§ 9607 or 9613, or Section 7003 of RCRA, 42  
10 U.S.C. § 9673; or (3) any other claims arising out of Settling  
11 Defendants' response activities at the Site, including but not  
12 limited to nuisance, trespass, taking, equitable indemnity and  
13 indemnity under California law, contribution under California and  
14 federal law, or strict liability under California law.

15 XXIV. EFFECT OF SETTLEMENT: CONTRIBUTION PROTECTION

16 A. Nothing in this Consent Decree shall be construed to  
17 create any rights in, or grant any cause of action to, any person  
18 not a Settling Defendant or a Released Party under this Consent  
19 Decree. The preceding sentence shall not be construed to waive  
20 or nullify any rights that any person not a signatory to this  
21 Consent Decree may have under applicable law. Each of the  
22 Parties expressly reserves any and all rights (including, but not  
23 limited to, any right to contribution), defenses, claims,  
24 demands, and causes of action which each party may have with  
25 respect to any matter, transaction, or occurrence relating in any  
26 way to the Site against any person not a Settling Defendant or  
27 Released Party under this Consent Decree.  
28

4483-9099

1 B. At such time as a judgment is entered and becomes final  
2 judicially approving this Consent Decree, each Settling Defendant  
3 hereby expressly waives any and all rights (including, but not  
4 limited to, any right to contribution, defenses, claims, demands,  
5 and causes of action under State of California or federal law)  
6 against all other Settling Defendants and Released Parties with  
7 respect to Covered Matters specified in Paragraph C of this  
8 Section. Notwithstanding the foregoing, any funding of the  
9 repair of earthquake damage ("Earthquake Funding") by Lockheed  
10 Martin pursuant to Section XIV (Funding of Response Activities),  
11 Paragraph N of this Consent Decree, is without prejudice to its  
12 right to assert claims against other Settling Defendants (except  
13 the Appendix 3 parties and Settling Work Defendant) for  
14 reimbursement of Earthquake Funding. No Settling Defendant  
15 (except the Appendix 3 parties and Settling Work Defendant) shall  
16 assert that any agreement which exists between any of the  
17 Settling Defendants at the time of entry of this Second Consent  
18 Decree acts as a bar or provides a defense to any reimbursement  
19 or contribution claim by any other Settling Defendant for  
20 Earthquake Funding. The provisions of this Paragraph  
21 specifically supersede the provisions of Paragraph B of Section  
22 XXII (Contribution Protection) of the First Consent Decree. With  
23 regard to claims by third parties for contribution against  
24 Settling Defendants and/or Released Parties for such Covered  
25 Matters specified in Paragraph C of this Section, the Parties  
26 hereto agree that the Settling Defendants and Released Parties  
27 are entitled to such protection from contribution actions or  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 claims as is provided by CERCLA Section 113(f)(2), 42 U.S.C.  
2 § 9613(f)(2). Certain defendants have entered into private  
3 agreements with regard to certain matters which relate to those  
4 that form the subject matter of this Consent Decree; the waiver  
5 expressed in this Paragraph shall not operate to preclude  
6 enforcement of those private agreements.

7 C. The Covered Matters in this Consent Decree are:

8 1. EPA's and the State's Past Site-Specific Response  
9 Costs and Past Basin-wide Response Costs,  
10 2. EPA's and the State's Future Site-Specific Response  
11 Costs,  
12 3. all matters addressed in the First Consent Decree  
13 and this Consent Decree,  
14 4. all matters addressed in UAO 92-12 through the  
15 period covered during this Consent Decree, and  
16 5. all costs of implementing the O&M Activities and  
17 any other response activity to be performed under this Consent  
18 Decree, except to the extent this Consent Decree does not provide  
19 for one or more of the Settling Defendants to fund and/or to  
20 perform any part of such activities.

21 D. The Settling Defendants agree that with respect to any  
22 suit or claim for contribution brought by them for Covered  
23 Matters they will notify the United States and the State in  
24 writing no later than sixty (60) days prior to the initiation of  
25 such suit or claim.

26 E. The Settling Defendants also agree that with respect to  
27 any suit or claim for contribution brought against them for  
28

4483-9099

1 Covered Matters they will notify the United States and the State  
2 in writing within sixty (60) days of service of the complaint on  
3 them. In addition, Settling Defendants shall notify the United  
4 States and the State in writing within ten (10) days of service  
5 or receipt of any Motion for Summary Judgment and within ten (10)  
6 days of receipt of any order from a court setting a case for  
7 trial.

8 F. In any subsequent administrative or judicial proceeding  
9 initiated by the United States or the State for injunctive  
10 relief, recovery of response costs, or other appropriate relief  
11 relating to the Site, Settling Defendants shall not assert, and  
12 may not maintain, any defense or claim based upon the principles  
13 of waiver, res judicata, collateral estoppel, issue preclusion,  
14 claim-splitting, or other defenses based upon any contention that  
15 the claims raised by the United States or the State in the  
16 subsequent proceeding were or should have been brought in the  
17 instant case; provided, however, that nothing in this Paragraph  
18 affects the enforceability of the covenants not to sue set forth  
19 in Section XXII (Covenants Not to Sue by Plaintiffs).

20 G. Payment of all sums which a Settling Cash Defendant is  
21 obligated to pay pursuant to Section XIV (Funding of Response  
22 Activities) of this Consent Decree, comprises full settlement as  
23 to that Settling Cash Defendant, any related Released Party as  
24 described in Appendix 1, and any Related Settling Defendant as  
25 described in Appendix 1, for all Covered Matters and thus, such  
26 Settling Cash Defendants, Related Settling Defendants and related  
27 Released Parties are entitled to such protection from  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 contribution actions or claims as is provided by CERCLA Section  
2 113(f)(2), 42 U.S.C. § 9613(f)(2).  
3 XXV. ACCESS TO INFORMATION  
4 A. Settling Defendants shall provide to EPA and the State,  
5 upon request, copies of all documents or portions thereof which  
6 are not privileged by the attorney-client privilege, the attorney  
7 work product doctrine, or any other privilege recognized by law,  
8 and information within their possession or control or that of  
9 their contractors or agents relating to response actions at the  
10 Site or to the implementation of this Consent Decree including,  
11 but not limited to, sampling, analysis, chain of custody records,  
12 manifests, trucking logs, receipts, reports, sample traffic  
13 routing, correspondence, or other documents or information  
14 related to the O&M Activities. Settling Defendants shall also  
15 make available to EPA and the State, for purposes of  
16 investigation or information gathering, their employees, agents,  
17 or representatives with knowledge of relevant facts concerning  
18 the performance of the O&M Activities.  
19 B. Settling Defendants may assert confidentiality claims  
20 covering part or all of the documents or information submitted to  
21 Plaintiffs under this Consent Decree to the extent permitted by  
22 and in accordance with Section 104(e)(7) of CERCLA, 42 U.S.C.  
23 § 9604(e)(7), and 40 C.F.R. § 2.203(b). Documents or information  
24 determined to be confidential by EPA will be afforded the  
25 protection specified in 40 C.F.R. Part 2, Subpart B. If no claim  
26 of confidentiality accompanies documents or information when they  
27 are submitted to EPA and the State, or if EPA has notified  
28

4483-9099

1 Settling Defendants that the documents or information are not  
2 confidential under the standards of Section 104(e)(7) of CERCLA,  
3 the public may be given access to such documents or information  
4 without further notice to Settling Defendants.  
5 C. The Settling Defendants may assert that certain  
6 documents, records and other information are privileged under the  
7 attorney-client privilege, the attorney work product doctrine, or  
8 any other privilege recognized by law. In the case of documents,  
9 if a Settling Defendant asserts such a privilege in lieu of  
10 providing documents, it shall provide the Plaintiffs with the  
11 following: (1) the title of the document, record, or  
12 information; (2) the date of the document, record, or  
13 information; (3) the name and title of the author of the  
14 document, record, or information; (4) the name and title of each  
15 addressee and recipient; (5) a description of the contents of the  
16 document, record, or information; and (6) the privilege asserted  
17 by such Settling Defendant. However, no documents, reports or  
18 other information created or generated pursuant to the  
19 requirements of this Consent Decree shall be withheld on the  
20 grounds that they are privileged. If a claim of privilege  
21 applies only to a portion of a document, the document shall be  
22 provided to EPA in redacted form.  
23 D. No claim of confidentiality or privilege shall be made  
24 with respect to any document that falls within Section  
25 104(e)(7)(F) of CERCLA, 42 U.S.C. § 9604(e)(7)(F).  
26  
27  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 XXVI. RETENTION OF RECORDS

2 A. Until ten (10) years after the Settling Defendants'  
3 receipt of EPA's notification pursuant to Paragraph B.2 of  
4 Section XV (Certification of Completion of the Work), each  
5 Settling Defendant shall preserve and retain all records and  
6 documents now in its possession or control or which come into its  
7 possession or control that relate in any manner to the  
8 performance of the O&M Activities or liability of any person for  
9 response actions conducted and to be conducted at the Site,  
10 regardless of any document retention policy to the contrary.

11 Until ten (10) years after Settling Defendants' receipt of EPA's  
12 notification pursuant to Paragraph A.2 of Section XV  
13 (Certification of Completion), Settling Defendants shall also  
14 instruct their contractors and agents to preserve all documents,  
15 records, and information of whatever kind, nature or description  
16 relating to the performance of the O&M Activities.

17 B. At the conclusion of this document retention period,  
18 Settling Defendants shall notify the United States and the State  
19 at least ninety (90) days prior to the destruction of any such  
20 records or documents, and, upon request by the United States or  
21 the State such Settling Defendant shall deliver any such records  
22 or documents to EPA or the State. A Settling Defendant may  
23 assert that certain documents, records and other information are  
24 privileged under the attorney-client privilege, the attorney work  
25 product doctrine, or any other privilege recognized by law. In  
26 the case of documents, if a Settling Defendant asserts such a  
27 privilege, it shall provide the Plaintiffs with the following:  
28

4483-9099

1 (1) the title of the document, record, or information; (2) the  
2 date of the document, record, or information; (3) the name and  
3 title of the author of the document, record, or information; (4)  
4 the name and title of each addressee and recipient; (5) a  
5 description of the subject of the document, record, or  
6 information; and (6) the privilege asserted by the Settling  
7 Defendant. However, no documents, reports or other information  
8 created or generated pursuant to the requirements of this Consent  
9 Decree shall be withheld on the grounds that they are privileged.  
10 If a claim of privilege applies only to a portion of the  
11 document, it shall be provided to EPA in redacted form.

12 C. Each Settling Defendant hereby certifies, individually,  
13 that it has not willfully and for an improper purpose altered,  
14 mutilated, discarded, destroyed or otherwise disposed of any  
15 records, documents or other information relating to its potential  
16 liability regarding the Site since notification of potential  
17 liability by the United States or the State or the filing of suit  
18 against it regarding the Site and that to the best of its  
19 knowledge, that it has fully complied with any and all EPA  
20 requests for information pursuant to Section 104(e) and 122(e) of  
21 CERCLA, 42 U.S.C. § 9604(e) and 9622(e), and Section 3007 of  
22 RCRA, 42 U.S.C. § 6927.

23 XXVII. NOTICES AND SUBMISSIONS

24 A. Whenever, under the terms of this Consent Decree,  
25 written notice is required to be given or a report or other  
26 document is required to be sent by one party to another, it shall  
27 be directed to the individuals at the addresses specified below,  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 unless those individuals or their successors give notice of a  
2 change to the other parties in writing. All notices and  
3 submissions shall be considered effective upon receipt, unless  
4 otherwise provided. Written notice as specified herein shall  
5 constitute complete satisfaction of any written notice  
6 requirement of the Consent Decree with respect to the United  
7 States, EPA, the State, and the Settling Defendants,  
8 respectively.

9 As to the United States:

10 Chief, Environmental Enforcement Section  
11 Environment and Natural Resources Division  
12 U.S. Department of Justice  
13 P.O. Box 7611

32 Department of Toxic Substances Control  
33 Region 3  
34 1011 N. Grandview Avenue  
35 Glendale, CA 91201

4483-9099

1 As to the Settling Work Defendant:

2 City of Burbank  
3 Peter Frankel, P.E.  
4 Supervising Civil Engineer  
5 City of Burbank  
6 Public Service Department  
7 165 West Magnolia Boulevard  
8 Burbank, CA 91503-0631

9 As to the Settling Defendants Other Than Settling Work Defendant:

10 As set forth in Appendix 7.

11 XXVIII. EFFECTIVE DATE

12 A. The Effective Date of this Consent Decree shall be the  
13 date upon which it is entered by the Court, except as otherwise  
14 provided herein.

15 XXIX. RETENTION OF JURISDICTION

16 A. This Court retains jurisdiction over both the subject  
17 matter of this Consent Decree and the Settling Defendants for the  
18 duration of the performance of the terms and provisions of this  
19 Consent Decree for the purpose of enabling any of the Parties to  
20 apply to the Court at any time for such further order, direction,  
21 and relief as may be necessary or appropriate for the  
22 construction or modification of this Consent Decree, or to  
23 effectuate or enforce compliance with its terms, or to resolve  
24 disputes in accordance with Section XX (Dispute Resolution)  
25 hereof.

26 XXX. APPENDICES

27 A. The following appendices are attached to and  
28 incorporated into this Consent Decree:

Appendix 1 is the complete list of the Settling Cash  
Defendants and Released Parties and/or other Settling Defendants

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 who are related to a Settling Cash Defendant, to Lockheed Martin  
2 or to the City of Burbank in the manner described in Appendix 1.

3  
4 Appendix 2 is the complete list of the Owner Settling  
5 Defendants and the properties they own within the Site.

6  
7 Appendix 3 is the complete list of Settling Defendants  
8 who are excepted from the operation of Section XXII (Covenants  
9 not to Sue by Plaintiffs), Paragraphs A, B and C.

10  
11 Appendix 4 is the Second Stage Statement of Work.

12  
13 Appendix 5 is ESD2.

14  
15 Appendix 6 is a list of the Settling Defendants and for each  
16 Settling Defendant, the person to whom notices and submissions  
17 shall be sent pursuant to Section XXVII (Notices and Submissions)  
18 of this Consent Decree.

19  
20 Appendix 7 is a plot plan or plans which depict extraction  
21 wells VO-1, 2, 3 and 4 as described in Paragraph L of Section XIV  
22 (Funding of Response Activities), and the City's liquid phase GAC  
23 wellfield located at 164 West Magnolia Boulevard, Burbank,  
24 California, as described in Paragraph G of Section V (General  
25 Provisions) and Paragraph H.4 of Section VI (Performance of the  
26 Work).

27 B. The following exhibits are attached to this Consent  
28 Decree for reference purposes and are not incorporated herein

4483-9099

1 unless otherwise noted.

2 Exhibit 1 is the First Consent Decree.

3 "Appendix A" to the First Consent Decree is the ROD  
4 prior to its modification in ESD1, the First Consent Decree, and  
5 ESD2.

6 "Appendix B" to the First Consent Decree is ESD 1.

7 "Appendix C" to the First Consent Decree is the Map of  
8 Corrected Well Locations.

9 "Appendix D" to the First Consent Decree is the SOW.

10 "Appendix E" to the First Consent Decree is Schematics.

11 "Appendix F" to the First Consent Decree is a Plot Map.

12 Exhibit 2 is Unilateral Administrative Order 92-12 and the  
13 April 26, 1992 Amendment to Unilateral Administrative Order 92-  
14 12.

15 Exhibit 3 is a Scope of Work regarding Plant Facilities  
16 Insurance.

17 XXXI. COMMUNITY RELATIONS

18 A. Settling Work Defendant shall participate and cooperate  
19 with to EPA and the State concerning its participation in the  
20 community relations plan ("Plan") for the Site to be developed or  
21 which has been previously developed by EPA. In consultation with  
22 Settling Work Defendant, EPA will determine the appropriate role  
23 for the Settling Work Defendant under the Plan. Settling Work  
24 Defendant shall cooperate with EPA and the State in implementing  
25 the Plan and pursuant thereto, in providing information regarding  
26 the O&M Activities to the public. As requested by EPA, or the  
27 State, Settling Work Defendant, Lockheed Martin, and/or the  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 Settling Cash Defendants (including the UAO Parties) shall  
2 participate in the preparation of information for dissemination  
3 to the public and in public meetings which may be held or  
4 sponsored by EPA or the State to explain activities at or  
5 relating to the Site.

6 XXXII. MODIFICATION

7 A. Schedules specified in this Consent Decree, in the  
8 Second Stage Statement of Work, or in any work plan approved by  
9 EPA pursuant to this Consent Decree for completion of the O&M  
10 Activities or any other response activities may be modified by  
11 agreement of EPA and the Settling Work Defendant, and any other  
12 Settling Defendant whose rights and/or obligations would be  
13 substantially affected thereby. All such modifications shall be  
14 made in writing.

15 B. No modifications shall be made to the Second Stage  
16 Statement of Work without written notification to and consent by  
17 any Settling Defendant whose rights or obligations would be  
18 substantially affected thereby, and written approval of the  
19 United States. Prior to providing its approval to any  
20 modification, the United States will provide the State with a  
21 reasonable opportunity to review and comment on the proposed  
22 modification.

23 C. Nothing in this Consent Decree shall be deemed to alter  
24 EPA's authority to make changes to the interim remedy for the  
25 Burbank Operable Unit in compliance with CERCLA, the National  
26 Contingency Plan, and any other applicable laws or regulations,  
27 or to require court approval of such changes.  
28

4483-9099

1 D. Nothing in this Consent Decree shall be deemed to alter  
2 the Court's power to enforce, supervise or approve modifications  
3 to this Consent Decree.

4 XXXIII. LODGING AND OPPORTUNITY FOR PUBLIC COMMENT

5 A. This Consent Decree shall be lodged with the Court for a  
6 period of not less than thirty (30) days for public notice and  
7 comment in accordance with Section 122(d)(2) of CERCLA, 42 U.S.C.  
8 § 9622(d)(2), and 28 C.F.R. § 50.7. The United States also shall  
9 publish notice of the proposed settlement described in this  
10 Consent Decree in the Federal Register pursuant to section 122(1)  
11 of CERCLA, 42 U.S.C. § 9622(1). The United States hereby gives  
12 notice and opportunity to the public for a public meeting in the  
13 affected area, and a reasonable opportunity to comment on the  
14 proposed settlement prior to its final entry, pursuant to section  
15 6973(d) of RCRA, 42 U.S.C. § 7003(d).

16 B. The United States reserves the right to withdraw or  
17 withhold its consent or suggest modifications to this Consent  
18 Decree if the comments regarding the Consent Decree disclose  
19 facts or considerations which indicate that the Consent Decree is  
20 inappropriate, improper, or inadequate. Settling Defendants  
21 consent to the entry of this Consent Decree without further  
22 notice. However, Settling Defendants' consent to the entry of  
23 this Consent Decree is not consent to any modifications, and no  
24 Settling Defendant shall be bound by modifications to this  
25 Consent Decree without its prior written consent.

26 C. If for any reason the Court should decline to approve  
27 this Consent Decree in the form presented, this Consent Decree is  
28

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

1 voidable as to any party at the sole discretion of such party and  
2 the terms of this Consent Decree may not be used as evidence in  
3 any litigation between the Parties.

4 XXXIV. SIGNATORIES/SERVICE

5 A. Each undersigned representative of a Settling Defendant  
6 to this Consent Decree, Plaintiffs, and the Assistant Attorneys  
7 General for the Environment and Natural Resources Division of the  
8 Department of Justice and for the State of California, certifies  
9 that he or she is fully authorized to enter into the terms and  
10 conditions of this Consent Decree and to execute and legally bind  
11 such Party to this document.

12 B. Each Settling Defendant hereby agrees not to oppose  
13 entry of this Consent Decree by this Court or to challenge any  
14 provision of this Consent Decree unless the United States has  
15 notified the Settling Defendants in writing that it no longer  
16 supports entry of this Consent Decree.

17 C. Each Settling Defendant shall identify, on the attached  
18 signature page, the name, address and telephone number of an  
19 agent who is authorized to accept service of process by mail on  
20 behalf of that Party with respect to all matters arising under or  
21 relating to this Consent Decree. Concerning any action brought  
22 by the United States or the State to enforce the terms of this  
23 Consent Decree, Settling Defendants hereby agree to accept  
24 service in that manner and to waive the formal service  
25 requirements set forth in Rule 4 of the Federal Rules of Civil  
26 Procedure and any applicable local rules of this Court,  
27 including, but not limited to, service of a summons. Concerning  
28

4483-9099

1 the lodging and entry of this Consent Decree, Settling Defendants  
2 agree to accept in lieu of service by mail or the formal service  
3 requirements set forth in Rule 4 of the Federal Rules of Civil  
4 Procedure, service by the United States and the State by mail of  
5 one (1) copy of any document(s), motions or related matters upon  
6 the following persons:

7 For Lockheed Martin:

8 Gregory McClintock, Esq.  
9 McClintock, Weston, Benshoof  
10 Rochefort, Rubalcava, MacCuish  
11 444 South Flower Street, 43rd floor  
12 Los Angeles, CA 90071

13 For the City of Burbank:

14 Benjamin Kaufman, Esq.  
15 Freilich, Kaufman, Fox & Sohagi  
16 11755 Wilshire Blvd., Suite 1230  
17 Los Angeles, CA 90025-1518

18 For the remaining Settling Defendants:

19 Robert Yahiro, Esq.  
20 Rodi, Pollock, Pettker, Galbraith & Phillips  
21 801 South Grand Avenue, Suite 400  
22 Los Angeles, CA 90017

23 SO ORDERED THIS 22 DAY OF June, 1998

SECOND  
EXPLANATION OF SIGNIFICANT DIFFERENCES  
DECLARATION

SITE NAME AND LOCATION

San Fernando Valley Area 1  
Burbank Operable Unit  
Los Angeles County, California

I. Statement of Basis and Purpose

This decision document presents the Second Explanation of Significant Differences (ESD2) to the interim remedial action selected by the Burbank Operable Unit (Burbank OU) Record of Decision (ROD) signed June 1989. The Burbank OU ROD was previously modified by an Explanation of Significant Differences dated November 1990 (ESD1). Additional changes to the remedy were made in a 1992 Consent Decree, which was approved by the Central District of California federal court. ESD2 has been developed in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (42 U.S.C. Section 9601 et. seq.) and the National Contingency Plan (40 C.F.R. Section 300 et. seq.).

II. Description of the Selected Remedy in the ROD and ESD1

The Burbank OU ROD selected the interim remedy for an area of groundwater contamination, located within the San Fernando Valley Area 1 Superfund Site, which encompasses wellfields which were operated by the City of Burbank prior to being shut down as a result of the contamination. The ROD selected extraction of contaminated groundwater, treatment by air or steam stripping, and use of the treated water as a public water supply by the City of Burbank. The interim remedy was estimated to cost \$69 million over 20 years (in 1989 dollars).

The ROD selected as the interim remedy the extraction and treatment of groundwater at a rate of 12,000 gallons per minute (gpm). This was considered to be the extraction rate necessary to hydraulically control, i.e. to prevent the spreading of, groundwater at concentrations of 100 parts per billion (ppb) of trichloroethylene (TCE) and 5 ppb of perchloroethylene (PCE). Extraction wells were to be placed in locations which would control plume migration while initiating aquifer restoration. The treatment technology specified was either air stripping or steam stripping, with off-gas control.

240

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2  
Page 3

The ROD states that the treated water must meet all existing federal and state Maximum Contaminant Levels (MCLs) and State Action Levels (SALs). It also states that the water must meet all drinking water treatment technology requirements. The ROD states a preference for delivering the treated water to the City of Burbank's distribution system for use as a public water supply. Using the treated water in this manner was considered preferable to discharging the water to waste because it represents a beneficial use of the groundwater resource in a water-poor region.

III. Summary of ESD1

ESD1 clarified and superseded certain parts of the Burbank OU ROD, as follows.

Based on new information regarding the occurrence of nitrate in the groundwater (nitrate levels turned out to be higher than anticipated), it became clear that additional treatment measures would be required in order for the extracted and treated groundwater to be used as a public water supply. EPA decided to require blending of the extracted and treated Burbank OU groundwater with a water supply lower in nitrates, such that the MCL is achieved in water served to the public.

The nitrate blending requirement increased the total amount of water produced by the interim remedy. The total amount to be produced was high enough that the possibility was raised that the City of Burbank would not be able to accept the total quantity of water produced at the Burbank OU. Other local water purveyors were unwilling to commit to accept excess water produced by the Burbank OU treatment plant. Therefore, in order to ensure that the interim remedy would continue to extract contaminated groundwater at the intended capacity, EPA decided to require reinjection of any excess water.

EPA clarified that the interim remedy could be designed, constructed, and operated in phases. Phasing the project allows for initial completion of a portion of the total extraction wellfield and treatment plant capacity. Operation of this first phase of the project allows collection of data on aquifer response and treatment plant efficiency. This data helps the design engineer to optimize the design of the following project phases, and helps to optimize overall groundwater containment and treatment efficiency for the project.

EPA clarified statements in the ROD pertaining to containment of groundwater containing TCE at 100 ppb and PCE at 5 ppb. These levels are not treatment goals to be attained in groundwater, but

241

4483-9099

ESD2  
Page 4

are to be used in designing the containment area to be developed by the extraction wellfield.

Because of the addition of reinjection as a component of the project, ARARs pertaining to reinjection of extracted and treated groundwater were identified. Specifically mentioned was the "Statement of Policy with Respect to Maintaining High Quality of Waters in California," which requires that reinjected water not degrade existing water quality.

The additional cost due to ESD1 changes in the interim remedy were estimated at \$8.8 million over 20 years (in 1990 dollars).

IV. Summary of Additional Significant Differences (ESD2)

Based on additional study of the local (Burbank OU) groundwater system by Lockheed Martin, and by EPA's consultant CH2M Hill, EPA has concluded that an extraction rate of 9,000 gpm results in substantially the same level of groundwater containment as an extraction rate of 12,000 gpm. Overall costs are reduced at the lower extraction rate, because the need to construct and operate expensive reinjection facilities is eliminated. Cost effectiveness is improved because the lower extraction rate makes it less likely that the upper groundwater zone will become dewatered, and thus will allow EPA to achieve its goal of preferentially pumping the most contaminated zones. Based on these factors, EPA has lowered the interim remedy extraction rate to 9,000 gpm.

EPA has decided to eliminate reinjection as a requirement based on projections that there will essentially be no excess water at the revised groundwater extraction rate. The City of Burbank can substantially accept, and has committed to accept, an average of 9,000 gpm from the interim remedy facilities.

Due to elimination of reinjection from the project, the Burbank OU groundwater extraction rate will not be a continuous 9,000 gpm. The instantaneous extraction rate will fluctuate with the City of Burbank's water demand. In recognition of the likelihood that it will not be possible to extract groundwater at a rate of 9,000 gpm, twenty-four hours a day, three hundred and sixty-five days a year, EPA is specifying that the new extraction rate will be achieved as an average rate, not an instantaneous rate.

EPA has also decided to suspend the 9,000 gpm extraction rate requirement during times when nitrate levels in the extracted groundwater exceed 50 mg/l as nitrate. The ability to maintain an annual extraction rate of 9,000 gpm is not only dependent on the City of Burbank's water demand, but also upon nitrate concentrations in the extracted groundwater. It is possible that

242

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2  
Page 5

these concentrations may rise high enough such that, during periods of low water demand, it is not possible to extract an average of 9,000 gpm and also meet the nitrate MCL. EPA's analysis suggests that even under the worst case scenario for nitrates, an average of 8,500 gpm would be pumped. EPA believes the interim remedy will continue to be protective of human health and the environment even at this slightly reduced groundwater extraction rate, which, if it occurs, will only occur on an occasional basis.

EPA estimates that changes to the interim remedy effected by ESD2 will reduce implementation costs by \$49 million (1995 dollars).

Further, the City of Burbank holds a public water supply operating permit, issued by the California Department of Health Services. This permit has been amended to cover operation of the Burbank OU treatment facilities. The requirements of this permit will govern off-site requirements for drinking water protectiveness.

V. Declaration

The selected remedy, as modified by this ESD, is protective of human health and the environment, attains federal and state requirements that are applicable, or relevant and appropriate, to this interim remedial action, and is cost-effective. This remedy satisfies the statutory preference for remedies that employ treatment which permanently and significantly reduces the volume, toxicity or mobility of the hazardous substances as a principal element. It also complies with the statutory preference for remedies that utilize permanent solutions and alternative treatment technologies or resource recovery technologies to the maximum extent practicable. As part of the remedy, groundwater monitoring will be conducted to track contaminant levels at the Burbank Operable Unit and to monitor the performance of the extraction and treatment system in order to ensure adequate protection of human health and the environment.

San Fernando Valley Area 1, Burbank Operable Unit

SECOND EXPLANATION OF SIGNIFICANT DIFFERENCES  
February 12, 1997

I. Introduction

On June 30, 1989, the U.S. Environmental Protection Agency (EPA) signed a Record of Decision (ROD) for the San Fernando Valley Area 1 Superfund Site, Burbank Operable Unit (Burbank OU). On November 21, 1990, EPA signed an Explanation of Significant Differences (ESD1) modifying the interim remedial action selected in the ROD. The purpose of this Second Explanation of Significant Differences (ESD2) is to explain additional modifications to the interim remedial action.

Under Section 117 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980, as amended by the Superfund Amendment and Reauthorization Act of 1986, and pursuant to 40 C.F.R. Sec. 300.435(c)(2)(i) (55 Fed. Reg. 8666, 8852 (March 8, 1990)), EPA is required to publish an Explanation of Significant Differences when significant (but not fundamental) changes are made to a final remedial action plan as described in a ROD.

This document provides a brief background of the Site, a summary of the remedy selected in the Burbank OU ROD, a summary of changes made to the remedy by ESD1, a description of the changes to the remedy EPA is making in this ESD2 (including how the changes affect and better refine the remedy selected in the ROD), and an explanation of why EPA is making these changes.

EPA is issuing ESD2 in order to take into account technical data received after ESD1 was signed in November, 1990. The changes are: (1) Based on additional study of the local (Burbank OU) groundwater system, EPA has concluded that an extraction rate of 9,000 gallons per minute (gpm) results in substantially the same level of groundwater containment as an extraction rate of 12,000 gpm. Therefore, the interim remedy extraction rate has been reduced to 9,000 gpm; (2) EPA is specifying that the new extraction rate will be achieved as an average rate, not an instantaneous rate; (3) EPA has decided to eliminate reinjection as a requirement based on projections that, on an annual basis, there will be no excess water at the revised groundwater extraction rate; and, (4) EPA has decided that the specified average extraction rate need not be met during times when nitrate levels in the extracted groundwater exceed 50 mg/l, because under this circumstance a greater quantity of blending water will be

244

## Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2  
Page 7

required, leaving the City of Burbank less capacity to accept extracted groundwater for use as a public water supply.

ESD2 and the supporting documentation will become part of the Burbank OU Administrative Record. Copies of the Administrative Record have been placed at the following locations:

City of Burbank Public Library  
110 North Glenoaks Boulevard  
Burbank, CA 91502  
818-953-9737

City of Glendale Public Library  
222 East Harvard Street  
Glendale, CA 91205  
818-956-2027

## II. Background

## A. Site background and description

The following gives a brief background of the Burbank OU and a short summary of the remedy selected in the ROD and modified by ESD1. Further background information can be found in the ROD (dated June 30, 1989), and in ESD1 (dated November 20, 1990), as well as in other documents in the Burbank OU Administrative Record.

In June 1986, EPA evaluated the threat posed by groundwater contamination at a number of water supply wellfields within the San Fernando Valley and Verdugo groundwater basins. The chief contaminants of concern are trichloroethylene (TCE) and perchloroethylene (PCE). As a result of its investigation, EPA designated four wellfield areas as National Priorities List (NPL) sites. EPA is managing the four sites as a single project consistent with CERCLA Section 104(d)(4).

The San Fernando Valley Groundwater Basin has historically been an important source of drinking water for the Los Angeles metropolitan area, including the City of Burbank. The groundwater basin provides enough water to serve approximately 600,000 residents.

Groundwater extracted from the basin is especially important during years of drought. Due to contamination by volatile organic chemicals (VOCs), including TCE and PCE, beneficial use of the groundwater resource has been partially lost. Surface water supplies have replaced the lost resource, but are costly, and may not be available in the future due to periodic drought conditions and the potential for changing water rights policy.

245

4483-9099

ESD2  
Page 8

The Burbank OU is located within the San Fernando Valley groundwater basin and encompasses wellfields which were operated by the City of Burbank prior to being shut down as a result of contamination. The Burbank OU was specifically developed to address this areal extent of groundwater contamination.

The City of Burbank's production wells have been shut down since the early 1980s because of the presence of TCE and PCE in concentrations exceeding federal and state Maximum Contaminant Levels (MCLs). Consequently, the city purchases close to one hundred percent of its water from the Metropolitan Water District of Southern California, which supplies surface water imported from outside the San Fernando basin. (The city does operate a granular activated carbon groundwater extraction and treatment plant during parts of the year, but the contribution of this plant toward meeting the overall water demand is small.)

## B. Selected remedy as modified by ESD1

The Burbank OU ROD selected the interim remedy for an area of groundwater contamination generally located within the San Fernando Valley Area 1 Superfund Site. The ROD selected extraction of contaminated groundwater, treatment by air or steam stripping, and use of the treated water as a public water supply by the City of Burbank. The interim remedy was estimated to cost \$69 million over the 20 year planned length of the interim remedy. ESD1 added the requirement to blend the extracted, treated, water with a lower nitrate source in order to meet nitrate MCLs. ESD1 also added the requirement for reinjection of excess water that the city could not accept due to water demand limitations. The changes to the interim remedy caused by ESD1 were estimated to cost \$8.8 million, raising the total estimated project cost to \$77.8 million (in 1989/1990 dollars).

Based on analyses conducted by the Los Angeles Department of Water and Power, through their consultant James M. Montgomery, in the Burbank OU Feasibility Study, the ROD specified that groundwater would be extracted and treated at a rate of 12,000 gpm. This rate was considered necessary in order to control plume migration and to initiate aquifer restoration. The 12,000 gpm rate was projected to hydraulically contain groundwater having a concentration of 100 parts per billion (ppb) of TCE and 5 ppb of PCE. ESD1 clarified that these levels are not treatment goals to be attained in groundwater, but are to be used in designing the containment area to be developed by the extraction wellfield.

The ROD states that the treated water must meet all existing federal and state MCLs and State Action Levels (SALs). It also states that the water must meet all drinking water treatment technology requirements. The treated water is being delivered to

246

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2 Page 9

the City of Burbank's distribution system for use as a public water supply. Use of the treated water in this manner is considered preferable to discharging the water to waste because it restores the groundwater resource to beneficial use.

With respect to meeting drinking water standards, ESD1 concluded that, based on new information suggesting high nitrate levels in the groundwater, additional measures were required to meet the MCL for nitrate in the extracted and treated water. EPA decided to require blending of the extracted and treated groundwater with a water supply lower in nitrates, such that the MCL is achieved in water served to the public.

Addition of the nitrate blending requirement raised the possibility that the City of Burbank would not be able to accept the total quantity of water produced by the interim remedy. This is because nitrate blending raises water production, from the initially anticipated rate of 12,000 gpm, to a rate as high as 24,000 gpm. Under ESD1, EPA decided to require reinjection of any excess water, or water the City of Burbank could not use as a public water supply due to insufficient demand. EPA also identified Applicable or Relevant and Appropriate Requirements (ARARs) pertaining to reinjection of extracted and treated groundwater, specifically, the "Statement of Policy with Respect to Maintaining High Quality of Waters in California," which requires that reinjected water not degrade existing water quality.

Under ESD1, EPA also clarified that the interim remedy could be designed, constructed, and operated in phases. Phasing the project allows for initial completion of a portion of the total extraction wellfield and capacity treatment plant capacity. Operation of this first phase of the project allows collection of data on aquifer response and treatment plant efficiency. This data helps the design engineer to optimize the design of the following project phases, and helps to optimize overall groundwater containment and treatment efficiency for the project.

Portions of the Burbank OU ROD and ESD1 have already been implemented through a 1992 Consent Decree and a Unilateral Administrative Order. EPA also made additional operational changes in the interim remedy in the 1992 consent decree, which was approved by the Central District of California federal court. The 1992 consent decree, captioned United States of America v. Lockheed Corporation et al., Civil Action No. 91-4527 MRP(Tx), is included in the Administrative Record.

Under the Consent Decree, Lockheed Martin and the City of Burbank have constructed the first phase of the interim remedy. Under the Unilateral Administrative Order, a group of parties associated with six other Burbank facilities have constructed the

247

4483-9099

ESD2 Page 10

blending facility, the purpose of which is to reduce nitrates in the extracted, treated groundwater. The first phase of the interim remedy was completed and became operational in January 1996. The first phase consists of groundwater extraction and treatment at a rate of 6,000 gpm, blending with Metropolitan Water District water, and use of the treated, blended water as a public water supply.

III. Summary of Significant Differences

ESD2 provides for the following changes to the interim remedy:

- 1) EPA has lowered the interim remedy extraction rate to 9,000 gpm. Based on additional study of the local (Burbank OU) groundwater system during the Remedial Design phase, EPA has concluded that an extraction rate of 9,000 gpm results in substantially the same level of groundwater containment as an extraction rate of 12,000 gpm. Cost effectiveness is improved at the lower extraction rate, not only due to the reduced cost of pumping less water, but because the need to construct and operate expensive reinjection facilities is eliminated. In addition, the lower extraction rate makes it less likely that the upper groundwater zone will become de-watered, and thus will allow EPA to achieve its goal of preferentially pumping the most contaminated zones.
- 2) EPA has decided to eliminate reinjection as a requirement. This decision is based on projections that, under existing aquifer conditions, there will be no excess water (i.e. water that cannot be used by the City of Burbank as a public water supply) produced at the revised groundwater extraction rate. The City of Burbank has committed to accept an annual average of 9,000 gpm from the interim remedy facilities.
- 3) EPA is specifying that the 9,000 gpm extraction rate will be achieved as an average rate, not as an instantaneous rate. Due to elimination of reinjection, the instantaneous rate will fluctuate with the City of Burbank's water demand. EPA recognizes that it will not be possible to extract groundwater at a rate of 9,000 gpm, twenty-four hours a day, three hundred and sixty-five days a year. However, EPA's analysis suggests that under the worst case scenario for nitrates, groundwater can be extracted at a minimum rate of 8,500 gpm. EPA believes protectiveness of human health and the environment is maintained even at this slightly reduced rate, which, if necessary, will only be necessary on an occasional basis. In order to maximize the amount of groundwater pumped, EPA has decided to count groundwater extraction from the city's granular activated carbon treatment plant toward the 9,000 gpm average rate. This wellfield will most likely be used by the city during the summer

248

## Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2  
Page 11

to meet peak water demand. The City of Burbank has agreed to maximize its use of treated groundwater. These decisions and agreements are to be included in a second consent decree between EPA, the city, and numerous Burbank parties.

4) EPA has decided to suspend the 9,000 gpm extraction rate requirement during times when nitrate levels in the extracted groundwater exceed 50 mg/l as nitrate. This decision is being made to ensure that under no circumstances will the MCL for nitrate be exceeded in the treated water. The ability to maintain an annual extraction rate of 9,000 gpm is not only dependent on the City of Burbank's water demand, but also upon nitrate concentrations in the extracted groundwater and in the blending water. It is possible that these concentrations may rise high enough such that, during periods of low water demand, it is not possible to extract an average of 9,000 gpm and also meet the nitrate MCL. However, as mentioned in the above paragraph, the City of Burbank has agreed to maximize its use of treated groundwater.

Lockheed Martin has estimated that changes to the interim remedy effected by ESD2 will reduce implementation costs by 49 million dollars (1995 dollars), and EPA is in agreement with this estimate.

IV. Explanation and Detailed Description of Changes and Clarifications

After the ROD and ESD1 were signed, EPA received and reviewed new data from its Alternative Remedial Contracting Strategy (ARCS) contractor CH2M Hill, from the City of Burbank, and from the Lockheed Martin Corporation, regarding the Burbank OU groundwater system. This new information included both data collected in the field (from groundwater monitoring wells) and the output from computer modeling exercises. Reports and technical memoranda were generated compiling this data, which project that the implementation of ESD2 will not reduce the protectiveness of the Burbank OU interim remedy. Thus, EPA's conclusion in the ROD and ESD1 that the interim remedy is protective of human health and the environment has not changed. The new and existing technical information that EPA relied upon to prepare ESD2 is identified in the discussion which follows, and this information can be found in the Burbank OU Administrative Record.

A. Background

Based on this new information, EPA has concluded that a lower pumping rate than originally projected will result in the desired degree of containment of the VOC contaminant plume in the vicinity of the Burbank OU. This projection results from an

249

4483-9099

ESD2  
Page 12

improved ability on EPA's part to predict aquifer response to pumping, made possible because real operating data is now available from Phase 1 of the Burbank OU interim remedy, which includes a 6,000 gpm groundwater extraction wellfield. In addition, the local groundwater flow models designed by CH2M Hill and by Lockheed Martin have undergone additional improvement and verification since the ROD was written. Results from both models predict that a 9,000 gpm extraction rate achieves the goals of the ROD.

EPA believes it is important to implement this change not only because it is based on sound scientific analysis, but also because of cost savings to the project. Reducing the pumping rate allows for elimination of costly reinjection facilities required under ESD1. The lower pumping rate also ensures that EPA will be able to pump from the most contaminated zones of the aquifer without dewatering the aquifer.

EPA, with the assistance of CH2M Hill, the City of Burbank, and Lockheed Martin, performed the following analysis in reaching these conclusions.

B. Options

While CERCLA Section 117(c) and 40 C.F.R. Section 300.435(c)(2)(i) merely require an explanation of significant differences and the reason for these differences, ESD2 sets out in detail four options regarding the rate of groundwater extraction, along with EPA's analysis of these options. The four options are as follows:

1. Extraction and treatment of an annual average of 6,000 gpm of groundwater from the existing Phase 1 Burbank OU wellfield, with use of the treated water by the City of Burbank (this phase of the project is currently in operation; therefore, if Option 1 were selected, no further construction would be required at the Burbank OU);
2. Extraction and treatment of an annual average of 9,000 gpm of groundwater from the existing Phase 1 Burbank OU wellfield, and the planned Phase 2 wellfield, with use of the treated water by the City of Burbank;
3. Extraction and treatment of an annual average of 12,000 gpm of groundwater from the existing Phase 1 and proposed Phase 2 and Phase 3 Burbank OU wellfields, with use of the treated water by the City of Burbank, with conveyance of excess water to other purveyors;
4. Extraction and treatment of an annual average of 12,000 gpm of groundwater from the existing Phase 1 and proposed Phase 2 and

250

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2 Page 13

Phase 3 Burbank OU wellfields, with use of the treated water by the City of Burbank, and reinjection of excess water (this is the option selected by the ROD as modified by ESD1).

C. Analysis of options

The four options presented above were compared with each other based on the nine criteria listed and explained in the National Contingency Plan (NCP), 40 C.F.R. Section 300.430(e)(9)(iii). The nine criteria and the results of the comparison of the options are presented in this subsection. The nine criteria are as follows:

- 1. compliance with ARARs
2. overall protection of human health and the environment
3. short-term effectiveness in protecting human health and the environment
4. long-term effectiveness and permanence in protecting human health and the environment
5. reduction of toxicity, mobility, and volume of contaminants
6. technical and administrative feasibility of implementation
7. capital and operation and maintenance costs
8. state acceptance
9. community acceptance

An analysis of the four options in terms of the above criteria follows.

1. Compliance with ARARs

The Burbank OU ROD recognizes that chemical-specific ARARs for the groundwater itself will be addressed in the final remedy. The remedial action adopted pursuant to the ROD, ESD1, and ESD2, is an interim action; therefore, chemical-specific ARARs for the groundwater contaminant plume do not apply to the activities taken pursuant to the ROD, ESD1, and ESD2.

However, for each of the four options being considered, drinking water standards, including state and federal MCLs, source water monitoring protocols, and treatment technology requirements, must be met. The existing treatment plant designed under Phase 1 has been shown to meet these standards during operation at flows up to 6,000 gpm. Option 1 is essentially Phase 1 of the Burbank OU interim remedy, which EPA has previously concluded meets drinking water ARARs.

The Phase 1 Burbank OU treatment plant is currently being operated to meet all standard state drinking water requirements.

251

4483-9099

ESD2 Page 14

and several special conditions, as specified in the public water supply operating permit issued to the City of Burbank by the California Department of Health Services (DHS). Since the treatment plant was designed with excess capacity, and can produce up to 9,000 gpm with no loss in treatment efficiency, EPA is confident that Option 2 will also meet drinking water ARARs. Options 3 and 4 would require modification to the treatment plant, but EPA is also confident that such modifications could be performed such that these standards would be met.

The treatment standards applicable to the Burbank OU treatment system were initially established in the ROD. The ROD required that the treatment system meet MCLs for all constituents (other than nitrates). Because water from the Burbank OU treatment system is conveyed offsite for use as a public water supply, and applicable drinking water standards may change, the consent decrees governing operation of the treatment plant recognize that EPA may identify requirements promulgated after the date of the ROD as ARARs in accordance with section 300.430(f)(1)(ii)(B)(1) of the NCP. That section requires attaining (or waiving) requirements promulgated after the date of the ROD where necessary to protect human health or the environment. This ESD does not change the treatment standards for operation of the treatment plant.

With respect to groundwater reinjection, ARARs include the California Regional Water Quality Control Board's (RWQCB) Non-degradation Policy, and Resource Conservation and Recovery Act (RCRA) Section 3020. The only option studied which involves reinjection is Option 4.

Any water reinjected on-site must meet all action-specific ARARs for reinjection. The reinjection must meet the "Statement of Policy With Respect to Maintaining High Quality of Waters in California," which requires that reinjected water not unreasonably degrade existing water quality. Nitrates are of concern with respect to reinjection; to avoid degradation, water from the Burbank OU treatment plant would have to be reinjected into an area of the aquifer containing as high or higher nitrate concentrations.

RCRA Section 3020 provides that the ban on the disposal of hazardous waste into a formation which contains an underground source of drinking water shall not apply to the injection of contaminated groundwater into the aquifer if: (i) such reinjection is part of a response action under CERCLA; (ii) such contaminated groundwater is treated to substantially reduce hazardous constituents prior to such reinjection; and (iii) such response action will, upon completion, be sufficient to protect human health and the environment.

252

## Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2  
Page 15

Compliance with reinjection ARARs could be problematic for implementation of Option 4 due to high nitrate levels in the extracted and treated groundwater, and limited areas of the aquifer available for reinjection based on ARARs criteria.

Based on consideration of drinking water ARARs, Options 1, 2, and 3 are considered equivalent. Option 4 is considered less favorable than Options 1-3 due to potential difficulties in meeting reinjection ARARs.

## 2. Overall protection of human health and the environment

Options 1-4 are all protective of human health and the environment. In each case, direct threat of human contact with contaminated groundwater has been minimized. Extracted groundwater is being treated to meet drinking water standards before being served to the public. Therefore, the selection of any of the four options for interim remedial action would result in no change in protection to human health and the environment from that achieved under the interim remedial action established in the ROD and ESD1.

Options 1-4 all inhibit the spreading of the VOC plume to downgradient wellfields, and along with federal and state source water monitoring requirements minimize the likelihood that contaminated water from downgradient wells would be served to the public. As far as the degree of overall containment is concerned, based on studies performed by CH2M Hill and Lockheed, EPA believes that protection of the aquifer is adequate under Options 2, 3, and 4, and may be adequate under Option 1. This issue is discussed further in the section on long-term protectiveness below.

Options 1-4 all protect the environment from contact with contaminated groundwater. Under all four options, extracted groundwater is being treated and used as a public water supply and is not being discharged to the land surface. Option 4 differs from the other three options in that it requires reinjection of excess water. As long as reinjection ARARs are followed, Option 4 will not result in degradation of groundwater quality.

## 3. Short-term effectiveness in protecting human health and the environment

The analysis regarding short-term effectiveness of the Burbank OU interim remedy in protecting human health and the environment does not differ from the above analysis of overall protection of human health and the environment. Options 1-4 are all protective in the short-term. Phase 1 of the Burbank OU project has already been constructed, and treated groundwater is being provided to

253

4483-9099

ESD2  
Page 16

the residents of the City of Burbank without negative impact; therefore, Option 1 would not produce additional short-term impacts.

Options 2-4 would require additional construction activity. The only potential additional short-term impact to human health and the environment would be limited to minor, standard, construction concerns such as exposure to wind-blown dust, and noise impacts. The well drilling activities necessitated under these three options would be limited to one to two months in duration, would produce very little airborne dust, and noise would be limited to daytime hours. Option 2 would not produce any other short-term impacts. Options 3 and 4 would require an upgrade of the Burbank OU treatment plant, but this would consist of modifications to an existing plant and would not require significant excavation or earth moving activities, merely the addition or modification of existing physical components to the plant.

EPA believes any construction impacts would be minimal, and that Options 1-4 are all protective of human health and the environment in the short-term.

## 4. Long-term effectiveness and permanence in protecting human health and the environment

Options 1-4 would all maintain reliable protection of human health and the environment over time. Minor differences arise in the permanence of the various options. Since this is an interim remedial action, and the action itself is not considered permanent, permanence has not been considered a major factor in this evaluation.

However, in ranking the options with respect to permanence, EPA has evaluated to what degree they would contribute to aquifer restoration. Option 2 results in the greatest mass removal of PCE and TCE, suggesting that the combination of pumping rate and location of extraction wells is optimized under this alternative. The other options result in a similar degree of mass removal, with differences of only a few percent. This suggests that the 20 year period of groundwater extraction, which is not changed by this ESD, may be the controlling factor for mass removal. One unknown factor in this analysis is how much mass will continue to enter the groundwater system over the 20 year period of time. The final remedy will attempt to assess this effect and will attempt to address permanence in a more thorough analysis.

A comparison of mass removal for Options 1-4 over 20 years is presented below. These figures derive from an analysis performed by Lockheed Martin Corporation and reviewed by EPA, and EPA's consultant CH2M Hill. (See the Administrative Record: document entitled Evaluation of Extraction Scenarios for the BOU, dated

254

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

ESD2  
Page 17

March 20, 1995, prepared by Hydro-Search, Inc.) The comparison of percent removal uses as a baseline the Burbank OU groundwater plume as defined by the 5 ppb contour line. Percent removal refers to the percentage of the mass within the 5 ppb contour which is removed by the Burbank OU extraction wells over the 20 year projected length of the interim remedy.

As noted, the amount of mass removed is greater at a 9,000 gpm extraction rate (Option 2) than at a 12,000 gpm extraction rate (Option 4). This is due to the need to meet reinjection ARARs for nitrates under Option 4. The locations where reinjection wells may be placed to meet ARARs are not favorable for mass removal, because under Option 4, the treated water must be reinjected in an area close to the extraction wells. The reinjected water actually displaces and dilutes contaminated water such that overall removal efficiency for TCE and PCE decreases.

Table 1 - Mass Removal Over Twenty Years

	% mass PCE removed	% mass TCE removed
Option 1 <sup>1</sup>	89	73
Option 2 <sup>2</sup>	92	78
Option 3 <sup>3</sup>	91	78
Option 4 <sup>4</sup>	88	75

The only other long-term protectiveness issue relates to air emissions from the Burbank OU treatment plant. The off-gas from the plant's aeration towers contains TCE and PCE molecules which have been stripped from the groundwater. Although this off-gas is treated with the use of air-phase granular activated carbon, a small quantity of TCE and PCE (less than 1% of the total present in the off-gas) is released to the atmosphere at an elevation of approximately sixty feet above the ground surface. The South Coast Air Quality Management District has reviewed the emission levels and found them well within ARARs for air emissions. EPA believes that emissions from Options 1-4 will not negatively impact human health and the environment, due to the low level of emissions, and due to their emission at a significant height above ground surface, away from people.

- <sup>1</sup>6,000 gpm pumping rate, no reinjection
- <sup>2</sup>9,000 gpm pumping rate, no reinjection
- <sup>3</sup>12,000 gpm pumping rate, no reinjection
- <sup>4</sup>12,000 gpm pumping rate, with reinjection

255

ESD2  
Page 18

Nonetheless, Options 1-4 can be ranked in terms of overall emissions. The lower the groundwater extraction rate, the lower the rate of TCE and PCE removal, and the lower the rate of TCE and PCE emissions. Option 1 at a groundwater extraction rate of 6,000 gpm results in the least air emissions. Option 2 performs the next best in this respect. Options 3 and 4 result in slightly higher emissions.

5. Reduction of toxicity, mobility, and volume of contaminants

As stated above, EPA has evaluated to what degree the four options will contribute to mass removal. Mass removal of contaminants relates very closely to reduction in toxicity and volume of contaminants in the groundwater. Based on EPA's evaluation, all four options would result in similar degrees of reduction in toxicity and volume.

An assessment has also been made regarding the degree of hydraulic control Options 1-4 would exert over the groundwater contamination (Evaluation of Extraction Scenarios for the BOU, dated March 20, 1995, prepared by Hydro-Search). The degree of hydraulic control achieved relates very closely to reduction in mobility of the contaminants. The following comparison of hydraulic control is made based upon the groundwater plume as defined by the 5 ppb contour line (percent control refers to the percentage of the area within the 5 ppb contour which is contained, i.e. which does not move downgradient):

Table 2 - Hydraulic Control Over Twenty Years

	% control PCE	% control TCE
Option 1 <sup>5</sup>	66	51
Option 2 <sup>6</sup>	72	60
Option 3 <sup>7</sup>	74	68
Option 4 <sup>8</sup>	71	58

Based on this analysis, Option 3 would result in the greatest reduction in mobility, particularly with respect to control of the TCE plume. Options 2, 3, and 4 control to a similar degree the PCE plume. Option 1 clearly results in a lesser degree of

- <sup>5</sup>6,000 gpm pumping rate, no reinjection
- <sup>6</sup>9,000 gpm pumping rate, no reinjection
- <sup>7</sup>12,000 gpm pumping rate, no reinjection
- <sup>8</sup>12,000 gpm pumping rate, with reinjection

256

## Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2  
Page 19

control. Option 3 turns out to be more efficient than Option 4, despite the fact that these options use the same pumping rate of 12,000 gpm, because based on current projections nitrate levels in the aquifer will not accommodate reinjection in hydraulically advantageous locations. A hydraulically advantageous location would be one where the reinjected water would assist in plume containment. ARARs requirements would restrict the placement of reinjection wells in areas where groundwater quality would not be degraded, meaning in areas where nitrates in groundwater are higher than nitrates in the water to be reinjected. If reinjection wells could be placed in the most hydraulically advantageous locations, Option 4 would be slightly superior to Option 3 in this regard.

When the interim remedial action is complete, EPA projects that contamination will remain in the groundwater under each of the four options. The final remedial action will determine how to address this remaining contamination.

Based on current data, Options 2 and 3 appear superior in terms of this criterion, but all options fulfill the goal of the ROD to partially control the movement and spread of groundwater contaminants in the Burbank OU area, while contributing to aquifer restoration.

#### 6. Technical and administrative feasibility of implementation

The technical differences between the four options are as follows:

Option 1 would require no additional construction. (Option 1 has already been implemented as Phase 1 of the interim remedy; therefore, it has been proven feasible.)

Option 2 would require construction of 3,000 gpm of additional extraction wellfield capacity.

Option 3 would require construction of 6,000 gpm of additional extraction wellfield capacity, plus a 3,000 gpm upgrade to treatment facility capacity.

Option 4 would require construction of 6,000 gpm of additional extraction wellfield capacity, plus a 3,000 gpm upgrade to treatment facility capacity, plus construction of a 8,500 gpm reinjection wellfield.

In general, technical implementability increases in complexity as construction tasks are added to a project. Some construction tasks are more complex than others; for example, construction of a reinjection wellfield is more complicated than construction of an extraction wellfield due to more complex well specifications

257

4483-9099

ESD2  
Page 20

intended to reduce clogging of the well screens. Using this rationale, Option 4 is more complex than Option 3, which is more complex than Option 2, which is more complex than Option 1. As stated above, Option 1 has already been implemented technically (as well as administratively).

Ease of operation also factors into implementability. Application of proven technology generally reduces uncertainty of implementability, while application of a new technology increases uncertainty. Options 1, 2, and 3 all use common technology, while Option 4, by adding reinjection, uses a technology that has not been implemented widely in the geographic region of the Burbank OU.

Administratively, Options 1, 2, and 3, would be relatively simple because they would follow the framework developed during start-up of Phase 1 of the Burbank OU interim remedy. As part of Phase 1 start-up, EPA, the City of Burbank, Lockheed Martin Corporation, and DHS reached agreement on operational plans for the facility. Once again, Option 1, since it has been constructed and placed in operation, is not expected to present any administrative difficulties.

Construction of additional facilities, which would be necessary under Options 2, 3, and 4, would require amending the City of Burbank's public water supply operating permit, issued by DHS. Although this would be an additional administrative task, EPA is confident that additional permit conditions required by virtue of the addition of such facilities, would be achievable.

Option 3 would have the administrative complication of committing additional purveyors to accept water the City of Burbank could not accept. It is not likely that these additional purveyors would be willing to sign a consent decree, the chosen implementation document for the interim remedy. Lockheed Martin Corporation and the City of Burbank have both attempted, without success as of the date of this ESD2, to obtain the commitment of other local purveyors to accept Burbank OU water. Without this commitment, there is a good deal of uncertainty whether 12,000 gpm of groundwater could be purveyed on a routine basis, during periods when the City of Burbank could not accept the entire production of the Burbank OU facilities.

Option 4 would be more complicated to implement administratively due to the likely increased involvement of a regulatory agency, RWQCB, in the process. RWQCB has previously expressed reservations about reinjection based on water quality degradation concerns. However, EPA believes this additional administrative step would not present a barrier to implementation.

258

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2  
Page 21

Based on technical and administrative considerations, Options 1 and 2 are considered superior. Options 3 and 4 have administrative complications, which would need to be resolved prior to implementation. Option 3 may present a barrier to implementation while Option 4 probably does not.

7. Capital and operation and maintenance costs

The following discussion compares the costs of Options 1-4 on a net present value basis. Costs include construction and 20 years of operation and maintenance. These costs are not based on the original estimates set forth in the ROD and in ESD1, but are based on more recent estimates prepared by a consultant to Lockheed Martin Corporation, the entity which has undertaken design and construction of the interim remedy under EPA oversight. (See the Administrative Record: document entitled Burbank Operable Unit Costs Comparison Summary, dated March 20, 1995, prepared by Parks, Palmer, Turner & Yemenidjian.) These estimates were independently reviewed by CH2M Hill, EPA's ARCS contractor. Therefore, the actual cost of the Phase 1 Burbank OU treatment facilities constructed by Lockheed Martin, the City of Burbank, and six other businesses, has been incorporated into these estimates. CH2M Hill's analysis is presented in a memorandum entitled Review of Burbank Operable Unit Costs Comparison Summary, dated November 11, 1996. EPA has concluded that the cost estimates prepared by Lockheed Martin used appropriate assumptions and are therefore appropriate for purposes of comparison of alternatives.

Option 1 is the least expensive of the four options. The capital cost for this option is estimated at \$31 million in 1996 dollars. The present value of the 20 years of operation and maintenance is estimated at \$88 million. Therefore, the total net present value of Option 1 is estimated at \$119 million. Economic assumptions used by Lockheed Martin's consultant in this analysis are as follows: a discount rate of 8% was used; an inflation rate of 3% was used; calculations are in 1995 dollars.

Option 2 is more expensive than Option 1 but less expensive than Option 3. The capital cost for this option is estimated at \$38 million in 1996 dollars. The present value of 20 years of operation and maintenance is estimated at \$93 million. Therefore, the total net present value for Option 2 is estimated at \$131 million.

Option 3 is more expensive than option 2 but less expensive than Option 4. The capital cost for this option is estimated at \$49 million in 1996 dollars. The present value of 20 years of operation and maintenance is estimated at \$97 million. Therefore, the total net present value for Option 3 is estimated at \$146 million.

259

4483-9099

ESD2  
Page 22

Option 4 is the most expensive of the four options. The capital cost for this option is estimated at \$70 million in 1996 dollars. The present value of 20 years of operation and maintenance is estimated at \$110 million. Therefore, the total net present value for Option 4 is estimated at \$180 million.

For purposes of comparison, this information is set out in the following table:

Table 3 - Cost Comparison

Option	Capital	O&M	Total
1 <sup>9</sup>	\$31 million	\$ 88 million	\$119 million
2 <sup>10</sup>	\$38 million	\$ 93 million	\$131 million
3 <sup>11</sup>	\$49 million	\$ 97 million	\$146 million
4 <sup>12</sup>	\$70 million	\$110 million	\$180 million

8. State acceptance

EPA has coordinated with state agencies throughout this project, specifically RWQCB, the California Department of Toxic Substances Control (DTSC), and DHS. These agencies either accepted, or did not object to, the interim remedy originally designated by the ROD and ESD1. The Administrative Record details the communications between EPA and these State agencies throughout the interim remedy selection process.

Regarding the remedy discussed in the ROD and ESD1, the record reflects that the RWQCB supports the use of the treated water as drinking water, provided that all requirements for the serving of public drinking water are met. RWQCB agrees that reinjection may be implemented as long as compliance is achieved with respect to the "Statement of Policy With Respect to Maintaining High Quality Waters in California." (See the Administrative Record: letter dated June 8, 1990, from Hank Yacoub, RWQCB, to Alisa Greene, EPA; letter dated June 20, 1990, from Robert Ghirelli, RWQCB, to Alisa Greene, EPA.)

The record reflects that neither DTSC nor DHS stated a preference or rejection of any of the options presented in the ROD and ESD1. (See the Administrative Record: letter dated May 15, 1990, from

- <sup>9</sup>6,000 gpm pumping rate, no reinjection
- <sup>10</sup>9,000 gpm pumping rate, no reinjection
- <sup>11</sup>12,000 gpm pumping rate, no reinjection
- <sup>12</sup>12,000 gpm pumping rate, with reinjection

260

## Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2  
Page 23

Hamid Saebfar, DTSC, to Alisa Greene, EPA, and letter dated June 11, 1990, from Gary Yamamoto, DHS, to Alisa Greene, EPA.)

In addition to reviewing the Administrative Record through the ROD and ESD1, EPA notified the state agencies regarding the proposed changes which would be made by ESD2. Neither RWQCB nor DTSC provided written comments on the options presented in ESD2. However, as stated above, EPA also has presented EPA's position on the ESD2 options to the state and other agencies at quarterly Management Committee meetings. EPA's understanding based on exchanges with representatives from these agencies is that neither RWQCB nor DTSC objects to EPA's approach.

DHS did provide written comments on the changes proposed by ESD2, but did not state a preference for any of the options presented herein. (See the Administrative Record: letter dated September 6, 1996, from Gary Yamamoto, DHS, to David Seter, EPA.) DHS raised the issue that "limiting the pumping rate to a maximum of 9,000 gpm and the elimination of the re-injection option may limit U.S. EPA's future success in containing the contaminant plume." In response to this comment, EPA believes the analysis presented in this ESD2, in terms of the nine NCP criteria, thoroughly considers the impact of the various options including the impact on plume containment.

Specifically, the nitrate levels currently projected in the aquifer do not accommodate reinjection in hydraulically advantageous locations. The City of Burbank has already agreed to maximize its use of treated groundwater, which will be an average of 9,000 gpm. An extraction rate of 9,000 gpm without reinjection thus accomplishes better hydraulic control than an extraction rate of 12,000 gpm with reinjection.

#### 9. Community acceptance

The basic groundwater extraction and treatment concepts being evaluated in ESD2 do not differ greatly from the concepts evaluated in the ROD and in ESD1. The same degree of treatment will be applied to water made available as a public water supply. During the thirty day comment period provided for by EPA during the development of ESD1, there were no comments submitted by the public.

In addition, EPA will publish notice of availability of this ESD2 in a local newspaper of general circulation, and will consider any comments submitted by the public as required by 40 C.F.R. Section 300.825(c).

261

4483-9099

ESD2  
Page 24

#### D. Decision on options

Based on the above analysis of Options 1-4, EPA has chosen Option 2, which consists of groundwater extraction at an average rate of 9,000 gpm, treatment by air stripping and granular activated carbon to remove VOCs, nitrate reduction by blending with a low nitrate water source, and use of the treated and blended water by the City of Burbank as a public water supply.

Option 2 was chosen because:

- 1) it performs equally as well as Options 3 and 4 and better than Option 1 at removing contaminant mass over a 20 year period of time;
- 2) it performs substantially as well as Option 3 and better than Options 1 and 4 at retarding migration of the groundwater contamination plume;
- 3) its total implementation cost is
  - \$15 million less than Option 3
  - \$49 million less than Option 4;
- 4) it avoids the potential administrative difficulties of Options 3 (identifying additional water purveyors) and 4 (resolving reinjection regulatory issues);
- 5) it complies with ARARs;
- 6) it is protective of human health and the environment.

This is an interim remedy. In the future, after the Burbank OU facilities have been operational for a substantial period of time, the optimal extraction rate may be better determined. This information will eventually factor into a decision on the final remedy. But for the purposes of ESD2, the data suggest that a groundwater extraction rate of 6,000 gpm may be too low to meet the groundwater containment objective. However, the data do not justify the added expense of raising pumping to a rate of 12,000 gpm. EPA has concluded that the Option 2 rate of 9,000 gpm is a reasonable, efficient, and cost-effective solution.

Although under ideal conditions pumping 12,000 gpm would provide greater containment than pumping 9,000 gpm, the reality of the ground water system as it exists in Burbank presents certain limitations. Under ideal conditions, nitrate levels would be low enough to meet ARARS reinjection requirements in areas determined to be hydraulically advantageous to reinjection. This is not the case, and is not likely to be the case throughout the time frame for implementation of the interim remedy. Because reinjection must take place in hydraulically disadvantageous locations, the effectiveness of Option 4 is lessened.

The Option 2 pumping rate is 9,000 gpm, which represents a 25% reduction in pumping versus Options 3 and 4. Yet, according to analyses performed by Lockheed Martin with which EPA concurs,

262

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

ESD2 Page 25

Option 2 is superior in containment to Option 4 and provides only slightly less containment than Option 3.<sup>13</sup> Furthermore, cost savings for Option 2 are significant (a savings of 27% versus Option 4).

Although additional cost savings are projected from further reducing the pumping rate to 6,000 gpm (Option 1), EPA believes that, should water levels increase in the aquifer system, capture could fall below acceptable levels under this option. As long as 9,000 gpm can be extracted and used without being wasted or reinjected, EPA concludes that Option 2 presents the best balance of reducing mobility of contaminants and cost-effectiveness.

As described above, EPA has also concluded that, for the purposes of long-term containment, groundwater extraction need not equal 9,000 gallons per minute each day. This is why EPA has set a goal of 9,000 gallons per minute as an annual average instead of an instantaneous average. EPA also believes its approach of allowing reduced groundwater extraction during periods of high nitrate concentration increases protectiveness to public health without adversely affecting long-term containment.

V. Support Agency Comments

The State of California agencies discussed in Section IV.C.8. above are the support agencies for this action. Their comments are addressed in that section.

VI. Summary of Selected Remedy

The interim remedy for the Burbank Operable Unit, as selected in the ROD and as modified by ESD1 and ESD2, consists of groundwater extraction at an average rate of 9,000 gpm, treatment by air stripping and granular activated carbon to remove VOCs, nitrate reduction by blending with a low nitrate water source, and use of the treated and blended water by the City of Burbank as a public water supply.

VII. Statutory Determinations

Considering the new information that has been developed, the EPA believes that the interim remedy as modified by ESD2 remains

<sup>13</sup>This comparison was made based upon the degree of hydraulic control exerted by the various options on the TCE/PCE groundwater plume.

263

4483-9099

ESD2 Page 26

protective of human health and the environment, complies with federal and state requirements that are applicable or relevant and appropriate to this interim remedial action, and is cost effective. In addition, this remedy satisfies the statutory preference for remedies that employ treatment which permanently and significantly reduces the volume, toxicity or mobility of the hazardous substances as a principal element. It also complies with the statutory preference for remedies that utilize permanent solutions and alternative treatment technologies or resource recovery technologies to the maximum extent practicable. The changes and clarifications contained in ESD2 are significant but do not fundamentally change the remedy. They do not change the decision to conduct an interim pump and treat action to inhibit the spreading of the contaminated groundwater plume and to begin aquifer restoration. They also do not alter the technologies used in the interim remedy.

VIII. Public Participation Activities

EPA has presented these changes to the remedy in the form of an Explanation of Significant Differences because the changes are of a significant, but not fundamental, nature. The basic groundwater extraction and treatment concepts being evaluated in ESD2 do not differ greatly from the concepts evaluated in the ROD and in ESD1. ESD2 and underlying information have been added to the Burbank OU Administrative Record. Additional provisions for public comment are not required for an ESD (see 40 C.F.R. Section 300.435(c)(2)(i)), and EPA is not providing a formal public comment period for ESD2. However, EPA has published notice of the availability of ESD2 in a local newspaper as required by 40 C.F.R. Section 300.435(c)(2)(i)(B), and per 40 C.F.R. Section 300.825, will consider any significant comments submitted in a timely manner.

**APPENDIX V**

4483-9099

Appendix 5  
Statement of Work

265

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

BURBANK OPERABLE UNIT  
SECOND STAGE STATEMENT OF WORK  
(LONG TERM O&M)

I. General Provisions

A. Definitions: All words, as defined in the Consent Decree, have the same meaning when used herein.

B. Warranty: EPA has exercised its best efforts to include in this Statement of Work all activities necessary to fulfill Operation and Maintenance requirements for the Burbank Operable Unit. However, the settling parties acknowledge and agree that nothing in this Statement of Work or any deliverable approved by EPA pursuant hereto constitutes a warranty or representation, either express or implied, by the United States that compliance with this document and/or deliverables approved pursuant to this document will result in the achievement of the Performance Standards that the Settling Work Defendant is required to meet under the Consent Decree. Nothing in this Statement of Work or in deliverables approved pursuant hereto shall be deemed to limit EPA's rights pursuant to Subpart D (General Reservation of Rights) of Section XXII of the Consent Decree.

266

4483-9099

C. EPA Approval: EPA approval of any submittal by a Settling Defendant within the context of this Consent Decree, including but not limited to plans, specifications, and reports, is administrative in nature and designed to permit the Settling Defendants to proceed with the deliverables. The Settling Defendants acknowledge and agree that EPA's approval of deliverables does not constitute a warranty or representation, as discussed in Paragraph B above.

II. Schedule

A. Dates: The schedule of deliverables for this Statement of Work is presented in Attachment 1 and shall be referred to as the Work Schedule. In the Work Schedule, EPA has provided an approximation of its review time; however, failure to review a deliverable within the estimated time shall not constitute a violation of the Consent Decree by the United States. Settling Defendants are required to submit deliverables within the time periods stated, and failure to do so constitutes a violation of the Consent Decree. See Consent Decree, Section XII (Submissions Requiring Agency Approval).

B. Items Triggered by Date of Entry of Consent Decree:

1. Designation of Project Coordinator: Pursuant to Section XIII (Project Coordinators) of the Consent Decree, within

2

267

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

30 days of the date of entry of the Consent Decree, the Settling Work Defendant (City of Burbank), Lockheed Martin, the UAO Parties, and EPA shall submit to one another, in writing, the name, title, and qualifications of their proposed respective Project Coordinators and Alternate Project Coordinators. The coordinators for the Settling Defendants may be members of the Settling Defendants' staff or an independent contractor.

2. Designation and Review of Supervising Contractor: Pursuant to Section VI (Performance of the Work) of the Consent Decree, within 180 days of the date of entry of the Consent Decree, the Settling Work Defendant shall notify EPA and the State in writing of the name, title, and qualifications of its proposed Supervising Contractor. Prior to this date, the Settling Work Defendant may submit to EPA and the State a list of contractors for pre-qualification. It is the Settling Work Defendant's responsibility to provide any pre-qualification information to EPA and the State in a time frame that allows for timely designation of the Supervising Contractor. The Supervising Contractor may come from within the ranks of the Settling Work Defendant's staff. The factors to be considered in approving or disapproving the Supervising Contractor shall include: professional and ethical reputation; professional

268

4483-9099

registration; demonstrated project management experience; experience and qualifications in the field of water treatment and supply; sufficient capacity (professional, technical and support staff) to accomplish the project tasks according to the Work Schedule; and sufficient business background and financial resources to provide uninterrupted services throughout the life of the project. Upon its approval of the Supervising Contractor, EPA will issue an authorization to proceed.

3. Progress Reports: These reports shall be prepared by the Settling Work Defendant pursuant to Section XI (Reporting Requirements) of the Consent Decree. The schedule for submittal of progress reports is summarized in Attachment 2 and shall be referred to as the Reporting Schedule. Progress Reports shall include at a minimum:

a. A brief narrative describing any noteworthy accomplishments or problems encountered at the Plant Facilities during the reporting period (including but not limited to: the implementation of process improvements; non-routine maintenance; and a summary of any violations of the Consent Decree, the cause of such violations, and the steps being taken to avoid future violations);

b. Status of expenditures in comparison to the

269

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

Annual Budget;

c. The quantity of water pumped by each Burbank OU extraction well, and each GAC Wellfield extraction well;

d. A daily summary of water production broken down into categories of: Burbank OU Treatment Plant; GAC Wellfield; Blending Water; and Total Production;

e. A compliance calculation of the project's water budget showing whether the 9,000 gpm average groundwater extraction rate is being met; and specifically, the status of the Cumulative Pumping Credit for the reporting period, including designation of any days on which the Cumulative Pumping Credit fell below zero gallons;

f. Copies or summaries of compliance data submitted by the Settling Work Defendant to the California Department of Health Services;

g. Status of Maintenance Credits; and

h. Report of nitrate levels in: the extracted groundwater; the blending water; and the product water.

4. Second Stage O&M Work Plan: Pursuant to Section VI (Performance of the Work) of the Consent Decree, the Settling Work Defendant shall submit, within one year of the date of entry of the Consent Decree, the Second Stage O&M Work Plan. The

4483-9099

Second Stage O&M Work Plan shall incorporate Operation and Maintenance activities to be performed on all portions of the Plant Facilities to ensure that the facilities continue to run according to specification. The Second Stage O&M Work Plan shall include: a detailed description, including drawings, of the Plant Facilities; manufacturer specifications for the Plant Facilities and equipment; easily understood, stepwise standard operating procedures for the Plant Facilities at all foreseeable flow rates; startup and shutdown procedures for all facilities, including emergency shutdown procedures; a detailed description of manual and electronic control systems; and any other elements pertaining to efficient and safe operation of the Plant Facilities. The Second Stage O&M Work Plan shall describe in detail: the routine maintenance activities to be performed on each element of the Plant Facilities; a schedule for these routine maintenance activities; a schedule of visual inspection of the Plant Facilities; a schedule of equipment overhauling per manufacturers specifications; a description and schedule of cleaning and backflushing; detailed chemical handling procedures; and any other elements pertaining to efficient and safe maintenance of the Plant Facilities. The Second Stage O&M Work Plan shall incorporate by reference the Staffing Plan, Health and

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

Safety Plan, Operational Sampling Plan, and Contingency Plan. The Second Stage O&M Work Plan in conjunction with the Staffing Plan shall delineate clear lines of responsibility for performing the activities referenced within the plan, designating which activities are the responsibility of the O&M Contractor, especially with respect to emergency shutdown and implementation of the Contingency Plan if it becomes necessary.

5. Staffing Plan: Pursuant to Section VI (Performance of the Work) of the Consent Decree, the Settling Work Defendant shall submit, within one year of the date of entry of the Consent Decree, the Staffing Plan. The Staffing Plan shall identify the supervisory chain of command for the project; shall provide an organizational chart identifying specific individuals in the chain of command where possible; and shall define the roles of the Settling Work Defendant, the Supervising Contractor, and the O&M Contractor. The position of the Settling Work Defendant's Project Coordinator in the chain of command shall be made clear. The plan shall also estimate staffing levels required to implement the O&M activities, including the levels of expertise required.

6. Time Line and Schedule: Pursuant to Section VI (Performance of the Work) of the Consent Decree, the Settling

7

272

4483-9099

Work Defendant shall submit, within one year of the date of entry of the Consent Decree, the Time Line and Schedule. The Time Line and Schedule shall list the major milestones to be accomplished in order for the Settling Work Defendant to efficiently assume long term Operation and Maintenance of the Plant Facilities. It shall include the items listed in the Work Schedule, and also intermediate milestone activities such as: the Settling Work Defendant's projected bidding schedule for hiring the O&M Contractor; the schedule for transition of O&M Activities as agreed upon by Lockheed Martin and the Settling Work Defendant; and any other items relevant to orderly implementation of O&M Activities. The identification of intermediate milestones, which are defined as those milestones not specified in the Work Schedule, is solely for planning purposes. Any failure by the Settling Work Defendant to meet the Time Line's intermediate milestones shall not be deemed a violation of the Consent Decree.

7. Quality Assurance Project Plan: Pursuant to Section IX (Quality Assurance, Sampling, and Data Analysis), the Settling Work Defendant shall prepare and submit a Quality Assurance Project Plan addressing analytical and data quality methods and objectives to be applied in support of Operation and Maintenance Activities. The Quality Assurance Project Plan shall

8

273

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

be submitted to EPA and the State for review within eighteen months of the date of entry of the Consent Decree. Addenda to the Quality Assurance Project Plan shall be prepared by the Settling Work Defendant on an as-needed basis to reflect major changes in analytical methods.

8. Operational Sampling Plan: In conjunction with the Quality Assurance Project Plan, the Settling Work Defendant shall submit, within eighteen months of the date of entry of the Consent Decree, an Operational Sampling Plan which defines the data gathering methods and schedules to be used in performing the sampling and analytical portion of the Operation and Maintenance activities. At a minimum, the Operational Sampling Plan shall address sampling of water treatment system influent and effluent, airborne discharges, and any hazardous materials generated at the Plant Facilities. The monitoring requirements of the domestic water supply permit as issued and amended by the California Department of Health Services shall be incorporated into the Operational Sampling Plan.

9. Health and Safety Plan: The Settling Work Defendant shall submit, within eighteen months of the date of entry of the Consent Decree, a Health and Safety Plan which describes the minimum health, safety, and emergency response

274

4483-9099

requirements for the Operation and Maintenance activities to be undertaken by the Settling Work Defendant, the Supervising Contractor, and/or the O&M Contractor. The plan shall be prepared in accordance with U.S. Occupational Health and Safety Administration ("OSHA") requirements and any other applicable requirements.

10. Contingency Plan: The Settling Work Defendant shall submit, within eighteen months of the date of entry of the Consent Decree, a Contingency Plan which is written for the local affected population in the event of an accident or emergency at the Site. It shall incorporate an Air Monitoring Plan and a Spill Control and Countermeasures Plan. The following is a suggested list of items that shall be included in the Contingency Plan:

a. Name of the person responsible for responding in the event of an emergency incident;

b. List of key contacts in the local community with phone numbers and addresses and the State and Federal agencies to be involved in the cleanup, as well as local emergency squads and hospitals;

c. First aid and medical information, including names of personnel trained in first aid, a clearly marked map

275

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

with the location of medical facilities and all necessary emergency phone numbers for fire, rescue, and local hazardous material teams;

d. An air monitoring plan to assure that the VOC treatment system is meeting the requirements of the South Coast Air Quality Management District. Air monitoring may include personnel monitoring, on-site and/or off-site area monitoring. Trigger concentrations to implement the Contingency Plan shall be specified; and

e. A Spill Control and Countermeasures Plan which shall specify actions to be taken in the event of spills from material handling and/or transportation. The plan shall describe methods, means and facilities required to prevent contamination of soil; water; atmosphere; uncontaminated structures, equipment, or material. It shall specify provisions for equipment and personnel to perform emergency measures required to contain any spillage; to remove and properly dispose of any material that becomes contaminated due to spills; and to decontaminate structure, equipment, or material.

C. Items Triggered by Phase 2 System Operation Date:

1. Designation of O&M Contractor: Pursuant to Section VI (Performance of the Work) of the Consent Decree,

4483-9099

within six months after the Phase 2 System Operation Date, the Settling Work Defendant shall submit to EPA and the State in writing the name, title, and qualifications of its proposed O&M Contractor. Prior to this date, the Settling Work Defendant may submit to EPA and the State a list of contractors for pre-qualification. It is the Settling Work Defendant's responsibility to provide any pre-qualification information to EPA and the State in a time frame that allows for timely designation of the O&M Contractor. The factors to be considered in approving or disapproving the O&M Contractor shall include: professional and ethical reputation; professional certification and/or registration; demonstrated experience in the field of water treatment; ability to meet the requirements of the Staffing Plan to accomplish the O&M tasks in accordance with the Second Stage O&M Work Plan; sufficient business background and financial resources to provide uninterrupted services throughout the life of the project; and ability to provide insurance. Upon its approval of the O&M Contractor, EPA will issue an authorization to proceed.

2. Transition Activities: Commencing no later than one year after the Phase 2 System Operation Date, the Settling Work Defendant and Lockheed Martin shall jointly plan a series of

# Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

transition activities under which the Settling Work Defendant shall assume Operation and Maintenance of all Plant Facilities. The Settling Work Defendant shall assume Operation and Maintenance of all Plant Facilities on the Date of Commencement, which will occur approximately two years after the Phase 2 System Operation Date.<sup>1</sup>

D. Other Items:

1. Selection of Cost Consultant: Pursuant to Section XIV (Funding of Response Activities) of the Consent Decree, by January 1, 1999, Lockheed Martin and the Settling Work Defendant shall jointly notify EPA in writing of the name, title, and qualifications of the proposed Cost Consultant. Prior to this date, Lockheed Martin and the Settling Work Defendant may submit to EPA a list of consultants for pre-qualification. It is the joint responsibility of Lockheed Martin and the Settling Work Defendant to provide any pre-qualification information to EPA in a time frame that allows for timely designation of the Cost Consultant. The factors to be considered in approving or disapproving the Cost Consultant shall be based on: professional and ethical reputation; professional certification; experience in

<sup>1</sup>See Consent Decree for further detail.

the type of cost estimating and budgeting activities to be performed; sufficient capacity (professional, technical and support staff) to accomplish the project tasks according to the Work Schedule; and sufficient business background and financial resources to provide uninterrupted services.

2. Deliverables: The Settling Work Defendant shall submit three copies of each deliverable identified in the Work Schedule to the EPA Project Coordinator.

3. Final Inspection: At the end of the time period for which the Settling Work Defendant is required to perform O&M Activities pursuant to the Consent Decree, EPA shall conduct a final review of records and inspection of the Plant Facilities. The inspection shall be a necessary part of approving or disapproving the Certificate of Completion pursuant to Section XV (Certificate of Completion) of the Consent Decree.

4. Determination of Decommissioning/Dismantling of Plant Facilities: In conjunction with the process of reviewing the Certificate of Completion for the Burbank OU Interim Remedial Action, EPA will make a determination as to whether all or a portion of the Plant Facilities shall be decommissioned/dismantled. At least ninety days prior to the date that the Settling Work Defendant anticipates that the Work will have been

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

fully performed, the Settling Work Defendant and the Settling Defendants may voice their respective opinions to EPA on whether all or a portion of the Plant Facilities shall be decommissioned/dismantled. In order to facilitate this process, the Settling Work Defendant shall notify the Project Coordinators for the Settling Defendants at least ninety days prior to the date that the Settling Work Defendant anticipates that the Work will have been fully performed, that a written request for Certification of Completion has been submitted to EPA.

III. Operational Compliance Determinations

A. Period of Operation and Maintenance: The Settling Work Defendant shall perform Operation and Maintenance Activities on the Plant Facilities as required under Section VI (Performance of the Work) of the Consent Decree, for a period of eighteen years. This period of Operation and Maintenance shall commence on the Date of Commencement, which will occur approximately two years after the Phase 2 System Operation Date.<sup>2</sup>

B. Cumulative Pumping Credit: If the quantity of groundwater extracted as part of the Burbank OU Interim Remedy exceeds the requirements of the First and Second Consent Decrees,

<sup>2</sup>See Consent Decree for further detail.

280

4483-9099

then the excess quantity shall accumulate as a credit. This credit will be measured in units of gallons and will be known as the Cumulative Pumping Credit. The credit will accumulate and "carry over" from day to day and from year to year, and will be used for compliance determination purposes, as described below.

1. Status on the Date of Commencement: On the Date of Commencement, the Cumulative Pumping Credit that has been accumulated throughout Phase 1 and Phase 2 up to the Date of Commencement shall be credited in full to the Settling Work Defendant. Should the Cumulative Pumping Credit be a negative number upon assumption of O&M Activities by the Settling Work Defendant, the credit will be reset to zero on the Date of Commencement.

2. Additions to and Subtractions from the Cumulative Pumping Credit: On each non-Maintenance Day, beginning on the Date of Commencement, the sum of the amount of groundwater, in gallons, pumped from the Burbank OU Extraction Wellfield and the City of Burbank GAC Wellfield shall be compared with the amount, in gallons, required under Section VI (Performance of the Work) of the Consent Decree. For the purposes of making this comparison, the amount of pumpage, in gallons, required under the Consent Decree shall be the same each day and shall be calculated

281

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

as follows:

$$(9,000 \text{ gallons/minute}) \times (60 \text{ minutes/hour}) \times (24 \text{ hours/day}) = 12,960,000 \text{ gallons/day}$$

a. On each day when in excess of 12,960,000 gallons is pumped from a combination of the Burbank OU Extraction Wellfield and the City of Burbank GAC Wellfield, that excess amount will be added to the Cumulative Pumping Credit as follows:

$$PC' = PC + (GPBOU + GPGAC - 12,960,000)$$

where

PC' = new Cumulative Pumping Credit (gallons)

PC = old Cumulative Pumping Credit (gallons)

GPBOU = number of gallons pumped for the day from the Burbank Operable Unit wellfield

GPGAC = number of gallons pumped for the day from the City of Burbank GAC Wellfield

b. On days when less than a total of 12,960,000 gallons is pumped from a combination of the Burbank OU Extraction Wellfield and the City of Burbank GAC Wellfield, except on high nitrate days (see Section III.B.4. below), the difference between 12,960,000 gallons and the amount actually pumped will be

282

4483-9099

deducted from the Cumulative Pumping Credit as follows:

$$PC' = PC - (12,960,000 - GPBOU - GPGAC)$$

Where

PC' = new Cumulative Pumping Credit (gallons)

PC = old Cumulative Pumping Credit (gallons)

GPBOU = number of gallons pumped for the day from the Burbank Operable Unit wellfield

GPGAC = number of gallons pumped for the day from the City of Burbank GAC Wellfield

3. Effect of Maintenance Days on the Cumulative Pumping Credit: On each day which the Settling Work Defendant designates as a Maintenance Day (which need not be a full day, but may be a portion of a day), if the amount of groundwater pumped for the day exceeds 12,960,000 gallons, the amount in excess of 12,960,000 gallons shall be added to the Cumulative Pumping Credit according to Section III.B.2.a., but the Cumulative Maintenance Credit (see Section III.C. below) shall not change.

If the amount of groundwater pumped by the Settling Work Defendant on the designated Maintenance Day is less than

283

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

12,960,000 gallons, the Cumulative Pumping Credit shall not change, but the Cumulative Maintenance Credit will decrease as follows:

$$MC' = MC - (12,960,000 - GPBOU - GPGAC)$$

where

MC' = new Cumulative Maintenance Credit

MC = old Cumulative Maintenance Credit

GPBOU = number of gallons pumped for the day from the Burbank Operable Unit extraction wellfield

GPGAC = number of gallons pumped for the day from the City of Burbank GAC Wellfield

4. Effect of High Nitrate Days on the Cumulative Pumping Credit: A High Nitrate Day is defined as a day on which nitrate levels in groundwater pumped from the Burbank OU Extraction Wellfield (as measured at or near the Point of Delivery) are equal to or greater than 50 milligrams per liter as nitrate. On each High Nitrate Day when the quantity of groundwater pumped from a combination of the Burbank OU Extraction Wellfield and the City of Burbank GAC Wellfield exceeds 12,960,000 gallons, that excess amount shall be added to

4483-9099

the Cumulative Pumping Credit according to Section III.B.2.a.

On each High Nitrate Day when the quantity of groundwater pumped from a combination of the Burbank OU Extraction Wellfield and the City of Burbank GAC Wellfield falls below 12,960,000 gallons (due to high nitrate concentrations and not for other reasons, e.g. maintenance), the Cumulative Pumping Credit shall increase according to the following formula:

$$PC' = PC + I$$

where

PC' = new Cumulative Pumping Credit

PC = old Cumulative Pumping Credit

I = increase to the pumping credit (I will be set to zero should the following calculation yield a negative number)

and

$$I = CWD - 12,960,000$$

where

CWD = actual metered City Water Demand on the High Nitrate Day

5. Determining Compliance using the Cumulative

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

Pumping Credit: The Cumulative Pumping Credit shall be used to determine whether the Settling Work Defendant is meeting the groundwater extraction requirements under Section VI (Performance of the Work) of the Consent Decree. On a date one year following the Date of Commencement, the initial pumping compliance determination shall be made.

If the Cumulative Pumping Credit is zero or greater, the Settling Work Defendant shall be deemed to be in compliance with the groundwater extraction requirements. If on that date the Cumulative Pumping Credit is less than zero, the Settling Work Defendant shall be deemed to be out of compliance with the groundwater extraction requirements. 6.

Calculation of Days Out of Compliance: If the Cumulative Pumping Credit one year after the Date of Commencement is less than zero, the Settling Work Defendant shall be deemed to be out of compliance for the number of days calculated as follows:

DOC = (- PC (gallons)) / 12,960,000 (gallons/day)

where

DOC = number of Days Out of Compliance

PC = Cumulative Pumping Credit

Days Out of Compliance shall be rounded down to the nearest whole number of days, and shall be the number of days the Settling Work Defendant will be deemed out of compliance for the year. The Settling Work Defendant shall be subject to stipulated penalties for days out of compliance (see Consent Decree).

This compliance calculation will be performed annually on the anniversary date of the Date of Commencement, except in the event of a High Precipitation Year (see Section III.B.7. below).

7. Effect of a High Precipitation Year on Determining Compliance Using the Cumulative Pumping Credit: The time frame for performing the compliance calculation described in Sections III.B.5. and III.B.6. above will change as follows in the event of a High Precipitation Year. If the one year period of time over which a compliance determination is being made is a year during which the precipitation amount, as measured at a local weather station, is greater than 125% of the mean annual rainfall locally, that year shall be designated a High Precipitation Year. This precipitation determination shall be made on the anniversary date of the Date of Commencement. In the event a High Precipitation Year is designated, the compliance calculation shall be suspended until a year-long compliance period occurs during which precipitation is less than 125% of the mean annual

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

rainfall, in which case the compliance determination for that year performed on the anniversary date of the Date of Commencement will be performed as in Section III.B.5. above.

C. Annual Maintenance Credit: The Annual Maintenance Credit shall be measured in units of gallons and shall be used as a means for the Settling Work Defendant to perform a certain amount of routine maintenance on the Plant Facilities without being penalized under the Consent Decree. The Annual Maintenance Credit will also be used as a means of measuring compliance with the limits set on suspension of operations (see below).

1. Status on the Date of Commencement: On the Date of Commencement, the Maintenance Credit that has been accumulated throughout Phase 1 and Phase 2 up to the Date of Commencement shall be credited to the Settling Work Defendant in an amount up to 648,000,000 gallons.<sup>3</sup> If this carryover amount does not exceed 648,000,000 gallons, the Annual Maintenance Allowance, described below, shall be added to the Maintenance Credit, except that the total Annual Maintenance Credit shall not exceed 648,000,000 gallons.

2. Annual Maintenance Allowance: On the Date of

<sup>3</sup>50 days x 12,960,000 gallons/day

4483-9099

Commencement, and at one year anniversaries from the Date of Commencement, the Settling Work Defendant will be credited with an Annual Maintenance Allowance of 648,000,000 gallons. There shall be no carryover of unused Maintenance Credits.

3. Subtractions from the Maintenance Credit: During the year following the Date of Commencement, on each day which the Settling Work Defendant designates as a Maintenance Day, the Maintenance Credit will decrease by the amount of gallons by which actual groundwater pumpage falls short of the daily goal of 12,960,000 gallons. The same procedure will hold for subsequent operating years, with the maximum possible Maintenance Credit at the beginning of the year being 648,000,000 gallons, with that number being reduced during the operating year as Maintenance Days are designated.

D. Maintenance Credit for Non-Routine Maintenance: "Non-routine maintenance," as used in this paragraph, shall include unplanned maintenance events which could not reasonably be anticipated by the Settling Work Defendant, or the timing of which could not reasonably be anticipated by the Settling Work Defendant in the ordinary course of operations.

1. At the outset of an event which requires non-routine maintenance, the Settling Work Defendant shall notify EPA

Submission 4483 (Kimberly Bick, Lockheed Martin Corporation, December 2, 2022) - Continued

4483-9099

4483-9099

of the event, the projected maintenance requirements, and the projected timing for completion of such requirements.

2. EPA shall determine a reasonable time period for the maintenance to be completed based on, but not limited to, information provided by vendors and submitted to EPA by the Settling Work Defendant. EPA shall notify the Settling Work Defendant of the deadline for completion of the non-routine maintenance.

3. The deadline for completion of the non-routine maintenance established by EPA shall be binding upon the Settling Work Defendant unless extended by EPA or the Settling Work Defendant invokes the Dispute Resolution process of Section XX of the Consent Decree.

4. Invocation of the Dispute Resolution process, by itself, will not postpone any maintenance activities.

E. Suspension of Operations: The Settling Work Defendant may suspend operations by designating a maintenance day.

Maintenance outages during the operating year shall not exceed the Annual Maintenance Credit, or the Settling Work Defendant shall be considered in violation of the Consent Decree.

Maintenance days may not be designated for reasons other than maintenance. The Settling Work Defendant shall notify the EPA

290

Project Coordinator in advance of a planned Maintenance Day and as soon as practicable when a Non-Routine Maintenance Day has occurred. Maintenance Days shall be specifically accounted for in the required Progress Reports.

California High-Speed Rail Authority  
ATTN: Palmdale to Burbank Draft EIR/EIS Comment  
355 S Grand Avenue, Suite 2050  
Los Angeles, CA 90071

4487-8239

The Crescenta Highlands Neighborhood Association (CHNA) is a grassroots volunteer organization representing residents that live in the City of Glendale portion of La Crescenta in the Crescenta Valley. The goals of the association are to provide a forum for the discussion of issues and events within the neighborhood and community; to encourage members and other residents to come together for common purposes; and to promote and preserve the benefits of the neighborhood by all appropriate means including but not limited to advocating for neighborhood interests in various governmental and non-governmental forums.

As one of the Member Associations of the Glendale Homeowners Coordinating Council, CHNA wholeheartedly supports the comment letter submitted in response to the draft EIR/EIS for the Palmdale to Burbank section of the CAHSR. We are very concerned about the topics outlined in the letter – segmentation; air quality and noise mitigation; Hollywood-Burbank airport safety and operations; and community outreach. Thank you for the opportunity to comment now on other concerns that specifically relate to the foothill communities that live south of the Angeles National Forest.

CHNA has a unique interest in the California High-Speed Rail project not only because the neighborhood association resides within the boundary of the City of Glendale but our homes are adjacent to the part of the City of Los Angeles most affected by the E2 route proposal -- Lake View Terrace, Sunland-Tujunga, and Shadow Hills. Even though we are composed of many different jurisdictions, we are a close-knit group of suburban communities that share the same vision for limited development. It is clear from the environmental report that any one of the six Build Alternatives will have an immediate negative impact to the entire region but the E2/E2A route would be particularly destructive to our neighborhoods. The Crescenta Highlands Neighborhood Association stands in solidarity with our neighbors to the west currently living directly in the path of trains, if the E2/E2A route is ultimately chosen.

4487-8240

Established Communities Will Be Divided in Lake View Terrace and Shadow Hills  
In reviewing the environmental report, the draft EIR/EIS summary states, "Construction of the Build Alternative would physically and visually divide established communities." There is no better example of this than the proposed E2/E2A route. The southern most end of the

## Submission 4487 (Mary-Lynne Fisher, Crescenta Highlands Neighborhood Association, December 1, 2022) - Continued

4487-8240

bored/mined tunnel will emerge right in the middle of the 1950s housing tract in Lake View Terrace. The portal and surface route will take out an expanse of parcels then the elevated viaduct will traverse the wash that is used for hiking and equestrian trails. On the opposite side of the wash, the reverse will happen as the train dives back into the portal among the houses in Shadow Hills and continues underground to the Burbank station. In one fell swoop, two rural communities will be divided in half and quiet open space will be lost forever. Perhaps the most shocking element of the proposal other than the route not being eliminated during the CEQA process, is the recommended mitigation measure for destroying neighborhoods. The report summary chart says, "The Authority will engage in special outreach to affected homeowners, residents, landowners, business owners, community organizations, and local officials." Yep, that should fix it.

4487-8241

### Communities Will Experience Poor Level of Service During Construction

The communities lining the foothills of the San Gabriel Mountains and the Verdugo Hills are known for their beauty and ease of access to the natural environment. Many of our association members enjoy getting outside and hiking the trails near their homes. The configuration of the local terrain is such that most of the towns in the corridor have only one or two paved arterials around or through the canyon passes into Sylmar, Sun Valley or Burbank. If a street is blocked, traffic can be backed up for miles or even hours. When there is an emergency evacuation such as occurred during the La Tuna Canyon fire in 2017, this limited access can create a dangerous situation for area residents who may be trapped.

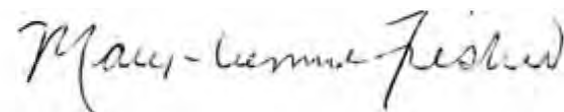

During construction, the E2/E2A route will significantly affect and reduce the Level of Service on Foothill Blvd., Wentworth Street, Sunland Blvd., La Tuna Canyon Road, and other connector streets. These are main arterials used by Lake View Terrace and Shadow Hills residents but also by drivers in Sunland-Tujunga, La Crescenta, Montrose and the surrounding communities. It will be the Authority's responsibility to ensure that secondary roads are kept clear to every extent possible, and that closures and construction detours allow for safe and expedient evacuation in the unfortunate event of an emergency.

4487-8242

Based on the severe impact of the Authority's proposal to build the high-speed route through established neighborhoods without ability for appropriate mitigation, and because of the inherent high risk during emergencies due to roadway closures, the E2/E2A Build Alternative should be removed from consideration prior to the final determination. Of course, the No Project option would be the most preferred alternative for area residents.

Thank you for considering these comments of the Crescenta Highlands Neighborhood Association as part of the draft environmental review process for the California High-Speed Rail, Palmdale to Burbank section. Please include them in the final document and provide response to our concerns.

Sincerely,

Mary-Lynne Fisher, President  
Crescenta Highlands Neighborhood Association  
crescentahighlands@gmail.com

## Response to Submission 4487 (Mary-Lynne Fisher, Crescenta Highlands Neighborhood Association, December 1, 2022)

### 4487-8239

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-AQ-2: Health Risks and Impacts, PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS, PB-Response-N&V-2: Noise Mitigation and selection of Proposed Sounds Barriers.

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-AQ-2: Health Risks and Impacts, PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS, PB-Response-N&V-2: Noise Mitigation and selection of Proposed Sounds Barriers. The commenter supports the comment letter submitted separately by the Glendale Homeowners Coordinating Council expressing concerns about project impacts related to segmentation, air quality, noise, Hollywood-Burbank airport safety and operations, and community outreach and involvement. Responses to that comment letter are set forth separately. The specific concerns delineated in this comment letter focus on the E2 and E2A Build Alternatives because those are the alignments located closest to the Foothills, south of the ANF. The Authority has identified the SR14A Build Alternative as the Preferred Alternative for the Palmdale to Burbank Project Section, with the Burbank Airport Station. The Authority identified the Preferred Alternative by balancing the adverse and beneficial impacts of the project on the human and natural environment. The Authority weighed a variety of issues, including natural resource and community impacts, the input of the communities along the route, the views of federal and state resource agencies, project costs, constructability, and other differentiators to identify what the Authority believes is the best Build Alternative to achieve the project's Purpose and Need. Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-AQ-2: Health Risks and Impacts, PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS, and PB-Response-N&V-2: Noise Mitigation and selection of Proposed Sounds Barriers. Neither the E2 nor E2A alternatives are the Authority's preferred alternative. The Preferred Alternative, SR14A, would avoid many of the impacts and issues identified by the commenter because this Alternative would avoid impacts to the Crescenta Highlands Neighborhood area. The commenter's concern is acknowledged. Responses are provided for each comment recorded in the noted attachment.

### 4487-8240

The commenter raises a number of concerns and their opposition to the E2/E2A Alternatives. The E2 and E2A Alternatives are not the Authority's preferred alternative. The Preferred Alternative, SR14A, would avoid many of the impacts and issues identified in by the commenter. For more information regarding identification of the SR14A as the preferred alternative, please refer to Chapter 8 of the Draft EIR/EIS.

As required by CEQA and NEPA, the Authority has analyzed the potential impacts related to the division of established communities and disclosed those impacts in Section 3.12, Socioeconomics and Communities in the Draft EIR/EIS. The commenter is particularly concerned about division of existing communities. Section 3.12 specifically addresses both Lake View Terrace and Shadow Hills in its discussion of Impact SOCIO#2, explaining that where new physical and visual barriers would occur within existing communities, access between properties and the local road networks may be adjusted but would be maintained. The project would provide adequate roadway overcrossings and undercrossings to facilitate pedestrian, bicycle, and vehicular circulation. As summarized in Table 3.12-43 of the Draft EIR/EIS, the Authority concluded that impacts related to the division of established communities would be no adverse effect post mitigation for all Build Alternatives. As summarized in Table 3.12-44 of the Draft EIR/EIS, the Authority concluded that impacts related to the division of established communities would be less than significant with mitigation for all Build Alternatives.

## Response to Submission 4487 (Mary-Lynne Fisher, Crescenta Highlands Neighborhood Association, December 1, 2022) - Continued

### 4487-8241

Refer to Standard Response PB-Response-S&S-3: Effects on Local and Regional Evacuation Plans.

The commenter expresses concerns about the effect of construction activities on access and circulation of the communities in the foothills of the San Gabriel Mountains and the Verdugo Hills, including the resulting operation of streets and intersections during the construction as it relates to evacuation in emergencies. Refer to Standard Response PB-Response-S&S-3: Effects on Local and Regional Evacuation Plans for a discussion of how the Authority will address evacuation and safety needs during construction.

### 4487-8242

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-GEN-4: General Opinions, Opposition or Support, PB-Response-S&S-3: Effects on Local and Regional Evacuation Plans, PB-Response-TRA-1: Temporary Traffic Associated with Construction.

The commenter expressed concern that project impacts to established neighborhoods are not appropriately mitigated. Based on preceding comments by the commenter (Comments #8239 and 8240), the commenter is concerned about division of the communities of Lake View Terrace and Shadow Hills. The commenter also expressed concern that construction-related roadway closures would result in safety concerns during emergencies. Additionally, the commenter expressed opposition to the E2 and E2A Build Alternatives and their preference for the No Project Alternative.

Section 3.12, Socioeconomics and Communities, of the Draft EIR/EIS, states that the southern portion of the Central Subsection for the E2 and E2A Build Alternatives would traverse the city of Los Angeles neighborhoods of Lake View Terrace and Shadow Hills. As discussed in Impact SOCIO#1: Temporary Disruption to Community Cohesion or Division of Existing Communities from Construction, under the E2 and E2A Build Alternatives, residences adjacent to the construction alignment in Lake View Terrace and Shadow Hills would be subject to temporary construction impacts. However, although construction activities could temporarily disturb nearby residents, they would not physically divide established communities. Additionally, although the E2 and E2A Build Alternatives would not result in a temporary impact related to dividing established communities, these two alternatives would implement six IAMFs and one mitigation measure to minimize temporary construction impacts such that existing land-use patterns and community cohesion would be preserved. A detailed construction management plan would be developed prior to construction as part of SOCIO-IAMF#1, and would include actions pertaining to communications, visual protection, air quality, safety controls, noise controls, and traffic controls to minimize impacts on residents. The plan would also verify that property access is maintained for local businesses, residences, and emergency services. NV-IAMF#1 would ensure minimization of noise-related disruptions near sensitive receptors, including residential neighborhoods, pursuant to federal noise guidelines. AQ-IAMF#1 would require the preparation and implementation of a fugitive dust control plan. Temporary impacts related to air quality

## Response to Submission 4487 (Mary-Lynne Fisher, Crescenta Highlands Neighborhood Association, December 1, 2022) - Continued

### 4487-8242

would also be minimized by low-volatile organic paint during construction (AQ-IAMF#2) and concrete batch plant siting and control measures (AQ-IAMF#6). Construction-related traffic disruptions would be minimized by the preparation and implementation of a construction traffic plan (TR-IAMF#2). AVR-MM#2 would require shielding of lighting for nighttime construction and directing it downward in such a manner that the light source is not visible off-site, and so that the light does not fall outside the boundaries of the project site to avoid light spillage off-site.

As discussed in Impact SOCIO#2: Permanent Disruption to Community Cohesion or Division of Established Communities from Construction, in Section 3.12, Socioeconomics and Communities, of the Draft EIR/EIS, construction of the E2 and E2A Build Alternatives within the Central Subsection would present new physical and visual barriers with the potential to divide the Lake View Terrace neighborhood. Specifically, the E2 and E2A Build Alternatives would be constructed at-grade and on viaduct within the Los Angeles community of Lake View Terrace, which would require the displacement of residential properties and would therefore divide the neighborhood between Jimenez Street and Wheatland Avenue. Connectivity between the divided neighborhood would be maintained via Arnwood Road and Foothill Boulevard, both of which would pass underneath the elevated HSR right-of-way. Foothill Boulevard would continue to provide the neighborhood with access to the regional road network. Therefore, where new physical and visual barriers would occur within Lake View Terrace, access between properties and the local road networks would be maintained.

Regardless, new physical and visual barriers created by the project within existing communities represents a significant impact pursuant to CEQA. Mitigation Measure SO-MM#2: Implement measures to reduce impacts associated with the division of communities, will require the Authority to conduct special outreach to affected residential neighborhood and community residents, community organizations, and local officials, as well as require the Authority's evaluation of the community's modified access, to enable the Authority to maintain community cohesion and avoid physical deterioration. The Authority will work with community organizations and community leaders within affected neighborhoods to maximize attendance and generate awareness of community workshops. Upon gathering feedback from the community, the Authority would use the input and develop enhancements to ameliorate effects associated with community

### 4487-8242

cohesion and community division. The Authority would be responsible for implementing the measures to reduce impacts through project design and through the long-term management of the measures, which would involve documenting the desired design concepts, incorporating them into the final design, and facilitating ongoing maintenance. Therefore, the impact of physically dividing existing communities would be less than significant for all Build Alternatives.

With regard to safety concerns during emergencies due to construction-related roadway closures, please refer to Standard Responses PB-Response-TRA-1: Temporary Traffic Associated with Construction and PB-Response-S&S-3: Effects on Local and Regional Evacuation Plans. As discussed in Standard Response PB-Response-S&S-3, the Authority will develop and implement a construction safety transportation management plan (SS-IAMF#1) that will incorporate emergency vehicle access procedures. These procedures would avoid impacts on the accessibility of emergency service providers, response times, or other emergency service performance objectives through coordination with local jurisdictions to maintain emergency vehicle access and by establishing detour provisions for temporary road closures and routes for construction traffic. Additionally, as stated previously in this response, under SOCIO-IAMF#1, the detailed construction management plan for the project would verify that property access is maintained for emergency services, as well as for businesses and residences.

Regarding the commenter's opposition to the E2 and E2A Build Alternatives and their preference for the No Project Alternative, please refer to Standard Responses PB-Response-GEN-4: General Opinions, Opposition or Support and PB-Response-ALT-1: Alternatives Selection and Evaluation Process.

 770 L Street, Suite 620 MS-1  
 Sacramento, CA 95814

Subject: Draft EIR/EIS for the Palmdale to Burbank Project Section (SCH #2014071074)

Dear High-Speed Rail Authority:

Thank you for the opportunity to provide comments on the joint Draft Environmental Impact Report (EIR) and Environmental Impact Statement (EIS) published for the California High Speed Rail (HSR) Palmdale to Burbank section.

Land Veritas Corp. is the Bank Sponsor of both the Petersen Ranch Mitigation Bank (PRMB), located in Los Angeles County, and the Soquel Canyon Mitigation Bank (SCMB), located in San Bernardino and Orange Counties.

The PRMB was approved in 2016 by the Lahontan Regional Water Quality Control Board (RWQCB), United States Army Corps of Engineers (USACE), the United States Environmental Protection Agency (EPA), and the California Department of Fish and Wildlife (CDFW) and sells credits that can be used to offset impacts regulated by Sections 401 and 404 of the Clean Water Act, Section 1602 of the California Fish and Game Code, the Porter Cologne Water Quality Act, the California Endangered Species Act (CESA) and the California Environmental Quality Act (CEQA). The PRMB's credits include aquatic resources such as seasonal wetlands, ephemeral streams, alluvial floodplains, and riparian habitats, Swainson's hawk foraging credits, and covered habitats such as riparian forests, valley and foothill grasslands, mixed chaparral communities, and great basin scrub. Nearly all 4,100 acres of the PRMB Property are credited for Swainson's hawk foraging habitat, and actively foraging Swainson's hawks have been observed onsite.

The SCMB was approved in 2014 by the USACE, EPA, CDFW, and the Santa Ana RWQCB and sells credits that can be used to offset impacts regulated by Sections 401 and 404 of the Clean Water Act, Section 1602 of the California Fish and Game Code, and the California Environmental Quality Act (CEQA). The SCMB's credits include aquatic resources such as ephemeral, intermittent, and perennial stream system credits, and riparian habitats, and covered habitats such as chaparral, coastal sage scrub, mulefat scrub, native grassland, and oak and walnut woodlands.

Land Veritas Corp 1001 Bridgeway, Suite 246, Sausalito CA 94965 p 415.729.3733

## Submission 4488 (Stephanie Gad, Land Veritas Corp., December 1, 2022) - Continued

4488-10241

4488-10241

The PRMB includes over 4,100 acres of natural habitats and the SCMB includes over 300 acres, the regular management and maintenance of which are funded through each Bank's respective non-wasting endowment. Importantly, both the PRMB and the SCMB Service Areas, defining the area in which the Bank can sell credits, overlap with portions of the HSR Palmdale to Burbank section. The PRMB and SCMB service area with the approximate location of the Palmdale to Burbank project section is illustrated in Appendix A. The PRMB is located within important wildlife migratory corridors, and while it has already been credited for the aforementioned resources, there is also suitable habitat for other special status plant and animal species at PRMB that the HSR Palmdale to Burbank section could potentially impact. Examples of special status species with potential impacts and observed at the PRMB include burrowing owl, tricolored blackbird, vernal pool fairy shrimp, monarch butterfly, mountain lion, and rare plant species including western Joshua tree which were translocated onto the property in 2022 as part of a pilot program.

Approximately 2,500 acres of the PRMB Property are not yet under conservation easement. Mitigation projects can therefore be planned and implemented on unencumbered portions of the PRMB Property to match specific project impacts for the Palmdale to Burbank project section, including the possible translocation of impacted special-status plant species.

Land Veritas has reviewed the HSR Palmdale to Burbank Section DEIR/DEIS and presents the following comments on specific Biology Mitigation Measures (BIO-MM) included therein:

**Prepare and Implement Plan for Salvage and Relocation of Special-Status Plant Species (BIO-MM#2) and Compensate for Impacts to Listed Plant Species (BIO-MM#38):** Land Veritas agrees with HSR's determination to collect seeds and plant materials, stockpile and segregate topsoil, and salvage and relocate species listed as threatened or endangered under FESA and/or CESA. Petersen Ranch Mitigation Bank contains potentially suitable areas to receive salvaged and relocated special-status plants and develop seed banks for federal and/or state-listed species.

Similarly, Land Veritas supports proper compensatory mitigation for impacts to federal- and state-listed plant species through assigning appropriate mitigation ratios based on mitigation type and likelihood of ongoing success. The large size and diverse list of native habitats at PRMB coupled with the fact that only a portion of the site is currently under conservation easement provides for an ideal scenario for mitigating the impacts of the HSR Palmdale to Burbank section.

**Provide Compensatory Mitigation for Loss of Swainson's Hawk Nesting Trees and Habitat (BIO-MM#43):** Land Veritas suggests referencing the document; Swainson's Hawk Survey Protocols, Impact Avoidance, and Minimization Measures for Renewable Energy Projects in the Antelope Valley of Los Angeles and Kern Counties, California (California Energy Commission [CEC] and California Department of Fish and Game [CDFG], 2010) to inform survey protocols, minimization practices and compensatory mitigation requirements for the project, as this document was developed specifically for the study and conservation of the genetically-distinct Antelope Valley Swainson's hawk population. Notably, the Antelope Valley guidance calls for a minimum 2:1 mitigation ratio for impacts to Swainson's hawk foraging habitat impacted within a five-mile radius of an active nest. These measures were assessed scientifically and deemed critical by two state agencies for the recovery of the species, and we urge the HSR Authority to incorporate its recommendations into this mitigation measure.

BIO-MM#43 requires the Authority provide mitigation lands, but does not reference BIO-MM#53 (Compensatory Mitigation Plan) nor does it include the option to purchase credits from a CDFW approved mitigation bank. The purchase of credits from a CDFW approved mitigation bank within the Antelope Valley, such as PRMB, to mitigate for unavoidable impacts to Swainson's hawk foraging habitat guarantees that (i) the impacted population of Swainson's hawk is protected; (ii) the mitigation is permanently conserved with a restrictive easement; and (iii) an endowment is fully funded to provide land management and protection in perpetuity. We recommend the option to purchase credits to satisfy compensatory mitigation requirements for impacts to Swainson's hawk be included in this mitigation measure.

**Loss of Active Burrowing Owl Burrows and Habitat (BIO-MM#44), Impacts on Tricolored Blackbird Habitat (BIO-MM#70):** For tricolored blackbird and burrowing owl, compensatory mitigation is typically required to be located within areas of documented use by the species, such as the PRMB. For BIO-MM#44 and BIO-MM#70 Land Veritas suggests specifying this requirement for burrowing owl and tricolored blackbird, respectively. Given both species are experiencing a reduced range and higher level of threat from development throughout Southern California, this measure should be required to adequately contribute to the recovery of both species. Additionally, the purchase of mitigation credits that meet the above criteria should be prioritized over other forms of mitigation as outlined below in our comment on BIO-MM#53.

**BIO-MM#46: Provide Compensatory Mitigation for Permanent Impacts on Riparian Habitat:** Both the joint USACE and EPA 2008 Mitigation Rule (33 C.F.R. 325 and 332, 40 C.F.R. 230) and the state wetland policy for California (California State Water Resource Control Board, 2019) specify a preference for purchasing riparian habitat credits from approved mitigation banks over other forms of compensatory mitigation. This preference was established because mitigation banks avoid temporal loss of function to impacted resources, must be managed and funded in perpetuity, are protected via permanent conservation easement, and are subject to a high degree of regulatory oversight relative to other options. Land Veritas recommends including a preference for the purchase of mitigation credits over other forms of compensatory mitigation in BIO-MM#46 to be consistent with state and federal guidance.

## Submission 4488 (Stephanie Gad, Land Veritas Corp., December 1, 2022) - Continued

4488-10241

**Prepare a Compensatory Mitigation Plan (CMP) for Species and Species Habitat (BIO-MM#53) and Aquatic Resources (BIO-MM#47):** The CMPs defined in BIO-MM#53 and BIO-MM#47 identify several methods to provide mitigation for impacts to protected species, habitats, and aquatic resources, including purchasing mitigation credits from an agency-approved mitigation bank. As identified in the prior comment regarding BIO-MM#46, both state and federal mitigation policies specify a preference for purchasing credits from approved mitigation banks over other forms of compensatory mitigation. Land Veritas recommends including this regulatory preference for mitigation credit purchase at an approved bank in BIO-MM#53 and BIO-MM#47. The purchase of mitigation credits from an approved mitigation bank can support achieving construction timelines for the Palmdale to Burbank section. To this end, mitigation credits from PRMB are available to mitigate Palmdale to Burbank section impacts within the same Section 404, Porter-Cologne, Section 1602, CEQA, and CESA (Swainson's hawk foraging) service areas. Additionally, mitigation credits from Soquel Canyon Mitigation Bank are available to mitigate Palmdale to Burbank section impacts within the Section 404 and 401, and CEQA service areas.

Lastly, the portions of the PRMB not yet under conservation easement may contain habitat for burrowing owl (BIO-MM#44), tricolored blackbird (BIO-MM#70), mountain lion (BIO-MM#97), and other special-status species, which have been observed at the implemented portions of the PRMB. Mitigation projects can therefore be planned and implemented on the unencumbered portions of the PRMB Property to match specific project impacts for the Palmdale to Burbank section, including the possible translocation of impacted special-status species.

We thank you for the opportunity to provide comments on this project and hope you consider the PRMB and SCMB as future partners, as we can supply compensatory mitigation that achieves compliance while providing superior environmental outcomes. For more information on PRMB and SCMB, please see the attached brochures (Appendix A). These brochures include figures illustrating the PRMB and SCMB service area overlap with an approximate location of the Palmdale to Burbank project section. These figures are for illustrative purposes only to demonstrate that the approximate location of the Palmdale to Burbank project section overlaps with a portion of the PRMB or SCMB service areas.

Sincerely,

H. Tracey Brownfield

## PETERSEN RANCH MITIGATION BANK

### Summary

Land Veritas (LV), a Women-Owned Business Entity, is the sponsor of The Petersen Ranch Mitigation Bank (Bank). The Bank was approved and received its first credit release in June 2016. The United States Army Corps of Engineers (Corps), Environmental Protection Agency (USEPA), Lahontan Regional Water Quality Control Board (Lahontan RWQCB) and California Department of Fish and Wildlife (CDFW) are signatory participants in the Interagency Review Team (IRT) that reviewed and approved the Bank over a 5+ year entitlement process.

Located in unincorporated Leona Valley, Los Angeles County, California, the Bank contains approximately 4,103 acres and consists of two properties: The Petersen Ranch Bank Property (approximately 3,789 acres) and the Elizabeth Lake Bank Property (approximately 314 acres), as shown in Exhibit A.

Implementing the Bank's Development Plan established/re-established, rehabilitated, enhanced, and/or preserved of hundreds of acres of aquatic features, including streams, wetlands, alluvial floodplains, and non-wetland riparian areas. These actions generated credits that can be used to mitigate for impacts authorized through Section 404 of the Clean Water Act (404 Credits), the Porter-Cologne Water Quality Control Act (PC Credits), Section 1600 of the California Fish and Game Code (1600 Credits), the California Environmental Quality Act (CEQA Credits) and the California Endangered Species Act (CESA Credits). The Bank Property contains habitat for Swainson's hawk (state threatened species) as well as other special-status species including, but not limited to, western pond turtle, tricolored blackbird and coast horned lizard, as well as several sensitive vegetation communities.

The Bank Properties are being established in multiple phases across six geographic areas (Areas A – F). Restoration of Area A of the Petersen Ranch Property and Area E of the Elizabeth Lake Property were completed in 2016. Phase 1 included Area A on the Petersen Ranch Property and Area E of the Elizabeth Lake Property. Subsequent phases will be constructed and incorporated into the Bank over time. The Bank Properties will be managed in perpetuity with funding provided by a non-wasting endowment. The Southwest Resource Management Association is a CDFW-approved non-profit land trust and holds both the conservation easement and endowment.

# Submission 4488 (Stephanie Gad, Land Veritas Corp., December 1, 2022) - Continued

4488-10242

4488-10242

## REGULATIONS COVERED

The Bank has five credits categories that can mitigate for impacts associated with the following regulations:

### 404 Credits:

- Section 10 of the Rivers and Harbors Act,
- Section 404 of the Clean Water Act,
- Section 401 of the Clean Water Act,

### Porter Cologne Credits:

- the Porter Cologne Water Quality Control Act,

### 1600 Credits:

- Section 1600 et seq. of the California Fish and Game Code,

### Swainson's Hawk Credits:

- the California Endangered Species Act,

### CEQA Credits:

- the California Environmental Quality Act

Though not a signatory to the Bank, the Los Angeles Regional Water Quality Control Board has authorized permittees to purchase credits from the Bank to satisfy 401 certification requirements.

## SERVICE AREA

Attached are service areas for each category of credits that are available. Service areas are the areas in which Mitigation and Conservation Banks can sell credits; however, impacts outside of the service areas can use Bank credits on a case-by-case basis upon regulatory approval.

The Elizabeth Lake property is an inholding within the Angeles National Forest and therefore suitable for mitigation on federal lands (see attached maps). While the Elizabeth Lake property is located within the Santa Clara River watershed, the Petersen Ranch property is located at the headwaters of two major watersheds, as the divide between the Santa Clara River and Antelope Valley-Fremont Valley watersheds bisects the Ranch. This results in a large service area in which the Bank's credits can be sold.

Land Veritas Corp 1001 Bridgeway, Suite 246, Sausalito CA 94965 p 415.729.3733

## PRICING

Each of the Bank's credit categories overlap to form a bundled credit that can be used to mitigate for resources under multiple jurisdictions simultaneously. As a result, each credit is assigned a "Price Tier" based on the highest valued component within the bundle. For example; a Chaparral CEQA credit that overlaps with a 404 credit is assigned a higher Price Tier than a Chaparral CEQA credit that cannot be used for 404 mitigation. There are twelve different credit price tiers, ranging from the highest for 404 re-establishment credits to the lowest for Swainson's hawk credits. Credit prices vary across a wide range, and can be provided through a direct consultation with the Bank Sponsor.

## 404 CREDITS AND PORTER COLOGNE CREDITS

404 Credits and PC Credits can mitigate for impacts associated with waters and wetlands of the United States and waters and wetlands of the State. All 404 Credits are either classified as re-establishment or preservation, including riparian and upland buffer preservation credits. These credits cover numerous habitats including:

- **Alluvial Floodplains:** Diverse alluvial fan habitats containing complexes of braided ephemeral streams and riparian habitats.
- **Ephemeral Streams:** Single thread seasonal streams and associated riparian habitats.
- **Freshwater Marsh:** Seasonal to Perennial wetlands containing cattails and rushes and supporting special status species including western pond turtle and tri-colored blackbird.
- **Open Water:** Mostly perennial deeply ponded areas providing important food and water sources for wildlife and supporting aquatic habitat for western pond turtle and amphibians.
- **Seasonal Wetland:** Seasonally flooded depressions and large meadow complexes dominated with wetland grasses, rushes and sedges.
- **Wetland Riparian:** Wetland habitats with understory similar to seasonal wetlands and a diverse shrub and tree canopy of mulefat, willows, elderberry, cottonwoods and other riparian species.

## 1600 CREDITS

1600 credits can be used to offset impacts to CDFW regulated resources authorized under a Lake and Streambed Alteration Agreement. These credits include the following habitats which are the same as those described under the 404 Credits and PC Credits, except where noted:

- Alluvial Floodplain
- Ephemeral Stream
- Freshwater Marsh
- Open Water
- Seasonal Wetland
- Wetland Riparian

Land Veritas Corp 1001 Bridgeway, Suite 246, Sausalito CA 94965 p 415.729.3733

# Submission 4488 (Stephanie Gad, Land Veritas Corp., December 1, 2022) - Continued

4488-10242

4488-10242

- **Non-wetland Riparian:** A diverse mixture of riparian habitats ranging from xeric desert riparian scrub to upland Fremont cottonwood forests.

For each of the above habitats the Bank has the following 1600 credit types:

- **Re-established:** Restoration of an upland habitat into an aquatic habitat in a location that was historically aquatic but had been converted to uplands through past human disturbance. This credit type comes from restoration activities that increase the amount of aquatic habitats within the Bank.
- **Rehabilitated:** Restoration of an existing, but degraded, aquatic habitat into a high quality habitat. This credit type comes from multiple restoration activities that work together to repair a previously impacted habitat to its natural condition.
- **Enhanced:** Improvement of an existing aquatic habitat through vegetation management or planting.
- **Preserved:** Protection of a high quality existing habitat.

### SWAINSON'S HAWK CREDITS

Nearly the entire Bank generates foraging credits for Swainson's hawk. Potential nesting habitat has also been identified within the Bank, but nesting Swainson's hawks have not been observed.

### CEQA CREDITS

CEQA credits can be used to offset impacts to natural vegetation communities. These credits cover multiple habitat types including the following:

- Bare Ground
- Chaparral
- Cismontane woodland, pinyon-juniper woodland
- Great Basin scrub
- Non-native woodland
- Open water
- Riparian forest
- Riparian scrub
- Seeps, meadows, marshes
- Valley and foothill grassland

SOQUEL CANYON MITIGATION BANK

**Summary**

Land Veritas Corp (LV), a Women-Owned Business Entity, is the sponsor of the Soquel Canyon Mitigation Bank (Bank). In December 2014, LV garnered final regulatory agency approvals and released the first round of credits at Soquel Canyon Mitigation Bank (Bank). Located primarily in Chino Hills (with a small portion in Orange County), the Bank's southern boundary is the Chino Hills State Park, a premier natural open space in the hills of the Santa Ana Canyon near the junction of San Bernardino, Orange, Riverside, and Los Angeles Counties (Bank Property). The State Park serves as a critical link in the Puente-Chino Hills biological corridor, encompassing over 14,000 acres of oaks, sycamores, and rolling grassy hills stretching nearly 31 miles from the Santa Ana Mountains to the Whittier Hills.

The Bank offers a great diversity of vegetation and thus provides mitigation for a range of habitat types found in the region. Its canyons support riparian areas which protect water quality and provide suitable habitat for numerous wildlife species including least Bell's vireo and California coastal gnatcatcher. The black walnut trees in low-lying riparian areas join coast live oaks to form mixed walnut woodlands in and adjacent to the creeks, while a variety of coastal sage scrub and chaparral communities are found on slopes. There are almost 80,000 linear feet of streams located throughout the Bank property, including perennial, intermittent, and ephemeral streams and their associated riparian habitats.

Credits are phased over six releases, which is dependent on the Bank meeting certain agency-mandated performance standards and submitting payments and reports.

**Service Area**

Attached are service areas for each category of credits that are available. Service areas are the areas in which Mitigation and Conservation Banks are allowed to sell credits, however, impacts outside of the service areas may be mitigated on a case-by-case basis upon regulatory approval.

**Pricing**

Each of the Bank's credit categories overlap to form "stacked" credits, which can mitigate simultaneous impacts to resources under multiple jurisdictions. The three credit categories (Waters of the U.S., Waters of the State, and Covered Habitat) overlap with each other such that a debit from one credit table will often require a corresponding debit in one or more of the other credit tables. For example, every creditable acre has a CEQA associated with it, therefore, every debit of Waters of the U.S. or Waters of the State credit will also include the overlapping Covered Habitat Credit type. The price of each credit sold is determined by the highest value credit that it overlaps with. Credit pricing varies based on the type of credit and amount of overlap, and begin at \$100,000/credit. More accurate pricing information can be provided through a direct consultation.

**CREDITS OFFERED**

The Bank has been approved to sell credits by the U.S. Army Corps of Engineers (USACE), U.S. Environmental Protection Agency (EPA), California Department of Fish and Wildlife (CDFW), and the

Land Veritas Corp 1001 Bridgeway, Suite 246, Sausalito CA 94965 p 415.729.3733

4488-10242

4488-10242

Santa Ana Regional Water Quality Control Board (RWQCB). These credits can be used to mitigate for impacts to Waters of the United States (404 credits), Waters of the State (1600 Credits), and Sensitive Habitats (CEQA credits).

**404 Credits**

Soquel Canyon’s 404 credits can be used to mitigate for impacts to Waters of the United States regulated under Sections 404 and 401 of the Clean Water Act. The Bank provides three types of 404 Credits, including:

- Ephemeral Stream Enhancement Credits
- Intermittent Stream Enhancement Credits
- Perennial Stream Enhancement Credits

All 404 Credits are combination credits include three components: Waters of the U.S. streambank, Riparian buffers, and Upland Buffers. In 2008, USACE acknowledged the importance of buffers for maintaining the ecological viability and aquatic resource function of the Waters of the U.S.

The Bank generates Waters of the U.S. Enhancement Credits by converting non-native vegetative communities to native types, reducing/eliminating invasive seed sources and, enhancing habitats for protected species. These activities repair habitat for sensitive species, including least Bell’s vireo and California coastal gnatcatcher. Enhancement is also achieved by excluding cattle and managing invasive species in existing natural communities.

**1600 Credits**

The Credits available as mitigation for impacts to Waters of the State regulated under Section 1602 of the California Fish and Game Code include Stream Restoration Credits, Riparian Restoration Credits, Stream Enhancement Credits, and Riparian Enhancement Credits.

Invasive plant species management and cattle exclusion activities generate enhancement credits. Areas that were also planted with native plant species generate restoration credits, as planting activities increase the area, functioning, and resiliency of these communities.

Waters of the State Credits include:

- |  |   |  |
|--|---|--|
| <p><u>Ephemeral</u></p> <ul style="list-style-type: none"> <li>• Riparian Enhancement</li> <li>• Riparian Restoration</li> <li>• Waters Enhancement</li> <li>• Waters Restoration</li> </ul> | <p><u>Intermittent</u></p> <ul style="list-style-type: none"> <li>• Riparian Enhancement</li> <li>• Riparian Restoration</li> <li>• Waters Enhancement</li> <li>• Waters Restoration</li> </ul> | <p><u>Perennial</u></p> <ul style="list-style-type: none"> <li>• Riparian Enhancement</li> <li>• Riparian Restoration</li> <li>• Waters Enhancement</li> <li>• Waters Restoration</li> </ul> |
|--|---|--|

Land Veritas Corp 1001 Bridgeway, Suite 246, Sausalito CA 94965 p 415.729.3733

**CEQA Credits (Covered Habitat)**

Covered Habitat credits can be used to offset impacts to natural vegetation communities. These enhancement and restoration credits cover multiple habitat types including the following:

- Chaparral
- Coastal Sage Scrub
- Mulefat Scrub
- Native Grassland
- Oak Woodland
- Perennial Streambed
- Walnut Woodland

RE: Palmdale to Burbank Project Section Draft EIR/EIS Comment

To Whom It May Concern:

The Kagel Canyon Civic Association unequivocally supports the NO PROJECT ALTERNATIVE as the only feasible alternative presented in the Draft Environmental Impact Report (DEIR) as produced by the California High-Speed Rail Authority (CHSRA).

We have concerns and comments on a myriad of topics in the report:

The first concern and primary concern is WATER. Proposed tunneling through the Angeles National Forest (ANF) and the San Gabriel Mountains National Monument jeopardizes critical groundwater sources in the mountains that provide drinking water to the Los Angeles basin. Our Upper Kagel Canyon residents are all on well water, and yet in CHSRA's maps, only three wells in our area are documented. On what scientific basis has CHSRA made the determination that our wells are outside of the area of impact of tunneling?

The document does nothing to ensure that underground water sources won't be altered, causing these wells to go dry. It also doesn't guarantee that these water sources won't be contaminated.

If this happens, how will residents be remedied in case of both or either of these two serious catastrophic situations? If our wells are not documented in advance by CHSRA, how will our residents receive mediation for damage to our only source of water? One of your proposed mitigation measures is to truck in water for residents whose wells have been damaged or destroyed by CHSRA's tunneling. How will not having a water source impact our property values, and will CHSRA compensate our residents for any financial loss sustained in resale?

We all know that California is currently in another epic drought and CHSRA will use hundreds of millions of gallons of water to constantly spray their construction areas to mitigate fugitive dust, operate the tunnel boring machine, and build miles of concrete tunnels. You even have a plan to truck in tens of millions of gallons of water for the oak trees in the ANF if tunneling causes dewatering. Where will this water come from? How will it affect the ground water?

P.O. Box 922191 Sylmar, CA 91392-2191

KCCA response to Palmdale to Burbank Project Section Draft EIR/EIS Comment  
November 29, 2022  
Page 2

KCCA response to Palmdale to Burbank Project Section Draft EIR/EIS Comment  
November 29, 2022  
Page 3

4490-8985

Secondly, San Fernando and Santa Clarita Valley residents will be living through construction for at least 7 years, probably more than 10 years. Heavily traveled intersections and freeways will be impacted by construction staging areas nearby the proposed area of the 118 and 210 interchanges as well as the Paxton and Foothill Boulevard intersections. Another construction staging area is proposed for Little Tujunga Canyon Road by Gold Creek which is in the ANF. In all, these sites will produce noise, vibration, dust, and exhaust as millions of truck trips are needed to haul spoils out of bored tunnels. Overall, traffic will increase for these millions of truck trips on our local roads and on the 5, 118 and 210 freeways.

4490-8986

The third and next point we want to address is our concerns for the surface impacts to the ANF. Just because HSR will be tunneling beneath the ANF does not mean there will not be impacts to the forest above. Tunneling inherently means there will be manmade encroachments in the ANF where none currently exist.

CHSRA will be adding buildings in the forest which will be used to access the tunnels, provide ventilation, access roads and power lines, and CHSRA plans to construct portals in multiple locations at the borders of the ANF. Proposed alignments and construction staging areas will cross and interrupt the Pacific Crest Trail and the Rim of the Valley Trail, and wilderness areas will be disrupted, impacting wildlife with years of construction invading their habitat. This infrastructure and manmade construction activity will introduce new fire hazards in the ANF, causing additional threats to residents of the Northeast San Fernando Valley, specifically to our community which is in the urban-wildland interface.

4490-8987

Our fourth area of concern is SEISMICITY. Each and all of the routes proposed cross the San Andreas, San Gabriel, Sierra Madre, and Verdugo Fault Zones. We have great concern this work will trigger one of these fault zones. Why is the CHSRA not conducting the necessary studies and technical evaluations on seismicity NOW, prior to selecting an alignment and moving forward with the project? Shouldn't this critical issue be addressed ahead of time to determine if tunneled routes through these fault zones are even feasible?

4490-8988

The fifth concern is for Air Quality. The construction will generate more greenhouse gases than it will recoup in 70 years of operation. CHSRA is a beneficiary of Cap & Trade funds as it claims to be a "green project," but the irony is that CHSRA will have to PURCHASE offset credits during construction as its pollution levels exceed AQMD standards.

4490-8989

The sixth concern is for Area Aesthetics. Our designated scenic corridors will be blighted with multi-acre construction staging areas to house construction equipment, concrete batch plants, and more. The Portals aren't just tunnel openings; they have huge infrastructure with them, including 65' three-story buildings. Two proposed routes still include a viaduct to carry the train out of the mountain and over the Big Tujunga Wash.

4490-8990

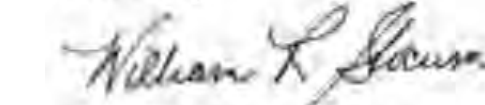

Moreover, additional concerns we have include the fact that instead of fully studying important topics (e.g., seismicity) prior to approving the project, CHSRA is placing the brunt of the study work and planning to be left to contractors being hired AFTER the

4490-8990

project is approved. CHSRA employs a 15/85 design plan, which means that only 15% of the project needs to be designed before the project is approved. The total budget has ballooned to \$105 Billion in 2022, and not a single inch of track has yet been laid. Lastly, over 150 local businesses nearby will be displaced without alternate locations available locally.

Thus, the KCCA has no confidence in CHSRA to mitigate any of the issues we've addressed.

Sincerely,

William R. Slocum  
President

## Response to Submission 4490 (William R. Slocum, Kagel Canyon Civic Association, December 1, 2022)

### 4490-8982

The commenter indicates a preference for the No Build Alternative and refers to an attached letter. Responses to the commenter's concerns are addressed in Response to Comment #8983 through Comment #8990.

### 4490-8983

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-GEN-4: General Opinions, Opposition or Support.

The commenter indicates a preference for the No Build Alternative. This comment presents an opinion on the HSR Palmdale to Burbank Project Section. The No Build Alternative would not meet the HSR purpose, need, or objectives outlined in Chapter 1, Project Purpose, Need, and Objectives of the EIR/EIS. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### 4490-8984

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF, PB-Response-PUE-3: Water Demand and Usage, PB-Response-SOCIO-2: Property Values.

The commenter expressed concerns regarding groundwater and Upper Kagel Canyon wells. Additionally, the commenter inquired about how the wells were documented, if there are mitigation measures proposed for damaged or destroyed wells, if there is budget for mitigation for those whose water sources have been damaged and if there is well monitoring. The commenter also inquired about the timeline for producing mapping of Kagel Canyon wells, and if the unmapped wells would be damaged or depleted, or if compensatory mitigations would be applied. Additionally, the commenter expressed concerns related to property values. The commenter also expressed concern about water usage necessary to support the project in the face of recent drought conditions.

The resource study area (RSA) for tunnel construction is the area within 1 mile of the centerline of each of the six Build Alternatives, which includes a portion of Kagel Canyon. Portions of Kagel Canyon within 1 mile of the alignment were therefore considered in the impact analysis in Section 3.8, Hydrology and Water Resources, of the Draft EIR/EIS. Pursuant to the Authority's 2019 Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest and 2019 Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest (referenced in Section 3.8 of the EIR/EIS), based on observed impacts on groundwater from past tunnel projects, no impacts to wells are expected to occur outside the tunnel construction RSA (more than 1 mile from the centerline of each Build Alternative). Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail how the Authority would address impacts to private water supply wells outside the ANF. For wells within the ANF

## Response to Submission 4490 (William R. Slocum, Kagel Canyon Civic Association, December 1, 2022) - Continued

### 4490-8984

(including in Kagel Canyon) that are determined through modeling and monitoring to be adversely affected by groundwater reductions caused by the HSR, the Adaptive Management and Monitoring Plan (AMMP) included in Mitigation Measure HWR-MM#4 requires modifications to the affected wells or by providing supplemental water. Supplemental water would only be provided if monitoring indicates that the HSR construction caused groundwater impacts. However, the Authority has identified several IAMFs to avoid and minimize the potential for impacts to water supply wells and the need for supplemental water. HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 require design features and construction methods to address potential groundwater intrusion, including the installation of a tunnel liner(s) capable of effectively controlling inflows into the tunnels. As such, groundwater inflow during construction would likely be minimal and temporary. Please refer to both Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest and Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest for additional information regarding impacts to wells and correlating mitigation measures and IAMFs.

Regarding potential loss of property values, please refer to Standard Response PB-Response-SOCIO-2: Property Values.

Regarding the water demand from construction of the project, please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

### 4490-8985

The commenter notes that construction activities will result in potential effects to local and regional roads due to truck trips. Section 3.3, Air Quality and Global Climate Change and Section 3.4, Noise and Vibration provide details assessments of air quality, noise and vibration effects of construction activities. Depending upon the Build Alternative, different construction staging areas would be used; as such, construction-related impacts would not occur at all of these locations, only those for the selected Build Alternative. Impact TRA#4, in Section 3.2.6.3, presents the spoils hauling effects on freeway segments. To address the effects of spoils hauling, TR-IAMF#2, TR-IAMF#6, and TR-IAMF#7 would be implemented. In addition, the mitigation program, especially TR-MM#12, would reduce impacts associated with haul route traffic, including the scheduling of a majority of travel during off-peak hours, stationing traffic control officers, developing alternative routes to reduce trucks on sensitive facilities, and developing and implementing an outreach program. More information on the IAMFs and Mitigation Measures can be found at in Appendix 2-E, Section 3.2.4.2 and Section 3.2.7 of the Final EIR/EIS.

## Response to Submission 4490 (William R. Slocum, Kagel Canyon Civic Association, December 1, 2022) - Continued

### 4490-8986

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-BIO-3: Wildlife Movement Corridors, PB-Response-S&S-1: Wildfire.

The commenter expresses concern regarding the surface impacts within the Angeles National Forest (ANF) from adding buildings, roads, and power lines, as well as tunnel portals. The commenter also expresses concern regarding impacts on the Pacific Crest Trail, Rim of the Valley Trail, and wilderness areas, as well as impacts on wildlife during construction. Additionally, the commenter expresses concern regarding new fire risks.

As discussed in Section 3.15, Parks, Recreation, and Open Space, of the Final EIR/EIS, 28 acres of the ANF and the SGMNM would temporarily be used as a construction staging area the Refined SR14 and SR14A Build Alternatives. It is noted that land around the Vulcan Mine, which is not a recreation or open space resource, would be used for disposal of construction spoils for the Refined SR14 and SR14A Build Alternatives; the Authority is conducting ongoing coordination with USFS regarding acquisition of land and spoils disposal within Vulcan Mine. Approximately 38 acres of the ANF, including the SGMNM, would be used under the E1 and E1A Build Alternatives for construction near Aliso Canyon Road; this area of the resource is available for recreational uses as open space but does not have developed recreational facilities such as campgrounds, trails, or picnic areas. Under the E2 and E2A Build Alternatives, approximately 38 acres of the ANF, including the SGMNM, would be used for construction near Aliso Canyon Road and/or BP and L Road; no recreation resources would be affected by this construction. The total use of land under all six Build Alternatives would represent less than 0.01 percent of the ANF. Although the project would be built beneath the ANF, including the SGMNM, in tunnels, some construction activities would take place at the surface within the ANF, including the SGMNM. Refer to Section 2.5.4 for a full description of construction activities within the ANF, including the SGMNM, for each of the Build Alternatives.

Construction of the Build Alternatives could result in temporary access, noise, vibration, air quality, and visual changes within the ANF. During construction, access to the temporary construction area within the ANF, including the SGMNM, would be restricted. However, the temporary impact areas would be located entirely within private in-

### 4490-8986

holdings and the Vulcan Mine, which is not open to the public and does not serve a recreational purpose. Within the ANF, including the SGMNM, tunnel construction would not result in noise or vibration impacts at the surface due to the depths of the proposed tunnels beneath the surface of the ANF. Some portions of the Build Alternative alignments would entail surface construction activities (e.g., portals and construction of adits) within and immediately adjacent to the ANF, including the SGMNM. Surface construction activities within and adjacent to the ANF, including the SGMNM, would result in perceptible noise and vibration effects during construction activities. However, no noise- and vibration-sensitive receivers would be affected, as no designated recreational areas (e.g., trails and campgrounds) occur in or near the construction activities. Visitors to the ANF, including the SGMNM, would have unobstructed views of the construction activities taking place at the adits within the ANF. Construction staging areas would introduce major visual changes to the immediate surroundings. However, these impacts would be temporary and disturbed areas would be restored after completion of construction.

Regarding the effects of the Build Alternatives on the Pacific Crest Trail, Rim of the Valley Trail, wilderness areas, and wildlife, please see response to comment #8973. Also refer to Standard Responses PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife and PB-Response-BIO-3: Wildlife Movement Corridors regarding wildlife impacts.

Regarding how the new infrastructure and construction activity will introduce new fire hazards in the ANF, Impact S&S#16: Temporary and Permanent Exposure to Wildfire Hazards discussed in Chapter 3.11, Safety and Security, discusses where the Build Alternatives would traverse Fire Hazard Severity Zones (FHSZs) throughout urban and rural portions of the RSA. The following above-ground HSR facilities would encounter FHSZs (mapped on Figure 3.11-4 in the FEIR/EIS): (1) Refined SR14, SR14A, E1, E1A, E2, and E2A surface trackway and ancillary facilities south of Palmdale; (2) Refined SR14 surface trackway and ancillary facilities between Acton and Agua Dulce and in the Soledad Canyon/Vulcan Mine area of the ANF, including SGMNM; (3) SR14A surface trackway and ancillary facilities between 0.75 mile east of Agua Dulce Canyon Road and the Soledad/Canyon/Vulcan Mine area of the ANF, including SGMNM; (4) E1, E1A, E2, and E2A tunnel portal and ancillary facilities near Angeles Forest Highway and in Aliso

## Response to Submission 4490 (William R. Slocum, Kagel Canyon Civic Association, December 1, 2022) - Continued

### 4490-8986

Canyon; (5) Refined SR14/SR14A, E1/E1A, and E2/E2A optional adit facilities within the ANF along Little Tujunga Canyon Road (described further in Section 3.11.10); (6) Refined SR14/SR14A adit options SR14-A2 and SR14-A3, located south of Pacoima Dam; (7) Refined SR14, SR14A, E1, and E1A Build Alternative intermediate window options near the State Route 118/Interstate 210 interchange; and (8) The E2 and E2A tunnel portal and alignment near Pacoima and Lake View Terrace. Table 3.11-16 in the FEIR/EIS summarizes the permanent surface footprint of the Build Alternatives in Very High FHSZs for state responsibility areas within the ANF. Some permanent facilities would be located within the ANF in Very High FHSZs. Most notably, a portion of the Refined SR14 Build Alternative improvements located near the Vulcan Mine would be in a Very High FHSZs. Other above-ground facilities for each of the Build Alternatives (including utility lines, roadway modifications, and adit buildings associated with optional adits near Little Tujunga Canyon Road) would also be in Very High FHSZs within the ANF. Within the ANF, project construction could increase fire risks due to the storage and use of flammable and combustible materials, operation of vehicles and heavy machinery, or other factors resulting from human activity. During project operations, HSR trains would not create fire hazards; trains would be electric and would not carry flammable fuel or freight, and trainsets would reduce fire risks from sparks caused by the friction of wheels against the wheels since they would be contained within the right-of-way as a basic design feature of the California HSR System. Permanent HSR infrastructure within FHSZs would include traction power substations, adit structures, water utility corridors, access roads, switching and paralleling stations, and electrical interconnections. The presence of adit structures and water utility corridors would not pose a fire risk because they would not contain flammable materials. Additionally, HSR infrastructure would be co-located with existing infrastructure of a similar nature and located in disturbed areas where possible, in order to reduce wildfire risks. However, cars and trucks driving on new access roads and the presence of electrical facilities could increase fire risks. For example, if damaged, electrical facilities could create sparking or arcing. The project design includes fire warning systems, as well as emergency exits and notification systems, consistent with the requirements of the NFPA Safety Code including NFPA Standard 130: Standard for Fixed Guideway Transit and Passenger Rail Systems, the California Building Standards Code, and the International Building Code. Fire risks would be minimized or avoided through the application of SS-IAMF#1 and SS-IAMF#2, which will require the development and incorporation of a fire

### 4490-8986

and life safety program into the design and construction of the Palmdale to Burbank Project Section. The fire and life safety program is coordinated with local emergency response organizations to provide them with an understanding of the rail system, facilities, and operations, and to obtain their input for modifications to emergency response operations and facilities, such as evacuation routes. Fire risks would also be reduced by the Authority's formation of a statewide Fire and Life Safety and Security Committee (FLSSC) through implementation of SS-IAMF#2, which will be composed of representatives from fire, police, and local building code agencies. The purpose of the FLSSC will be to review issues that are critical to fire and life safety and security, to acquire input and concurrence from the state and local authorities having jurisdiction over the proposed designs to meet code requirements, and to comply with state and local fire code standards or fire and life safety hazard programs during the design phase of the project. The fire and life safety program will include regional FLSSCs who will focus on the fire and life safety characteristics specific to the Palmdale to Burbank Project Section and provide input on local building codes or requirements that align with the emergency response characteristics and capabilities of the local agencies for the Palmdale to Burbank Project Section. Representation and operations of the statewide FLSSC and regional FLSSCs will be coordinated with local emergency response organizations to provide an understanding of the California HSR System and its facilities and operations, and to obtain their input for modifications to emergency response operations and facilities. These programs and coordination activities would allow for a rapid response by local emergency responders in the case of an accident, reducing the potential for uncontrolled wildfire events.

## Response to Submission 4490 (William R. Slocum, Kagel Canyon Civic Association, December 1, 2022) - Continued

### 4490-8987

Refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

The commenter expresses concerns that the HSR Palmdale to Burbank Section would trigger a fault zone and asks about technical evaluations that have been conducted. Although excavation and tunneling activities associated with HSR construction of the SR14A and E1 alternatives would occur in the seismically active Kagel Canyon, these construction activities would not be capable of triggering tectonic displacement that would result in an earthquake. Earthquakes in California originate through the release of stress deep in the earth (approximately 6 to 15 kilometers below ground). Stress release displacement radiates out from that origin (i.e., hypocenter) along an active fault plane. Tunnel construction activities are far too shallow (less than 1 kilometer) and take place in too small of an area to influence or trigger tectonic displacement as deep as typical hypocenters in California.

The Authority has conducted a preliminary geotechnical assessment in support of the project design and EIR/EIS process to assess tunnel feasibility and potential impacts related to seismicity (Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest, 2017). In addition, the Authority has identified several Impact Avoidance and Minimization Features (IAMFs) as part of the project design that would ensure there would be no significant impacts related to seismicity. For additional information about the technical evaluation that the Authority conducted and the IAMFs that will be implemented, please refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

### 4490-8988

The commenter projects that the project will generate more greenhouse gases than the project will save "in 70 years of operation." The Authority has calculated the payback of Greenhouse Gas (GHG) Emissions for the six Build Alternatives at 4 to 6 months of project operation (Draft EIR/EIS Table 3.3-44). In other words, the Authority predicts it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions, not 70 years. After that, the project will produce net benefits by reducing greenhouse gas emissions (Draft EIR/EIS, page 3.3-126). As discussed in Section 3.3.7, mitigation measures are included to offset and significantly lessen impacts associated with construction air emissions, via agreements with the applicable air districts (see AQ-MM#1 to AQ-MM#3). The purchase of offsets is an established and acceptable method to mitigate project impacts. See CEQA Guidelines section 15126.4(c)(3). As applied here, these offsets meet all the requirements for feasible mitigation included in CEQA Guidelines Section 15126.4. It is anticipated that agreements will be in place with each applicable air district to ensure that offset credits or other mechanisms account for the project's construction emissions.

### 4490-8989

Refer to Standard Response PB-Response-AVQ-1: Impacts to Scenic Vistas and Scenic Drives, PB-Response-AVQ-2: Visual Effects on Big Tujunga Wash, PB-Response-AVQ-3: Effects on Visual Quality during Construction.

The commenter is concerned about the visual effects of the Project staging areas and portals on Scenic corridors and the Big Tujunga Wash area. These topics are discussed in PB-Response-AVQ-1, PB-Response-AVQ-2, and PB-Response-AVQ-3.

## Response to Submission 4490 (William R. Slocum, Kagel Canyon Civic Association, December 1, 2022) - Continued

### 4490-8990

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding, PB-Response-GEN-4: General Opinions, Opposition or Support, PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter expressed concerns related to the finalization of the project design that will occur after the project is approved since additional seismic investigation would be required post-approval. The commenter is also concerned with the cost of the HSR Palmdale to Burbank Project Section and the displacement of local businesses.

General opposition to the HSR Palmdale to Burbank Project Section is addressed in Standard Response PB-Response-GEN-4: General Opinions, Opposition or Support. While the commenter cites cost, unknown seismic information, and local displacement as the reasons for their opposition to the project, there would be many offsetting benefits within the communities within the HSR Palmdale to Burbank Project Section footprint. These include regional and statewide improvements in LOS and VMT metrics, improvements in regional air quality and health risks, reductions in vehicular, cycling and pedestrian accidents, economic revitalization, and the generation of 80,000 to 85,000 construction jobs and 5,400 permanent jobs. Regarding the cost and funding of the HSR Palmdale to Burbank Project Section, refer to Standard Response PB-Response-GEN-2: Project Costs and Funding. Please also refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations for the Authority's response to concerns about displacement of businesses, which discusses SOCIO-IAMF#2 (Compliance with Uniform Relocation Assistance and Real Property Acquisition Policies Act) that will provide relocation assistance to persons and the owners/occupants of said properties displaced by the Build Alternative in compliance with the Uniform Act. Regarding the current design level and future seismic investigations, CEQA and NEPA both allow for design of the project to be conducted concurrent with environmental review. For instance, CEQA Guidelines section 15004(b) states that "Choosing the precise time for CEQA compliance involves a balancing of competing factors. EIRs and negative declarations should be prepared as early as feasible in the planning process to enable environmental considerations to influence project program and design and yet late enough to provide meaningful information for environmental assessment." The level of design and information about the seismic conditions in the project area are sufficient for

### 4490-8990

understanding the impacts of the project (see CEQA Guidelines section 15124, CEQA Guidelines section 15125(a), 40 CFR section 1502.15). The EIR/EIS adequately evaluates seismicity-related impacts, as discussed in Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, and the information known about the project design and seismic conditions are sufficient.

Date:  
 Re: **Comments on Draft Environmental Impact Review for Palmdale to Burbank Segment**

The Nature Conservancy (TNC) is a science-based organization that works throughout the world to identify conservation solutions that protect both people and nature. In California, we have worked together with multiple agencies and partners to protect over 1.5 million acres of land and 3.8 million acres of sea floor. In the Santa Clara River valley, which is the focus of this environmental review document and our comments, TNC has worked with partners for over 20 years including the Wildlife Conservation Board, California State Coastal Conservancy, California Department of Fish and Wildlife and other State and Federal Agencies to protect over 4,000 acres and 21 river miles of vital habitat and we continue to focus on this location to protect multiple plant and animal species as well as their movement pathways, in perpetuity. High Speed Rail implementation in this location has the potential to impact wildlife connectivity and the headwaters of the Santa Clara River at Arrastre Canyon in Acton and, therefore, the valued biodiversity of this region, our shared water resources, as well as the public's access and enjoyment to this great resource.

TNC thanks the California High-Speed Rail Authority (CHSRA) for providing a platform for us to comment on the Draft Environmental Impact Review (DEIR), and thanks the authorities' engineers for meeting with TNC staff and stakeholders to discuss this segment's potential impacts to TNC's Arrastre Canyon property and the area's natural resources. We value this opportunity to provide feedback on key sections of the DEIR. Please find below an overview on the significance of the Santa Clara River headwaters importance to multiple species, as well as our comments on the Draft EIR and our recommendations and preferences for the Palmdale to Burbank section of the HSR.

**Overview of Santa Clara River and Headwaters Regional Significance related to Alternatives E1, E1A, E2 and E2A:**

The Santa Clara River has been identified as a critically important conservation landscape based on a multitude of factors. These include the region's high levels of biodiversity and habitat integrity, its intact connection between two major mountain systems, its potential to support rapid climate change adaptation, its status as the largest river system in southern California that remains in a relatively natural state, and its provision of drinking and irrigation water to hundreds of thousands of users in LA and Ventura Counties<sup>1,2,3</sup>. From the estuary to the upper watershed, the Santa Clara River provides a

## Submission 4492 (Kat Selm, The Nature Conservancy, December 1, 2022) - Continued

4492-9897 | diversity of habitats supporting 18 threatened or endangered species including riparian dependent bird species, terrestrial wildlife, anadromous fish and rare plants<sup>4</sup>.

4492-9898 | Impacts of Alternative E1, E1A, E2 and E2A on TNC’s Arrastre Canyon Property  
 Alternatives E1, E1A, E2 and E2A will result in permanent impacts to TNC’s Arrastre Canyon property through the construction and long-term operation of the Acton Window and associated paved access roads. These impacts are summarized below.

4492-9899 | Biological Resources:  
 TNC’s Arrastre Canyon property lies at the headwaters of the Santa Clara River. It supports good quality habitat for species listed under the federal Endangered Species Act (ESA), such as California red-legged frog (*Rana draytonii*), least Bell’s vireo (*Vireo bellii pusillus*), arroyo toad (*Anaxyrus californicus*). Additionally, an extant population of unarmored threespine stickleback (*Gasterosteus aculeatus williamsoni*) occurs less than 1,000 yards downstream. The following species are present on TNC’s Arrastre Canyon property, southwestern willow flycatcher (*Empidonax trailii extimus*; federally endangered), California androsace (*Androsace elongate* subsp. *Acuta*), and Lemmon’s syntrichopappus (*Syntrichopappus lemmonii*).

Additionally, Arrastre Canyon contains a large, intact, and healthy riparian forest with perennially flowing surface water and a shallow surface to groundwater connection. Freshwater streams are some of the most threatened in the world<sup>5</sup> and headwater streams contribute largely to the overall health of river system by regulating sediment export, retaining nutrients, processing organic matter, and can act as refugia for species during specific life-history stages<sup>6</sup>. Avoidance of this vital resource should be a priority.

4492-9900 | Parks and Recreation:  
 In the time since CHSRA adopted the alternatives in the Palmdale to Burbank section, TNC has been negotiating and has nearly finalized a land use agreement with the County of Los Angeles Department of Parks and Recreation (LADPR) for the maintenance and management of a public access trail through TNC property at Arrastre Canyon and connecting to the Angeles National Forest. Public access for equestrians and hikers through TNC Arrastre Canyon ownership will begin in early 2023 and will be managed by LADPR. The trail has local significance as it is included in the Los Angeles County Antelope Valley Area Plan, as shown in attachment A.

According to Section 4(f) of the United States Department of Transportation Act (23 United States Code [U.S.C.] 138 and 49 U.S.C. 303) Section 4(f) of the U.S. Department of Transportation Act, “It is the policy of the United States government that special effort should be made to preserve the natural beauty of the countryside and public park and recreation lands, wildlife and waterfowl refuges, and historic sites.” It further specifies that the Secretary may approve a transportation program or project requiring the use of publicly owned land of a public park, recreation area, or wildlife and waterfowl refuge of national, state, or local significance (as determined by the federal, state, or local officials having jurisdiction over the park, area, refuge, or site) only if (1) there is no prudent and feasible

4492-9900 | alternative to using that land and (2) the program or project includes all possible planning to minimize harm to the Section 4(f) property resulting from the use.

Although the land itself is not in the public trust, a public entity has interest in this property and the public’s access to it, additionally this property was purchased with public funding from the federal government (United States Fish and Wildlife Service (USFWS) Section 6 Program) and the State of California (Wildlife Conservation Board). The Section 6 funding has specific land use restrictions tied to that funding.

4492-9901 | Noise and Vibration:  
 The following is taken from section 3.4.5.5. “The Authority reviewed trails, parks, wildlife refuges, and other public recreation areas where wild animals and domestic animals such as horses are likely to be present within 50 feet of the alignment centerline. This review screened for public recreation areas and trails that permit equestrian activities and/or have equestrian facilities, such as riding stables. The following public recreation areas were identified within 50 feet of the alignment centerline where rapid onset of HSR noise...would have the potential to startle domestic animals (horses) or wildlife:

- Pacific Crest Trail (Refined SR14 Build Alternative only)
- Vasquez Rocks Natural Area Park (Refined SR14 and SR14A Build Alternatives only)
- Hansen Dam Recreation area (E2 and E2A Build Alternatives only)
- Stonehurst Park and Recreation Center (E2 and E2A Build Alternatives only)”

As described above in the Parks, Recreation, and Open Space section, TNC and LADPR will be managing public access for equestrians and hikers through TNC’s Arrastre Canyon property, and therefore it’s preclusion in the above list of public access locations in the *Noise Environment for Domestic Animals and Wildlife* section is an oversight. Although the authority had no way of knowing at the time of drafting this EIR, we are informing the authority now for the correction.

4492-9902 | Utilities:  
 Sheets UT-C4031- E2, UT-C4032-E2, and UT-C4543-E2 through UT-C4547-ET establish that CHSRA plans to install two 16-inch water mains along Arrastre Canyon Road in Acton to supply water for the tunnel boring machines (TBMs) operating at the window that will be constructed for Routes E1, E1A, E2 and E2A; however, according to local experts, these water lines do not connect to Antelope Valley-East Kern Water Agency (AVEK) (pers. comm.). Instead, they originate at the intersection of Crown Valley Road and Arrastre Canyon Road adjacent to the Santa Clara River 10 floodplain, which may suggest the use of groundwater for these purposes. Should this be the case, the draft fails to consider the adverse environmental impacts to local residential well yields, riparian habitat, and vernal pools that will result from extracting from the Santa Clara River. CHSRA is advised that many domestic well yields in Acton have been reduced because of persistent drought conditions, thus extracting even more groundwater from the river will further exacerbate these problems. This constitutes a significant environmental impact.

Submission 4492 (Kat Selm, The Nature Conservancy, December 1, 2022) - Continued

4492-9903

Page 3.6-77 presents conclusions regarding water supply impacts created by the Project, and it suggests that CHSRA appears to understand that AVEK does not reliably receive water allocations from the State Water Project and may not have water resources sufficient to serve CHSRA's construction needs (particularly during "dry years") because it states "the impact from construction water demand is conservatively assumed to result in a significant impact under CEQA" (page 3.6-77). However, the primary mitigation measure that is identified to address this impact is to simply secure additional water allocations for AVEK that will come from the State Water Project and will be paid for by CHSRA. This mitigation measure (referred to as PUE MM#1) is infeasible as State Water Project allocations are restricted by State Law and are based on extant environmental circumstances in the Sacramento Delta; thus, it is impossible for CHSRA to unilaterally obtain "allocations for additional water supply" from the State Water Project.

4492-9904

TNC would like to see a more realistic approach to utilities that addresses the correct connections to AVEK, and fully explores the feasibility of increased allocations from the State Water Project, and if groundwater is required for supplement, the full environmental impact of this use should be addressed. In addition, for the portion of the Palmdale to Burbank section that goes through TNC's ownership at Arrastre Canyon for Routes E1, E1A, E2 and E2A, TNC would like to impress upon CHSRA the importance of undergrounding any utility lines required, such as those shown in Utility Relocation Plan DRAWING NO. UT-C4031-E1, which shows new utilities required for the Arrastre Canyon section as overhead. This is a very high fire hazard severity zone according to Cal Fire<sup>6</sup> and any new utilities should be undergrounded to protect the area from wildfire risk.

4492-9905

Cultural Resources:

Cultural resources have been found in the Arrastre Canyon area by previous owners of the parcel, see figure 1 below. According to Figure 3.17-4 Cultural Resources within the Area of Potential Effects (APE) (Map 4 of 7), the project footprint on TNC property does include an archaeological APE. These resources should therefore be avoided and protected in place.

Figure 1. Photo from Kent Strumpell, previous owner of TNC's parcels at Arrastre Canyon.

4492-9906

Tunnel Construction and Long-Term Operation:

To avoid impacts to intact protected natural lands, TNC requests that all tunneling should be completed using the boring machine rather than digging from the surface as currently proposed under Alternatives E1, E1A, E2 and E2A on TNC's Arrastre Canyon property and adjacent US Forest Service lands (Acton Window). In addition to impacts associated with habitat loss from window construction and operation, the construction and operation of permanent paved access roads through the TNC property to the window facility are anticipated to bring long term un-mitigatable impacts, including runoff, erosion, small wildlife mortality, and disruption of planned recreational uses.

**Because of the importance of TNC's Arrastre Canyon property to the functioning of the Santa Clara River and its value as planned recreational open space, we strongly recommend that Alternatives E1, E1A, E2 and E2A be abandoned and that the authority move ahead with Alternative SR14A.**

4492-9907

**Comments for All Alternatives**

Mitigation

TNC is concerned that determinations on mitigation will be made after the DEIR is finalized. The timing of such actions removes an important component of both NEPA and CEQA, the requirement for public participation in the process. TNC believes that the mitigation determinations should be made with input and feedback from conservation organizations and local stakeholders with detailed knowledge of the challenges and opportunities present in the project area. As proposed in the DEIR, all of the specific mitigation requirements will be determined by regulatory agencies after the public-facing environmental review process has concluded. Similarly, all compensatory mitigation plans will be developed with a lack of transparency that potentially misses out on information that local organizations can provide and does not seem appropriate for such a large public project in an extremely sensitive area.

For example, the two rare plant species at TNC's Arrastre Canyon property California androsace (*Androsace elongate* subsp. *Acuta*), and Lemmon's syntrichopappus (*Syntrichopappus lemmonii*) are both annual species that rely on specific habitat conditions and large seed banks. According to experts at the California Botanic Garden, transplanting and seeding of annuals such as these two species is usually not successful. Their recommendation would be to collect and store seeds separately from each mother plant to produce more seed in the nursery from each (pers. comm.) BIO-MM#6 would benefit from local experts such as this in developing the restoration and revegetation plan for species with such specific niches, in distinct soil types, with short growing seasons, and that are dependent on large seed banks.

This type of expert guidance is critical in making appropriate mitigation decisions. TNC suggests that all mitigation requirements and plans should be subject to a public comment period and that all comments should be addressed. TNC suggests that independent committees of local experts in restoration, plant ecology, and native plant propagation with relevant experience should be created to review and approve all mitigation requirements (ratios, locations, and success criteria) and compensatory mitigation plans to ensure impacts are adequately offset to support the DEIR findings that impacts are less than significant.

## Submission 4492 (Kat Selm, The Nature Conservancy, December 1, 2022) - Continued

4492-9908

### Wildlife Connectivity Mitigation

TNC supports Santa Monica Mountains Conservancy's (SMMC) wildlife connectivity mitigation recommendations put forth in their comment letter to the authority dated October 17, 2022. Specifically, TNC agrees that the SR14A Build Alternative should incorporate wildlife connectivity mitigation to offset associated impacts of at grade segments of HSR in the Santa Clara River valley. HSR presents yet another barrier to connectivity in addition to the existing SR 14 and rail line between the San Gabriel and Sierra Pelona Mountain Ranges in the San Gabriel-Castaic Connection. HSR must not preclude wildlife crossing recommendations put forth in [A Linkage Design for the San Gabriel-Castaic Connection](#) prepared by SC Wildlands in 2004. Thus, TNC supports SMMC recommended mitigation to secure land and construct new wildlife undercrossings for both SR 14 and the closely associated Soledad Canyon Road between Spring and Bee Canyons. In addition, TNC recommends that the all at-grade and elevated portions of the HSR within the San Gabriel-Castaic Connection incorporate noise and light barriers to reduce impacts to wildlife and wildlife movement. TNC strongly recommend that the authority work closely with SMMC and Mountains Recreation and Conservation Authority to develop the recommended mitigation measures put forth in the SMMC comment letter to ensure that habitat connectivity is protected and restored in the San Gabriel-Castaic Connection.

4492-9909

### Conclusion

It is our hope that CHSRA will incorporate our recommendations for public input on mitigation, adopts the recommendations put forth by SMMC, and moves ahead with alternative SR14A, avoiding Arrastre Canyon and its sensitive natural and cultural resources and importance to nearby recreationists.

We thank you for giving us this opportunity to comment on the Draft EIR for the Palmdale to Burbank section of the High-Speed Rail.

Sincerely,

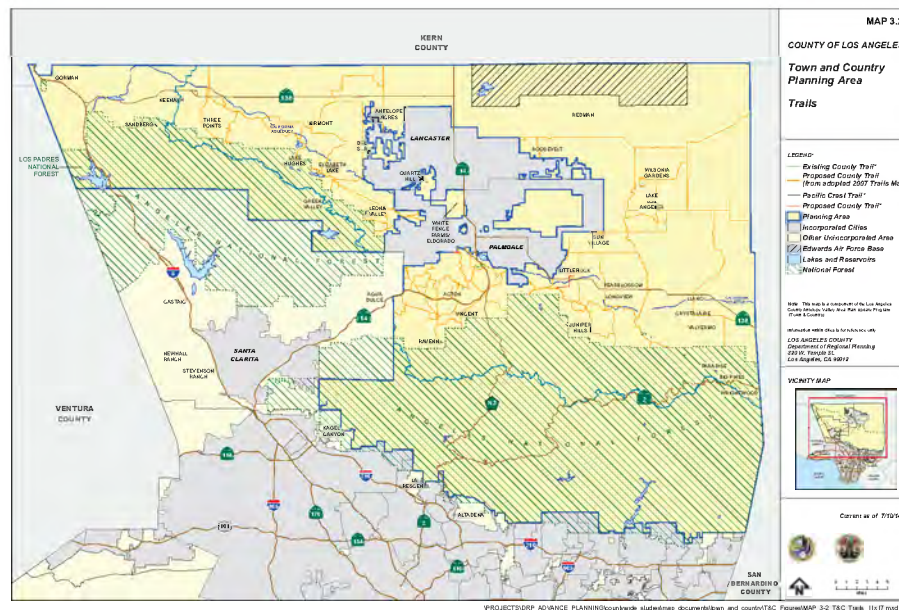

Kat Selm  
The Nature Conservancy  
Stewardship Associate  
Santa Clara River and Coast

Submission 4492 (Kat Selm, The Nature Conservancy, December 1, 2022) - Continued

## Response to Submission 4492 (Kat Selm, The Nature Conservancy, December 1, 2022)

### 4492-9896

The commenter, The Nature Conservancy, refers to a comment letter that provides an overview of the significance of the Santa Clara River headwaters' importance to multiple species, comments on the Draft EIR, and recommendations and preferences for the HSR project. Comment noted. Thank you for your comment.

### 4492-9897

Refer to Standard Response PB-Response-GEN-6: Impacts on the Santa Clara River.

The commenter notes the importance of the Santa Clara River as a conservation landscape and source of drinking and irrigation water for LA and Ventura. Please see PB-Response-GEN-6: Impacts on the Santa Clara River.

### 4492-9898

The commenter states that Alternatives E1, E1A, and E2A will result in permanent impacts to The Nature Conservancy's property within Arrastre Canyon, which they summarize in their following comments. Responses to these comments are provided below in Response to Comment #s 9899-9908. Please note that project-related construction and permanent facilities in Arrastre Canyon would be associated with the E1/E1A, E2/E2A Build Alternatives. The Authority's Preferred Alternative (SR14A Build Alternative) does not include any project construction or permanent facilities in Arrastre Canyon, and therefore, would avoid the impacts that are the concern of the commenter.

### 4492-9899

The commenter explains that their property in Arrastre Canyon contains habitat for several endangered species which is correct. And that this property contains healthy riparian forested areas and the importance of these habitats in supporting refugia for various species during specific life-history stages, which is also correct. Build Alternatives E1, E1A, E2, and E2A would include above-ground construction footprint in this area which would result in some impacts to the resources cited by the commenter. The Final EIR/EIS does include various IAMFs and MMs to reduce and off-set such impacts. However, the Authority's Preferred Alternative, SR14A, avoids the need for surface construction footprint in Arrastre Canyon altogether, thereby avoiding impacts to the specific habitat and resources cited by the commenter as present on their property in Arrastre Canyon.

## Response to Submission 4492 (Kat Selm, The Nature Conservancy, December 1, 2022) - Continued

### 4492-9900

The comment pertains to potential impacts to an area in Arrastre Canyon that is being considered for public access and recreation. The commenter is referencing the proposed extension of the Acton Community Trail, which is discussed as a Section 4(f) resource in the Draft and Final EIR/EIS. For the Section 4(f) analysis for the proposed Acton Community Trail extension, refer to pages 4-71 to 4-73 of the Draft EIR/EIS.

The Acton Community Trail and proposed trail extensions are outside the limits of the nearest permanent project improvements for the Refined SR14 and SR14A Build Alternatives, and the Refined SR14 and SR14A Build Alternatives would not result in use of this resource. The E1, E1A, E2, and E2A Build Alternatives would require temporary construction easements that would conflict with an approximately 0.25-mile segment of the proposed Acton Community Trail extension near Vincent View Road, and a 0.5-mile segment of the trail along Arrastre Canyon Road. If the proposed trail extension is operational at the time of project construction, access to the trail in these areas would be temporarily restricted. Ultimately, the construction of traction power facilities (electrical lines) would require the permanent acquisition of an approximately 150-foot segment of the proposed Acton Community Trail extension. However, once constructed, the trail will be able to pass underneath the electrical lines.

The project would also require construction of water conveyance facilities (pipeline) across the trail alignment near Carson Mesa Road. Where the trail alignment follows Aliso Canyon Road, Crown Valley Road, and Arrastre Canyon Road, the project would also construct water lines along this same route, which could temporarily affect trail use. However, these water lines would be placed underground, thereby not impairing the use of the trail once installed. As a result of installation of the water and electrical lines, no adverse effect would occur to the trail's protected activities, features, or attributes under the E1, E1A, E2, and E2A Build Alternatives.

Implementation of PR-MM#6 will return temporarily acquired land to the property owners after construction. In addition, implementation of PR-MM#7 and PR-MM#9 will require the Authority to consult with property owners and public agencies for the acquisition or easement of private and public lands. Compensation, replacement, or enhancement would be granted as deemed necessary. These mitigation measures would ensure that each resource acquired would be accessible during construction. As a result, the

### 4492-9900

Authority has preliminarily concluded that the permanent use of the trail and trail realignment would constitute a de minimis impact because the features and attributes that qualify the resource for protection under Section 4(f), including its purpose as a contiguous recreational hiking trail, would not be diminished under the E1, E1A, E2, and E2A Build Alternatives.

The existing trail intersects with and runs parallel to existing transportation corridors along its alignment, including Metrolink. Trail connectivity would be maintained with implementation of the E1, E1A, E2, and E2A Build Alternatives. Therefore, the Authority has preliminarily concluded that the E1, E1A, E2, and E2A Build Alternatives would result in a de minimis impact as defined by 49 U.S.C. 303(d). This preliminary determination is subject to concurrence by the official with jurisdiction for this resource (Los Angeles County Department of Parks and Recreation).

According to the Authority's knowledge based on the information available on the LA County Department of Parks and Recreation website, as of December 2023, the Acton Community Trail proposed extension has not been constructed. The commenter also states that the land was purchased using monies from the federal Section 6 program. It is assumed that the commenter is referring to the Section 6(f) Land and Water Conservation Fund (LWCF) Area's program. As discussed in Section 4.10, Section 6(f) Analysis of the Final EIR/EIS, a thorough investigation of the properties in the Palmdale to Burbank Project Section determined that there were no properties that were acquired using monies from the LWCF program to develop recreational resources within the Section 4(f) RSA and therefore, the land use restrictions specified in that program would not be applicable to the HSR project and no further analysis of potential conversion of Section 6(f) resources is needed.

## Response to Submission 4492 (Kat Selm, The Nature Conservancy, December 1, 2022) - Continued

### **4492-9901**

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The comment pertains to potential noise impacts to Arrastre Canyon. As discussed in Section 3.4, noise and vibration impact mitigation measures would be employed for sensitive receptors within 1,000 feet of the HSR alignment centerline. The Arrastre Canyon Trail is located well beyond 1,000 feet from any HSR alignment centerline; therefore, it would not be impacted by noise and vibration from HSR operation. Additionally, please refer to PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which addresses impacts to horses.

In addition, the Authority has identified the SR14A Build Alternative to be the preferred build alternative. The SR14A Build Alternative does not cross or pass near the Arrastre Canyon property. Therefore, under this alternative, there would be no noise and vibration related impacts to the Arrastre Canyon Trail.

### **4492-9902**

The commenter indicates that the 16-inch water mains shown on Draft EIR/EIS Volume 3 Drawings UT-C4031-E2, UT-C4032-E2 and UT-C4543-E2 thru UT-C4547-E2 do not connect to AVEK. The commenter also expresses concern that given the location of these mains, groundwater could potentially be used as a water source during construction, and that use of groundwater wells is not evaluated for this location.

Plans are based on information provided by the utility providers. PUE-MM#1 (described in Section 3.6.7 of the Draft EIR/EIS) will require the Authority to prepare an updated water supply analysis for the selected Build Alternative that details and describes the minimum adequate water supply based on a more detailed project design. Based on the results of the water supply analysis, the Authority will coordinate with the water agencies to determine if allocations for additional water supply are needed and would pay the water agencies its fair share of the State Water Project fees. Additionally, PUE-MM#1 will require the Authority to utilize non-potable water from regional water utility service providers for construction activities where feasible, as well as recycling/reusing water used for tunnel construction, further minimizing demand for water supplies. As stated in Standard Response PB-Response-PUE-3: Water Demand and Usage, the sources of water for the Project could be a combination of potentially numerous potable and recycled water suppliers. As such, the Authority would not directly use groundwater. No water will be extracted from the Santa Clara River. Water used during construction activities would be obtained from existing permitted commercial sources in the cities of Palmdale, Santa Clarita, Burbank and Los Angeles, as well as in unincorporated Los Angeles County.

### **4492-9903**

The commenter expresses concern for the feasibility of Mitigation Measure PUE-MM#1 in Section 3.6 of the Draft EIR/EIS. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides additional information about water supplies for the project, including the Authority's consideration of additional water sources beyond AVEK and why implementation of Mitigation Measure PUE-MM#1 is feasible.

## Response to Submission 4492 (Kat Selm, The Nature Conservancy, December 1, 2022) - Continued

### 4492-9904

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter identifies that they would like to see the Authority address connections to AVEK, to fully explore the possibility of increased allocations from the State Water Project, and to evaluate the full environmental impacts if groundwater would be required; requests that any utility lines that cross land under TBC ownership in Arrastre Canyon for the E1, E1A, E2, and E2A Build Alternatives be installed underground; and identifies concerns about wildfire due to overhead utility lines.

Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, for concerns related to water supply, including supplemental water for groundwater-related impacts. Standard Response PB-Response-PUE-3: Water Demand and Usage describes that the Project would not directly use groundwater and that any indirect use of groundwater (from AVEK, which includes groundwater as one of its sources) would not affect sustainable groundwater management or the ability of residents who receive water from AVEK to receive water that includes groundwater.

As a matter of clarification, the Authority's Preferred Alternative remains the SR14A Build Alternative, which would avoid the Arrastre Canyon area. The Authority will work with property owners, as needed, to determine on a case-by-case basis when undergrounding of utility lines is warranted.

Regarding concerns related to wildfire from overhead utilities, Section 3.11 Safety and Security in the Draft EIR/EIS discusses potential impacts related to wildfire, including in Section 3.11.5.3 and Impact S&S#19, which identifies that SS-IAMF#1 and SS-IAMF#2 would require the implementation of fire and life-safety programs during design, operations, and maintenance of the Palmdale to Burbank Project Section to reduce the risk of wildfire from the Build Alternatives.

### 4492-9905

The commenter states that cultural resources have been found in the Arrastre Canyon Area and requests that these resources be avoided and protected in place. As described in Impact CUL#2, in Section 3.17, Cultural Resources of the Draft EIR/EIS, ground disturbance associated with construction of the HSR Build Alternatives may result in impacts on unknown or previously undiscovered archaeological resources located within the Area of Potential Effect (APE). Implementation of CUL-IAMF#3 (refer to Section 3.17.5.3, in Section 3.17, Cultural Resources) would reduce impacts by ensuring the completion of pre-construction cultural resource surveys in previously inaccessible portions of the archaeological APE. As discussed in Section 3.17.7, CUL-MM#1 and CUL-MM#3 would further reduce impacts on previously undiscovered archaeological resources from ground-disturbing activities during construction by consulting with MOA signatories, concurring parties, and tribal consulting parties to determine the preferred treatment and appropriate mitigation measures and by developing meaningful mitigation measures for effects on as-of-yet-unidentified Native American archaeological resources that cannot be avoided. In addition, the Authority will implement CUL-MM#2, which will halt construction activities and require compliance with 48 Fed. Reg. 44716-42 and 14 Cal. Code Regs. Chapter 3, Article 9, Sections 15120–15132, should there be an unanticipated archaeological discovery. These treatment plans describe detailed requirements for the treatment of resources affected by the project, site monitoring during construction, handling of unanticipated discoveries, data recovery, and curation of artifacts, among other things. In accordance with the PA, the mitigation of impacts to historic properties (and the development of Memoranda of Agreement) and historical resources is being developed with input from consulting parties, which include local city and county jurisdictions, as well as local Native American representatives. Combined, these mitigation measures would mitigate for impacts to both known and unknown archaeological resources.

## Response to Submission 4492 (Kat Selm, The Nature Conservancy, December 1, 2022) - Continued

### 4492-9906

The commenter explains that their property in Arrastre Canyon contains habitat for several endangered species which is correct. And that this property contains healthy riparian forested areas and the importance of these habitats in supporting refugia for various species during specific life-history stages, which is also correct. Build Alternatives E1, E1A, E2, and E2A would include above-ground construction footprint in this area which would result in some impacts to the resources cited by the commenter. The EIR/EIS does include various IAMFs and MMs to reduce and off-set such impacts. However, the Authority's Preferred Alternative, SR14A, avoids the need for surface construction footprint in Arrastre Canyon altogether, thereby avoiding impacts to the specific habitat and resources cited by the commenter as present on their property in Arrastre Canyon.

### 4492-9907

The commenter expresses concern that determinations of mitigation will be made after the Draft EIR/EIS is finalized; that mitigation, including compensatory mitigation, will be developed without input from local organization; requests that mitigation requirements be subject to a public comment period; and that a committee of local experts be formed to review and approve mitigation requirements.

While implementation decisions regarding bank credit purchases and particular parcels to acquire will be made at a later date after design advances, in consultation with resource agencies, the mitigation measures in the Draft EIR/EIS have been prepared appropriately to comply with CEQA and NEPA requirements by specifying details such as mitigation ratios and geographic area. Regarding concern about public input on mitigation, the Authority understands and appreciates the specific needs and expertise of stakeholders and values public participation. Mitigation measures were made available for public review and comment during release of the Draft EIR/EIS, at which time the Authority received comments on mitigation from the public and responded to each one. In some cases, where appropriate, the Authority revised mitigation measures based on public input. Several of the mitigation measures include components for interagency coordination. Per BIO-MM#47 (Prepare and Implement a CMP for Impacts on Aquatic Resources) and BIO-MM#53 (Prepare and Implement a CMP for Species and Species Habitat), all compensatory mitigation provided under ESA, CESA, CWA, 1600, and Porter-Cologne is subject to approval by the regulatory agency or agencies. Because of this outreach and coordination, the Authority sees no further benefits to creating a committee of local experts. Please refer to Standard Response P-B-Response-BIO-2:Construction and Operations Impacts to Special-Status Plants and Wildlife, which provides additional information about effectiveness of compensatory mitigation.

## Response to Submission 4492 (Kat Selm, The Nature Conservancy, December 1, 2022) - Continued

### **4492-9908**

Refer to Standard Response PB-Response-BIO-3: Wildlife Movement Corridors.

The commenter expresses concerns related to wildlife connectivity and crossing opportunities. The WCA identified crossing opportunities that align with the South Coast Missing Linkage Project San Gabriel-Castaic Linkage Design. Alternatives SR14 and SR14A would cross over Soledad Canyon on viaduct, allowing wildlife to cross under the project alignment. BIO-MM#99 mitigates for light during construction and BIO-MM#100 mitigates for light during operations.

### **4492-9909**

The commenter expresses support for the SR14A Build Alternative and requests that the Authority adopt the recommended mitigation measures put forth by SMMC, which are listed in Comment #9907. Response to Comment #9907 explains why the mitigation outlined in the Draft EIR/EIS is adequate. SMMC recommends that the SR14A Build Alternative incorporate wildlife connectivity mitigation to offset the associated impacts of at grade segments. Additionally, SMMC recommends mitigation measures for the SR14A Build Alternative that include securing land and constructing new wildlife crossings and recommends that all at-grade and elevated portions of the HSR within the San Gabriel-Castaic Connection incorporate noise and light barriers to reduce impacts to wildlife and wildlife movement. Please see response to Comment #9907, which explains why the Authority's analysis concludes that the SR14A Build Alternative's effects on wildlife movement would be less than significant and additional mitigation is not necessary. In addition, please see standard response PB-Response-Bio-3: Wildlife Movement Corridors, which provides further detail regarding project effects on wildlife movement corridors and the South Coast Missing Linkages San Gabriel-Castaic Linkage Design. The Authority will continue to engage with stakeholders and resource agencies in the implementation of mitigation measures. The commenter's support of the preferred Alternative is acknowledged.

Re: Palmdale to Burbank Project Section Draft EIR/EIS Comment

Dear California High-Speed Rail Board of Directors:

4494-9174

This letter serves as Save Angeles Forest for Everyone's official comment letter for the Draft Environmental Impact Report (DEIR) with respect to the above-referenced project section. Our Coalition includes volunteers from the communities of Kagel Canyon, Sunland-Tujunga, Shadow Hills, Lakeview Terrace, La Tuna Canyon, and Sun Valley, all in the Foothills of the San Gabriel Mountains, and all significantly impacted by each/all of CHSRA's proposed build alternatives.

This comment letter is organized by Chapter or Chapters (some with accompanying Appendices), and then stand-alone Appendices. Questions are incorporated throughout the document for CHSRA's review and response. In some sections, the focus was directed to the Preferred Alternative (SR14A) and in others, no specific route alternative was identified, and the analysis was intended to address all six build alternatives.

**EXECUTIVE SUMMARY**

4494-9175

The California Environmental Quality Act (CEQA) generally requires state and local government agencies to inform decision makers and the public about the potential environmental impacts of proposed projects, and to reduce those environmental impacts to the extent feasible.

The CEQA Guidelines define three types of effects (or impacts):

1. Direct or primary effects that are caused by a project and occur at the same time and place.
2. Indirect or secondary effects that are reasonably foreseeable and caused by a project, but occur at a different time or place.
3. Cumulative effects, which refer to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.

State CEQA Guidelines require that the cumulative impacts of a project be addressed in an EIR when the cumulative impacts are expected to be significant and when the project's incremental effect is cumulatively considerable. Such impacts can result from individually minor but collectively significant actions taking place over time. (State CEQA Guidelines Section 15130[a]).

Section 15355 of the CEQA Guidelines states:

"Cumulative impacts" refers to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.  
 (a) *The individual effects may be changes resulting from a single project* or a number of separate projects.

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 2 of 156

4494-9175

(b) The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.

In Chapter 3.19, CHSRA sets forth a cumulative impact analysis. However, CHSRA only considers the cumulative impacts as created by and/or in connection with **other** projects in the resource study area; CHSRA fails to take into account or analyze the cumulative impacts of its own project.

Considering that this is the largest infrastructure project in the history of the State of California (and one of the largest in the history of the United States), spanning 800 miles (and comprising over 10 years of construction for this project section alone), CEQA requires that CHSRA consider and study **the cumulative impacts of its own project**.

In its DEIR, CHSRA sets forth nearly 7,000 pages of significant and unavoidable impacts to or with respect to the following categories of study, many of which cannot be mitigated:

- Transportation
- Air Quality and Global Climate Change
- Noise and Vibration
- Electromagnetic Interference and Electromagnetic Fields
- Public Utilities and Energy
- Biological and Aquatic Resources
- Hydrology and Water Resources
- Geology, Soils, Seismicity, and Paleontological Resources
- Hazardous Materials
- Safety and Security
- Socioeconomics, Communities, and Environmental Justice
- Agricultural Farmland and Forest Land
- Parks, Recreation, and Open Space
- Aesthetics and Visual Quality
- Cultural Resources
- Regional Growth
- Project Cost and Operations

Were CHSRA to have studied and accurately reported the cumulative impacts of its own proposed high-speed rail project as required under CEQA, it would be clear that these impacts to the Palmdale to Burbank project section, when considered on a cumulative basis, far outweigh any potential "benefits" which may be realized by the completion of the high-speed rail system.

In light of the foregoing, it is clear that the only choice is the No Project Alternative.

**LIMITATIONS OF THIS COMMENT LETTER**

4494-9176

Due to the fact that the California High-Speed Rail Authority's ("CHSRA" or "HSR" or "the Authority") DEIR is comprised of nearly 7,000 pages (excluding additional ancillary documents, one of which was over 2,000 pages, which were referenced but not included as part of the official DEIR), and due to the fact that our coalition is comprised solely of community volunteers, we did not have adequate resources to perform an in-depth review of all sections, let alone to subsequently prepare comments and questions on each and every section within the 90-day review period. As such, there are significant portions of the DEIR which we simply did

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 3 of 156

4494-9176

not have the time to read: CHSRA should not interpret a lack of commentary on any particular section or issue of the DEIR to mean that there were no questions or concerns on that section or issue.

Our task was further hindered by the fact that the DEIR frequently referenced documents that were not available on the website and required a Public Records Request to obtain. While we did utilize CHSRA's portal to request documents, there were delays in getting some of the requests fulfilled. One such request was delayed not once, but twice, with the new date range for fulfillment extending beyond the December 1 comment period deadline.

Additionally, much of the data in the DEIR was stale, i.e., pulled from prior to 2016. We are nearly in 2023, so this data already is 8 years old and, as such, we contend that it is unreliable. Many of the financial data sets were difficult to compare because some were presented in the current year, and others were in the year of expenditure which includes inflation and escalations.

Similar to the DEIR, there is overlap and redundancy among the various sections in this document.

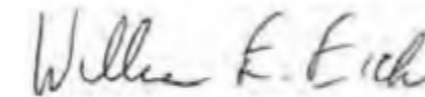

Sincerely,  
On Behalf of the S.A.F.E. Coalition,

Cindy Bloom (818-445-5602)

Kelly Decker (818-761-7713)

William E. Eick, Esq. (818-497-7874)

## CHAPTER 3 CHAPTER 3.2: TRANSPORTATION

4494-9177

### Spoils Hauling Conditions

The spoils (rock and dirt) generated from miles of tunneling and other excavation areas will be loaded onto trucks and transported to numerous landfills in the region. Four disposal sites will be able to receive spoils via conveyer belt, therefore, not necessitating truck use.

The truck haul routes are shown in the map below:

Depending on the spoils origination, hauling will occur either 8 hours per day 5 days per week or 16 hours per day 7 days per week (tunnel portals). This nearly incessant two-way parade of trucks will further increase the traffic and wear and tear on the two most traveled (and congested) freeways in the area: the I-5 and the I-210.

4494-9177

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 7 of 156

Appendix 2.1-1 Spoils Disposal Assumptions contains charts for each alternative that shows: Spoils location, bulk cubic yards/day, years, number of outbound trips per hour, and potential off-hauling scenario. What it does NOT include is the total number of truck trips for the duration of the project or, perhaps even more importantly, the total amount of contaminated or hazardous material that will require special handling. Knowing the total is essential to fully understand the devastating impact this activity will have in our area in terms of air quality, noise, vibration, dust, freeway onramp queues, and traffic congestion.

**Question:** Why did CHSRA fail to enumerate the truck trips, the amount of contaminated soil, and all of the columns that contain numerical values in Appendix 2.1-1?

The following formula was used to determine the totals for the preferred alternative SR14A:

No. of outbound trips per hour x no. of hours (either 8 or 16) per day x no. of days per week (either 5 or 7) x 50 weeks per year (assumes 2 weeks' holidays annually) x no. of years. (During a CHSRA working group meeting held in September, CHSRA confirmed this is the correct formula to determine the total no. of truck trips.)

**The total is astounding: 2.4 MILLION one-way truck trips  
or 4.9 MILLION round-trip truck trips!  
10.9 million bulk cubic yards of contaminated soil!**

CHSRA assumes that each one-way trip is 20<sup>1</sup> miles, making the total number of round-trip miles: **97 MILLION miles!**<sup>2</sup> This is the equivalent of over 400 trips to the moon or wrapping around the equator 3,900 times—all while emitting greenhouse gas diesel trucks.

**Question:** Why does CHSRA believe that 4.9 million round-trip truck trips are acceptable?

The following chart summarizes what CHSRA did not—i.e., the total aggregate amount of spoils removal, truck trips, and the amount of contaminated soil what will have to go to a treatment plant.

NO. OF TRUCK HAULING TRIPS (REMOVING SPOILS FROM LOCATION TO DISPOSAL SITE)			
	Per Week	Per Year	Project Duration Total
Round-Trips	42,480	2.1 million	4.8 million
Round-Trip Miles	.8 million	42.5 million	97 million
Duration of removing spoils from location	4 months to 6.4 years		
Duration of truck trips per hour	16.4 average, maximum 49		
Total amount of bulk cubic yards of hazardous/ contaminated material	10.9 million		

At portal P9, the stated estimated truck trips per hour is 49—that means one outgoing truck every 1.2 minutes! The average of 16.4 trucks per hour is still daunting at one outgoing truck every 3.7 minutes. Then there is the issue of empty returning trucks.

**Question:** What specific mitigation strategies will be implemented to limit truck traffic during peak times?

<sup>1</sup> Per Scott Steinwert of CHSRA, they used 25 miles 1-way to a disposal site. At 10-12-22 in person mtg, another engineer said probably too high so 20 miles 1-way was used

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 8 of 156

4494-9177

Then there is the issue of workers' vehicles travelling and parking at the work sites, and the transportation and parking/storage of construction vehicles and equipment.

**Question:** What is considered a "peak time?"

**Question:** How will workers get to/from the work sites and where will they park?

**Lack of Accountability for "Mitigation" Measures.** While CHSRA plans to mitigate the problems that spoils hauling will create, in most instances, it places the burden on the contractor(s):

- TR-IAMF#1: Protection of Public Roadways During Construction—will require **the contractor** to provide a photographic survey documenting the condition of the public roadways along truck routes. **The contractor** will be responsible for the repair of structural damage to public roadways caused by HSR construction or construction access.
- TR-IAMF#2: Construction Transportation Plan—will require **the contractor** to prepare a detailed CTP to minimize construction and construction traffic impacts on nearby roadways. The CTP will address, in detail, the activities to be executed in each construction phase to maintain traffic flow during peak travel periods.
- TR-IAMF#7: Construction Truck Routes—will require **the contractor** to deliver construction-related equipment and materials on appropriate truck routes, avoiding impacts on streets not designed to accommodate truck traffic.
- TR-IAMF#8: Construction during Special Events—will require **the contractor** to provide a mechanism to prevent roadway construction activities from reducing roadway capacity during major athletic events or other special events that substantially (10 percent or more) increase traffic on roadways affected by project construction as part of the CTP outlined in TR-IAMF#2.

**Question:** Who is ultimately responsible (i.e., the contractor or CHSRA) for imminent failures pertaining to the above four IAMFs?

4494-9178 **Construction impacts**

Refined SR14 and SR14A Build Alternative spoils hauling would degrade Level of Service (LOS) to unacceptable levels at the roadway segments for up to 6.4 years. Per CEQA:

*"Level of service (LOS) is a quality measure describing operational conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, and comfort and convenience. Safety is not included in the measures that establish service levels."<sup>3</sup>*

In the following chart, there are 11 scenarios of roadway segments for Refined SR14A. Of those 11, **9 fail!**

Source: Caltrans (2017)  
 \*Maximum type indicating that the intersection will operate at an unacceptable LOS (E, F, or worse) when the change in VC values exceeds by 0.5 or more.  
<sup>2</sup>Volume is measured using peak hour average daily traffic and includes the total volume of roadway during peak hours.  
 1 = Interstate Highway  
 LOS = level of service  
 D = degraded  
 E\* = degraded to acceptable rate  
 WB = westbound

The same story repeats itself for impacts at street intersections and freeway ramp delays. The spoils hauling would degrade level of service to unacceptable levels for 100% of the 37 intersections for up to 6.4 years. For freeway onramps and offramps, 100% of the ramps (4) fail. Regarding ramps, CHSRA says there is adequate "storage." That means the ramps are large/long enough for the queue of vehicles, including hauling trucks.

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank

Page 10 of 156

4494-9178

CHSRA states that they will be using 18-cubic yard dump trucks.<sup>4</sup> Standard 18-yard dump trucks are about 22 feet long. The average car is 14.7 feet, so each dump truck equals about 1.5 cars.

4494-9179

### Mitigation Strategies

There is nothing new or innovative with CHSRA's mitigation plans. Even with the best mitigation efforts, all road or rail construction in populated areas cause bottlenecks, congestion, backed-up traffic, drivers making erratic and dangerous maneuvers to avoid congested areas, irate tempers, and more greenhouse gas emissions from idling vehicles sitting in gridlock.

Their "solutions"? Simply implement a transportation Construction (or Congestion) Management Plan during the construction duration (construction will last up to 6.4 years in some areas):

Mitigation Effort	Comment/Questions
Schedule a majority of construction-related travel during off-peak hours	Won't this cause light pollution due to high wattage lamps? Won't this stress the power grid during high-usage times? CalTrans does this and it results in high traffic and bottlenecks during times when drivers do not expect traffic.
Relocate spoils collection areas and access to minimize delays during peak hours	Where? Where are these "collection areas" for spoils?
Develop detour routes to facilitate traffic movements through construction zones without substantially increasing cut-through traffic in adjacent residential neighborhoods	How can this be accomplished? Won't this increase air pollution because drivers' routes will be longer than usual?
Temporarily restripe roadways to maximize vehicular capacity at locations affected by construction closures, where feasible	Won't this cause squeezed lanes, increasing the likelihood of collisions?
Temporarily remove on-street parking to maximize vehicular capacity, transit capacity, and bicycle circulation at locations affected by construction closures, where feasible	Where will these people who normally park on the street park?
Station traffic control officers at major intersections to minimize delays during peak hours, where feasible	Accomplishes nothing.
Develop alternative routes to reduce number of trucks on sensitive facilities without substantially increasing cut-through traffic in adjacent residential neighborhoods	How is this different from the "develop detour" routes above? Won't this increase air pollution because drivers' routes will be longer than usual?
Develop and implement an outreach program to inform the general public about the construction process and planned roadway closures	Won't this increase traffic on side streets in residential neighborhoods?
Develop and implement a program with business owners to minimize impacts on businesses during construction activity	How will they accomplish this? What program?
Modify Signal Timing—Electronically modifying signal timing at existing signals and would involve little to no physical disturbance that could cause impacts	Most cities, including Los Angeles, already have their signals timed and are working at optimal capacity. How can it be further improved?

<sup>4</sup> Transportation Technical Report 2019, p. 2-42.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 11 of 156

4494-9179

Modify Signal Phasing—Electronically modifying signal phasing at existing signals and would involve little to no physical disturbance that could cause impacts	Most cities, including Los Angeles, already have their signals timed and are working at optimal capacity. How can it be further improved?
Provide a Traffic Signal—Installing new signals to existing intersections generally could occur within existing pavement or disturbed graded right-of-way and will involve minor physical disturbance that could cause secondary environmental impacts.	Doesn't more signals mean more congestion and more starts and stops resulting in increased air pollution due to gasoline or diesel vehicles (including hauling trucks) idling while waiting for the signal to turn? To install a single traffic signal in Los Angeles costs \$250,000.
Widen Intersection—Widening intersection approaches by adding a through lane to improve LOS and intersection operations	This is completely infeasible.
Reconfigure Intersection—Reconfiguring intersection geometry to improve LOS and intersection operations	By doing what? Turning it into an equilateral triangle?

The above mitigation recommendations generally are not feasible and likely will not work. There is simply no solution to the chaos that will ensue from hauling spoils (particularly contaminated debris) as it requires hauling from the portals on roadways, getting onto the freeway via an onramp, taking up space of 1.5 cars on the onramp, utilizing the already congested 5 and 210 freeways, getting off the freeway, using roadways again, and dumping at the disposal site. Then the journey is reversed with an empty truck.

4494-9180

### Angeles National Forest/San Gabriel National Monument

Once again, CHSRA puts the burden of major impacts upon the contractor. The DEIR states:

*"Construction activities within the ANF could also lead to temporary disruption of transportation system operations and possible damage to elements of the roadway system such as pavement and bridges, thereby interfering with USFS's abilities to maintain National Forest System roads and infrastructure. The contractor will be responsible for the repair of structural damage to public roadways caused by HSR construction or construction access.*

*Trips for construction workers working within the ANF would generally occur outside of the peak hours for freeway and street traffic. The movement of heavy construction equipment such as cranes, bulldozers, and dump trucks to and from the site generally would occur during off-peak hours on designated truck routes. The Contractor will be responsible for identifying adequate off-street parking for construction-related vehicles and if necessary, designating remote parking areas for these workers, with shuttles to bring them to and from the construction area if the remote parking areas are distant from the project site.*

*The construction of the HSR track alignment would require temporary construction easements, which could require the temporary closure of parking areas, roadway travel lanes, transit routes, pedestrian facilities, bicycle lanes, and paths. The contractor will prepare and implement specific CMPs to ensure safe transit, pedestrian, and bicycle access during the construction period. Upon completion of construction, parking areas, roadway lanes, pedestrian facilities, and bicycle lanes will be restored to a condition equivalent to or better than their pre-project condition." (Emphasis added)*

The roads within the Angeles National Forest and the San Gabriel National Monument are simply not built to handle the weight of heavy construction equipment, years of heavy truckloads of spoils hauling, and overall wear and tear this project will create. They were constructed to accommodate occasional maintenance vehicles.

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 12 of 156

4494-9180 CHSRA concentrates on avoiding disruption during "peak" times. The problem with this effort is that they will move activities during "non peak" times, thus turning those "non peak" into times of noise and vibration, increased traffic, and disruption of roadways.

### CHAPTER 3.3: AIR QUALITY AND GLOBAL CLIMATE CHANGE

4494-9181 On Page 3.3-9 of the DEIR, CHSRA explains Assembly Bill 32, "The Global Warming Solutions Act of 2006." Among AB 32's specific requirements are the following:

- Prepare a scoping plan for achieving the maximum technologically feasible and cost-effective reductions in GHG emissions from sources or categories of sources of GHGs by 2020 (Health and Safety Code Section 38561). The scoping plan, approved by CARB in 2008 and updated in 2014 and 2017, provides the outline for future actions to reduce GHG emissions in California via regulations, market mechanisms, and other measures. The 2008 scoping plan included the implementation of HSR as a GHG reduction measure for the transportation sector.

California Climate Investments reports annually on Cap-and-Trade auction proceeds and investments. Below is a chart delineating the FY 2020-21 & Cumulative Appropriations of Cap-and-Trade Funds by Administering Agency.<sup>5</sup> Considered on both an annual and cumulative basis, CHSRA is by far the recipient of the most money from the Cap-and-Trade funds.

34 Due to our error, this value does not reflect an additional \$0.3M in benefits to priority populations. Including these additional benefits, 15% of project dollars are benefiting priority populations.  
35 Estimated GHG emission reduction from the California High-Speed Rail Project is 102 million MTCO<sub>2</sub>e over its first 50 years of operating life, as detailed in the Revised Draft 2020 Business Plan available at <https://www.chsra.gov/about/press-releases/2020/01/2020-business-plan/>.  
36 GGRF funds provide an essential part of the total funds for the system, though it is difficult to estimate precisely what the ultimate GGRF investment will be, and consequently, a comparable "GGRF investment per ton of GHG reduced" metric.

In reviewing this data, there are some noteworthy conclusions. First, 70% of the recipients of cap-and-trade funds have already reported a demonstrable reduction in greenhouse gas emissions; CHSRA has not -- and will not for years to come (if it ever does).

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 17 of 156

4494-9181

Second, we can compare projects in terms of their efficacy. Evaluating simply the GHG reductions achieved to date, some standouts include the Clean Vehicle Rebate Program, which has already achieved over 6 million metric tons of GHG reductions; the Dairy Digester Research and Development Program, which has already achieved over 19 million metric tons of GHG reductions; the Forest Health Program, which has already achieved over 11 million metric tons of GHG reductions; the Sustainable Agricultural Lands Conservation Program, which has already achieved over 5 million metric tons of GHG reductions; and the Low Carbon Transit Operations Program, which has already achieved over 6 million metric tons of GHG reductions. By comparison, despite being the largest recipient of cap-and-trade funds, CHSRA has achieved 0 tons of GHG reductions as it has only been a net polluter during the construction phase.

Another way that we can compare the efficacy of projects is to consider the cost per metric ton of GHG reduced. California Climate Investments reported that, "Overall, California Climate Investments are reducing greenhouse gas emissions at an average rate of \$125 per MTCO<sub>2</sub>e, not including greenhouse gas emission reductions attributable to the High-Speed Rail Project."<sup>7</sup>

The projects that stand out here in terms of being the best value or best investment of funds when compared against GHG reductions are: the Dairy Digester Research and Development Program, at a cost of just \$9 per MTCO<sub>2</sub>e reduction; the Forest Health Program, at a cost of \$29 per MTCO<sub>2</sub>e reduction; and the Sustainable Agricultural Lands Conservation Program, at a cost of just \$9 per MTCO<sub>2</sub>e reduction. Even other transit projects present a respectable rate of return on investment: the Low Carbon Transit Operations Program has a cost of \$90 per MTCO<sub>2</sub>e reduction (reporting a better-than-average rate of return when considered across all programs); and the even the Clean Vehicle Rebate Program costs \$131 per MTCO<sub>2</sub>e reduction (at a cost slightly higher than the average rate of return, though very popular with over 300,000 people participating in the program).

Footnote 35 on this table states that: "The estimated GHG reduction from the California High-Speed Rail Project is 102 million MTCO<sub>2</sub>e over its first 50 years of operating life, as detailed in the Revised Draft 2020 Business Plan." Note that on page 3.3-12 of the DEIR, Figure 3.3-1 depicts the Aggregate GHG Emissions Reductions that Would Result from the California High-Speed Rail System. CHSRA's data in this chart states that the "Anticipated GHG Benefits Over 50-Year Timeframe" total 75.9 MMTCO<sub>2</sub>e. This is 26 million less than quoted in the chart presented by California Climate Investments.

**Question:** Why is there such a large discrepancy in the data reported in the 2020 Business Plan and the data reported in the DEIR with respect to GHG reductions?

**Question:** In Summary of Investments and Outcomes reported by California Climate Investments, there is no data included for CHSRA with respect to both GHG reductions and Cost per GHG. In the interest of full disclosure and transparency, shouldn't the chart reflect negative data (meaning, a total net expenditure, not reduction of GHG) at least during the construction phase of the CHSRA project? Why is data not included to show the extent to which CHSRA is a contributor to GHG during the construction phase of the project?

Even if we were to believe CHSRA's claims that it will reduce GHG by somewhere between 75.9 and 102 MMTCO<sub>2</sub>e over its first 50 years of operating life, the cost of construction is currently estimated to be \$105 billion. Using CHSRA's 75.9 MMTCO<sub>2</sub>e estimate, **this puts its cost per MTCO<sub>2</sub>e reduction at \$1,383.** Comparing this cost to the more cost-effective projects, this means that -- on an investment to return basis -- the Dairy Digester Research and Development Program is 153 times more effective than CHSRA; the Sustainable Agricultural Lands Conservation Program is 153 times more effective than CHSRA; and the Forest Health Program is 48 times more effective than CHSRA. Comparing CHSRA to other transit projects, the Low Carbon Transit Operations Program is 15 times more effective than CHSRA; and the even the Clean Vehicle Rebate Program is more than 10 times more effective than CHSRA. Compared to the California Climate Investment's reported average rate of \$125 per MTCO<sub>2</sub>e, the average award recipient is 11 times more effective than CHSRA.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 19 of 156

4494-9183

Returning for a moment to the language of AB 32, the specific requirements of the The Global Warming Solutions Act of 2006's included the following: **Prepare a scoping plan for achieving the maximum technologically feasible and cost-effective reductions in GHG emissions from sources or categories of sources of GHGs by 2020.**

**Question:** CHSRA has achieved no GHG reductions by 2020 and will not for the foreseeable future. How does it meet the requirements of AB 32?

4494-9184

**Question:** When considering CHSRA in comparison to other recipients of cap-and-trade funds, even using CHSRA's own high estimates for eventual GHG reductions (i.e., over the next 50 years), CHSRA's cost per MTCO<sub>2e</sub> is significantly higher than the more successful program recipients which have already demonstrated GHG reductions. Given that CHSRA has not demonstrated and will not demonstrate **cost-effective reductions in GHG emissions** (by 2020, let alone ever), and AB 32 sets forth the expectation to achieve the maximum cost-effective reductions in GHG emissions, how does CHSRA meet the requirements of AB 32?

In its *Due Diligence Report*, the Reason Foundation highlights several problems with the HSR's claims that it will reduce GHG emissions. The first of those is that the United Nations Intergovernmental Panel on Climate Change has estimated that GHG emissions reductions can be achieved at a cost of \$20 - \$50 per ton. Using CHSRA data, Reason's report calculated that the emissions offset by the HSR during operation would cost \$1,800 per ton – and this was before the cost of the project more than doubled and before ridership projections were revised downward.<sup>8</sup> This \$1800/ton offset cost is in line with the \$1,383/ton estimate calculated above.

**Question:** Given that the United Nations Intergovernmental Panel on Climate Change has estimated that GHG emissions reductions can be achieved at a cost of \$20 - \$50 per ton, and given that CHSRA's cost per ton is between 30 – 90 times that cost, how does CHSRA meet the requirements of AB 32 with respect to achieving **cost-effective reductions** in GHG emissions?

4494-9185

**Question:** Historically with respect to GHG reduction claims, CHSRA intentionally omits the GHG produced during construction of the project. How were CHSRA's estimates of 75.9 and 102 MMTCO<sub>2e</sub> over 50 years of operation calculated? Do these estimates take into account the GHG that are created/emitted during construction of the project? Assuming the answer is no, and the estimates were advised to take into account the GHG created during construction, what would be the net increase or reduction in GHG emissions?

Other independent entities have evaluated CHSRA's claims that it is a "green" project. The non-partisan California Legislative Analyst's Office states:

*"High-Speed Rail Would Initially Increase GHG Emissions for Many Years. As mentioned above, in order to be a valid use of cap-and-trade revenues, programs will need to reduce GHG emissions. While the HSR has not conducted an analysis to determine the impact that the high-speed rail system will have on GHG emissions in the state, an independent study found that—if the high-speed rail system met its ridership targets and renewable electricity commitments—construction and operation of the system would emit more GHG emissions than it would reduce for approximately the first 30 years. While high-speed rail could reduce GHG emissions in the very long run, given the previously mentioned legal constraints, the fact that it would initially be a net emitter of GHG emissions could raise legal risks."*<sup>9</sup>

Additionally, the researchers at the University of California, Berkeley, who published *"Life-Cycle Assessment of High-Speed Rail: The Case of California"* concluded that it would take 71 years of HSR operations to save enough GHG emissions to negate the emissions produced during the construction of the train. Much of HSR's ability to recoup its GHG emissions depends upon its ridership levels. The Berkeley researchers concluded that

<sup>8</sup> [http://reason.org/files/california\\_high\\_speed\\_rail\\_report.pdf](http://reason.org/files/california_high_speed_rail_report.pdf) page 14  
<sup>9</sup> <http://www.lao.ca.gov/analysis/2012/transportation/high-speed-rail-041712.pdf>.

4494-9185

if the HSR operates at 25% ridership capacity, it will NEVER achieve a recoupment on the amount of energy consumed and GHG emissions produced during construction.<sup>10</sup>

On the other hand, in Table 3.3-44, CHSRA asserts that, "The Build Alternatives construction would generate GHG emissions between 2020 and 2029. However, these emissions would be almost fully offset after 4 to 6 months of operations (depending on the ridership scenario and Build Alternative). After a maximum of 6 months, the Build Alternatives would result in net annual emissions reductions and a GHG benefit."

**Question:** The independent analyses conducted by California Legislative Analyst's Office and the University of California, Berkeley, each reach conclusions that are vastly different from CHSRA's own claims that it will recoup all construction emissions in the first 4 – 6 months of operation. How does CHSRA account for this difference?

SB 32 (Chapter 249, Statutes of 2016) established a 2030 greenhouse gas emission reduction target of 40 percent below 1990 levels.<sup>11</sup> Further, in April 2015, Governor Edmund Gerald Brown issued EO B-30-15, which directed all State agencies with jurisdiction over GHG-emitting sources to implement measures designed to achieve the new interim 2030 goal, as well as the pre-existing, long-term 2050 goal identified in EO S-3-05 of reducing emissions 80 percent under 1990 levels by 2050.

**Question:** As no section of the train will be operable by 2030, by the time the State is legislatively required to achieve the target of 40% below 1990 GHG emissions levels, CHSRA will have only contributed to, not reduced, GHG emissions. How is CHSRA operating in compliance with the requirements of SB 32? As CHSRA is a State agency with jurisdiction over GHG-emitting sources, and CHSRA will be a net emitter of GHG between 2015 and 2030, how is CHSRA operating in compliance with EO B-30-15?

State law requires the Department of Finance, in consultation with the California Air Resources Board and other state agencies, to submit a three-year investment plan to the Legislature to guide the investment of Cap-and-Trade Auction Proceeds. The Third Investment Plan was submitted to the Legislature in February 2019 and provided three main recommendations to the Legislature. One of those was to:

- Continue to invest in existing programs and prioritize new programs that **achieve near-term climate and health benefits** and contribute to long-term transformation to low-carbon communities and ecosystems that are adaptable and resilient.<sup>12</sup>

**Question:** Given that CHSRA will not achieve any reduction in GHG emissions until at least the train begins operating (and may never in the life of the train achieve a net reduction in GHG emissions), and given that CHSRA is by far the largest recipient of Cap-and-Trade Auction Proceeds, and given that the Department of Finance recommendation to the Legislature was to prioritize programs that **achieve near-term climate benefits**, how is CHSRA meeting the requirements of the state Investment Plan?

In Table 3.3-16, CHSRA sets forth its estimated emissions in each year of the construction period:

<sup>10</sup> <http://its.berkeley.edu/btl/2010/spring/HRS-life-cycle>  
<sup>11</sup> Page 135, [https://ww2.arb.ca.gov/sites/default/files/auction-proceeds/2021\\_cci\\_annual\\_report.pdf](https://ww2.arb.ca.gov/sites/default/files/auction-proceeds/2021_cci_annual_report.pdf)

Emissions (tons/year)	<0.1	0.1	<0.1	<0.1	<0.1	<0.1
Exceeds General Conformity threshold?	No	No	No	No	No	No
Total for Years 2020 – 2028 (supposed construction phase of the project section)	VOC	NO <sub>x</sub>	CO	SO <sub>2</sub>	PM	PM
	18.3	228.2	466.8	1.8	51.6	14.4

Throughout the DEIR, CHSRA explains that it will rely on the purchase of "offset credits" to mitigate the GHG emissions it will generate during 10+ years of construction, as described on Page 3.3-72 of the DEIR:

AQ-MM#1 requires the purchase of emission offsets through the SCAQMD Emission Offsets programs. Emission reduction credits will be obtained from SCAQMD to offset emissions associated with the construction of the Build Alternatives. Purchase of emission offsets through SCAQMD's RECLAIM Program or Air Quality Investment Program, emission reduction credits, or another mechanism, subject to discussion with and approval by SCAQMD (AQ-MM#1), would offset and/or decrease NO<sub>x</sub> emissions.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 21 of 156

4494-9186

On Page 3.3-79, CHSRA states:

Unlike the federal General Conformity regulations, obtaining offsets or emission reduction credits for CO exceedances of the CEQA thresholds is not prohibited. AQ-MM#3, described in Section 3.3.7, requires the use of ZE or NZE technology for 25 percent of all light-duty on-road vehicles, with a goal to use ZE or NZE technology for 100 percent of the light-duty on-road vehicles. 25 percent of the heavy-duty on-road vehicles, and a minimum of 10 percent for off-road construction equipment used for construction. **All remaining emissions after implementation of AQ-MM#3 will be offset with emission offset credits required under AQ-MM#1 to below the SCAQMD CEQA thresholds.** However, until the contractual agreement between the Authority and the SCAQMD is in place and the purchase of emission offsets is secured, this represents a significant and unavoidable impact for the SR14A Build Alternative.

Further, on Page 3.3-104 of the DEIR, CHSRA explains:

Emissions from construction of the Palmdale to Burbank Project Section would be temporary. However, based on the amount of construction to be completed, **construction activities would involve heavy-duty construction equipment and cause air quality impacts that would conflict with or obstruct implementation of the applicable air quality plan, which serve to attain federal and state ambient air quality standards.** Construction NO<sub>x</sub> and CO emissions would exceed the SCAQMD and AVAQMD thresholds and could impede the implementation of the respective air quality plans. With incorporation of on-site IAMFs (AQ-IAMF#1, AQ-IAMF#2, AQ-IAMF#4, AQ-IAMF#5, and AQ-IAMF#6), NO<sub>x</sub> and CO effects will be reduced. With implementation of AQ-MM#1 and AQ-MM#2, construction emissions of NO<sub>x</sub> and CO will be offset until General Conformity or the CEQA threshold is met.

Per its own estimations as set forth in Table 3.3-16, CHSRA will be exceeding AQMD emissions levels in 7 of the 9 years of construction, and CHSRA will be required to purchase offset credits for at least these 7 years of construction.

4494-9187

**Question:** How can an agency that will be a gross polluter for at least the first 7 years of construction (i.e., to the extent that it is required to purchase offset credits as its emissions levels surpass those established by AQMD) simultaneously qualify to be the largest recipient of Cap-and-Trade funds?

4494-9188

**Question:** If the high-speed rail project is not completed, will CHSRA be required to return the funds it has already received to the Greenhouse Gas Reduction Fund so that the money can be reallocated to projects that actually reduce GHG emissions?

**Question:** If the high-speed rail project is completed, but never demonstrates a net reduction in GHG emissions, will CHSRA be required to return the funds it has already received to the Greenhouse Gas Reduction Fund so that the money can be reallocated to projects that actually reduce GHG emissions? Is there a penalty for not producing demonstrable emissions reductions?

4494-9189

**Question:** CHSRA includes the caveat that, "However, until the contractual agreement between the Authority and the SCAQMD is in place and the purchase of emission offsets is secured..." What is the process by which CHSRA purchases credits from AQMD? Is there the possibility that CHSRA will not be permitted to purchase the entirety of credits necessary to offset its construction emissions? In the event that CHSRA is unable to secure such a contractual agreement, what will CHSRA do to mitigate its significant deviance from AQMD accepted emissions levels?

**Question:** Why is purchasing offset credits considered to be an acceptable mitigation for pollution? Do the people who are living next to and working next to the construction staging areas (i.e., the people who will be

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 22 of 156

4494-9189 subjected to the pollution for 10+ years) get a say in what is an acceptable mitigation for violating applicable air quality standards? 4494-9190

4494-9190 On Page 3.3-27 of the DEIR, CHSRA sets forth its General Assumptions for Construction Activities, stating, "This analysis quantitatively estimates construction phase emissions related to the earthwork and construction activity associated with the following Build Alternative components":

- Mobilization (including on-road deliveries)
- Site preparation/access roads (Off-road construction equipment, as well as on-road worker trips, deliveries, truck hauling, and grading activities)
- Demolition (Off-road construction equipment, as well as on-road worker trips, deliveries, truck hauling, and demolition activities)
- Earthmoving (Off-road construction equipment, as well as on-road worker trips, deliveries, and truck hauling activities)
- Tunneling (Off-road construction equipment, as well as on-road worker trips, deliveries, and truck hauling activities)
- Roadway segment construction (Off-road construction equipment, as well as on-road worker trips, deliveries, and truck hauling, grading, and paving activities)
- Grade separation construction (Off-road construction equipment, as well as on-road worker trips, deliveries, truck hauling, grading, and paving activities)
- Cut-and-cover (Off-road construction equipment, as well as on-road worker trips, deliveries, and truck hauling activities)
- Train station construction (Off-road construction equipment, as well as on-road worker trips, deliveries, truck hauling, grading, architectural coating, and paving activities)
- Retaining wall construction (Off-road construction equipment, as well as on-road worker trips, deliveries, truck hauling, and grading activities)
- Viaduct construction (Off-road construction equipment, as well as on-road worker trips, deliveries, truck hauling, and grading activities)
- Build Alternative alignment construction (Off-road construction equipment, as well as on-road worker trips, deliveries, and truck hauling activities)
- Demobilization (On-road deliveries)

While at first glance, this appears to be an exhaustive list of construction-related activities that would produce GHG emissions, upon closer look, there are several notable line items missing from this list. The first is concrete.

Per Table 2-12 (Summary of Design Features for the Build Alternatives) located on Page 2-79 of the DEIR, the Preferred Alternative features 27.95 miles of bored tunnel. For the ease of calculating using the estimated layman's methodology herein, we will call the tunnel length an even 28 miles.

The online "Concrete Calculator" located at <https://www.calculator.net/concrete-calculator.html> allows users to estimate the volume of concrete necessary to build elements of various shapes and sizes. The screenshot below is the result of the calculation of the total volume of concrete necessary to build one of the twin bore tunnels at a length of 28 miles.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 23 of 156

## Circular Slab or Tube

### Result

Total Volume: **17,852,399.33** cubic feet  
or **661,199.98** cubic yards  
or **505,523.65** cubic meters

If using pre-mixed concrete with density of 2,130 kg/m<sup>3</sup> or 133 lbs/ft<sup>3</sup>:

Total Weight needed	<b>2,374,369,111.42</b> lbs or <b>1,076,765,381.4</b> kg
Using 60-lb bags	<b>39,572,818.52</b> bags
Using 80-lb bags	<b>29,679,613.89</b> bags

\* Different types of concrete can have very different densities.

Total volume for one tunnel = 17,852,399 cubic feet of concrete.  
For two tunnels (twin bore): 17,852,399 x 2 = 35,704,798 cubic feet of concrete.

In addition to the twin tunnels through which the HSR trains will traverse, there are going to be cross tunnels connecting the twin tunnels (primarily for the purpose of emergency evacuation), and these will be located every 800'. For 28 miles of tunnel, that means there will be 184 cross tunnels constructed (6.6 cross tunnels per mile of twin tunnel length).

Per CHSRA's specs set forth on Page 234 of the tunneling appendix, the average length of the cross tunnel will be 44', and the diameter of the cross tunnel will be 16'.

The screenshot below is the result of the calculation of the total volume of concrete necessary to build the 184 cross tunnels with the specifications set forth above.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 24 of 156

4494-9190

## Circular Slab or Tube

### Result

Total Volume: **319,518.55** cubic feet  
or **11,834.02** cubic yards  
or **9,047.76** cubic meters

If using pre-mixed concrete with density of 2,130 kg/m<sup>3</sup> or 133 lbs/ft<sup>3</sup>\*,

Total Weight needed	<b>42,495,967.49</b> lbs or <b>19,271,724.19</b> kg
Using 60-lb bags	<b>708,266.12</b> bags
Using 80-lb bags	<b>531,199.59</b> bags

\* Different types of concrete can have very different densities.

Adding together the concrete for the twin bores (35,704,798 cubic feet of concrete) + the concrete for the 184 smaller cross tunnels (319,518 cubic feet of concrete) = **36,024,316 cubic feet of concrete.**

To calculate the tons of concrete based on this volume, we can assume that:

1 cubic foot of concrete = .075 tons of concrete

$$1 : .075 = 36,024,316 : x$$

$$1x = 36,024,316 * .075$$

$$x = \mathbf{2,701,823 \text{ tons of concrete}}$$

This estimate seems low when compared to comparable tunneling projects which have already been completed. For example, the Gotthard Tunnel in Switzerland consists of 35-mile long twin bore tunnels that are between 29 and 31.5 feet in diameter, with 178 cross passage tubes to connect them. This project used 4.4 million tons of concrete.<sup>13</sup>

The Channel Tunnel (the "Chunnel") connecting Folkestone, England to Calais, France is 31.35 miles in length and is a three-bore tunnel, consisting of two 25' diameter rail tunnels and one 16' diameter service tunnel in between. Given its length and the size of its tunnels, the Chunnel serves as a suitable comparator to the tunnels that CHSRA proposes to build through the San Gabriel Mountains. Though the Chunnel is slightly longer than the proposed Preferred Alternative, the Chunnel only has 2 portals (one at each end), whereas the

<sup>13</sup> <https://www.basf.com/global/en/media/news-releases/2016/05/p-16-212.html>

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 25 of 156

4494-9190

Proposed Alternative features 5 portals; therefore, the assumption is made that the Chunnel and the Preferred Alternative tunnels would use comparable amounts of concrete, as the amount of concrete needed at the greater number of San Gabriels tunnel portals offsets the greater length of the Chunnel. Construction of the Chunnel utilized 6.82 million tons of concrete,<sup>14</sup> which is more than twice the estimated 2.7 million tons of concrete needed to complete the tunneled portion of the Preferred Alternative.

Why is the volume of concrete an important consideration vis à vis GHG emissions?

Because the major component of concrete is cement, and the cement industry is one of the two primary producers of carbon dioxide, a GHG. The cement industry produces over 5% of worldwide man-made emissions of CO<sub>2</sub>.<sup>15</sup>

California ranks second in the nation (just behind Texas) in terms of CO<sub>2</sub> emissions created by the cement industry, producing over 11 million metric tons per year.<sup>16</sup> The intensity of CO<sub>2</sub> emissions created by cement plants varies per state, and can be higher or lower depending on the fuel type, the raw ingredients used, and the energy efficiency of the cement plant.<sup>17</sup> While the weighted national average is 0.97 tons of CO<sub>2</sub> emitted for each ton of cement produced, California comes in slightly higher with just over 1 ton of CO<sub>2</sub> emitted per ton of cement produced. This makes for an easy comparison, as we can consider that for every ton of cement produced for the HSR project, one ton of CO<sub>2</sub> is emitted.<sup>18</sup>

If we use the estimate calculated above, that **2,701,823 tons of concrete** will be utilized in the construction of the tunnels for the Preferred Alternative, and if we use the industry standard that that structural concrete is comprised of 15% cement, then the tunnels will use:

$$2,701,823 * .15 = 405,273 \text{ tons of cement.}$$

Employing the intensity factors established above, **we may conclude that the production of 405,273 tons of cement used to build the tunnels will produce 405,273 tons of CO<sub>2</sub>.**

By comparison, the Gotthard Tunnel, with 4.4 million tons of concrete, utilized approximately 660,000 tons of cement, which equates to 660,000 tons of CO<sub>2</sub> emissions; and the Chunnel, with 6.82 million tons of concrete, utilized approximately 1.023 million tons of cement, which equates to 1.023 million tons of CO<sub>2</sub> emitted during construction. As these are comparable projects to the Preferred Alternative, we can assume that CO<sub>2</sub> emissions attributable to just the concrete used during the construction of the tunnel portion of the project will range from 400,000 tons to 1 million tons of CO<sub>2</sub>.

4494-9191

**Question:** In its emissions estimates presented in the DEIR, does CHSRA include the amount of CO<sub>2</sub> that will be generated during the creation of cement mixed to build the tunneled portion of the project? If not, why not?

California Climate Investments reports its investments and outcomes on a statewide basis, not per geographic area or project section. As calculated above, between 400,000 and 1 million tons of CO<sub>2</sub> will be emitted simply from the production of the concrete utilized to construct the 28-mile tunneled segment between Palmdale and Burbank. But the Palmdale to Burbank segment represents only 7% of the total HSR length.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 26 of 156

4494-9192

**Question:** How many tons of CO<sub>2</sub> will be emitted during the production of the concrete needed to construct the remaining 492 miles connecting San Francisco to Los Angeles? Is California Climate Investments aware of these figures and, if so, why do they not include them when reporting annually on the efficacy of its Cap-and-Trade funding recipients?

**Question:** Does CHSRA assume that the concrete/cement tunnel linings will be manufactured locally? If not, where will they be manufactured?

In another chapter of the DEIR, CHSRA suggests that it may use 40-foot pre-fabricated lining segments. 28 miles x 5,280 feet / 40 feet = 3,696 segments. Admittedly this is for the entire circumference of the tunnel lining, and these would be broken into smaller segments to complete the round.

**Question:** In the event that these 3,696 tunnel segments are pre-fabricated elsewhere (i.e., to save local water sources) and then transported to the project section for installation, this will require 3,696 diesel truck trips made from a potentially significant distance. In its estimates of GHG emissions as set forth in the DEIR, has CHSRA included estimates of emissions that will be generated by the transportation of pre-fabricated concrete tunnel lining pieces?

4494-9193

**Question:** In Chapter 3.08 of the DEIR ("Hydrology and Water Resources"), CHSRA describes that for sections of the tunnel which experience water pressure in excess of 25 bar, CHSRA will install a second concrete tunnel lining. How will this additional layer of concrete lining impact the estimates above and, therefore, the overall carbon emissions stemming from the use of concrete in this project?

In an article entitled, "The Secrets of the World's Longest Concrete Tunnel," Cembureau, the European Cement Association, explains some of the unique factors of the Gotthard Tunnel in Switzerland. One of these was the stipulation that 100% of the aggregate used to make the concrete must come from recycling materials excavated on site. Cembureau explains that, "The key to ensuring that the material was sustainable was the use of recycled aggregate – with the tunnel team recycling more than one third of 28.2 million tonnes of excavated rock during the manufacture of the concrete."<sup>19</sup>

4494-9194

**Question:** Does CHSRA have plans to recycle any of the aggregate that it is removing from the tunnels as spoils and use it in the creation of concrete needed to build the tunnels?

In a previously released document on "Green Practices," CHSRA provides only one example of GHG tonnage produced by its construction activities. That's the example of 30,107 tons of CO<sub>2</sub> that it expects to be generated from construction of the first 29-mile segment of rail from Madera to Fresno.<sup>20</sup> This 29-mile Madera to Fresno segment is comparable in length to the 28-mile tunneled portion of the Palmdale to Burbank segment; however, the tonnage of emissions is drastically different between the two project segments.

In considering GHG emissions from cement alone, we can compare 400,000 tons to 1 million tons of CO<sub>2</sub> emitted during construction of the 28-mile Preferred Alternative tunnels to 30,107 tons of CO<sub>2</sub> emitted during construction of the 29-mile Madera to Fresno rail alignment. We can only assume that the difference is attributable to the fact that the Madera to Fresno segment is at grade, while the Palmdale to Burbank section is tunneled, meaning that it requires exponentially more concrete to build.

4494-9195

**Question:** If construction of a tunneled route will generate 30X as much GHG emissions than construction of an at-grade route of comparable length, and if CHSRA purports to be a "green project," then why does CHSRA not construct the Palmdale to Burbank project section at grade utilizing the existing transportation corridor?

<sup>19</sup> <http://useofcement.cembureau.eu/2018/04/06/the-secrets-of-the-worlds-longest-concrete-tunnel/>  
<sup>20</sup> [http://www.hsr.ca.gov/docs/programs/green\\_practices/HSR\\_Reducing\\_CA\\_GHG\\_Emissions\\_2013.pdf](http://www.hsr.ca.gov/docs/programs/green_practices/HSR_Reducing_CA_GHG_Emissions_2013.pdf)

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 27 of 156

4494-9195

In the same "Green Practices" paper, CHSRA explains that it will offset the 30,107 tons of CO<sub>2</sub> emitted during construction of the 29-mile Madera to Fresno rail alignment by planting over three million trees.<sup>21</sup> The equivalent for the Palmdale to Burbank section would require planting to over 90,000,000 trees.

4494-9196

**Question:** Does CHSRA plan to plant over 90 million trees along the Palmdale to Burbank project section in order to offset its GHG emissions in this region? To get a sense of how large that number is, if CHSRA did nothing but plant trees every day for one year, it would need to plant 246,575 trees every single day in order to plant 90 million trees on day 365. If we increased the planting time to 10 years – i.e., to coincide with the construction period of the project in the Palmdale to Burbank project section – then CHSRA would still need to plant approximately 25,000 each day in order to achieve the equivalent offset goal that it set for the Madera to Fresno project section.

4494-9197

In a recent article for *Electrical Contractor* magazine entitled "Feeding the Monster," author Claire Swedberg describes the important role played by Royal Electric Construction Corporation in a public utilities project in Columbus, Ohio that involves using a tunnel boring machine to tunnel 4.5 miles under the city.

Of course, digging out a 4.5-mile tunnel under city streets, as well as under a river, requires not only heavy equipment, but also power. Royal Electric Construction Corp. is providing all power to light the way, pump water in and out of the tunnel, and maintain wireless connectivity. In addition, Royal is powering a giant by the name of Marsha, a 546-foot-long tunnel boring machine (TBM), which is chewing through rock and clay under the city. "There is a great deal of high-voltage and data work being done, and they are handling all aspects of the job," said Bob Rautenberg, Kenny Construction project manager.

Marsha, the TBM, is working her way deeper into the tunnel—which drops down to 170 feet beneath the surface—at a rate of up to 40 feet per day, five days per week, 24 hours per day. The \$16 million, two-story machine consists of its 95-ton, 23-foot diameter grinding disk and an excavation chamber where broken rock passes before entering an auger-screw conveyor. That conveyor excavates the material into a slurry system, where a water, rock and clay mix is pumped to the surface. The TBM also has thrust cylinders to hold six 5-foot-long concrete pieces in place, while installing them into what becomes a segment ring in the newly cut hole; those cylinders also advance and steer the machine by pushing off from the concrete segments.

The TBM was assembled, as much as possible, on the surface in segments of 30–40 feet. The machine is hydraulically driven but requires electric power, so the mechanical and electrical contractors rely on each other to keep it operating correctly. To turn the blade, the machine requires six 350-kilowatt (kW) motors. Additionally, its 546-foot length houses multiple motors for the many oiling and grease systems and the fresh-air ventilation system.

To power the TBM, Royal Electric installed approximately 18,000 feet of machine cable, ranging in size from 1/0 to 500 MCM (thousand circular mils) and more than 30,000 feet of low-voltage control cable for the wireless networks.

The entire project is supplied with a medium-voltage switchyard that was constructed on-site to allow for two 14,400V circuits for the TBM and water-pumping system. Both circuits will travel the entire length of the expanding tunnel, one providing 26,000 kW to the TBM and the other providing 36,000 kW to the pumps that are moving fresh and wastewater through the tunnel. To accomplish this, more than 46,000 feet of 15-kilovolt, tough, oil-resistant, SO cable is being installed as the TBM travels toward the other end of the tunnel.

<sup>21</sup> [http://www.hsr.ca.gov/docs/programs/green\\_practices/HSR\\_Reducing\\_CA\\_GHG\\_Emissions\\_2013.pdf](http://www.hsr.ca.gov/docs/programs/green_practices/HSR_Reducing_CA_GHG_Emissions_2013.pdf)

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 28 of 156

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 29 of 156

4494-9197

The TBM's lower level houses three transformers to convert the incoming 14,400 circuit to 480 volts (V). The upper level contains five large motor control cabinets and an emergency generator for lighting in the event of a power outage.

The monthly cost to power the entire site for the temporary power averages between \$75,000 and \$100,000, and that average is expected to double toward the end of the project. In fact, this volume of electricity consumption causes a major challenge for contractors.

"The biggest hurdle is managing the incoming power," Rautenberg said. "We are limited on the amount of electrical energy that the city can supply to us, and we need to balance that energy between the TBM and the 13 pumps (six at 500 horsepower, seven at 300 hp) that need to be installed in the tunnel. We are working with Royal to optimize the positioning of all this equipment."

4494-9198

**Question:** Other sections of the DEIR address electrical requirements. Do the estimates that CHSRA set forth in Table 3.6-22 include the energy electricity to run multiple tunnel boring machines a day with each boring machine requiring up to 3,500 kwh (this number based on existing boring machine specifications)?

Additionally, this exceptional use of electricity factors into this chapter on Climate Change. The EPA's online Greenhouse Gas Equivalencies Calculator<sup>22</sup> allows a user to convert emissions or energy data to the equivalent amount of carbon dioxide emissions from using that amount.

We used the Greenhouse Gas Equivalencies Calculator to convert the amount of energy required to power one tunnel boring machine for the duration of time it would take to complete one tunnel.

Assuming an average daily energy usage of 3,500 kwh per day \* 365 days per year \* 10 years \* estimation that it will really only be running 70% of the time due to downtime, maintenance, etc. = 8,942,500 kwh of electricity.

Inputting this number to the GHG Equivalencies Calculator, 8,942,500 kwh of electricity equates to 3,868 metric tons of CO<sub>2</sub> emitted just to operate one TBM.

Per "Construction Power Requirements" set forth in a report by Jacobs Associates for the Gorge 2<sup>nd</sup> Tunnel project in Seattle, the electricity consumed by the TBM represents about 55 percent of the total electric needed to run corollary operations in tunnel construction.<sup>23</sup> Therefore if we double the calculations above, we can estimate the total amount of electricity needed during tunnel construction, 8,942,500 kwh \* 2 = 17,885,000 kwh of electricity, which equates to 7,736 metric tons of CO<sub>2</sub> emitted in order to run construction-related equipment during tunnel construction.

4494-9199

**Question:** In its emissions estimates presented in the DEIR, does CHSRA include the amount of GHG that will be generated by the electricity necessary to operate the TBMs and/or the related equipment necessary to effectuate tunnel construction? If not, why not?

4494-9200

**Question:** Given the challenges experienced by Royal Electric with respect to the sheer volume of electricity required for the project and the limited supply available from the city electric company, what conversations has CHSRA had with SoCal Edison and/or DWP regarding the 10+ year need for a significant increase in energy on an already stressed system?

<sup>22</sup> <https://www.epa.gov/energy/greenhouse-gas-equivalencies-calculator#results>

<sup>23</sup> [https://www.seattle.gov/light/g2t/docs/Appendix\\_O\\_Power\\_Reqmts.pdf](https://www.seattle.gov/light/g2t/docs/Appendix_O_Power_Reqmts.pdf)

4494-9200

Additionally, there is an electrical requirement for the production of cement. Per information presented by Cembureau, each ton of cement requires 121kwh of electricity to produce.<sup>24</sup> Per previous calculations in this comment section, we can assume that the construction of the tunnels in the Preferred Alternative will require between 400,000 and 1 million tons of cement.

400,000 \* 121 kwh = 48,400,000 kwh of electricity. Using the EPA's GHG Equivalencies Calculator, that is equivalent to 20,938 metric tons of CO<sub>2</sub>. Using the higher estimate of 1 million tons of cement, 1,000,000 \* 121 kwh = 121,000,000 kwh of electricity, which equates to 52,344 metric tons of CO<sub>2</sub>.

4494-9201

**Question:** In its emissions estimates presented in the DEIR, does CHSRA include the amount of GHG that will be generated by the electricity necessary to mix the cement utilized in the construction of the tunnels? If not, why not?

On Page 3.3-20 of the DEIR, CHSRA explains the statewide, regional, and local air quality standards that must be achieved with respect to sensitive receptors:

The local air quality impact analysis focuses on the effects of pollutant emissions from both the construction and operation of the six Build Alternatives on nearby sensitive receptors. Sensitive receptors include residential dwellings, schools, churches, hospitals, and parks. The local RSA is defined as the Build Alternative footprint, plus 1,000 feet around the Palmdale and Burbank Stations, as well as roadway intersections projected to operate at unacceptable levels of service (i.e., generate localized pockets of traffic congestion and vehicle emissions) under future project conditions.

However, in Section 3.3.5.5, CHSRA sets forth its list of sensitive receptors that will be impacted by the build alternatives, including, "Non-residential sensitive receptors located within 1,000 feet of the Build Alternative."

4494-9202

**Question:** If "parks" were included in the definition of sensitive receptors on Page 3.3-20, why in its list of sensitive receptors in Section 3.3.5.5 does CHSRA not list the Angeles National Forest, the San Gabriel Mountains National Monument, the Big Tujunga Wash, and Hansen Dam? These locations are sensitive receptors that will suffer tremendous impacts as portals will be constructed and operated at their borders. In addition to many years of construction of the infrastructure needed to support portals, portals will also serve as a place by which spoils will be extricated for the duration of the excavation of the tunnels.

On Page 3.3-28 of the DEIR, CHSRA lists Build Alternative Start Dates as January 2020. This DEIR was not even released until nearly two full calendar years later, and will not be finalized/certified until at least three full calendar years after this supposed Start Date. Additionally, before the route can be started, significant additional geotechnical investigation will have to be conducted along the tunneled portions (i.e., 100 – 150 additional test bore holes will need to be drilled) before design-build contracts can even be bid, let alone issued.

4494-9203

**Question:** Why are CHSRA's dates so far off what could be considered a reasonable construction schedule? In releasing this DEIR to the public in September 2022, CHSRA was well aware that they had long passed the "Build Alternative Start Date" of January 2022. Why was the DEIR not revised to include more realistic dates?

On Page 3.3-113 of the DEIR, with respect to vehicle exhaust emissions, CHSRA states that:

AQ-IAMF#1, AQ-IAMF#2, AQ-IAMF#4, and AQ-IAMF#5 implement the lowest-emitting construction equipment technology and adopt best management practices to minimize construction-period emissions. No additional emissions control/mitigation measures exist. Given that all feasible DPM control measures (i.e., renewable diesel, Tier 4-compliant construction equipment, and 2010 or newer

<sup>24</sup> <https://cembureau.eu/about-our-industry/key-facts-figures/>

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 30 of 156

4494-9203

truck fleet) will already be implemented as IAMFs, no additional DPM control measures exist. Therefore, this impact would be significant under CEQA.

4494-9204

**Question:** In a separate section of this comment letter, we utilized information in the DEIR to calculate that more than 5 million truck trips will be required to haul spoils from the tunnel portals and transport them to their ultimate destination. Are the emissions from these 5 million truck trips included in CHSRA's Annual Construction Emissions tables?

4494-9205

**Question:** If, after the implementation of all available/known mitigation measures, the air quality impact with respect to vehicle exhaust emissions is still significant per CEQA standards, what is the consequence? It seems there are many study areas presented in this DEIR for which, even after mitigation, there will still be a significant impact. Has CHSRA prepared a Statement of Overriding Conditions? If not, will CHSRA prepare a Statement of Overriding Conditions and present it to the State Legislature for consideration with respect to either approval and/or funding requests vis a vis this project?

On Page 3.3-114 of the DEIR, CHSRA addresses the issue of Aircraft Emissions:

As indicated in Table 3.3-37 and Table 3.3-38, the operation of the six Build Alternatives would be expected to reduce aircraft emissions when compared to the existing and future No Project baselines (Table 3.3-12). The decrease in aircraft emissions would occur as intrastate travelers are expected to shift away from flying toward more use of the California HSR System. The reduction in aircraft travel as a result of the California HSR System is the largest contributor to the reduction in statewide and regional emissions.

As more thoroughly examined in a separate section of this comment letter, there is no evidence to suggest that the implementation of high-speed rail in California will lead to a reduction in flights. The only flights that could change or be impacted by the implementation of high-speed rail are flights between San Francisco and Burbank (i.e., the hubs serviced by both HSR and airplanes). As of the time of this writing, current flights on both United and Southwest are \$168 round trip between SFO and BUR and take under 1 ½ hours. On the other hand, a high-speed rail ticket is predicted to cost \$200 round trip (\$100 each way) and take a minimum of 2 hours 40 minutes.

4494-9206

**Question:** CHSRA's assumption that travelers will choose HSR over flying is overstated at best (if not misplaced entirely). Given the cost and time parameters set forth above, on what grounds does CHSRA believe that it will capture such a significant share of the air market?

Second, CHSRA's assumption that air carriers who currently service this route will simply take planes out of commission as passengers choose HSR over air is not realistic; in the event that airlines servicing SFO and BUR see a reduction in demand, they will simply reallocate those airplanes to different routes that are experiencing a higher demand.

**Question:** Considering that CHSRA admits that, "The reduction in aircraft travel as a result of the California HSR System is the largest contributor to the reduction in statewide and regional emissions," if CHSRA revised its calculations to not overstate HSR's potential capture of the air market, what emissions gains, if any, would result? If CHSRA recalculated its emissions tables based on the questions and information provided in this comment letter (including, but not limited to, factoring in and accurately reporting emissions generated during construction), what, if anything, would be the emissions gains for the lifetime of the project? In what year, if ever, would CHSRA recoup the amount of emissions generated during construction of the project?

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 31 of 156

4494-9206

On Page 3.3-129 of the DEIR, CHSRA asserts that:

Operation of the Palmdale to Burbank Project Section would reduce statewide GHG emissions by 1.1 to 1.7 MMT CO<sub>2</sub>e in 2040, depending on the ridership scenario (medium and high). These annual reductions would represent 0.6 to 1.0 percent of the 172 MMT CO<sub>2</sub>e needed to achieve the SB 32 goal.

Going back to the very first comments presented in response to this chapter of the DEIR, it is a requirement of AB 32 to, "Prepare a scoping plan for achieving the maximum technologically feasible and cost-effective reductions in GHG emissions from sources or categories of sources of GHGs by 2020." CHSRA's current budget predicts that it will cost \$105 billion to complete the high-speed rail network. Under CHSRA's own best-case scenario (and still not taking into account other construction-related emissions which we do not believe have been accounted for in CHSRA's tables), CHSRA predicts that its operations will represent, at most, 1% of the CO<sub>2</sub> emission reductions necessary to achieve the goals set forth in SB 32. In reviewing the "Summary of Investments and Outcomes" compiled by California Climate Investments, the cost-benefit ratio achieved by CHSRA would be the highest of all agencies administering programs funded by the Cap-and-Trade Auction Proceeds.

4494-9207

**Question:** Given that CHSRA has not demonstrated and cannot demonstrate that it can achieve cost-effective reductions in GHG emissions (let alone achieve the maximum feasible cost-effective reductions in GHG emissions), how is CHSRA in compliance with the requirements of AB 32? Why should CHSRA continue to receive funding from the Cap-and-Trade auction proceeds when it is not a cost-effective program and when it is questionable if/when it will ever reduce GHG emissions?

In Section 3.3.4.5 (Method for Determining Significance Under CEQA) of the DEIR, CHSRA states that, "The Authority is using the following thresholds to determine if a significant impact on air quality and global climate change would occur as a result of the project. A significant impact is one that would:

1. Conflict with or obstruct implementation of the applicable air quality plan;
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the Palmdale to Burbank Project Section region is nonattainment under an applicable NAAQS or CAAQS;
3. Expose sensitive receptors to substantial pollutant concentrations;
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people;
5. Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment;
6. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs."

**Question:** Considering that CHSRA's plans as set forth in Chapter 3.3 of the DEIR meet each/all six of the foregoing criteria for determining if a project will result in a "significant impact" on air quality and global climate change, how is this project in compliance with CEQA with respect to air quality considerations? If state and/or federal legislators were aware of the information presented in Chapter 3.3 of the DEIR, for what reasons should they continue to allocate funds to support the continuation of this project?

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 32 of 156

**CHAPTER 3.5: ELECTROMAGNETIC INTERFERENCE & FIELDS**  
**CHAPTER 3.6: PUBLIC UTILITIES AND ENERGY**  
**APPENDIX 3.6-A: HIGH RISK AND MAJOR UTILITY IMPACT REPORT**

**Electromagnetic Interferences and Electromagnetic Fields**

4494-9208

Section 3.5, Electromagnetic Interference and Electromagnetic Fields, is CHSRA's evaluation of existing Generated Electromagnetic Fields (EMF) and how CHSRA's operations will impact existing EMF infrastructure. The existing EMF infrastructure includes radio waves (RF) from radio communications in use by Public Safety Organizations, Burbank Airport, private radio communications use by delivery companies, Cell Phone communications and EMF generated by critical machinery including Medical Equipment (MRI for example).

Per government regulation, CHSRA's generated EMF from CHSRA's operations (train's electric motors for example) must not create Electromagnetic Interference (EMI) which adversely impacts the operations of the EMF infrastructure or provide plans for shielding CHSRA's operations to mitigate the generated EMI from CHSRA's. CHSRA's trains, tracks, and electrical infrastructure generate EMF fields. The generated EMF can impact existing EMF infrastructure as well as impact the health of people and animals in close proximity to the CHSRA train and electrical power lines and distribution stations. CHSRA has defined a 1000-foot buffer zone between CHSRA trains and power lines to mitigate the impact of EMI to people, animals, and electrical infrastructure in order to meet US and California regulations.

**Question:** CHSRA proposes to have their contractors "prepare an Implementation Stage Electromagnetic Compatibility Program Plan (ISEP) to identify construction BMPs that will minimize EMI/EMF effects and demonstrate how EMI/EMF will be maintained below applicable standards." Given how current CHSRA contractors on the Merced Line have not met CHSRA build standards as defined in their existing contracts, what actions will CHSRA take to ensure that appropriate standards are met within this project section? Will CHSRA implement heavy contractual penalties for failure to meet contractual obligations?

4494-9209

**Question:** CHSRA operations will operate in sparsely populated areas and through heavily populated areas. In non-tunnel CHSRA right of way, a 500' buffer from the centerline to streets, homes, businesses, or wildlife was studied to assess the effects of CHSRA EMF on the affected areas. For areas where a 500' buffer cannot be maintained, what mitigation will CHSRA provide to the impacted businesses, homes, schools, and wildlife? For example, if Sierra Hospital's MRI system is impacted by CHSRA EMF, who will pay to mitigate this impact – CHSRA or Sierra Hospital?

Table 3.5-2 (p3.5-3) identifies the Frequency and related Wavelengths studied for this section to evaluate CHSRA impacts to existing infrastructure.

**Table 3.5-1 Relationship Between Typical Frequencies and Their Wavelengths**

Frequency	Wavelength	Common Commercial Uses
60 Hz	3,105 miles	Electric power grid
10 kHz	18.6 miles	Radio navigation
10 MHz	98.4 feet	Shortwave radio
100 MHz	9.8 feet	FM radio
2000 MHz	6 inches	Cellular communications

Source: Authority 2017  
Hz = Hertz      kHz = KiloHertz  
MHz = Megahertz

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 33 of 156

4494-9209

Volunteer "HAM" radio operators are critical during a catastrophic infrastructure emergency (such as earthquakes) and provides critical communications when established infrastructure (such as cell phones, landlines, and even public safety agencies) are inoperable.

In Appendix 3.5-A, Electromagnetic Measurement Survey Summary, the introduction indicates "Two types of measurements were performed at each location. The first involved measurement of radiated electric fields from 10 kilohertz (kHz) to 6 gigahertz (GHz), meant to characterize the radio frequency (RF) environment. These electric field strengths were measured using an RF spectrum analyzer and calibrated antennas."

The purpose of this evaluation is to measure the interference to existing RF infrastructure caused by the CHSRA and how the CHSRA will interfere with communications and electrical equipment operations close to CHSRA. By measuring the existing infrastructure RF environment, CHSRA performed an evaluation projecting how the CHSRA-generated RF will impact existing infrastructure and what mitigation would be required to eliminate or reduce the impact to the existing infrastructure or how the existing infrastructure could impact CHSRA operations.

During infrastructure emergencies (e.g., floods, earthquakes, fires), HAM operators provide critical communications when traditional infrastructure is down. During disasters, HAMs will establish mobile operations at critical locations. The most used HAM bands are in the Very High Frequency (VHF) and Ultra High Frequency (UHF) Bands; most often in the 144MHz, 220MHz, and 420MHz ranges. Most of the HAM repeater Networks, located on mountain tops and supported by backup power, operate in the VHF and UHF ranges. Additionally, HAMs may need to operate at the Super (SHF) and Extremely (EHF) Frequency Bands from 10 GHz to above 275GHz. While some infrastructure emergencies may shutdown CHSRA operations, the CHSRA electrical infrastructure could still be operations emitting EMI.

4494-9210

**Question:** Why did CHSRA exclude the HAM radio frequency spectrum above 2000MHz in section 3.5 in their evaluation of RF interference?

**Question:** Why was the RF environment capped at 6GHz when many HAM radio operators may need to operate at the SHF and EHF bands?

**Question:** Why was the RF environment capped at 200MHz (B6) and started again at 2.0Ghz (B9) on Table A3.5-1, ignoring the VHF and UHF bands?

**Question:** Why hasn't CHSRA considered RF impact on the critical HAM radio spectrums that become critical in local disaster situations?

**Electrical Requirements of the High-Speed Rail System**

4494-9211

Section 3.6.6.3 on p3.6-86 of the Draft EIR states: "The proposed California HSR System would obtain electricity from the statewide grid. None of the Build Alternatives would involve construction of a separate power source, but instead, would require the extension of existing power lines to traction power substations positioned along the HSR corridor. Impacts that might result from the proposed California HSR System would not affect statewide electricity reserves or transmission capacity. In September 2008, the Authority adopted a policy goal of utilizing renewable energy for all traction power. An industry survey in April 2013 indicated that there is sufficient renewable energy capacity to meet the system demand (Authority 2014b). Under the 2013 Policy Directive POLI-PLAN-03, the Authority has adopted a goal to purchase 100 percent of the HSR system's power from renewable energy sources (Authority 2016b)."

Table 3.6-7 Utility Service Provider (p3.6-24) of the Draft EIR indicates:

- Electrical Power to CHSRA will be provided by the local Power Utilities where CHSRA is planned to run. The relevant power utilities are Southern California Edison (SCE) from Palmdale to the LA City

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 34 of 156

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 35 of 156

- 4494-9211 Line, Los Angeles Department of Water and Power (LADWP) from LA City Line to Burbank City Line, and Burbank Water and Power (BWP) from Burbank City Line to Burbank Airport.
- All electrical power (100%) will be from renewable sources.
- Question:** Is this based upon SB100 – The 100 Percent Clean Energy Act that sets “State Policy”: that eligible renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity to California end-use customers and 100 percent of electricity procured to serve all State agencies by December 31, 2045?
- 4494-9212 **Question:** It has been almost 10 years since CHSRA has evaluated electrical power requirements sufficient to power the Palmdale to Burbank Project Section. Given the significant changes to the existing power infrastructure, the addition of renewal power sources to the power grid, and expanding electrification automobile transportation, why hasn't CHSRA reevaluated and validated 10-year-old assumptions?
- 4494-9213 **Question:** What discussions has CHSRA had with SCE, LADWP, and BWP regarding CHSRA power requirements to support CHSRA Palmdale to Burbank operations? What are the dates/times of these discussions? Are there notes/documentation of these discussions? What conclusions/agreements have been made as a result of these discussions?
- 4494-9214 **Question:** Have the Power Utilities committed to supplying 100% green electricity to CHSRA? At peak CHSRA power requirements? During Heat Emergencies when Cal ISO has declared a power “Flex Alert”? If so, what conclusions/agreements have been made from these discussions? When and where were these commitments made, and by what people? Can CHSRA's planned power backup capabilities provide enough power to keep CHSRA operational until a “Flex Alert” has been lifted?
- 4494-9215 **Question:** Has CHSRA provided Peak/Normal/Minimal power supply requirements (KWh) to run the CHSRA train from Palmdale to Burbank based upon expected train traffic to SCE, LADWP, BWP by Utility?
- Question:** If the necessary power requirements are not currently available from either SCE, LADWP, and/or BWP, have these utilities committed to increasing their infrastructure to provide CHSRA's “Green” power requirements?
- 4494-9216 **Question:** How much power (KWh) is to be delivered to each CHSRA power distribution station? If this metric cannot be determined until detailed design is complete, how can CHSRA justify statements in the Draft EIR that the current or future energy grid can supply the 100% green energy required to power the Palmdale to Burbank Project?
- Question:** Does the electrical infrastructure (e.g., high power electrical lines, utility distribution stations, etc.) required to deliver electrical power from the Electrical Utility (SCE, LADWP, BWP) to CHSRA at each electrical Power Distribution Station currently exist?
- Question:** If the required electrical infrastructure does not exist, who will build the infrastructure? Who will pay for the cost of building this infrastructure: CHSRA or SCE, LADWP, BWP? If built by the Electrical Utility, will SCE, LADWP, and/or BWP bill back the cost of building the required infrastructure to CHSRA? Or pass it along to their customers?
- 4494-9217 **Question:** Has the cost of additional electrical infrastructure required to power CHSRA been included in the latest published CHSRA Palmdale to Burbank Project Cost Projections?
- 4494-9218 **Question:** Has CHSRA had discussions with SCE, LADWP, and/or BWP regarding high fire danger and the brown/black out of existing power lines to prevent catastrophic wildfires?

4494-9219 **Question:** In the event of a utility planned power outage, how will SCE, LADWP, and BWP allocate power to CHSRA?

**Question:** In the event of a utility planned power outage, will SCE, LADWP, and BWP prioritize power to their residential/commercial/government customers over CHSRA? How would this situation affect CHSRA train schedules and operations?

**Question:** Given that sections of the Palmdale to Burbank Project are within a High Fire Severity Zone, how will CHSRA mitigate these risks and ensure to CHSRA is operational?

**Question:** How will temporary power be provided to CHSRA contractors? Will temporary infrastructure be required – poles, lines, etc.? Who will be responsible for installing and removing this infrastructure? Who will pay for these activities?

**Question:** Has CHSRA negotiated power rates for construction for the temporary infrastructure required to build the CHSRA?

**Question:** Has CHSRA considered alternative electrical power supplies? Solar Power Arrays at CHSRA Power Distribution Stations? Placing Solar Arrays along the CHSRA above ground rights of way above the tracks and electrical train connections?

### Environmental Consequences

Section 3.6.6.2, No Project Alternative of the Draft EIR, developed in 2016 details the assumptions used to provide environmental impact of the Palmdale to Burbank Project. This section states that, “Demand for energy would also increase at a level commensurate with population growth. Peak- and base-period electricity demand would increase and require additional generation and transmission capacity. According to the CEC Demand Analysis Office (CEC 2014), the average annual growth rate for statewide electricity demand between 2014 and 2026 is forecast to increase between 0.54 percent (low energy demand) and 1.27 percent (high energy demand). The CEC analysis included forecasts that considered impacts (beneficial and adverse) of approved efficiency programs, climate change, electric vehicle use, other electrification projects (including port projects and HSR), and demand response (time-of-use pricing) programs. Energy use in Los Angeles County would be anticipated to trend along the forecast state average during this same time period (2015-2040).”

Additionally, this section states, “Under the No Project Alternative, the projects listed in the regional transportation plans are expected to encourage both compact development and greater investment in local transit modes as a means of reducing VMT. Table 3.6-19 shows the projected 2040 estimate of energy consumed from fueling cars and planes, without the California HSR System. Under the No Project Alternative, the daily VMT in Los Angeles County would increase by the year 2040. In 2040, daily VMT would undergo an estimated increase of 9 percent under baseline conditions without implementation of the Southern California Association of Governments' 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (SCAG 2016). With implementation of this plan, which includes operation of the California HSR System, it is estimated that VMT would be reduced by 0.7 percent in 2040.”

This evaluation was completed in 2016, and as such, could not accurately predict the rapid increase in solar energy infrastructure (e.g., utility solar farms and rooftop solar), the increase of home solar battery systems, the rapid development and acceptance of electric vehicles, the government support of electrical charging stations along interstate and state highways, and the State of California's commitment to be Carbon Neutral by 2045. This evaluation also predicts net population gains, while California's population has held steady or decreased since 2016.

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 36 of 156

4494-9223

**Question:** Why hasn't CHSRA re-evaluated the accuracy of the 9% MVT increase or the expected 0.7 percent reduction by 2040 considering the changing infrastructure environment?

**Construction Impacts**

4494-9224

Section 3.6.6.3 states: "Construction and operations of the Build Alternatives could result in temporary and permanent impacts on public utilities and energy." Table 3.6-20 Summary of Potential High-Risk and Potential Major Low-Risk Utility Conflicts identifies these risks by build alternative. These risks include long or short-term interruption to electrical, water, gas, and other utility infrastructure.

**Question:** What compensation will homeowners and businesses receive from if their utilities are suspended due to construction of the Palmdale to Burbank Project?

**Question:** What supplemental utilities (e.g., power generators, water tanks, etc.) will a homeowner or business receive to bridge their utility outage?

**Question:** Will CHSRA compensate homeowners if suspended utilities require the homeowner to temporarily relocate to a hotel or other location during the outage?

**Question:** Will CHSRA compensate business for their outages if suspended utilities shut down their business?

4494-9225

**Temporary Energy Consumption During Construction**

Impact PUE#6 states: "During construction of the Palmdale to Burbank Project Section, energy would be consumed for the construction of trackway, stations, and ancillary facilities; production and transportation of construction materials; and the operation and maintenance of construction equipment. These construction activities typically utilize diesel- or gasoline-powered equipment and vehicles. Table 3.6-22 shows estimates of construction-related indirect energy consumption for the construction phase of the Build Alternatives.

Table 3.6-22 Estimated Energy Consumption for Construction of the Build Alternatives Build Alternative	Central Subsection (MMBtu)	Burbank Airport Station (MMBtu)	Total Consumption (MMBtu)
Refined SR14	2,982,239	173,589	3,155,828
SR14A	3,061,181	173,589	3,234,770
E1	2,522,664	173,589	2,696,253
E1A	2,532,424	173,589	2,706,013
E2	2,838,622	173,589	3,012,211
E2A	2,850,812	173,589	3,024,401

Energy used during construction of the Palmdale to Burbank Project Section would represent a one-time, nonrecoverable energy cost. The temporary demand for energy utilized during construction would not require additional permanent electricity transmission capacity and would not increase peak- or base-period demands for electricity from the electrical grid system."

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 37 of 156

4494-9225

**Question:** Do the estimates in Table 3.6-22 include the energy electricity to run multiple tunnel boring machines a day with each boring machine requiring up to 3,500 kwh (this number based on existing boring machine specifications)?

4494-9226

**Question:** How can CHSRA claim that, "The temporary demand for energy utilized during construction would not require additional permanent electricity transmission capacity and would not increase peak- or base-period demands for electricity from the electrical grid system"? How would CHSRA's operations not increase peak or base power demand when the tunnel boring machines would be running 24 hours per day 7 days a week?

4494-9227

**High Risk & Major Utility Impact Report**

Appendix 3.6-A details the impacts of CHSRA to critical Utility infrastructure including, Water, Power, Phone, Internet cables, Sewer, and other impacts.

Per CHSRA's report, you communicated with the various Organizations (Public and Private) to understand their existing infrastructure and how CHSRA will impact this critical infrastructure for each of the proposed CHSRA Route Alternatives.

**Question:** Appendix 3.6-A latest communications were in 2016. Why hasn't this EIR been updated or validated with current conditions, considering the last communications were 7 years ago?

**Question:** Did CHSRA validate the findings in Appendix 3.6-A with each of the impacted organizations? If so, when (date), with whom (persons), what were the results of discussion?

**Question:** Has CHSRA communicated with any of the impacted organizations since August 2016 to validate these findings? If so, when (date), with whom (persons), what were the results of discussion?

**Question:** Has CHSRA been informed of new or additional infrastructure projects since August 2016 (assuming this was the completion date of the Appendix) and how new or planned infrastructure would impact CHSRA Alternatives? If so, when (date), with whom (persons), what were the results of discussion? If updates were received, why are these updates not included in the Draft EIR?

4494-9228

**Construction Water Usage**

Appendix 3.8-D page 16 states that: "the volume of water necessary for construction of the SR14A Build Alternative has been estimated as a total of 193,680,000 gallons for the entire construction period." In water terms, 193,680,000 gallons is equal to 595 acre feet (AF) of water required to complete construction of the entire SR14A Build Alternative.

In Section 3.6-19, CHSRA estimates the amount of water required to build various CHSRA structures, including tunnelling, concrete structures, construction buildings, and cut-and-cover structures. See table 3.6-4 below.

A ballpark estimate of the tunneling requirement for boring the tunnels for SR14A, assuming a boring speed of 43 feet per day, estimates between a low of 327,1400,000 gallons (1,004 AF) and a high of 660,228,000 (2,026 AF) of water. Estimating the combined construction water estimates for all identified structures is between a low of 471,930,000 gallons (1,283 AF) and high of 751,018,000 (2,305 AF) of water (see spreadsheet below).

These water estimates are ONLY for major SR14A structures. This does not include additional construction water requirements for personnel, dust abatement around construction sites, water for constructing additional

Page 39 of 156

4494-9228

utility infrastructures, or water required for movement of existing utility wires, pipelines, water lines, telecommunications lines and other construction activities.

The Western States of the US (i.e., California, Idaho, Utah, Wyoming, Nevada, Arizona, and Colorado) are in a multi-year long drought that will require reduced water allocations from the Sierra Nevada, Cascade, and Colorado Water sheds. Critical negotiations are currently being held by these Upper and Lower Colorado River Water Shed State to reduce water allocations to each State.

**Question:** Where does CHSRA expect to obtain this volume of water to support construction?

4494-9229

**Question:** Will CHSRA construction require a reduction in water allocation to all residents of California?

**Question:** Will CHSRA construction require a reduction in water allocation to California's multi-billion dollar agricultural sector?

**Question:** Since all Californians are currently being asked to reduce water usage, what benefits will California residents obtain from additional water reductions that would be required to build the Palmdale to Burbank project section?

4494-9230

**Question:** Will there be sufficient water to support ongoing CHSRA activities once the CHSRA is completed?

California High-Speed Rail Authority August 2022 Palmdale to Burbank Project Section Draft EIR/EIS Page | 3.6-19

Table 3.6-4 Water Demand Rates for Construction Activities Activity	Demand Rate
Constructing a steel structure (truss/arch)	10,000 gallons/structure
Constructing a concrete structure	10,000 gallons/structure
Constructing station buildings	20,000 gallons/building
Cut-and-cover	40,000 gallons/day/double track tunnel
Tunnel boring machine	55,000–105,000 gallons/day per tunnel boring machine

**Estimated Water Usage Table - Route SR14A Estimated**

Feet per day estimate is based upon a Tunnel Boring Machine used in 2016 to bore a tunnel in the Swiss Alps. While this estimate is a maximum speed for this machine going through the Swiss Alps, the San Gabriel Mountains geology will provide additional challenges given the historic seismic conditions that currently exist.

Tunnel	Miles	Feet	Boring Speed-ft/day	Build Days
Tunnel 1	7.3	38544	43	897
Tunnel 2	3.1	16368	43	381
Tunnel 3	0.5	2640	43	62
Tunnel 4	0.9	4752	43	111

Table 3.6-30 Summary of CEQA Significance Conclusions and Mitigations Measures for Public Utilities and Energy states: "Impact PUE#3 Effects from Water Demand during Construction, Level of CEQA Significance after Mitigation is Less than Significant."

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 41 of 156

4494-9231

**Question:** Given the current drought conditions and expected low level of water availability in the future, how can CHSRA still consider this impact "Less than Significant"?

Impact	Level of CEQA Significance before Mitigation	Mitigation Measures	Level of CEQA Significance after Mitigation
<b>Construction Impacts</b>			
Impact PUE#1: Planned Temporary Interruption of Utility Services.	Significant	PUE-MM#2	Less than Significant
Impact PUE#2: Accidental Disruption of Utility Systems.	Less than Significant	No mitigation measures are required.	N/A
Impact PUE#3: Effects from Water Demand during Construction.	Significant	PUE-MM#1	Less than Significant

### CHAPTER 3.7: BIOLOGICAL AND AQUATIC RESOURCES

Questions:

4494-9232

**3.7-4** Who will be stipulating recovery plans? Who will be carrying the plans out? Who will be paying for them?

4494-9233

**3.7-9** Over what time period has CHSRA been working with the U.S. Forest Service with respect to the ANF? Were communications available to the public? If not, then why not? What is the process for voluntary protections under CA Assembly Bill 498?

4494-9234

**3.7-10** Are all contractors working in the ANF familiar with each of these listed Acts and Codes?

4494-9235

**3.7-11** Is the Authority exempt from Forest Service regulations? What would be an example of a mitigation measure that would minimize removal of native vegetation?

4494-9236

**3.7-12** What would be an example of an unavailable RSA? What exactly is the process of identifying species through aerial photography interpretation?

4494-9237

**3.7-18** How much training would be given during construction in addition to before construction? What is an example of WEAP training material? What is an example of a special status plant that might be encountered? Will workers be distracted from identifying plants when doing their jobs?

4494-9238

**3.7-19** How many Project Biologists will be working in an area? Will there be video cameras at night to track animal life? How will wildlife movement corridors be identified? What

Page 43 of 156

4494-9238		materials will be used to clean vehicles? Will rodenticides be used, given that they are harmful to animals, including owls and mountain lions?	4494-9253	3.7-103	Is there groundwater recovery from tunnel construction as mentioned in the Arrowhead Tunnels? If so, how did that affect vegetation recovery?
4494-9239	3.7-22	What are examples of modeling tools?	4494-9254	3.7-106-7	How can the Authority justify destroying plants living in the San Gabriel Mountains National Monument? Is not that land protected? If endangered species of plants and animals are present, aren't they federally protected?
4494-9240	3.7-24	Were any of the Field Surveys, aside from the red-legged frog, actually conducted in the field as opposed to prepared from desktop research or aerial photographs?	4494-9255	3.7-110	In a 2015 meeting in Pacoima, Michele Boehm from CHSRA told those present, including myself, "If any routes affect the watershed, then they won't be selected." Was this statement, made by a high-ranking High-Speed Rail representative, not accurate? If it was accurate, then why are routes with impacted streams that foster plant communities being considered?
4494-9241	3.7-28	How were these 5 species chosen? Black bears are also prevalent in the San Gabriel Mountains. Why are they not on the list?	4494-9256	3.7-109	Research has now established the fact that tree communities communicate underground, and their well-being depends upon this communication. How will forest communities of special-status trees survive when their habitats are interrupted?
4494-9242	3.7-29	What are the special status plants? How many are there?	4494-9257	3.7-112	How will surveys for Special-Status Plant Species and Communities be conducted? Where will seed banks be stored? How will they be preserved, and then who will replant them? Where will they be replanted, and who will monitor their growth? What exactly is Vernal Pool Work Restriction? Who will oversee the work? What would be an example for BIO-MM#32,33 of associated plants that rely on a particular special-status plant? For how long during train operation would monitoring of aquatic resources continue?
4494-9243	3.7-32	Although much of the 834-square mile Los Angeles River Watershed has been paved over, it is not necessarily largely polluted. What specific evidence is there that water from the area cannot be converted or used, especially in this time of drought? Which specific areas of the 834 square miles can be used? How will vegetation communities be affected by spoils hauling both in north and south routes?	4494-9258	3.7-113	Who would receive compensation in BIO-MM#38? Who would determine what that compensation should be? What method would be used for restricting sensitive plant areas from construction areas? Would once a year suffice for an Annual Vegetation Control Plan? Wouldn't such plans vary by species? Who will be making specific plans in specific areas and monitoring activities? What does a Compliance Reporting Program look like? Who receives it and gives feedback? How do plans make impacts on plants "less than significant for all six Build Alternatives"? How could the Authority know if restoration of an affected habitat area is successful? How long would such an area be observed and maintained to determine success? What entity would receive compensation?
4494-9244	3.7-90	Since what is under the mountains affects what is above, how might wildlife be affected in significant ecological areas? How would vibrations from trains affect animal and wetland life as the train traverses these areas above ground? What part of Hansen Dam is under the jurisdiction of the Army Corps of Engineers?	4494-9259	3.7-114	When were surveys and habitat assessment conducted for red-legged frog populations? Were the observations done in person? If so, by whom?
4494-9245	3.7-92	Are any of the Build Alternatives to go on ground level in any part of the 275,000 protected areas? Are specific wildlife corridors known to the Forest Service?	4494-9260	3.7-116	How do we know that destruction to aquatic breeding habitats would be temporary? How often will the BIO AMFs be employed? Will workers be on the job at night?
4494-9246	3.7-93	What wildlife, including but not limited to mountain lions, have been killed on the 14 Freeway?	4494-9261	3.7-117	How does one compensate for "unavoidable impacts"? How will groundwater inflow during tunnel construction affect people who depend upon wells in the ANF for their water? Is there compensation for them?
4494-9247	3.7-95	Exactly what is meant by "would affect?"	4494-9262	3.7-121	What is the source of the surveys, Restoration Plans, and Minimization Measures? Have they been used in other high-speed rail construction projects? How successful have been? What are examples of Construction Activities and monitoring measures that can reduce impacts on nesting habitats? When a species is lost, how is it compensated?
4494-9248	3.7-96	To what extent are special status plants protected by law? Does "range of impact" mean that plants would be destroyed? Does "acres of impact" signify the number of acres found within the area of a Build Alternative or the number of acres that would be destroyed by the Build Alternative?			
4494-9249	3.7-96-99	What will be done to mitigate the loss of threatened, endangered, and rare species plants?			
4494-9250	3.7-101	How will the destruction of each plant community specifically affect wildlife (mammals, birds, fish) that depend on the plants for shelter or food?			
4494-9251	3.7-102	Will workers be allowed to smoke during construction?			
4494-9252	3.7-102	Why is CHSRA using the word "temporary" to describe impacts? How could the impacts described be temporary? How many biologists would be present on-site during construction? What are examples for WEAP training materials for workers? Where would construction spoils and waste go? How can construction equipment be cleaned and still not affect plant life from water drain off? Realistically speaking, how can hydrology changes in groundwater levels during construction be "temporary" in their impacts on plant life?			

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 45 of 156

4494-9263	3.7-122	What constitutes a way to eradicate weeds? Would a weed killer be used? It is important that rodenticides not be used. Will Arundo be eliminated? What are examples that would need reduced traffic speeds? Are these roads that are shared with other vehicles not related to High-Speed Rail construction? In what way and how often would compliance reports be made? Who receives them? What are examples of construction activities that can reduce impacts on breeding habitats for amphibian species? Will there be workers who specialize in construction in wetlands?	4494-9276		BIO-IAM#12: How will books regarding electrical wires and birds be enough to affect disrupted nests, noise from construction, and fragmented habitats of birds? Will construction avoid the breeding season for birds?
4494-9264	3.7-123	How can one determine that the listed mitigation measures automatically make impacts on amphibians less than significant in all cases, when construction has not started? Will construction continue from February to September during nesting months for the 5 FESA-listed species?	4494-9277	3.7-133	In the Protection of Wetlands (USEO 11990), "practicable measures to minimize harm" are necessary. How would the Bio Mitigation Measures that conduct surveys reduce impacts on nesting birds? What do the surveys consist of? Who conducts them? How are their results translated to construction workers?
4494-9265	3.7-125	How has CHSRA concluded that, "There is no known breeding activity within 10 miles of the Build Alternatives?" How do we know this to be true?	4494-9278	3.7-134	In BIO-MM#16, what specific measures would protect the California Condor? How does noting the presence of a nest protect the Swainson Hawk or the Burrowing Owl? What specific mitigation measures are used for protection? Does construction cease? Since restoration of habits and foraging areas are key to preservation of species, how would revegetation be carried out and when would it be done?
4494-9266	3.7-128	Looking at Section 3.7.4.2:  BIO-IAMF #1: Would appropriate Biologists for specific areas plan ahead to coordinate with bird nesting habits?	4494-9279	3.7-135	How and when will mitigation measures be documented? What evidence is there that habitat restoration will cause birds to return to a previous area?  How specifically will weeds be controlled? What are examples? How is noise from construction confined? What are specific examples of reducing traffic speeds through the ANF? What does the Compliance Reporting Program consist of? What entity receives it? How is it evaluated during construction? BIO-MM-63 states the Work Stoppage is the same as "reduced." Which is it?
4494-9267		BIO-IAMF#2: If issues are raised following a meeting between agencies, such as the USFWS, and sent to the Authority, what happens next?			
4494-9268		BIO-IAMF#3: How long should dissemination of WEAP Training Materials take to thoroughly make certain that workers understand? How are workers evaluated for understanding? Are materials available in the primary language of each worker?			
4494-9269		BIO-IAMF#4: What is an example of a penalty for noncompliance of a regulation?			
4494-9270		BIO-IAMF#5: At what point in the building process is the Resources Management Plan compiled?			
4494-9271		BIO-IAMF#6: What is an example of a type of material appropriate for a particular species protection? Will the Project Biologist inspect for wildlife daily?	4494-9280	3.7-136	Where would supplemental water for fostering habitat come from, and how would it be delivered? What "compensatory mitigation" would be issued and to whom? How does that make for "less than significant?"
4494-9272		BIO-IAMF#8: How much space will be used by staging areas and traffic routes that cover special-status species? How long will species be restored when temporary structures are removed? How large and permanent will the staging areas for construction equipment be?	4494-9281	3.7-138	How do mitigations involving biologists, planning, training, waste disposal, traffic, and maintenance of workspace and tools insure that special status fish are protected? How much time would this preparation be allowed?
4494-9273		BIO-IAMF#9: Will a new facility be built for storing construction spoils and waste? If so, how large will it be? How will disrupted plant species be preserved? What is meant by "treatment"?	4494-9282	3.7-142	BIO-MM#-32: At what point in the construction would riparian habitat be restored?
4494-9274		BIO-IAMF#10: Where will cleaning locations be? How large and disruptive to the forest will they be? What materials will be used to clean the equipment?	4494-9283		BIO-MM#33: What is the process for restoring aquatic resources? What is the difference between "Temporary" and "Permanent" impacts to fish?
4494-9275		BIO-IAMF#11: Will rodenticides that can harm animals, such as bobcats and mountain lions, be used? What method will be used to train workers to implement correct housekeeping?	4494-9284		BIO-MM#34: How does monitoring construction activities help to reduce impacts on fish? What is one activity that would have an effect in protecting a special status fish?
			4494-9285		BIO-MM#46: How is it determined that compensatory mitigation is appropriate? Who receives compensation? What is the follow-up process to offset the loss?

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

Page 47 of 156

4494-9286		BIO-MM#47: Are Aquatic Resources to be replenished? What is the source for replenishment?	4494-9304		BIO-MM#47: What is an example of an offset for a species?
4494-9287		BIO-MM#53: What is done with offset compensation?	4494-9305		BIO-MM#50: Who will supervise and carry out these mitigation measures? How will restoration be measured?
4494-9288	3.7-143	How could construction itself reduce special-status fish disturbance? What power would the Biologist have in enforcing these mitigations? To what extent does the contractor follow the biologist's recommendations?	4494-9306		BIO-MM#53: What is an example of a Compensatory Mitigation Plan for a specific species?
4494-9289		BIO-MM#61: Who is responsible for compiling and reporting on implementation of mitigation measures? How does a report reduce impacts on special-status fish?	4494-9307		BIO-MM#55: Who will prepare and implement the weed control plan?
4494-9290		BIO-MM#62: What is an example of a mitigation measure to reduce an impact on a special-status fish species should dewatering be an issue?	4494-9308		BIO-MM#56: Will the Contractor be answering to the Biologist? Will the Biologist be present at all construction activities which could impact invertebrate species habitat?
4494-9291		BIO-MM#63: How likely is it that work will be stopped for a fish species?	4494-9309		BIO-MM#60: What is a safe speed for a particular construction vehicle in an endangered butterfly zone?
4494-9292		BIO-MM#76: What is meant by "relevant guidelines for all special-status fish species?"	4494-9310	3.7-148	BIO-MM#61: How often are compliance reports written? Who receives them?
4494-9293		BIO-MM#84: How knowledgeable are workers expected to be of the three-spine stickleback? How will workers show their knowledge from an awareness program? Why will contaminants be allowed to enter the Santa Clara River channel?	4494-9311		BIO-MM#63: What is an example of work stoppage or reduction?
4494-9294		BIO-MM#86: What are some expected weather or seasonal work restrictions?	4494-9312		BIO-MM#94: How will workers recognize Monarch Butterfly host plants? What kind of compensatory mitigation would be provided?
4494-9295		BIO-M#87 What are some spill-proof measures?	4494-9313		How are the mitigation measures above ground guaranteed to be effective and, thus, considered "less than significant?"
4494-9296	3.7-144	BIO-MM#88: Which debris prevention measures are expected to be most effective?	4494-9314	3.7-150	What is the likelihood of mountain lions straying into human-populated areas as a result of high-speed rail construction disturbance? How will loss of mountain lions be determined and tabulated?
4494-9297		BIO-MM#89 Exactly what are the seasonal restriction dates for the unarmored three-spine stickleback?	4494-9315		How can lighting be changed and/or reduced to discourage insects and prevent disorientation of bats?
4494-9298		BIO-MM#90: If dewatering decreases water in the Santa Clara River, at what point will construction dewatering results begin again? Are pollutants expected to enter the river?	4494-9316	3.7-151	How do the listed BIO-IAMFs work for recognition of badger presence and survival? What does preservation "to the extent feasible" actually mean for a special-status mammal, such as a badger or bat? What studies are referenced by "previous monitoring of tunnel effects?"
		How do planned mitigations result in less than significant impacts? How are habitat areas measured to determine whether mitigation measures have been successful? At what point does measurement take place? Who receives compensation?			
4494-9299	3.7-146	How can the mitigation measures listed prevent construction activities, off-road traffic, and chemical runoff into habitats of special-status invertebrate habitats?	4494-9317	3.7-155	BIO-MM#6: How could revegetation plans be made for a ringtail?
4494-9300		BIO-MM#3: Does surveying the area for wildlife species change construction at all?	4494-9318		BIO-MM#25: How will mitigation be determined as successful for bats?
4494-9301		BIO-MM#4: What is an example of vernal pool work restriction for a particular species? Would work stop during that period?	4494-9319		BIO-MM#26: What method would be used to relocate bats?
4494-9302	3.7-147	BIO-MM#6: How will a revegetation plan, even if implemented, bring back a butterfly? When and how would its success be determined?	4494-9320		BIO-MM#27: How do bats get excluded?
		BIO-MM#39: What kind of compensatory mitigation can be expected?	4494-9321		BIO-MM#28: How would construction be changed to avoid Ringtails?
4494-9303			4494-9322		BIO-MM#29: Once a badger den is spotted, does construction cease?
			4494-9323		BIO-MM#36: How deep into the ground will barriers be installed?

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 49 of 156

4494-9324		BIO-MM#47: What is an example from an aquatic resource that would provide compensatory mitigation?	4494-9345	3.7-164	What evidence is there that the aforementioned mitigation measures will make impacts "less than significant"?
4494-9325		BIO-MM#50: Who will oversee Off-Site Habitat Restoration? How soon after construction will it be implemented?	4494-9346	3.7-167	To what extent would the E2 Build Alternative affect private wells in Kagel Canyon, north of Lake View Terrace? Because construction is significantly longer than two growing seasons, how long will it take for aquatic resources to be restored?
4494-9326		BIO-MM#55: What is an example for a weed control plan for a specific habitat?	4494-9347	3.7-169	With BIO-IAMF#11, what is considered a "timely manner" for weed abatement that will reduce impacts on aquatic resources? What regulatory agencies receive documentation? What sources are used for previous monitoring of tunnel effects? How are they pertinent to the ANF?
4494-9327	3.7-156	BIO-MM#56: How many Project Biologists will be monitoring sensitive areas when several different locations are involved in construction at a given time?	4494-9348	3.7-172	What is the name of the "agency-approved mitigation bank"? Knowing that the CEQA Conclusion acknowledges significant impact, how can CHSRA justify destroying California and Federal wetlands and water, especially in this time of extreme drought?
4494-9328		Will different types of exclusionary materials be installed at the same locations for different species? If construction equipment would crush burrows, how would impacts on species be avoided?	4494-9349		BIO-MM#4: How would pool work restriction be carried out? Who would monitor it?
4494-9329		BIO-MM#61: Does compliance reporting necessarily insure that impacts on special-status species are reduced?	4494-9350		BIO-MM#5: What expert will oversee avoidance and minimization measures?
4494-9330		BIO-MM#63: How many times is work stoppage expected to minimize mammal injury?	4494-9351		What is an example of one measure and how it protects aquatic resources?
4494-9331		BIO-MM#76: What is an example of a Wildlife Rescue Measure?	4494-9352		BIO-MM#s32,33: How will habitats be restored?
4494-9332		BIO-MM#96: Will cameras be used when surveying for mountain lion dens?	4494-9353		BIO-MM#34: Will waters not considered Jurisdictional also be monitored?
4494-9333		BIO-MM#97: Once a mountain lion den is located, what is a following procedure?	4494-9354		BIO-MM#39: Who will oversee the mitigation for impacts?
4494-9334		BIO-MM#99: How would reduced lighting be different for species which are accustomed to no lighting? What lighting that is not artificial would be employed?	4494-9355		BIO-MM#47: Will these mitigation plans also be approved by Federal authorities? What are several different specific plans to mitigate impacts on shrimp habitats?
4494-9335	3.7-157	How exactly is groundwater-dependent surface water monitored? Where would needed supplemental water come from? How does CHSRA guarantee that the mitigation measures would make impacts "less than significant"?	4494-9356		BIO-MM#50: How does saying that some unstated measures will definitely minimize and reduce impacts on habitats actually mean that aquatic resources will be restored?
4494-9336	3.7-163	BIO-MM#6: How does a plan reduce impacts?	4494-9356	3.7-173	BIO-MM#56 and BIO-MM#58: Who will be in charge of these two mitigations?
4494-9337		BIO-MM#7: How are surveys for reptile and amphibian conducted?			What will be the source of supplemental water? Do the mitigations mentioned here change impacts under CEQA? How?
4494-9338		BIO-MM#8: Will amphibians be cleared from construction areas on a daily basis?	4494-9357	3.7-176	Who will design, monitor, and implement the mitigation measures that are to be applied in each area that has construction that could affect fish and wildlife species in streams, rivers, and lakes?
4494-9339		BIO-MM#36: What materials are best for barriers against reptiles?	4494-9358	3.7-177	Can changes in groundwater levels caused by tunnel construction be permanent?
4494-9340		BIO-MM#47: Who prepares this plan? How is the contractor involved?	4494-9359	3.7-178	Is tunnelling allowed in the SGMNM?
4494-9341		BIO-MM#50: How do off-site mitigations differ from other mitigations?	4494-9360	3.7-179	BIO-MM#6: How would a revegetation plan affect wildlife and fish dependent upon streams during construction?
4494-9342		BIO-MM#52: What specifically is done during lizard monitoring?			BIO-MM#32: What is considered "long term"?
4494-9343		BIO-MM#53: Does a mitigation plan always offset impacts?			
4494-9344		BIO-MM#55: What is an example of an invasive weed and an example of a weed control plan that would be implemented in reptile species habitat?	4494-9361		

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

Page 50 of 156

4494-9362 | BIO-MM#33: How much time is considered as "temporary"?

4494-9363 | BIO-MM#34: How does construction activity monitoring differ in Jurisdictional waters as opposed to non-Jurisdictional water monitoring?

4494-9364 | BIO-MM#46: How does compensatory mitigation offset permanent impacts on areas?

4494-9365 | BIO-MM#47, MM#50 and MM#53: Who prepares and oversees the Compensatory Mitigation Plan on Aquatic Resources? How does a plan ensure mitigation?

4494-9366 | 3.7-180 | BIO-MM#55: What weeds are expected in the different Build Alternatives?

4494-9367 | BIO-MM#62: How much time will be given to ascertain the existence of special-status species within a waterbody? If dewatering affects such an area, how will the species be protected? To what extent have these aquatic mitigation measures been effective in other sections of the project? How would supplemental water be supplied?

4494-9368 | 3.7-181 | Although BIO-IAMF#1-5 and IAMF#12 may have good intentions, what evidence is there that they would have the desired effect until they were put into practice?

4494-9369 | 3.7-183 | BIO-MM#6: Who prepares the RRP, oversees that it is carried out, and evaluates the results?

4494-9370 | BIO-MM#47: In what way could there be an additional benefit to a critical habitat?

4494-9371 | BIO-MM#50: In what way could off-site habitat restoration restore fish? How do these mitigation measures ensure no adverse effects? What would be the source of supplemental water? How would it be administered? How does importing water justify that there are no adverse effects on species?

4494-9372 | 3.7-184 | What is the acreage of the Hansen Dam Spreading Grounds that would be affected? The Audubon Society conducts bird watching walks in the Hansen Dam area? How would birds, endangered or not, be affected by construction there?

4494-9373 | 3.7-185 | BIO-MM#6, MM#47, MM#50: During the construction period, would these plans be put into place? How would their success be determined? What are examples of particular measures to be put into place in the Hansen Dam SEA, for example?

4494-9374 | 3.7-186 | What specific mitigations would work for protecting native oak trees? Making and carrying out a plan will not work since oaks do not transplant well, and Oak Tree Ordinances require permission to cut more than 2 inches in diameter. What are mitigations for each of the kinds of trees that will be uprooted? What methods of compensation are being offered in BIO-MM#35? Because off-site tree colonies communicate underground for survival, how could they avoid being impacted in BIO-MM#50? Because oaks in particular have adapted to seasonal water from rain and can get mold from other watering, will there be any mitigations to protect the trees? Is the Authority aware that many oaks are well over 100 years old? Is it important to preserve native trees?

4494-9375 | 3.7-187 | BIO-MM#56: How close to elderly trees will construction machinery be allowed, keeping in mind that compaction over ground above tree roots is harmful to the trees? How can it

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 51 of 156

4494-9375 | be concluded that unnamed mitigation measures will be successful? What kinds of fencing will be used around portals and adits?

4494-9376 | 3.7-188 | How much soil will be displaced and allowed to cover areas around open-cut activities? How long will the soil stay in one spot before removal? How wide would the grading footprint be in at-grade sections in the San Gabriel Mountains and foothills?

4494-9377 | 3.7-193 | Considering its width, why is Angeles Forest Highway considered constraining to wildlife crossing?

4494-9378 | 3.7-198 | "Inundated" by what?

4494-9379 | BIO-MM#36: At what point in the process will fencing be introduced as opposed to the wildlife corridor protection?

4494-9380 | 3.7-199 | BIO-MM#37: Specifically, how would effects on wildlife movement corridors be minimized during construction?

4494-9381 | BIO-MM#60: What specific speeds are mandated for vehicle traffic at construction sites?

4494-9382 | BIO-MM#78: What does a Wildlife Jump-out look like, and how does it work?

4494-9383 | BIO-MM#83: What are examples of specific measures for at least three different kinds of special-status wildlife? How do WEAP training materials differ in areas for operation and maintenance compared to WEAP during construction?

4494-9384 | 3.7-200 | What are examples of herbicides and pesticides that would be used for weed abatement for different species needing protection? Why would trash and chemicals have accumulated within a Build Alternative footprint after construction if mitigation is complete? If mitigation for hazardous materials has been accepted as environmentally safe, how could it still be an issue?

4494-9385 | 3.7-201 | How will lights from catenaries affect birds which travel at night? How would light and noise at portals by the ANF and SGMNM affect wildlife?

4494-9386 | 3.7-202 | How would Santa Ana winds, prevalent in the area, affect seed settlement? How does a short duration of noise affect amphibians, given statements that they would already have been affected by possible water contamination and invasive plant species? What spacing is considered effective to prevent bird electrocution? How does marking lines help protect birds at night? What are other types of flight diverters besides fencing? What distance from a moving train could protect bird habitat?

4494-9387 | 3.7-204 | How exactly would implementing BIO-IAMF#12 minimize alteration of melatonin metabolism on several different species?

4494-9388 | 3.7-206 | Which reptiles are most vibration-sensitive? Are those reptiles inactive during the day in all seasons?

4494-9389 | BIO-MM#36: How much noise from a moving train would be reduced by an apron or fenced barrier for special-status species such as the mountain lion, for example?

4494-9390 | BIO-MM#53: What is an example of a CMP for a state-listed fish, for example?

4494-9391 | **3.7-207** | BIO-MM#54-55: How useful is weed control when invertebrates have already been crushed during equipment maintenance?

4494-9392 | | BIO-MM#73: How often will tracks be inspected for carrion removal?

4494-9393 | | BIO-MM#76: What would be a wildlife rescue measure for a specific endangered mammal? How would it be carried out? Who would oversee the operation?

4494-9394 | | BIO-MM#86: What is a specific example of a weather-related or seasonal work restriction for avoiding the Santa Clara River channel?

4494-9395 | | BIO-MM#88: Who will oversee debris prevention measures? What is an example of a measure?

4494-9396 | | BIO-MM#92: What are avoidance measures during operation and maintenance for the Santa Clara River?

4494-9397 | | BIO-MM#98: How can aerial species wildlife be minimized?

4494-9398 | **3.7-208** | BIO-MM#101: How does measurement of conditions for noise reduction for special-status bird habitats work? How logical is it to assume that the mitigations measures will be successful for a project that has not begun? At what point do you measure the effectiveness of the listed mitigation measures?

| | What happens if the mitigation measures have not been effective?

4494-9399 | **3.7-210** | Will decibels be measured during operation further than 50 feet of the aboveground centerline? Who will be carrying out the measurement? How often will measurements be recorded?

4494-9400 | **3.7-211** | What are examples of herbicides and pesticides that would be applied? Who would determine the compensation for impacts on protected trees?

4494-9401 | **3.7-212** | When removal of a tree is affected by a law (such as the L.A. County Oak Tree Ordinance) and transplantation is not possible, how is real compensation possible, and how does that suggest a "less than significant" measure? Would the contractor, who is responsible, be knowledgeable about tree conservation? Who in "The Authority" oversees the contractor's work with this issue?

4494-9402 | **3.7-213** | BIO-MM#2: Who will determine appropriate replanting areas to substitute for plants that could not be salvaged? Who will attend to new plant growth? Who approves the Project Biologist's plan?

| | BIO-MM#3: Is the "work" referred to the work of the Biologist or construction? Will there be no groundbreaking activities between October and April?

4494-9403 | | |

4494-9404 | **3.7-214** | BIO-MM#6 is quite general without CHSRA having identified a specific Build Alternative. Where would the Project Biologist be procuring these procedures for a variety of vegetation communities?

4494-9405 | **3.7-215** | BIO-MM#7: How does one survey for the presence or absence of special-status reptiles and amphibian species? How much time is given to a particular survey location?

4494-9406 | | BIO-MM#8: How is relocation of amphibians done?

4494-9407 | | BIO-MM#14: Will birds remain in nests within 75 feet of construction? Will construction take place between February and September?

4494-9408 | | BIO-MM#15: How effective are buffers for raptor nests?

4494-9409 | | BIO-MM#16: Will construction take place after sunset and before sunrise in the area of a roosting California Condor? If several different work areas will be constructed at the same time, will there be different Project Biologists overseeing different areas? Will the Project Biologist have had experience in identifying Swainson Hawks and their nests? What kinds of trees do Swainson hawks usually nest in?

4494-9410 | **3.7-217** | BIO-MM#21: How often do burrowing owls return to a relocated burrow?

4494-9411 | | BIO-MM#26: What determines whether removal or relocation of bat roosts is feasible? What is an example of an exclusion techniques? Are project activities continuing during the week after implementing exclusion activities? What kinds of relocation plans exist for bats?

4494-9412 | **3.7-218** | BIO-MM#29: Since badgers burrow, how will the Project Biologist determine whether a badger is pregnant? What is an example of a "passive den exclusion measure" for badgers?

4494-9413 | | BIO-MM#32: How will the Project Biologist time native plant seeding with the growing season for the plants to be restored?

4494-9414 | | BIO-MM#33: What is an example of maintenance monitoring for a specific aquatic plant?

4494-9415 | | BIO-MM#34: Will protective barriers be permanent?

4494-9416 | | BIO-MM#35: Examples would be useful here, especially since some plants, such as native oaks, do not transplant.

4494-9417 | **3.7-219** | BIO-MM#36, 37: How permanent and aesthetically unappealing will the fencing be?

4494-9418 | **3.7-220** | BIO-MM#38, 39, 44, 46: What are some examples from the Compensatory Mitigation Plan?

4494-9419 | **3.7-221** | BIO-MM#47: What are two agency-approved mitigation banks that could be used? Where is property that could be acquired? Would it be property conducive to aquatic resources?

4494-9420 | | BIO-MM#50: Who will be in charge of carrying out the IAMF measures?

4494-9421 | **3.7-222** | Does BIO-MM#53 apply to all federal and state-listed species and their habitat? What role does the Project Biologist have in the process of CMP preparation? Who will decide the type of credits to be given? Will easements be permanent?

| | **3.7-223** | How long is the process presented in BIO-MM#53 likely to take?

4494-9422		BIO-MM#54: What are cultural controls over vegetation? What chemicals might be used to control vegetation?	4494-9441	3.7-236	BIO-MM#93: Will AMMPs vary with different sites? How would supplemental water be provided? Where would it come from? How much supplemental water is expected to be needed over 3 seasons? How will supplemental water be transported? How often during the post-construction 5 years would groundwater levels be monitored?
4494-9423	3.7-224	BIO-MM#55: Who is in charge of carrying out the weed control plan? What paperwork is involved?	4494-9442	3.7-237	Is it not ironic that a project intended to help the environment is purchasing credits due to its destruction of habitats of endangered species?
4494-9424	3.7-225	Will new roads be created? If so, are they likely to cover over endangered plants which will need replacement?	4494-9443	3.7-238	BIO-MM#96: If a mountain lion den is determined to be occupied, will construction work continue? Given that mountain lions are apt to claim large areas, how will CHSRA keep track of them?
4494-9425		BIO-MM#61: What kind of feedback will go to the Project Biologist after the annual and daily reports are submitted and read?	4494-9444	3.7-239	BIO-MM#100: How much light from above will shields allow?
4494-9426	3.7-227	BIO-MM#62: What is the turnaround time for approval of preparation of plans or dewatering and diverting water plans?	4494-9445		BIO-MM#101: What might be an example of a special-status bird that could withstand noise as a result of sound barriers?
4494-9427	3.7-228	What would be an example of a feature that would accommodate wildlife movement when designing bridges and culverts in BIO-MM#64?	4494-9446	3.7-240	Although many of the mitigations may be standard and applicable to different locations, the question is: how long would they be in operation in order to be successful? Would they be temporary enough so that wildlife could revive or return to former habitats? How long would most of them be needed?
4494-9428		BIO-MM#65: How is the "pre-construction sweep" for golden eagle use carried out?	4494-9447	3.7-241	Stating that because secondary impacts are common in construction should not apply to this particular project, which is a first of its kind. How do impacts from this project differ from others, especially in the San Gabriel Mountains?
4494-9429		BIO-MM#66: What kinds of activities would likely disturb active eagle nests? Would the no-work buffer halt all work?	4494-9448	3.7-242	How can permanent security fencing be made agreeable to the eye? Will management activities be on-going? Are they budgeted?
4494-9430	3.7-229	BIO-MM#67: Can active eagle nests be relocated?	4494-9449	3.7-246-250	How do we know that the mitigations would leave no adverse effect when they have yet to be tried?
4494-9431		BIO-MM#70: Will the project Biologist be able to identify habitat loss of the tricolored blackbird?	4494-9450	3.7-256-269	Once again, there is an assumption that there would be no adverse effects due to mitigations when no work has begun. How is it possible to be certain of this conclusion?
4494-9432	3.7-230	BIO-MM#72: Will the Project Biologist be on site both day and night?	4494-9451	3.7-271-73	How have the mitigations managed to be so successful?
4494-9433		BIO-MM#74: How are vertical buffers measured? What materials are jump-outs made of?	4494-9452	3.7-275	What might be some difficulties in determining that there would be not adverse effects? Does reducing impacts erase all impacts in SEASs?
4494-9434	3.7-231-2	BIO-MM#79, 80, 81, 82: How will the surveys for the Coastal California Gnatcatcher, the Least Bell's Vireo, the Southwestern Willow Flycatcher, the Western Flycatcher, the Western Yellow-billed Cuckoo be conducted?	4494-9453	3.7-178	What existing constraints make wildlife movement impossible?
4494-9435		BIO-MM#83: How much fencing is being planned at at-grade sections? How tall will it be?	4494-9454	3.7-282-288	CEQA significance post-mitigation has also been deemed less than significant. Does the fact that compensation, when mitigations are not possible, make for low levels of significance?
4494-9436	3.7-233	Are crossing structures and fences to be inspected in perpetuity? Will there be a variety of biologists, each who specialize in different species?			
4494-9437		BIO-MM#85: Will the K-rail eventually be moved?			
4494-9438	3.7-234	BIO-MM87: Will hazardous materials be used at night?			
4494-9439		BIO-MM#88: What materials would the underslung tarp or other barrier consist of?			
4494-9440	3.7-235	BIO-MM#90: What is the purpose of dewatering? During this time of severe drought and given the unknown time period when this project might occur, how much water is expected to be dewatered? How will it be used?

**CHAPTER 3.8: HYDROLOGY AND WATER RESOURCES**  
**APPENDIX 3.8-A: HYDROLOGY AND WATER RESOURCES FIGURES PART 1**  
**APPENDIX 3.8-A: HYDROLOGY AND WATER RESOURCES FIGURES PART 2**  
**APPENDIX 3.8-B: MAJOR WATERBODIES CROSSED TABLE**

4494-9456

information, and therefore, "geological investigation ahead of the tunnel face was essential and was achieved by maintaining a strict regime of probe drilling."<sup>26</sup>

In their article, engineers Jim Clark and Steve Chorley describe the challenges they faced in boring this tunnel:

A routine probe hole (P1) was drilled at chainage 4056 m at the 11 o'clock position on the face. The depth of the hole was 27 m and minor ingress of water and silt was observed from probe chainage 4066.5 m up to 4077.3 m. A decision was made to drill a second probe hole (P2) at the 1 o'clock face position in order to gain further information on the geology/hydrology ahead of the face. During the night shift of the 18th November 2006, the P2 probe drilling operations were underway when the crew heard several cracking sounds emanating from the surrounding rock mass. Shortly after these events, the initial probe hole (P1) was observed to be discharging water and silt under high pressure. It took the crew almost 2 1/2 hours to seal the 51 mm hole using a mechanical packer attached to the probe drill. During these 2 1/2 hours, approximately 180 cubic meters of silt and 125,000 liters [33,021 gallons] of water were discharged, and continuous rock bursting was occurring.

On the 24th November probe hole P1 was successfully intersected and drainage operations were underway when several rock bursting events occurred. The pressure in probe hole P1 gradually increased until it exceeded the 25-bar capacity of the pressure gauge, and minor inflows of silt and water began to flow through fissures in the rock mass close to the face. Further rock bursting fractured the rock mass surrounding the collar of probe hole P1 causing the rock to fall away and expose the hole behind resulting in an inrush of water and silt under massive pressure. The crew tried unsuccessfully for several hours to insert a packer into P1 to stem the flow of material, but at 7:00 am with silt levels rising rapidly and rock bursting continually occurring, the tunnel was evacuated for safety reasons.

During the 25th November it was deemed impractical and unsafe to enter the tunnel. Water ingress was measured at the portal throughout the day and flow rates gradually increased until they exceeded 7000 liters/min [1,850 gallons/min]. On the 26th November flow rates stabilized so a team entered the tunnel to assess the situation. **They observed that the inundation had almost completely buried the TBM (see Figure 9) and that silt and water were still flowing from the probe hole.** However the pressure of the discharge had reduced and a crew was mobilized and managed to seal the probe hole by inserting a mechanical packer. **The total amount of silt deposited during this event was over 14,000 cubic meters, and the cleanup operation took over 2 months.**

4494-9455

**Case Study: Nora, the Tunnel Boring Machine**

In a 2017 article entitled, "Meet Nora, the TBM that will help to repair the world's longest tunnel," *NYC Water* magazine describes the tunnel boring machine that was tasked with repairing New York City's Delaware Aqueduct. Nora was charged with tunneling a bypass tunnel to convey water around a leaking portion of the Aqueduct. Nora's bypass tunnel is 2.5 miles long, and at a depth of 600 feet below the Hudson River. The article describes the capabilities unique to this TBM:

*Nora was built to withstand 30 bar of pressure—believed to be the most of any TBM every manufactured.* That's about 11 times the amount of pressure that comes out of a garden hose. The machine was built to withstand that much pressure because workers encountered huge inflows of water under immense head pressure when the aqueduct was first built more than 70 years ago.<sup>25</sup>

In Table 3.8-8 of the DEIR, CHSRA delineates the estimated groundwater pressure it expects to encounter in various sections of the alignments. CHSRA anticipates encountering groundwater pressure between 25 and 35 bars for lengths of tunnel segments between .6 miles and 2.1 miles (depending on the alignment); and anticipates encountering groundwater pressure over 35 bars for lengths of tunnel segments between 1 mile and 4.5 miles (depending on the alignment).

Further, on Page 3.8-33, CHSRA states that, "The highest anticipated groundwater pressures... are anticipated to be as high as 50 bar for Refined SR14, SR14A, E1, and E1A, and greater than 60 bar for E2 and E2A."

**Question:** If Nora is the TBM believed to withstand the most water pressure of any TBM ever manufactured, and if the amount of water pressure that Nora is able to withstand is equivalent to 30 bars, and if CHSRA anticipates having to tunnel for as much as 4.5 miles through terrain where it will encounter water pressure >35 bars; what evidence does CHSRA have that leads it to believe that it is possible to tunnel through these extreme conditions? What TBM(s) does CHSRA plan to utilize that can withstand >35 bars of pressure? And in what previous projects have these TBMs achieved proven success at these levels of pressure?

4494-9456

**Case Study: The Parbati Hydroelectric Project in India**

On Page 2-E-24 of the DEIR, CHSRA describes the mitigation measure HYD-IAMF#5 which pertains to the Tunnel Boring Machine Design and Features. HYD-IAMF#5 states that the TBMs that will be used in the boring of the tunnels through the ANF will be, "designed with ports for drilling horizontal probe holes through the TBM cutterhead," the purpose of which is to allow for water pressure and flow rates to be measured ahead of the TBM and to allow for pre-excavation grouting to be employed to prevent groundwater inflows.

In *The Greatest Challenges in TBM Tunneling: Experiences from the Field*, engineers from the Robbins Company detail their experience with the Parbati Hydroelectric Project in India. This tunneling project bears some similarities to the proposed CHSR tunnels through the ANF, as Parbati is located in a highly stressed mountain range at the foot of the Himalayan Mountains where there is limited access and high overburden above the tunnel alignment. Like CHSRA's proposed tunnels, Parbati offered limited availability of geological

November 30, 2022  
Page 58 of 156

4494-9456

Photo: Parbati TBM buried in silt

For the purposes of comparison, 14,000 cubic meters is the equivalent of 5 ½ Olympic-sized swimming pools of silt that was accumulated in one day due to the inflow of water and silt into the tunnel bore.

**Questions:** CHSRA's HYD-IAMF#5 lists the use a TBM with probe drilling capability as a mitigation measure to preemptively address the potential for groundwater inflow into the tunnel. The TBM used in the Parbati project also had this capability, and yet the result was rock bursting resulting in significant inflow of highly pressurized water – so much so that the tunnel had to be evacuated for the safety of the crew, and the amount of damage caused in the day that followed took two months to clean up. Based on this case study, coupled with the limited geotechnical data that CHSRA has on the tunnel areas, what leads CHSRA to believe that its experience will be any different or better than that which faced the Robbins Company in Parbati?

**Questions:** The engineers in Parbati mentioned damage that occurred when the pressure in one of the probe holes gradually increased until it exceeded the 25-bar capacity of the pressure gauge. CHSRA plans to tunnel for miles in areas that are expected to significantly exceed 25 bars of pressure. In these areas of the CHSRA alignments, will the conditions faced by the TBM and the crew not exceed what was experienced by those in the Parbati tunneling project?

**Case Study: The Gerede Water Transmission Tunnel in Turkey**

In their article, "Tunneling through 48 Fault Zones and High Water Pressures on Turkey's Gerede Water Transmission Tunnel," engineers D. Harding and Y. Alpagut of the Robbins Company detail what is known to be one of the greatest success stories of tunneling through difficult conditions. The article begins by stating that although preliminary bore holes of the area revealed challenging conditions, including a mix of rock types punctuated by fault zones, "What the contractor and owner could not know were the distinct challenges they would encounter, making it one of the most difficult projects attempted in the world of tunneling. The tunneling

4494-9457

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 59 of 156

4494-9457

success story highlights what today's equipment is capable of, and how far the Turkish tunneling industry has come in tackling its own incredibly difficult geology."<sup>27</sup>

The authors describe the challenges faced in tunneling through this difficult terrain:

**TBM-2** was launched from an intermediate shaft under higher cover, starting at 60 m and reaching over 400 m as it bored toward the south. The rock was more transitional in this section, and the TBM had bored a significant section of its 10,339 m tunnel when it encountered a massive inrush of water that flooded the TBM and tunnel. The TBM was boring downhill and the water had to be pumped out, which took some time. **The TBM was deemed a loss, and removed from the tunnel.**

**TBM-3** began boring from the south portal under increasingly high cover that would reach a maximum of over 500 m. The TBM was several kilometers into its 11,653 m downhill drive, struggling in karstic aquifer conditions that required polyurethane injection and slowed tunneling, when its problem became worse. **A high water inrush of 1,500 liters/second [400 gallons/second] flowed into the tunnel, causing the machine to become stuck. This inflow resulted in enough pressure to crush the TBM shields and send cylinders catapulting into the back-up.** Dye tests showed that the water had come from a river flowing overhead and entered into the tunnel through a cave system. **As quickly as it had started, the Gerede Water Transmission Tunnel ground to a halt with two TBMs stuck 9 km apart.**

**Of the three standard Double Shield TBMs used to originally bore sections of the tunnel, two became irretrievably stuck or damaged amid massive mud and water inflows.**

The revised geology was now understood to contain **more significant fault zones and an aquifer system that could cause high-pressure water inrushes of up to 20 bar.** However, the ground was expected to improve as the TBM advanced and consist mostly of sandstone, limestone and tuff with a maximum UCS in the range of 100 MPa. Kolin/Limak needed a machine that could effectively bore in those wide-ranging conditions, but also statically hold water pressure up to 20 bar in the event of an emergency flow—a failsafe that none of the standard Double Shield TBMs were equipped with.

Due to previous experiences at Gerede, the **new TBM is designed to statically hold up to 20 bar pressure in the event of a massive water inflow.** In order to protect the machine from such high water pressure, an extensive sealing system has been put into place. Around the main bearing, there is an outer row of six (6) seals and an inner row of three (3) seals. Between each seal, the cavity is filled with pressurized grease to ensure a constant pressure in each of the cavities. In the event that the machine is shut down and an inrush of water overtakes the machine, a pressure sensor will detect this presence of water and pressurize each cavity with grease in order to continually protect the seals from the pace pressure.

The logistics of getting components through the existing tunnel were the most challenging thing. The assembly chamber was 7 km (4 mi) from the portal. "The water inflow of 600 l/s (159 gal/s) made it difficult to get the materials to the machine," said Glen Maynard, Robbins Field Service Site Manager. **By the end of tunnelling, the TBM had crossed 48 such fault zones and statically held back 26**

4494-9457

**bar water pressure.** Each time a zone was encountered, exceptional thrust was used to keep the machine from becoming stuck combined with dewatering to lower the water pressure.<sup>28</sup>

The authors begin describing their field experience by touting the completion of the Gerede project as being, **"one of the most difficult projects attempted in the world of tunneling. The tunneling success story highlights what today's equipment is capable of."** By all accounts, it appears that the conditions that CHSRA will face in tunneling through the San Gabriel Mountains will exceed the difficulty level faced by the engineers in Turkey. Though the North Anatolian Fault in Turkey has been considered comparable in many ways to our San Andreas Fault, the water pressure in the depths of the San Gabriel Mountains is expected to exceed that experienced in Gerede.

In an article entitled, *"What Could Possibly Go Wrong,"* author Dominic Holden makes a case for Seattle's City Council to vote against giving the State of Washington permission to dig the world's largest deep bore tunnel under downtown Seattle. In his article, Holden cites Levent Ozdemir, the author of *North American Tunneling*, a technical book that examines, among other things, TBMs getting stuck underground due to boulders. Ozdemir explains that, "The tunnel boring machines were stuck... a total of 12 times in 40 cases (30 percent overall stuck rate)." Ozdemir notes that, "the delay and cost consequences of getting stuck are very high," in tunnels deeper than 50 feet and in those that go beneath the water table.<sup>29</sup>

In Table 3.8-12 of the DEIR, CHSRA delineates the expected water pressure in various segments of its alignments through the San Gabriel Mountains. One of the alignments anticipates 6.9 miles of tunneling at pressures exceeding 25 bars. Further, on Page 3.8-33, CHSRA states that, "The highest anticipated groundwater pressures... are anticipated to be as high as 50 bar for Refined SR14, SR14A, E1, and E1A, and greater than 60 bar for E2 and E2A."

**Question:** If the Gerede project is touted as being a success story highlighting what today's equipment is capable of, and if in the course of that project, two of three TBMs utilized became irretrievably stuck or damaged due to massive mud and water inflows, and if in the course of that project, the highest water pressure experienced was 26 bars, under what scientific reasoning does CHSRA believe that it will have success tunneling through fault zones where water pressure >60 bars will be encountered?

**Question:** Given that in the "success story" of the Gerede tunneling project, two of three TBMs were destroyed in the process, and given the warning of Levent Ozdemir that TBMs have a 30% overall "stuck rate," has CHSRA built into its plans an anticipated loss of TBMs?

4494-9458

**Question:** What is the anticipated cost of the tunnel boring machines to be used in this project? The cost of "Nora," the TBM utilized in the recent New York City Delaware Aqueduct project is estimated to be \$30 million.<sup>30</sup> How many, and at what total cost, is CHSRA planning to "lose" during the course of the tunneling project due for factors including but not limited to damage from mud and water inflows which are likely to exceed those experienced in the Gerede project?

4494-9459

**Question:** What is the methodology proposed by CHSRA to remove or retrieve a TBM in the likely event that at least one will get stuck during tunneling? If TBMs are incapable of backing up and cannot move forward, how will they be removed from the tunnel?

**Discussion: Potential for Groundwater Contamination from Use of Grout**

In a 2001 report for *Water Research* entitled, "Environmental risk assessment of acrylamide and methylolacrylamide from a grouting agent used in the tunnel construction of Romeriksporten, Norway," the authors concluded that:

"Increased focus on the possible environmental risk associated with large-scale use of grouting agents has revealed that leakage of chemicals from grouting activities may cause harm to the environment."<sup>31</sup>

Weideborg et al. studied the environmental impacts caused by the use of Rhoca-Gil (Siprogel), a common chemical grouting agent used to reduce water leakages during tunnel construction. Drainage water from the Norwegian tunnel was monitored to test for levels of acrylamide and methylolacrylamide, and the results showed that these substances leaked into the drainage water as a result of two factors: (1) in connection with

4494-9460

the injection of Rhoca-Gil, and (2) in connection with after-injection using other grouting agents. In the case of the Norwegian tunnel, the water was eventually discharged into the Alna River and into the Oslo Fjord. Both receiving waters demonstrated negative impacts on the aquatic life therein.<sup>32</sup>

During the period 1995–1997, the acrylamide and methylolacrylamide (N-hydroxymethylacrylamide)-containing product Rhoca-Gil (Siprogel) was used in tunnel construction works in both Hallandsåsen, Sweden, and in Romeriksporten, Norway. In both cases, discharge water from the injection sites led to high concentrations of acrylamide in recipient waters. In addition, the injections did not give the expected reductions of water leakages to the tunnels.

In Hallandsåsen, an 8.6 km long tunnel was built through a bed-rock ridge. The large-scale use of Rhoca-Gil in this tunnel started in August 1997. **A few weeks after the grouting agent was used, adverse effects symptomatic of acrylamide poisoning were observed in fish and cattle downstream the construction works. At the same time, symptoms characteristic of exposure to acrylamide were observed in workers in the tunnel.**

Symptoms characteristic of exposure to acrylamide were also observed for workers in this tunnel. An examination of 73 exposed tunnel workers, by the Norwegian Occupational Health Services, revealed suspected skin effects due to acrylamide exposure in 4 workers, and 7 workers had slight reductions of nerve conduction velocities or amplitudes. The product was used in areas with large water leakages both in the Hallandsåsen and the Romeriksporten tunnels, and this explains the high concentrations of acrylamides found in the drainage waters, and the subsequent high risk for adverse aquatic effects in the receiving waters.<sup>33</sup>

By the volume used, polyacrylamide grouting agents (including Rhoca-Gil) constitute one of the largest groups of grouting agents, but monitoring data from the use of polyacrylamide grouting agents are yet unpublished. Rhoca-Gil is prepared by mixing two solutions immediately prior to injection; Solution 1, containing 30–60% methylolacrylamide, 2% acrylamide and 1% formaldehyde, and Solution 2, containing a sodium silicate solution. In addition, an accelerator (Solution 3) containing an unspecified mixture of esters of dibasic acids and amine derivatives is used during the injection process.<sup>34</sup>

The authors noted that prior to their study, little research had been done on the toxic effects of acrylamide and methylolacrylamide, and, further, "the leakage potential of chemicals from the grouting agents during large-scale usage had never been examined."<sup>35</sup> As a result of these findings, the Norwegian authorities banned the use of grouting agents that contained acrylamide and methylolacrylamide. The use of acrylamides as a grout had already been banned in Japan as early as 1974, likely due to the correlation between their usage and several cases of neural disorder.<sup>36</sup> However, it does not appear that these chemicals have ever been banned in the United States, despite being under investigation by the EPA and included on California's Prop 65 List.

In a paper entitled, *Chemical Grouts for Potential Use in Bureau of Reclamation Projects*, the U.S. Department of the Interior warns against the use of grouting in tunnels in proximity to water sources:

The key to the question of toxicity is to be found during the selection process and planning. **If drinking water, especially ground water near wells, is involved, chemical grouts should not be used.** No matter how well a grout is mixed, excesses of one ingredient or another will remain after the grout has

<sup>32</sup> Mona Weideborg, et al. Pages 2645-2652.

<sup>33</sup> Mona Weideborg, et al. Pages 2645-2652.

<sup>35</sup> Mona Weideborg, et al. Pages 2645-2652.

<sup>36</sup> *Chemical Grouts for Potential Use in Bureau of Reclamation Projects*. December 1986. U.S. Department of the Interior, Bureau of Reclamation Division of Research and Laboratory Services Applied Sciences Branch. Page 8. <https://www.usbr.gov/tsc/techreferences/research/GR8613.pdf>

4494-9460

set. These excesses will migrate through the soil at a rate that depends on the presence of water and permeability of the grouted body.<sup>37</sup>

4494-9461

On Page 3.8-16 of the DEIR, CHSRA states that, "Construction of adits for the tunnels would be conducted using conventional mining methods, which would include pre-exploratory grouting, tunnel liners, and check grouting **such that effects on groundwater would be minimized.**" Per the case studies conducted above, we can conclude that the opposite is true: while grouting may be effective in limiting seepage of groundwater into the tunnels, grouting will still have effects on groundwater as the chemicals comprising the grouting compounds are likely to leak into the groundwater, negatively impacting the plant and animal life with which it comes into contact.

4494-9462

**Question:** What grouting compounds are likely to be used in tunneling through the ANF and the SGMNM?

**Question:** What chemicals comprise those compounds?

**Question:** What tests have been done to determine the toxicity of these grouting compounds?

4494-9463

**Question:** When mixed with water inflow into the tunnel, this water, contaminated with grouting chemicals, will be discharged. What is the ultimate destination of this contaminated water?

4494-9464

**Question:** When mixed with groundwater surrounding the tunnels, the chemicals will travel with the water where they will encounter flora and fauna. What tests have been done to determine the effects that these chemicals will have on the plant species in the ANF? What tests have been done to determine the effects that these chemicals will have on the animal species in the ANF, including the sensitive and threatened riparian species in the ANF and the Big Tujunga Wash?

4494-9465

**Question:** When mixed with groundwater surrounding the tunnels, the chemicals will travel with the water where they may eventually mix with water wells. What tests have been done to determine the effects that these chemicals will have on humans may consume them if chemicals are mixed with their primary source of water for a prolonged period of construction?

HYD-IAMF#7 describes CHSRA's reliance on grouting to minimize groundwater flows into the tunnels. On Page 2-E-26 of the DEIR, CHSRA describes that after pre-grouting, "Additional grouting will be implemented radially outward from the tunnel interior to broaden the diameter of the grouted zone surrounding the tunnel, as necessary, to further reduce groundwater flows into the tunnel." Further, CHSRA plans to inject bentonite to fill the void space between the TBM shield and the rock/soil outside the shield; plus backfill grouting with two-component grout; plus check grouting. Given the size of the tunnels (meaning, the diameter of each of the twin tunnels X the length of the tunnel, between 22 and 28 miles, depending on the build alternative that is ultimately selected), the volume of grouting needed must be significant.

4494-9466

**Question:** What is the estimated total volume of grouting compound that will be needed to complete HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7? How does the sheer volume of grouting needed to complete the tunnels correlate to the risk of contamination of the water supply and potential impacts on flora and fauna?

<sup>37</sup> *Chemical Grouts for Potential Use in Bureau of Reclamation Projects*. December 1986. U.S. Department of the Interior, Bureau of Reclamation Division of Research and Laboratory Services Applied Sciences Branch. Page 8. <https://www.usbr.gov/tsc/techreferences/research/GR8613.pdf>

4494-9467

**Discussion: Tunnel Boring Mitigation Measures**

On Page 2-E-24 through 2-E-27 of the DEIR, CHSRA sets forth HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7. mitigation measures designed to address and overcome the significant geologic challenges presented by the combination of faults and high water pressure.

On Page 2-E-24, CHSRA states that, "Current technology allows TBMs to sustain up to 17 bar of groundwater pressure while boring without additional measures." This implies that with the implementation of additional measures (e.g., pre-grouting), TBMs can sustain the intensity of water pressure that will be encountered in the tunnels beneath the ANF. However, according to sources previously cited in this analysis, the best tunnel boring machine in the world can only withstand water pressure up to 30 bars, and the TBM utilized in the construction of the Gerede project in Turkey withstood water pressure of 26 bars maximum. The TBM used in Gerede also implemented additional measures such as pre-grouting.

**Question:** Given that CHSRA's preliminary geotechnical analysis has indicated that TBMs will encounter water pressure >60 bars, what case studies does it have to demonstrate success of a TBM under these conditions?

4494-9468

Also on Page 2-E-24, CHSRA states that:

In circumstances where groundwater pressures are 25 bar or less, a one-pass lining system will be installed in the tunnels constructed behind the passing TBM. In circumstances in which groundwater pressures exceed 25 bar, a two-pass lining system will be installed after the TBM has finalized its operations.

This mitigation measure is more fully set forth in HYD-IAMF#6. "Tunnel Lining Systems":

The lining system, which will consist of segmental, precast, concrete lining with bolted and gasketed joints, will create a tunnel lining capable of resisting the groundwater pressure with minimal leakage. In sections where groundwater pressures are above 25 bar, and after the first lining has been installed, no significant water leakage is expected until a second lining has been put in place. Current gaskets available in the market are nominally rated up to 50 bar; however these gaskets are assumed to withstand only 25 bars in the design (using a safety factor of 2) to account for construction quality defects and the 100-year lifespan of the infrastructure. In order to minimize water leakage into the tunnel for the complete lifespan of the infrastructure, in the segments where ground water pressures are expected to exceed 25 bar, a monolithic second lining will be put in place after the TBM has finalized its operations and all its facilities have been dismantled (approx. 16 months).

CHSRA anticipates encountering water pressure conditions >25 bars in significant lengths of tunneling; between 1.6 miles and 6.6 miles of tunneling, depending on the alignment selected. Per its explanation above, the single lining system will suffice for the sections of tunnel where the water pressure is <25 bars; but for sections of the tunnel where the water pressure is >25 bars, CHSRA will have to put in place a second lining.

This second lining will be put in place after the TBM has finalized its operations. Per CHSRA's estimate, for a period of approximately 16 months, significant sections of the tunnel (between 1.6 miles and 6.6 miles) will be under water pressure >25 bars with a single tunnel lining that can only withstand 25 bars of pressure.

**Question:** Does CHSRA not anticipate breakthroughs due to significant water pressure during the 16 months that the tunnel is protected by only a single layer of lining? How does the mitigation measure of installing the second lining count as protection during the period of over one year when the tunnel will be vulnerable due to water pressures higher than are able to be withstood by the single layer? In the lengths of the tunnel where water pressure is anticipated to exceed 60 bars, and for the period of 16 months where the tunnel will only

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 65 of 156

4494-9468

have a single layer of lining that can withstand 25 bars of pressure, what is the failure rate predicted for these segments?

4494-9469

Per CHSRA's explanation of how the single layer lining is installed, it appears to be installed in pre-cast, 40-foot segments. This implies that the TBM has to have excavated a minimum of 40 feet ahead in order to allow for a 40-foot segment to be installed. As the TBM can excavate approximately 50 feet per day (under good conditions), we can expect that it will take a day for the TBM to advance sufficiently to allow installation of the single layer liner. Under difficult conditions, TBMs can expect a forward rate of progress of approximately 3 feet at best. Under these conditions, which could be anticipated in the difficult terrain under the San Gabriel Mountains where the water pressure is highest, we can expect that it will take over 13 days for the TBM to advance sufficiently to allow installation of the single layer liner. This means that for the span of somewhere between one day and two weeks, the only "protection" that the tunnel will be afforded against water pressure is the pre-grouting treatment advanced by the TBM.

**Question:** During this period of time when the tunnel is vulnerable, before the installation of the single liner, what is the failure rate anticipated by CHSRA for the miles of tunnel sections where water pressure exceeds 25 bars? What is the failure rate anticipated by CHSRA for the sections of tunnel where the water pressure exceeds 50 bars?

**Question:** Cumulatively, taking into account both the short period of time (i.e., approximately one day to two weeks) in which the tunnel has no liner, and the long period of time (i.e., approximately 16 months) in which the tunnel has a single layer liner, what is the risk associated with tunnel failure for the sections of tunnel in which the water pressure exceeds 25 bars? What is the risk associated with tunnel failure for sections of tunnel in which the water pressure exceeds 50 bars?

4494-9470

**Discussion of Applicable Laws**

In Section 3.8.2 ("Laws, Regulations, and Orders") of the DEIR, CHSRA asserts that, "The Authority would implement the high-speed rail project, including the project extent, in compliance with all federal and state regulations." In reviewing the applicable laws and regulations governing the use of water resources in comparison with CHSRA's plans, we have concluded that there are a number of inconsistencies between the six proposed Build Alternatives and the federal and state laws and regulations.

On Page 3.8-4 of the DEIR, CHSRA states that the *Protection of Wetlands (USEO 11990)*, "aims to avoid direct or indirect impacts on wetlands from federal or federally-approved projects when a practicable alternative is available." CHSRA previously considered a number of alignments that did not impact wetlands to the extent impacted by the routes through the Angeles National Forest, including routes following the 5 and 14 freeways. These alignments were practicable, but were eliminated from consideration for political (not engineering or geotechnical) reasons.

**Question:** Given the existence of practicable high-speed rail alignments that would not impact, or would impact to a lesser extent, wetlands, how is CHSRA's proposal to tunnel through the ANF and build corollary infrastructure in wetlands within and surrounding the ANF (e.g., Big Tujunga Wash, Hansen Dam) to support a high-speed train system *not* a violation of the intent of the USEO 11990?

4494-9471

The Safe Drinking Water Act (42 USC Section 300 et seq.) protects against both naturally-occurring and human-produced contaminants that may be found in drinking water. The Sole Source Aquifer Protection Program is authorized by Section 1424(e) of the Safe Water Drinking Act, and it is used, "to protect drinking water supplies where there are few or no alternative sources and where, if contamination occurred, use of an alternative source would be extremely expensive. All proposed projects to receive federal funds are subject to USEPA review to ensure that they do not endanger the water source."

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 66 of 156

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 67 of 156

4494-9471 The naturally-occurring sources of water in the San Gabriel Mountains are estimated to provide between 15 and 30 percent of Los Angeles' drinking water. Given the epic drought and given the depletion of sources of imported water (e.g., the Colorado River, Lake Mead), these sources are all the more important at this time and could be considered per the definition above to be the "sole source." Further for those residents within the ANF who rely on wells, those water sources truly represent the sole source.

**Question:** Given the impacts to naturally occurring water sources that are likely to result from CHSRA's tunneling through the ANF, how are CHSRA's plans not in violation of the Safe Drinking Water Act?

4494-9472 Per USFS Soil, Water, Riparian, and Heritage Standard 45, "all construction, reconstruction, operation, and maintenance of tunnels on National Forest System Lands shall use practices that minimize adverse effects on groundwater aquifers and their surface expressions." CHSRA's build alternatives have been designed to cross between 23 and 60 surface water features (depending on the alignment selected), including between 13 and 37 streams and tributaries. The DEIR devotes upwards of 100 pages detailing the potential impacts to groundwater and the myriad mitigation measures meant to address these impacts that will be created by tunneling.

**Question:** How are CHSRA's proposed alignments not in violation of S45?

4494-9473 Per USFS Soil, Water, Riparian, and Heritage Standard 47, a screening process must be applied to projects that could impact riparian areas, including such areas that are dependent on groundwater aquifers.

**Question:** What does this screening process entail, and has CHSRA begun the screening process with the USFS? What comments or concerns, if any, has the USFS brought forward with respect to CHSRA's potential impacts on riparian areas within the ANF?

4494-9474 Per US Fish and Wildlife Standard 11, habitat of special-status species within the National Forest System must be protected, including surface habitat that is impacted by subsurface changes in hydrogeologic conditions.

**Question:** Given the special status species within the ANF and the need for water to sustain their habitats, how are CHSRA's proposed alignments impacted by S11? Maps in Chapter 3.7 of the DEIR show the crossover of special species habitat with the CHSRA proposed alignments, including critical habitat for special status species like the Santa Ana Sucker Fish, the Arroyo Toad, and the Western Pond Turtle. Given that CHSRA's proposed alignments as well as surface infrastructure improvements intersect the critical habitat in multiple places, and given the likelihood of impacts to groundwater which will impact these sensitive species, how are CHSRA's plans protecting the habitat of special-status species within the ANF?

4494-9475 Sections 1601 to 1603 of the California Fish and Game Code ("Streambed Alteration Agreement") require that agencies notify the California Department of Fish and Wildlife prior to implementing any project that would divert, obstruct, or change the natural flow or bed, channel, or bank of any river, stream (including intermittent streams) or lake.

**Question:** Has CHSRA notified the California Department of Fish and Wildlife of its proposed alignments and their impacts on numerous applicable bodies of water? What has been the response of the California Department of Fish and Wildlife?

4494-9476 The Los Angeles Flood Control Act, adopted by the State Legislature in 1915, established the Los Angeles Flood Control District with a directive to provide flood protection, water conservation, recreation, and aesthetic enhancement within its boundaries.

**Question:** Given that the entirety of the Palmdale-Burbank Project Section takes place within the boundaries of the LAFCD, and given the amount of water necessary to construct the proposed alignments (including water

to operate the TBMs, water to mix cement, as well as water for mitigation measures including control of fugitive dust and trucking in water to supplement lost water in the ANF), how are CHSRA's plans not in violation of the LA Flood Control Act which requires water conservation within the district boundaries?

**General Discussion of Hydrological Concerns:**

On Page 3.8-15 of the DEIR, CHSRA states that for its analysis of potential hydrologic impacts, it relied in part on case studies of tunnel construction occurring under similar conditions, "including documented effects on surface water and other water resources associated with those tunnels," including case studies of other tunnels in Southern California.

**Question:** Did CHSRA study the tunneling of the Metro Red Line and the effects on Runyon Canyon? The tunneling dewatered Runyon Canyon, lowering the water table by over 100 feet. What did CHSRA learn from this case study, and how are those lessons applied to the plans to tunnel through the ANF?

On Page 3.8-16 of the DEIR, CHSRA states the following with respect to the potential for impact to naturally occurring water sources within the ANF:

1. The greatest potential for groundwater to flow into tunnels exists at locations where tunnel construction intersects faults and fractures in the bedrock.
2. The potential for water to flow into tunnels during construction, as well as the rate and volume of any such flows, is greatest in areas of high water pressure, assumed for purposes of this analysis to be greater than 25 bar.
3. Proximity of the tunnel construction to water resources influences the severity of the water loss. Closer proximity of a water resource to the tunnel excavation may result in greater impact.
4. Springs, intermittent and perennial streams, and water supply wells along, or in proximity to, faults are most vulnerable to impacts when tunnel construction intersects faults, areas of high water pressure, and water within fractures that seeps into the tunnel excavation.

With respect to Refined SR14 and SR14A, there are at least 12 intersection points:

- Figure 3.8-A-1 (Tunnel Construction RSA Detailed Map Refined SR14/SR14A – Map 1 of 3) depicts 7 intersection points where the proposed alignment crosses BOTH a fault line and a stream.
- Figure 3.8-A-2 (Tunnel Construction RSA Detailed Map Refined SR14/SR14A – Map 2 of 3) depicts at least 4 intersection points where the proposed alignment crosses BOTH a fault line and a stream.
- Figure 3.8-A-3 (Tunnel Construction RSA Detailed Map Refined SR14/SR14A – Map 3 of 3) depicts at least 1 intersection point where the proposed alignment crosses BOTH a fault line and a stream.

With respect to E1 and E1A, there are as many as 7 intersection points:

- Figure 3.8-A-4 (Tunnel Construction RSA Detailed Map E1/E1A – Map 1 of 6) depicts possibly 1 intersection point where the proposed alignment crosses BOTH a fault line and a stream.
- Figure 3.8-A-5 (Tunnel Construction RSA Detailed Map E1/E1A – Map 2 of 6) depicts possibly 1 intersection point where the proposed alignment crosses BOTH a fault line and a stream.
- Figure 3.8-A-6 (Tunnel Construction RSA Detailed Map E1/E1A – Map 3 of 6) depicts 0 intersection points where the proposed alignment crosses BOTH a fault line and a stream.

4494-9478

- Figure 3.8-A-7 (Tunnel Construction RSA Detailed Map E1/E1A – Map 4 of 6) depicts at least 1 intersection point where the proposed alignment crosses BOTH a fault line and a stream.
- Figure 3.8-A-8 (Tunnel Construction RSA Detailed Map E1/E1A – Map 5 of 6) depicts possibly 3 intersection points where the proposed alignment crosses BOTH a fault line and a stream.
- Figure 3.8-A-9 (Tunnel Construction RSA Detailed Map E1/E1A – Map 6 of 6) depicts possibly 1 intersection point where the proposed alignment crosses BOTH a fault line and a stream.

With respect to E2 and E2A, there are at least 17 intersection points:

- Figure 3.8-A-10 (Tunnel Construction RSA Detailed Map E2/E2A – Map 1 of 6) depicts possibly 1 intersection point where the proposed alignment crosses BOTH a fault line and a stream.
- Figure 3.8-A-11 (Tunnel Construction RSA Detailed Map E2/E2A – Map 2 of 6) depicts possibly 1 intersection point where the proposed alignment crosses BOTH a fault line and a water source.
- Figure 3.8-A-12 (Tunnel Construction RSA Detailed Map E2/E2A – Map 3 of 6) depicts at least 1 intersection point where the proposed alignment crosses BOTH a fault line and a stream.
- Figure 3.8-A-13 (Tunnel Construction RSA Detailed Map E2/E2A – Map 4 of 6) depicts at least 3 intersection points where the proposed alignment crosses BOTH a fault line and a stream.
- Figure 3.8-A-14 (Tunnel Construction RSA Detailed Map E2/E2A – Map 5 of 6) depicts at least 9 intersection points where the proposed alignment crosses BOTH a fault line and a stream.
- Figure 3.8-A-15 (Tunnel Construction RSA Detailed Map E2/E2A – Map 6 of 6) depicts at least 2 intersection points where the proposed alignment crosses BOTH a fault line and a stream.

4494-9479

**Question:** Based on the alignment that is selected, CHSRA proposes tunneling through as few as 7 or as many as 17 "high risk" intersections, where the alignment tunnels through a point where a known fault crosses a stream. Given that these water sources are considered to be most vulnerable to the impacts of tunneling, isn't jeopardizing 7 to 17 streams in the ANF too big a risk to take, particularly during a period of epic drought in California? What number of water sources does the USFS say is an acceptable number to jeopardize?

On Page 3.8-27 of the DEIR, CHSRA lists the number of active groundwater wells within 1 mile of the center lines of each of the 6 build alternatives. CHSRA states that for the Refined SR14/SR14A route, there are 30 active wells; for the E1/E1A route, there are 24 active wells; and for the E2/E2A route, there are 22 active wells. However, Figure 3.8-A-9 ("Tunnel Construction RSA Detailed Map for E1/E1A") shows only 3 active wells in the Kagel Canyon area. Even though these wells are just outside of the demarcation limit of 1 mile from the center line of the E1/E1A build alternative, the fact that 3 active wells are listed indicates that this must be of some significance to CHSRA (otherwise they would not include the locations of any wells outside the 1-mile zone). There are over 50 active wells in Kagel Canyon, all of which fall just outside the 1-mile demarcation.

4494-9480

**Question:** Given that CHSRA has more unknown than known factors regarding the geology and hydrology of the area within the ANF, how can CHSRA be certain that the 50+ wells in Kagel Canyon will not be impacted by tunneling?

**Question:** Since CHSRA has not noted the locations of these wells and is not considering them to be within the 1-mile "danger zone," what will happen to homeowners in Kagel Canyon if they experience depletion of

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 69 of 156

4494-9480

their water supply? How will they prove to CHSRA that they have sustained damage if CHSRA did not mark baseline water levels in Kagel Canyon prior to commencement of tunneling?

4494-9481

**Question:** One of the proposed mitigation measures is to truck in water to homeowners whose wells were depleted as a result of tunneling. What type of resale value does a property have if it no longer has a water supply? Will CHSRA compensate homeowners who suffer an economic loss in resale value if the productivity of their wells was damaged or destroyed by tunneling? Will this decision also apply to homeowners in Kagel Canyon, who fall just outside the 1-mile zone, but who represent the highest concentration of wells within the RSA?

According to Section 3.8.5.6 of the DEIR ("Other Hydrologic Resources"), CHSRA mapped seeps within 2 miles of the proposed alignments, but wells only within 1 mile of the proposed alignments.

4494-9482

**Question:** Why were seeps mapped at a center line distance twice that of wells? Were wells to be mapped at the same distance of impact, all 50+ wells in Kagel Canyon would be included in the mapping. What was the criteria CHSRA utilized for determining the distance of potential impact on these various sources of water?

Page 3.8-28 of the DEIR explains connection between faults and water sources:

The core samples illustrate broadly differing zones of fracturing, some with high density of fractures and other zones with virtually no fracturing. The wide variation of fracturing and the intersecting patterns of fracturing govern the direction and quantity of groundwater that is able to flow through the rock at those points. Generally, with greater and greater displacement along a fault, the fractured rock adjacent to a fault becomes a preferred path of groundwater flow.

According to a 2013 National Park Service study, "The San Gabriel Mountains are among the fastest growing mountains in the world. Forces from the San Andreas Fault to the north and a series of thrust faults on their south face are causing the San Gabriel Mountains to rise as much as 2 inches a year."<sup>38</sup>

4494-9483

**Question:** Given the rate at which the San Gabriel Mountains are growing, won't the fracturing in the rock along the alignments only grow over time? How will this growth and increased fracturing impact CHSRA's tunneling plans? How will this growth and increased fracturing impact the likelihood of disruption of the naturally occurring water sources in the San Gabriels as tunneling intersects the groundwater flow along fractured rock adjacent to a fault?

**Question:** If the San Gabriels continue to rise at approximately 2 inches per year, in the 10+ years that it will take CHSRA to construct this alignment, the concrete "ground" on which the track is laid within the may have risen nearly 2 feet. How will the growth of the San Gabriels impact the concrete tunnels? Will they not buckle as the mountains continue to grow? If and when the concrete tunnels buckle, will that not create cracks through which groundwater will flow into the tunnels?

On Page 3.8-29, CHSRA provides an example in which, "zones of completely intact rock could prevent groundwater flow, forming an impermeable barrier in the rock mass, whereas zones of more fractured rock facilitate storage and movement of groundwater."

4494-9484

**Question:** Will the introduction of 30-foot in diameter concrete tunnels not create an impermeable barrier preventing groundwater flow? How will the introduction of these large tunnels into the natural flow impact underground streams?

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 70 of 156

4494-9484 Later on the same page, CHSRA explains that, "Faults have the potential to act both as groundwater conduits and as barriers that often result in substantial variations in groundwater pressures from one side of the fault to the other."

4494-9485 **Question:** If CHSRA tunnels through a fault (as it proposes to do a minimum of 7 times and as many as 20 times, per the data set forth in Table 3.8-6), will this not create the possibility of changing the fault from a conduit to a barrier? What will be the effects "downstream" if water that was previously freeflowing is suddenly blocked?

On Page 3.8-32 of the DEIR, CHSRA explains the importance of groundwater pressure vis a vis tunneling; with an increase in groundwater pressure (measured in bars) comes a corollary increase in the risk of both (1) inflow into the tunnel from surrounding rock, and (2) impacts to both groundwater and surface water resources. CHSRA goes on to state that it estimated groundwater pressures along the alignments based upon the data available for the 6 core holes and bore samples taken from the ANF – i.e., approximately 2 core samples from each of the proposed alignments.

According to geotechnical engineers with whom we made inquiries on the subject, 2 core samples for a section of tunneling in excess of 20 miles is a vastly insufficient data sample on which to make determinations. These engineers stated that CHSRA would need to conduct between 100 and 150 test borings within the ANF along the specific alignment in order to gather sufficient data necessary to plan its tunneling.

4494-9486 **Question:** Has CHSRA approached the USFS regarding the need to conduct additional test drilling within the ANF? Has CHSRA quoted to the USFS an estimated number of test bores in excess of 100? What has been the response of the USFS to this proposition?

4494-9487 **Question:** In other sections of the DEIR, CHSRA minimizes the impact that its alignments will have on the ANF, insisting that since the majority of the route through the ANF will be tunneled, surface impacts will be minimal. This assertion clearly does not include the need for CHSRA to conduct an additional 100 – 150 test borings on the Forest floor. Test boring is a loud and invasive process which will negatively impact wildlife within the Forest. Why were the impacts from these additional test borings not included in the applicable sections of the DEIR?

4494-9488 **Question:** For Routes E1, E1A, E2, and E2A, test borings will presumably also need to be conducted within the San Gabriel Mountains National Monument. What has the USFS stated will be the difference, if any, in policy regarding permission to drill test bore holes in the ANF vs. in the SGMNM?

4494-9489 **Question:** Presumably the additional 100 – 150 test borings will only be conducted along the Build Alternative that is selected as the actual alignment to connect Palmdale to Burbank. What results could the test borings yield that would render that chosen alignment to be impracticable? If such results are yielded in the test borings for the selected alignment, what happens next? Will the project not be completed in this Project Section? Or will a different alignment then be selected and test borings conducted along that alignment?

4494-9490 **Question:** Given the lack of data available from only 2 test borings conducted along the preferred alternative, how can CHSRA even provide a reasonably accurate cost estimate to build this project section?

In Table 3.8-8, CHSRA sets forth the estimated groundwater pressures beneath the Angeles National Forest. Later on Page 3.8-33, CHSRA states that:

"Based on the limited data and professional judgment, the E1 and E1A, and the E2 and E2A Build Alternative alignments have three to five times the lengths of tunnel where the groundwater pressures are anticipated to exceed 25 bar, compared to the Refined SR14 and SR14A Build Alternative alignments. The highest anticipated groundwater pressures for portions of the Refined SR14, SR14A,

4494-9490

E1, E1A, E2, and E2A alignments are anticipated to be as high as 50 bar for Refined SR14, SR14A, E1, and E1A, and greater than 60 bar for E2 and E2A."

4494-9491

**Question:** Given previous discussion in this section of comment letter regarding the ability (or lack thereof) of TBM machines to withstand >30 bars of pressure, wouldn't the same professional judgment that led to the estimation of groundwater pressures beneath the ANF also suggest that it is either imprudent, infeasible, or both to construct the tunnels as proposed?

4494-9492

In Section 3.8.6.3 ("Build Alternatives") of the DEIR, CHSRA sets forth the number of water features that will be impacted by each of the build alternatives. Below is a summary, culled from the information set forth in this section:

Build Alternative	Surface Water Crossings: At Grade	Surface Water Crossings: Viaduct	Surface Water Crossings: Tunnel	Surface Water Crossings: TOTAL
Refined SR14	48	12	29	89
SR14 A	43	3	32	78
E1	43	7	43	93
E1A	42	3	44	89
E2	34	8	44	86
E2A	39	3	40	82
No Project	0	0	0	0

CHSRA goes on to summarize the impacts that construction of the build alternatives will have on these water sources, including:

- Water diversion and/or dewatering of water channels to accommodate in-channel construction activities, including the placement of the following WITHIN surface water channels:
  - Trackway
  - Viaduct piers and abutments
  - Traction power substations
  - Roadway/railway modifications
  - Access roads
  - Station areas
  - Construction staging areas
  - Drainage facilities.
- Permanent modification of water channel capacity and flow to accommodate placement of fill material in surface water channels;
- Permanent modification of water channels due to placement of piers and abutments within surface waterbodies;
- Permanent modification of stormwater runoff patterns due to placement of permanent HSR infrastructure within surface water bodies, which may reduce the amount of water in the receiving waterbodies.

Despite these major impacts to significant sources of water within the RSA, CHSRA has concluded that the impacts, "would be less than significant" for the build alternatives, and therefore CEQA does not require mitigation.

4494-9493

**Question:** Has CHSRA made the Antelope Valley Watermaster aware of its plans to impact between 78 and 93 surface water crossings? What has been the response of the Antelope Valley Watermaster to the proposed alignments and their impact on hydrology? Does the Antelope Valley Watermaster agree with CHSRA's conclusion that these impacts would be "less than significant"? Will the Antelope Valley Watermaster allow

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 72 of 156

4494-9493

CHSRA to proceed with its plans, either with or without conditions placed on the construction? Given the potential impacts to water within its jurisdiction, what reason would the Antelope Valley Watermaster have to select any alignment other than the No Project Alternative?

4494-9494

**Question:** Has CHSRA made the Upper Los Angeles River Area (ULARA) Watermaster aware of its plans to impact between 78 and 93 surface water crossings? What has been the response of the ULARA Watermaster to the proposed alignments and their impact on hydrology? Does the ULARA Watermaster agree with CHSRA's conclusion that these impacts would be "less than significant"? Will the ULARA Watermaster allow CHSRA to proceed with its plans, either with or without conditions placed on the construction? Given the potential impacts to water within its jurisdiction, what reason would the ULARA Watermaster have to select any alignment other than the No Project Alternative?

4494-9495

On Page 3.8-40 of the DEIR, CHSRA sets forth for each of the build alternatives what will be the total number of acres disturbed during and after construction. Below is a summary, culled from the information set forth in this section:

Build Alternative	Acres of construction-period ground disturbance footprint	Acres of permanent footprint	Acres of new impervious surface
Refined SR14	2,572 – 2,654	2,436 – 2,510	787
SR14 A	2,355 – 2,437	2,208 – 2,274	752
E1	2,249 – 2,263	2,156	742
E1A	2,022 – 2,159	1,898 – 2,021	700
E2	2,093 – 2,094	1,994 – 2,006	650
E2A	1,963 – 1,964	1,835 – 1,847	607
No Project	0	0	0

In conjunction with the thousands of acres that will be impacted during construction, CHSRA goes on to summarize the ways in which water resources may be impacted by construction, including the following:

- Contamination or pollution of surface waters due to use of construction-related chemicals;
- Water quality impacts from this contamination/pollution spread via stormwater runoff;
- Sedimentation and turbidity caused by erosion from soil disturbance during construction;
- Damage from activities within water courses related to the construction of infrastructure within the water channel;
- Dewatering, diversion, or disruption of streambeds during in-watercourse construction;
- Disposal of water that flowed into the tunnels during construction could release water contaminated with construction chemicals;
- Groundwater quality degradation due to TBMs (e.g., grouting, excavation, dewatering).

CHSRA concludes that with the implementation of mitigation measures that will "treat groundwater contamination," the Build Alternatives, "would not violate standards for groundwater quality or otherwise substantially degrade groundwater quality, and this impact would be less than significant for... the Build Alternatives."

**Question:** In contemplating a risk-reward analysis for this section of the DEIR, it seems that the risk is high, and the reward is low; the No Project Alternative is the only alternative that does not create thousands of acres of disturbance (some temporary, for those who define 10+ years as temporary, and some permanent) and myriad risks of contamination and disturbance to naturally occurring sources of groundwater. How would CHSRA present a risk-reward analysis that would justify the construction of any of the six proposed Build Alternatives?

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 73 of 156

4494-9496

On Page 3.8-46 of the DEIR, CHSRA sets forth Groundwater Recharge Impacts from New Impermeable Surfaces:

Impermeable surfaces created by the Build Alternatives would disrupt the infiltration of water from the surface to groundwater basins, permanently affecting groundwater recharge. Reducing groundwater recharge could lead to groundwater reduction. Nearby groundwater wells could be affected by a reduction in groundwater availability.

CHSRA explains that groundwater may be depleted by tunneling, and this could impact water in the Antelope Valley Groundwater Basin, the Acton Valley Groundwater Basin, The Santa Clara River Groundwater Basin, the San Fernando Groundwater Basin. However, CHSRA minimizes the importance of these groundwater basins by explaining that they are not listed as "medium or high priority groundwater basins" and that no applicable groundwater sustainability plans have been adopted for these basins.

4494-9497

On Page 3.8-47, CHSRA goes on to state that within the San Fernando Basin, several of the Build Alternatives, "would cross the Hansen Spreading Grounds on fill or embankment. New impervious surfaces within the spreading ground could reduce its capacity for groundwater recharge."

Despite CHSRA's marginalization of the importance of our local groundwater basins, there is evidence to underscore their significance – particularly during this time of California's epic drought. The "History" section of Hansen Dam's Wikipedia entry explains the importance of this groundwater basin:

During storms and flooding, the dam is intended to catch water within the reservoir. Provisions in the dam's standards of operations promote water conservation efforts coordinated with the Los Angeles County Department of Public Works. The provisions allow the dam to discharge water onto spreading grounds located south of the dam, which then percolates into groundwater recharge basins and is stored as part of the city's water supply.<sup>39</sup>

<sup>39</sup> [https://en.wikipedia.org/wiki/Hansen\\_Dam](https://en.wikipedia.org/wiki/Hansen_Dam)

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 75 of 156

4494-9498 In an article entitled, "Groundwater Recharge, Retention & Pollution," The Sierra Club explains the importance of our local water supply, quoting data from LADWP: "The local groundwater has historically provided approximately 11 to 15 percent of the city's total water supply. During times of drought and/or emergencies, the local groundwater has provided up to 30 percent of the total water supply."

This local groundwater is all the more important because of the current (and presumably future) issues with importing water to meet demand. The Sierra Club explains, "...we have to import water from northern California and, also, from the Colorado River. That is problematic because those places are not giving us the allotment they did even 10 years ago, and that means we need to rely more on our local water. We currently spend \$1 billion a year to import 85 percent of our water supply from other regions whose ecosystems are seriously threatened by that loss."<sup>40</sup>

4494-9499 The issue of water is critically important to California. At the end of July, levels in Lake Mead, according to NASA, "stand at their lowest since April 1937, when the reservoir was still being filled for the first time."<sup>41</sup> In September 2022, several days after the release of this DEIR, cuts to the water from supply from the Colorado River were announced: "Officials in California are closing in on an agreement to give up a significant portion of the water the state gets from the Colorado River, bowing to an emergency demand made by the federal government earlier this summer."<sup>42</sup>

In order to balance the drought and the need for water, the Sierra Club recommends that in Los Angeles, we, "Need to have the most water absorbent & sensitive areas as 'no-build places'."<sup>43</sup>

<sup>40</sup> [https://angeles.sierraclub.org/groundwater\\_recharge\\_retention\\_pollution](https://angeles.sierraclub.org/groundwater_recharge_retention_pollution)  
<sup>41</sup> <https://thehill.com/changing-america/sustainability/climate-change/3573535-nasa-photos-show-dramatic-shrinking-of-lake-mead/>  
<sup>42</sup> <https://grist.org/drought/colorado-river-water-california-imperial-irrigation-district/>  
<sup>43</sup> [https://angeles.sierraclub.org/groundwater\\_recharge\\_retention\\_pollution](https://angeles.sierraclub.org/groundwater_recharge_retention_pollution)

4494-9500

To take advantage of the wonderful resource of a highly absorbent aquifer we need to be able to use it when needed, so if there is a building placed on top of it then the aquifer can't do its job. Cities need to make those places "no build" and only used for such activities as recreation... In the past parks have not been a high priority but if they can be seen as a way of capturing water they might be seen as more important and, therefore, receive more funding. Other public rights-of-way crossing the watershed include 27.75 miles of channelized streams and five transmission line corridors. These interconnect with spreading grounds throughout the watershed, providing an ideal opportunity to create green infrastructure for stormwater capture, groundwater recharge, and habitat that can provide a network of trails, pocket parks, and community gardens. Prioritizing these areas for reclamation and restoration can have tremendous impact on our available amounts of local water supply. Along restored riparian (stream) corridors connecting the mountains and the washes, habitat for wildlife could be integrated with multiple-use parkland for people. **Permanent protection of open space is warranted, particularly along these corridors and in the urban fringe above Hansen Dam.**<sup>44</sup>

**Question:** Groundwater resources are more important to Los Angeles than ever before, yet CHSRA proposes polluting them, reducing them, and reducing their potential for recharge. all while claiming that these impacts are "less than significant." How can CHSRA's Board of Directors select in good faith any build alternative other than the No Project Alternative?

4494-9501

On Page 3.8-48 of the DEIR, CHSRA examines the impacts on Groundwater Recharge from Tunnel Construction, explaining,

Within the Antelope Valley Groundwater Basin, tunneling activities required for each of the six Build Alternatives could encounter shallow groundwater south of the California Aqueduct and north of the ANF. Where each of the Build Alternative alignments passes through foothills of the San Gabriel Mountains, tunnels would likely be constructed above the groundwater table. **However, not enough groundwater information is available at this time to identify the extent to which the tunnels may be below the water table.** There may be perched groundwater or seasonal springs in the vicinity of these tunnels (Figure 3.8-A-21); therefore, local water inflows during portal and tunnel excavations are anticipated in this area.

Further, with respect to design features such as the tunneling methods to be employed, CHSRA states:

The circumstances under which these approaches would be employed would be guided by site-specific geotechnical and hydrogeological characterizations that would be developed during the preconstruction phase of the selected Preferred Alternative. Such studies would include geotechnical investigations along the tunnel alignment for the selected Preferred Alternative to characterize the differing rock/soil types (e.g., strength, fracturing, in-situ stresses), groundwater pressures at tunnel depth, potential flow quantities, and structural geology, including faults and gouge zones.

**Question:** If not enough information on groundwater resources exists to know the relation of the tunnels to groundwater resources, how can we rely on CHSRA's admittedly limited analysis to know that its tunneling plans are even feasible?

4494-9502

**Question:** CHSRA is placing a great deal of emphasis on additional testing and studies that will need to be conducted after the Preferred Alignment is selected but before construction begins. These additional tests/studies will yield pretty important information that could determine whether or not an alignment is feasible. For example, if additional testing determines areas in which the water pressure exceeds 60 bars, what will happen then?

<sup>44</sup> [https://angeles.sierraclub.org/groundwater\\_recharge\\_retention\\_pollution](https://angeles.sierraclub.org/groundwater_recharge_retention_pollution)

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 76 of 156

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 77 of 156

4494-9503 **Question:** Will these additional studies be conducted by CHSRA itself, or by a contractor bidding on the build contract for the Preferred Alignment? 4494-9507

4494-9504 **Question:** Other than water pressure, what other factors could be discovered during these additional tests that would render an alignment infeasible or impracticable? If any such factor(s) are discovered during the period of additional study, will the Preferred Alignment be abandoned and there will be no project in this Project Section? Or will a different alignment then be selected and additional studies conducted along that alignment?

4494-9505 **Question:** Given CHSRA's admitted lack of information available on groundwater resources, how can CHSRA even provide a reasonably accurate cost estimate to build this project section?

4494-9506 With respect to the inventory and monitoring of groundwater and surface water resources, on Pages 3.8-68 and 3.8-69 of the DEIR, CHSRA explains that it will conduct monitoring activities to evaluate the recovery of water resources that were depleted or otherwise damaged by tunnel construction. These monitoring/recovery plans include the following statements:

1. Over time, groundwater resources would recover from losses sustained during construction through recharge by natural precipitation. Such recharge may take months to years after the tunnel lining system is installed.
2. The Authority will prepare contingency plans to provide supplemental water as necessary to support springs and streams determined through modeling and monitoring to be adversely affected by groundwater reductions. For all features, supplemental water would provide minimum flows and periods of inundation to match baseline conditions.
3. Supplemental water would be supplied to affected springs or streams to approximate baseline levels until groundwater recharged naturally. The actual method of distribution of supplemental water would vary according to site-specific characteristics. For example, at some locations, a drip irrigation system may be more appropriate, whereas at other locations, it may be more appropriate to simply discharge water directly to a creek bed.

**Question:** It seems to contradict common sense for reasonable people to choose importing water and dumping it into streams in the Forest instead of choosing to not damage the naturally-occurring water sources in the first place. Given that recharge of water resources may take years, and given that CHSRA proposes importing water and dumping it into streams in order to achieve baseline water levels before they were depleted by tunneling, what are the reasons why it would not be preferable to simply not cause the damage in the first place? 4494-9510

4494-9507 On Page 3.8-79 of the DEIR, CHSRA begins a section entitled, "Incomplete or Unavailable Information Regarding Evaluation of the Effects of Tunnel Construction" with the following:

Although preliminary assessments of subsurface conditions in the ANF have been conducted to date, many aspects of the hydrogeologic and hydrologic conditions that would be encountered during tunnel construction have been defined only partially, and data gaps remain regarding the surrounding bedrock, groundwater, soil, and surface hydrology conditions present in the vicinity of the proposed tunnels. The current data gaps include the following:

- Geologic conditions, including spatial distribution of rock formations, rock structure types, rock orientation, extent and intensity of fractures and shear zones, and characteristics of the San Gabriel fault zones and Sierra Madre fault zones, including lengths, widths, depths, and alignment of the fault zones in the subsurface;
- Hydrogeologic conditions, including aquifer boundaries, groundwater, and hydrostatic pressures, annual and interannual variation of groundwater conditions, responses to rainfall, conductivity, fault and fracture zone features, hydrologic connectivity with surface water resources and overlying alluvial aquifers, and groundwater chemistry; 4494-9513

- Hydrologic conditions, including average productivity of existing groundwater wells and springs, and the annual and interannual variation in productivity, metrics describing average, peak, and low-flow conditions of streams, and hydroperiods of surface water resources.

CHSRA has proven in the Central Valley that the 15/85 design plan (i.e., only 15% of the project has to be designed before 100% of the project has been approved) is an abject failure. The failure of CHSRA to sufficiently research proposed alignments in advance of their approval led to significant cost overruns as well as waste, as houses were taken by eminent domain which turned out to not even be in the eventual path of the train, and rerouting was necessary for miles as CHSRA failed to realize that utilities were in the way.

**Question:** Instead of repeating the mistakes made in the Central Valley, would it not be preferable to research the necessary factors ahead of time in order to conclude whether or not the Preferred Alignment is even feasible?

**Question:** The fact that the "data gaps" are in some of the most serious issues facing the design and construction of the CHSRA proposed alignments – i.e., geologic conditions, hydrogeologic conditions, and hydrologic conditions – is worrisome at best. Considering that some of the most significant questions/concerns about the feasibility of this project stem from these issues (e.g., seismicity, potential for disruption of water sources), would it not be preferable to do the necessary research now to address these significant concerns?

**Question:** Considering how little CHSRA actually knows about the geologic, hydrogeologic, and hydrologic conditions through the most technically challenging portion of the proposed rail system, what would CHSRA say are the chances of success in actually completing these tunnels? Given that the unknowns outweigh the knowns, what would CHSRA say are the chances of successfully completing this project section within the projected \$12B - \$24B estimate set forth in the 2022 Business Plan?

On Page 3.8-82 of the DEIR, CHSRA states that, "The AMMP would address foreseeable and unforeseeable impacts associated with the Build Alternatives."

**Question:** How does a plan address "unforeseeable impacts"?

**Conclusion:** Some of CHSRA's proposed mitigation measures may help to either prevent or remediate damage to water resources on a case-by-case basis; however, when considered overall/cumulatively, these mitigation measures are vastly insufficient to address not only the risk, but also the overwhelming likelihood of damage to water resources that will be sustained during both the construction period and the operation of the train. Additionally, CHSRA's admitted lack of information about the geologic, hydrologic, and hydrogeologic conditions that exist along the project alignments is alarming. The proposition that these factors will be studied at a later date, and possibly by contractors bidding on the build of the project section, is unacceptable for a project of this cost and complexity. These concerns are exacerbated by the epic drought currently facing the State of California, when for the foreseeable future the significance of our naturally-occurring sources of water are at an all-time high – and the thought of jeopardizing these resources is unthinkable. With the information that CHSRA has presented in Chapter 3.08 and its appendices, the only acceptable alternative is the No Project Alternative.

**APPENDIX 3.8-C: ADAPTIVE MANAGEMENT AND MONITORING PLAN FOR POTENTIAL HYDROLOGIC EFFECTS WITHIN THE ANGELES NATIONAL FOREST**  
**APPENDIX 3.8-D: SUPPLEMENTAL WATER PLAN ANALYSIS FOR POTENTIAL IMPACTS WITHIN THE ANGELES NATIONAL FOREST/SAN GABRIEL MOUNTAINS NATIONAL MONUMENT**

The high-speed train requires a substantial amount of water during and for construction as well as afterwards to ensure that the Angeles National Forest/San Gabriel National Monument's (hereinafter just referred to as "Angeles National Forest" or "ANF") habitat remains at its pre-construction condition. Therefore, the US Forest

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank

Page 78 of 156

4494-9513

Service (USFS) provided CHSRA with several mandates to follow concerning the alarming effects that constructing and operating tunnels through the ANF could or would cause.

California, and the rest of the Western United States, are in yet another multi-year mega-drought with no end in sight.<sup>45</sup> The fact that CHSRA is even thinking about using any water for any use is a non-starter. Therefore, the only feasible alternative is the No Build Alternative.

CHSRA acknowledges that tunnel construction can cause loss of water to the ANF's ground floor. This temporary or permanent loss of water would destroy habitat resulting in death for fish, amphibians, reptiles, small mammals, apex predators, and birds. One area of great concern is the negative impact loss of water will have on oak trees and hardwood conifers. Further, CHSRA recognizes that after tunnels are completed, they may leak, resulting in continuous seepage and loss of water for plants and riparian areas.

CHSRA states they have ways to seal the tunnel if they leak, but it is disquietingly reminiscent of the Central Artery/Tunnel Project, commonly known as "the Big Dig" in Massachusetts. This tunnel project was plagued with massive construction flaws including thousands of leaks. This negligence led to criminal convictions and the death of a motorist. Unlike the high-speed rail tunnels, the "Big Dig" tunnel was not hundreds or thousands of feet underground, nor was it subject to high pressure. Yet, because of poor construction, the tunnel failed. If you think, "Surely, CHSRA wouldn't use substandard construction," please refer to the high-speed rail's Madera bridge failure in 2020<sup>46</sup>. High-strength steel strands supporting the 636-foot-long structure began to snap in October 2020, one after another. Ultimately, 23 of the strands, which are composed of seven individual wires each, broke unexpectedly, according to rail authority documents and officials. The order to stop work was issued in November 2020. Additionally, the same contractor that built this failed Madera bridge, Tutor-Perini, was ordered in October 2022 to shut down construction for two weeks on LA's Metro Purple Line due to massive worker injuries. Guess who is CHSRA's largest contractor? Yes, it's Tutor-Perini – which has a nearly \$3 billion multi-year contract that expires in 2024.

4494-9514

On a side note, Tutor-Perini's business practices have earned Ron Tutor the title of "Change Order Artist." Officials in both San Francisco and Los Angeles are seeking to ban the company from bidding on contracts. Over 12 years, Tutor-Perini cost the San Francisco government \$765 million more than expected (or 40% above initial bids) for contracted projects by fraudulently inflating costs from \$626 million to \$980 million, as determined in a 2002 lawsuit. The company paid only \$19 million to settle the San Francisco based suit. Tutor-Perini filed a lawsuit against Los Angeles County for \$16 million in "unanticipated costs." Two decades later, the county has spent over \$32 million without a resolution to what the county refers to as a false reimbursement claim. With respect to the high-speed rail project, Tutor-Perini underbid the anticipated costs and then later made a change order and was given another \$63 million by the CHSRA as a result.<sup>47</sup>

4494-9515

With respect to impact on groundwater, USFS has provided various standards. Appendix 3.8-C, Section 2.1 provides:

*"Section 2.1 USFS Soil, Water, Riparian and Heritage Standard 45  
USFS Standard 45 establishes that activities on USFS land must minimize adverse effects on groundwater (USFS 2005). Standard 45 states: 'All construction, reconstruction, operation and maintenance of tunnels on National Forest System lands shall use practices that minimize adverse effects on groundwater aquifers and their surface expressions.'*

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 79 of 156

4494-9515

*Authority Objectives Regarding Standard 45:*

- Maintain the minimum baseline range of flows of springs and streams and measured groundwater levels (i.e., measured pressures) within documented seasonal parameters.
- Maintain minimum baseline spring and stream flows to maintain surface water conditions substantially similar to flows documented during monitoring that support existing habitats and wildlife species."

Similar standards are stated for fish and wildlife. In short, construction cannot be allowed that results in damage to the ecological system.

4494-9516

Currently, there is monthly water monitoring. A baseline will be established through various tests prior to construction and will include streams and springs (inflow and quality), impact on riparian habitats, plants, birds, and bats. Monitoring will continue during construction and then for 10 years after construction.

If a variance is found, remedial steps will be taken. However, it is our belief based on the effects that dewatering has had on other parts of the state (e.g., the Central Valley, Runyon Canyon in Los Angeles) that when water is gone, it is gone, and any mitigation measure will be too little too late.

4494-9517

In addition to the timing and the amount of irreversible loss of water even if dewatering is discovered, the remedies are infeasible and untenable.

While CHSRA outlines in detail their mitigation remedies on several pages of this appendix, their "mitigation" remedies are simplistic and senseless:

1. Replace the water in streams and springs by 8,000 gallon water truck deliveries<sup>48</sup> from local water agencies (water would require aeration, circulation, exposure to ultraviolet light, or otherwise treated to reduce concentrations of chlorine and other byproducts of water treatment which suggests that the water is potable) to match the existing naturally occurring water chemistry that was lost; water would be added to streambeds or delivered through drip irrigation systems (CHSRA estimates that there will be 27 truck trips DAILY to supply the necessary amount of supplemental water and states that this is a rather infeasible solution); trucks would have to drive 48 or 62 miles round trip, with 16 miles on Forest Service roads and an additional 9 and 15 miles on paved or urban roads, respectively, per visit; or
2. Replace the water in streams and springs by pumps and 620 foot long pipeline(s) along existing roads; and/or
3. Install permanent water tanks and irrigation systems to lessen the amount of truck trips; and/or
4. Rehome species that are negatively impacted to another area.
5. For affected supply wells, actions could include modifying the well equipment, such as by lowering the pump within the well, cleaning the pump, or providing a larger pump. Other or additional actions may include providing potable water supplementation until water levels recover in the water supply well. A third grader knows that the replacement water must come from somewhere and California does not have that "somewhere"! (NOTE: California Central Valley's groundwater loss caused irreversible sinking.)<sup>49</sup>

It is obvious that these "remedies" are infeasible, untenable, and absurd. California has more drought years than not, and its climate is changing to a much drier climate. To say California is suffering from yet another drought is like stating that the Sahara Desert continues to have droughts.

<sup>48</sup> A 8,000 gallon water truck weighs 30,283 pounds loaded and runs on greenhouse gas-emitting diesel. CHSRA acknowledges that ANF roads are not built for heavy usage and heavy weight vehicles. The noise, fumes, and vibration from frequent truck trips will harm the ANF.

<sup>49</sup> <https://news.stanford.edu/press-releases/2022/06/02/will-californiasley-stop-sinking/#:~:text=The%20floor%20of%20California's%20arid,water%20levels%20merely%20stop%20declining.>

4494-9518

CHSRA used precipitation data from 1932 to 2016 to determine how much water will be required to maintain the status quo. It excludes California's current predicament: October 2019 through September 2022 — the past three water years combined — was California's driest such period on record. In that time, much of northern California missed more than a year's worth of precipitation.<sup>50</sup> As each year of rainfall dwindles, the more supplemental water will be required. Further, the sources of this supplemental water also dwindle. Where is this water going to come from? It cannot come from California's current sources of water which includes reservoirs inside and outside of the state which are at a fraction of their normal capacity and whose agencies are draconianly cutting allocations.

Photograph redacted at the request of SAFE.

Where is this water going to come from? It cannot come from California's current sources of water which includes reservoirs inside and outside of the state which are at a fraction of their normal capacity and whose agencies are draconianly cutting allocations.

The LA Times' headline on November 23, 2022 says it all, "It's a disaster." *Drought dramatically shrinking California farmland, costing \$1.7 billion.* The article goes on to state that California has just gone through the state's driest three-year period on record, and this year the drought has pushed the fallowing of farmland to a new high. Further, scientists predict a fourth year of drought which puts California into uncharted territory.

Impacts of this current drought:

- California's irrigated farmland shrank by 752,000 acres, or nearly 10%, in 2022 compared with 2019 — the year prior to the drought. That was up from an estimated 563,000 acres of fallowed farmland last year.
- Gross crop revenues fell \$1.7 billion, or 4.6%, this year. Revenues of the state's food processing and manufacturing industries declined nearly \$3.5 billion, or 7.8%.
- An estimated 12,000 agricultural jobs were lost, representing a 2.8% decline.
- The amount of farmland left dry this year surpassed the peak of fallowed land during California's last drought from 2012 to 2016.
- With the Sacramento River watershed parched and Shasta Lake at low levels, wildlife officials dedicated some water to try to help the spawning of endangered winter-run Chinook salmon, which contributed to the cuts in water deliveries to farms. Very few fish survived.
- Lack of water now threatens millions of wetland-dependent birds, and could affect the migratory path along the Pacific Flyway.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 81 of 156

Satellite view of the Colorado River — one of California's largest water sources

4494-9519 The following chart enumerates how much supplemental water will be required:

Table 3 Estimated Water Demand for Supplemental Water at Two High Risk Areas within the Angeles National Forest

Subsection	Estimated Water Demand	
	acre-feet/year	gallons/year
<b>E1/E1A</b>		
E1/E1A-4	215.00	70,053,892.00
With 10% contingency	236.50	77,059,281.20
<b>E2/E2A (includes areas within the SGMNM)</b>		
E2/E2A-4	1.98	646,651.00
With 10% contingency	2.18	711,316.10

**70 to 77 MILLION GALLONS OF WATER PER YEAR!  
PLUS 194 MILLION GALLONS OF WATER DURING CONSTRUCTION!  
Assuming 7 years<sup>51</sup> of construction: 733 MILLION GALLONS OF WATER!**

733 million gallons of water would provide water for 6,275 households in Los Angeles for an entire year assuming a generous use of 320 gallons of water use per day or could fill 1,110 Olympic-sized swimming pools.

<sup>51</sup> Can be 7 years, but will probably exceed 10 years.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 83 of 156

4494-9520

CHSRA states that water will be provided by agencies such as wholesale water and retail domestic potable water agencies that serve the area. While none of this water would be drawn from natural water sources in the ANF, it will divert water used by businesses, residences, farms, ranches, and commercial enterprises.

Without construction of the high-speed rail project, water providers predict that sufficient water supplies would be available to meet demands in 2020 (it is nearly 2023), assuming normal water year conditions. However, in the event of single or multiple dry year conditions, which is the current situation with no end in sight, demands would exceed supplies in 2020. Additional water supplies would be needed to meet demands under such conditions, with or without construction of the project. Without the allocation of additional water during dry years, there may not be water supplies available from these providers. Every day it seems like there is another piece of news about water cuts from the usual reliable water suppliers. In October 2022, it was announced that the southwestern states that rely on the Colorado River must implement further cuts because the water levels are so low (25% of normal) that there won't be enough water to generate hydro power. The risk of dead pooling<sup>52</sup> is real.

4494-9521

CHSRA states that 10-25% of construction water can be recycled, treated, and then also re-used again for supplemental water. Even if this were true, any water for this project is too much water, particularly when we have essential uses for growing food and raising livestock, for drinking, cooking, washing, and flushing one's toilet.

4494-9522

With respect to water access and consumption, California residents, businesses, and farms should take precedence. California is the world's 5th largest supplier of food, cotton fiber, and other agricultural commodities. In the U.S., California is the largest producer of food, despite having less than 4% of the farms in the country.<sup>53</sup> It is simply reckless and wasteful, not to mention unfair, to divert water from anywhere in the Western United States for this project.

4494-9523

Per CHSRA, water for construction would be simply provided and delivered by domestic and wholesale providers to construction sites (primarily portal and adit locations) via pipelines that would be constructed as part of the project. These pipelines have been incorporated into the project footprint and have been evaluated in the impact analysis. Many of the portal and adit locations where domestic and wholesale water supplies would be piped in for construction are either within or near the Angeles National Forest and San Gabriel National Monument. These pipelines are just another encroachment into the environmentally-sensitive forest.

4494-9524

It is not a simple process to produce water from underground water resources. A production well would need to produce several hundred gallons of water per minute. Most of the bedrock wells in the vicinity of the tunnel alignments are low-yield wells for private uses<sup>54</sup> and are not capable of producing the quantity of water needed for supplementing affected surface water resources. A large yielding well would need to be in an alluvial groundwater basin rather than in bedrock areas. This would likely result in wells being located outside the ANF in basins—the Santa Clara River Valley Groundwater Basin and the San Fernando Valley Groundwater Basin.

4494-9525

**Question:** Are these water pipelines permanent infrastructure?

**Question:** Are the water storage tanks permanent infrastructure?

4494-9526

**Question:** Who pays for the 10-years of post-construction monitoring?

<sup>52</sup> Dead pool occurs when water in a reservoir drops so low that it can't flow downstream from the dam. The biggest concerns are Lake Powell, behind Glen Canyon Dam on the Utah-Arizona border, and Lake Mead, behind Boulder Canyon Dam on the Nevada-Arizona border.

<sup>53</sup> <https://blog.agheres.com/california-largest-food-producer-u-s/>

<sup>54</sup> This statement is confusing because CHSRA has stated that they would not utilize water from the ANF. We assumed it was because the optics are terrible but apparently it is because the pumps are not robust enough.

4494-9527

**Question:** Who pays for the water during and after construction?

**Question:** Who pays for the replacement water delivery systems?

4494-9528

**Question:** Are the water agencies who are assumed to be supplying the replacement water aware of this plan?

4494-9529

**Question:** Why is CHSRA going to pump water themselves if they are planning on getting their water from local water agencies? Don't local water agencies also rely on this groundwater for their inventory? Isn't that larceny?

4494-9530

**Question:** With respect to water allocation, why should this project be given priority over everyone else?

## CHAPTER 3.9: GEOLOGY, SOILS, SEISMICITY, PALEONTOLOGICAL RESOURCES

In this section, we will discuss the CEQA mandates and CHSRA's responsibilities as they relate to geology, soils, seismicity, and paleontological resources.

### CEQA Mandates

1. "CEQA was enacted to advance four related purposes; to (1) inform the government and public about a proposed activity's potential environmental impacts; (2) identify ways to reduce, or avoid, environmental damage; (3) prevent environmental damage by requiring project changes via alternatives or mitigation measures when feasible; and (4) disclose to the public the rationale for governmental approval of a project that may significantly impact the environment." (*California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 382.)
2. To further these goals, CEQA requires an agency to prepare an EIR for any proposed project that may have a significant effect on the environment. (Pub. Resources Code §§ 21100(a), 21151(a), 21080(d), 21080.2(d).)
3. "An [EIR] is the public document used by the governmental agency to analyze the significant environmental effects of a proposed project, to identify alternatives, and to disclose possible ways to reduce or avoid the possible environmental damage." (14 Cal. Code Regs. § 15002(f); Pub. Resources Code, § 21002.1) The EIR must clearly identify and describe the project's significant effects on the environment. (14 Cal. Code Regs. § 15126.2.)
4. "An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR." (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185.) Failure to adequately describe a project undermines CEQA.
5. The EIR must "describe feasible measures which could minimize significant adverse impacts," and the "formulation of mitigation measures shall not be deferred until some future time." (14 Cal. Code Regs. § 15126.4.)
6. Under CEQA, an agency must solicit and respond to comments from the public and from other agencies concerned with the project." (14 Cal. Code Regs. § 15200(j).)
7. The agency must evaluate comments on environmental issues received from persons who reviewed the Draft EIR and prepare a written response. (14 Cal. Code Regs. § 15088.) The agency must address "in detail" objections raised in the comments, "giving reason why specific comments and suggestions were not accepted. Conclusory statements unsupported by factual information will not suffice." (14 Cal. Code Regs. § 15088.)

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 84 of 156

**Failure to Meet Mandates**

The DEIR is 7,000 pages long (6 times the length of *War and Peace*) and yet still fails to meet the State Required Mandates on several levels as follows:

4494-9531 1. **Seismicity.** The DEIR proposes a design and build contract whereby the contractor, if one can be located, will somehow determine the subsurface features of the route. CHSRA only drilled 6 bore holes to cover the area of the 6 alternative routes. This is an insufficient number of bore holes for 28 miles of tunneling per alternative. Since earthquake faults that are not always "surface reflected," the subsurface conditions require the drilling of about 150 bore holes along each route. There is inadequate subsurface testing to allow a reasonably prudent contractor to enter into a design and build contract. More importantly, the CHSRA does not have enough information to make a rational decision about which route – if any – should be selected. The failure to test prior to issuing the DEIR violates Cal. Code Regs (14 Cal. Code Regs. § 15126.4.) You can't approve that which you do not know. Kicking the can down the road is an abrogation of the Authority's duties.

**Questions:**

- 4494-9532 1.1 Question: How many bore holes would a reasonable person making multi-billion-dollar decisions need along each proposed route to have sufficient information to make an "accurate stable and finite project description"?
- 4494-9533 1.2 Question: How can the Authority decide which route, if any, to approve if it has not conducted the tests (bore holes) needed to derive the requisite information?
- 4494-9534 1.3 Question: Has the authority approached any contractor about what information it will need to enter into a "design and build" contract for tunneling through the Angeles National Forest (ANF) or the Transverse Mountains?
- 4494-9535 1.4 Question: Is there an estimated cost for a design and build contract for tunneling through the ANF?
- 4494-9536 1.5 Question: What happens if the bore holes drilled along the preferred alternative confirm that preferred alternative is infeasible?
- 4494-9537 1.6 Question: What happens if the drilling of all bore holes yields results that render all the alternatives infeasible?

4494-9538 2. **Track Misalignment:** CHSRA proposes to mitigate the derailment damages likely to be caused by an earthquake event with the use of early earthquake warning (EEW) systems which will then contact the train to slow down.

**Questions:**

- 4494-9539 2.1 Question: At 200 miles per hour, how long (in miles and time) will it take a train to slow down and stop before derailing?
- 4494-9540 2.2 Question: Would restricting the train's speed to no more than 100 mph in a tunnel be a reasonable mitigation measure to decrease stopping distance and time?
- 4494-9541 2.3 Question: If the train were limited to traveling at 100 mph through the tunnel, wouldn't it be easier and less expensive to select the "no project" alternative and not tunnel under the ANF?
- 4494-9542 2.4 Question: The CHSRA talks about mitigating problems by using the Asian and European models but does not describe such models. What are those models?

4494-9543 3. **Tunnel Boring Machines:** In Seattle the tunnel boring machine (TBM) was named Big Bertha, after the first female mayor of Seattle. It got stuck in the hole and took about a year to extract. Portions of the geology of the Seattle tunnel can be similar to that found in the ANF. This is especially true around existing earthquakes that have pulverized the rock, and which will likely have excessive water pressure.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 85 of 156

4494-9543

**Question:** How long would it take to extract the TBM at 2,000 feet from the ANF?

**Question:** What is the additional cost of extracting a TBM from the ANF?

4494-9544

4. **Hydrology - High Pressure Water:** The DEIR states that when rocks have been crushed by earthquakes, the water pressure can be in excess of 25 bars. Twenty-five bars equal 362 psi of water pressure. Water pressure from most fire hydrants is 50 psi to 100 psi. This makes 25 bars up to 6 times as strong as pressure from a fire hydrant.

**Question:** How will the tunnels be constructed to meet this high water pressure?

**Question:** Where will all the water be sent during construction?

**Question:** How will high water pressure affect using the second tunnel as an escape for passengers from the first tunnel during an earthquake or derailment?

**Question:** At what pressure (psi) will water seep into tunnels?

**Question:** What is effect of water seeping into the tunnel?

4494-9545

5. **Hydrology - Surface Water:** The tunneling will likely cause the dewatering of the surface water with the attendant adverse consequences to flora and fauna. This happened in the Runyon Canyon portion of the Hollywood Hills during the construction in the Metro Red Line.

4494-9546

**Question:** Will the US Forest Service have the authority to withdraw its permit allowing CHSRA to travel through the ANF during or after the completion of the tunneling because of dewatering?

4494-9547

**Question:** Where will the water come from to provide water to the surface to replace the dewatering effect of tunneling?

**Question:** How much replacement water is needed and how much will it cost?

4494-9548

6. **Hydrology - Earthquakes:** The addition to or removal of water from surface formations can cause earthquakes. There are a series of articles in the 2014 *Smithsonian* which discuss the possibility of earthquakes caused by inserting liquids into underground formations (Oklahoma fracking) or removing water from the formation (Central California).

**Question:** What studies have the Authority conducted on the effect of the removal of water (dewatering) on earthquakes in the Transverse Mountains?

4494-9549

7. **Electricity:** There is no analysis of who is going to provide the electrical infrastructure for this section of CHSR. Neither the Los Angeles Department of Water and Power (LADWP) nor Southern California Edison (SCE) have commented on the cost of infrastructure nor who will pay for it. This is a failure to describe the project. This failure is a system-wide failure which may make the entire project infeasible. The questions which the DEIR fail to address are as follows:

**Question:** If public or private utilities do not pay for the purchase and installation of the electrical infrastructure for Palmdale to Burbank, who will pay for it?

**Question:** Regardless of who pays for the electrical infrastructure for the Palmdale to Burbank section, what is the estimated cost in 2022 dollars?

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 86 of 156

4494-9550

**Question:** Recently there have been flex alerts with threats of rolling blackouts of electricity. What priority of electrical usage does CHRSA have compared with residential and commercial users?

**Question:** Is the priority for usage consistent between all potential providers of electricity?

**Question:** What happens if electricity is not available on a portion of the CHRSA system?

4494-9551

**Question:** What agreements or memorandums of understanding does the Authority have with the utilities within the Palmdale to Burbank section to provide electricity or electrical infrastructure?

4494-9552

**Question:** Has CHSRA discussed these or similar issues with the LADWP?

4494-9553

8. **Conclusion:** "Substantial Evidence" is needed to sustain the approval of an EIR. In this matter there is no "substantial evidence" because there is no evidence at all. The use of a design and build standard means that all facts needed to determine if the project is feasible or what mitigation is appropriate will be made after the approval of the project. That is backwards and specifically prohibited under California law.

**Additional Questions on this Chapter:**

4494-9554

**Question:** Why isn't all the necessary/required and voluminous testing not being done PRIOR to approval of the preferred build alternative? As the many graphs included in this section include projections without the foundation of any previously proven results, what assurance does the public have that CHSRA can successfully complete this project?

4494-9555

**Question:** What is the reason that HSR has not already conducted the additional test bores necessary to evaluate the feasibility of the tunneled routes? Shouldn't that testing have occurred and the results been made available prior to the release of this DEIR?

4494-9556

**Question:** What are the dates of the graphs presented in this section?

4494-9557

**Question:** In what ways has CHSRA prepared for catastrophes (including but not limited to deaths of construction workers and/or eventual riders) that may occur as a result of tunneling through the San Gabriel Mountains?

4494-9558

**Question:** Is CHSRA prepared to reimburse the citizens that live in the Foothills for effects they may suffer as a result of construction and/or operation of the train, including but not limited to the depletion of water, landslides, deforestation, and construction impacts that disrupt everyday life?

4494-9559

**Question:** Why is CHSRA pursuing this project section when it knows that all 6 proposed build alternatives cross fault lines in many areas?

**CHAPTER AND APPENDIX 3.11: SAFETY AND SECURITY**

4494-9560

According to CHSRA, the high-speed train will be fully access controlled:

- Public to access train by platform only
- Access control barriers and railway/roadway barriers to prevent intrusion into the right of way, the fixed infrastructure and would employ the latest safety features and design to enable the trains to stay upright and in line in the event of a derailment
- Protect against collisions and derailments / outside hazards-intrusions into the right of way
- Earthquakes and severe weather conditions

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 87 of 156

4494-9560

The HSR guideway, stations and associated facilities would include:

- Fire and life safety infrastructure (including fire and smoke prevention and control)
- Security and communication systems
- Features to manage adjacent hazards from electrical and other utilities
- Hazardous materials facilities
- Oil and gas wells
- Wind and turbines

Appropriate setbacks and access controls for adjacent facilities or areas underneath elevated structures

- Based on existing regulations, guidance, or site-specific analysis, would maintain the safety and security of both the California HSR system operations and the adjacent communities.

The Authority will require the Safety and Security Management plan to be developed and implemented prior to project construction.

Regional and local safety plan analysis Summary shows:

- City of Lancaster, Palmdale, Los Angeles Burbank
- Los Angeles County
- Whiteman Airport, Hollywood Burbank Airport

These safety plans all together cover:

- Geology and seismicity, Flooding and drainage, noise, air installation land use compatibility, hazardous materials, crime prevention, fire prevention, disaster preparedness, emergency medical services, natural and human made hazardous materials, comprehensive risk management plans, public safety, safety and security in parking areas and commercial and residential areas, safety for pedestrians, bicyclists and equestrians, planned response to emergencies.

**Question:** What is the safety plan to prevent a derailment?

4494-9561

Emergency Response Plans

- City of Burbank, Lancaster, Palmdale, Santa Clarita, Los Angeles
- Los Angeles County, Southern California Association of Governments

These organizations cover: Prepare the district to respond to emergencies using the Standardized Emergency Management System, strategies to address multi hazard issue as well as hazard specific activities for windstorm, earthquakes, fires, flood, landslides and terrorism, ensure that the long-term values of the community are not compromised, strategies to ensure safety and mobility of the region's residents, including drivers and passengers, transit riders, pedestrians and bicyclists.

**Question:** What is the emergency response plan in the event there is a derailment?

4494-9562

Consistency with plans and Laws:

- The Authority reviewed 14 plans. Each of the 6 Building Alternatives is inconsistent with one policy from the Los Angeles County General Plan 2035. That policy is: The safety element of this plan addresses limited aspects of human-made disasters, such as hazardous waste and materials management, in particular, the plan addresses those aspects related to seismic events, fires and floods.

Inconsistent for all 6 alternatives

- Some features of the Palmdale to Burbank Project Section could introduce hazardous waste and materials to the project area.

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 88 of 156

4494-9562

- Despite the inconsistency, the project is consistent with the majority of regional and local policies and plans.

**Question:** How can CHSRA claim to be “consistent” with local safety policies?

4494-9563

**Safety and Security Resource Areas**

- Right of ways and stations as well as landfills must be ½ mile from the project footprint
- Schools must be ¼ miles away from project footprint
- Airports and high-risk facilities must be 2 miles from the project footprint
- Oil and Gas wells must be 150-foot buffer from alignment centerline
- All sections above must be ½ mile away from the airport

**Question:** On what basis does CHSRA believe that 150 feet of clearance from a track to a gas line is safe?

4494-9564

The construction team is supposed to comply to all safety and security standards and present their plan to the Authority prior to breaking ground.

**Question:** Who is going to monitor the construction contractor to ensure they are meeting all the standards in their plan? How often will monitoring be done?

4494-9565

All fire departments along the Palmdale to Burbank project section will have a 2-to-5-minute response time.

All the police departments along the Palmdale to Burbank project section will have a 3.36-to-16-minute response time.

**Question:** How can CHSRA assert these time frames when a great portion of the alignment will run through the Angeles National Forest, and current emergency response times to locations in this area already exceed CHSRA’s stated response times?

All Medical Emergency Facilities along the Palmdale to Burbank project section all respond to 911 calls

- At grade railroad crossings can hinder emergency response times when the train block the crossings.

4494-9566

**Community Safety and Security**

- This section covers safety and security in relation to vehicles, pedestrians, railroad operations, airport, schools, high-risk facilities, fall hazards. High winds, Valley Fever, geotechnical hazards, and landfills.
- High winds are an issue. There are some mountain areas of California where the wind was measured at 100mph and 130mph.

**Question:** How will CHSRA mitigate the inevitable spread of Valley Fever fungal spores arising from digging and transporting dirt? (Note: there were over 7,500 cases of Valley Fever in 2017.)

4494-9567

**Geotechnical Hazards**

- There is a history of earthquakes in Southern California.
- The response plan acknowledges that a large earthquake could exceed the response capabilities of the individual cities. Response and disaster relief would have to come from state and federal governments.
- There is a 1% annual chance of a flooding and high-risk flood zones along the Palmdale to Burbank Section.
- Even though there is a ¼ mile buffer from landfills to the project footprint, they have the potential to release methane gas, which may present an explosion risk.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 89 of 156

4494-9567

- Due to Southern California’s hot climate, wildfires have posed a threat to communities, some in the Fire Hazard Severity Zones in the Palmdale to Burbank section.
- Temporary Road Closures will be between 5 and 17.
- Permanent interference with emergency response times from construction activities. From the 6 build alternatives there will be between 5 and 13 permanent road closures

**Question:** How will CHSRA build for, and respond to, an earthquake in the event train(s) are in tunnels during the earthquake event?

4494-9568

Special measures are taken in response to:

- Temporary and permanent road closures, emergency response times, interference response from train and increased activity at stations and facilities, community safety and security, temporary exposure to criminal activity at construction sites, temporary exposure to construction site hazards, temporary exposure to traffic hazards, permanent exposure to traffic hazards, permanent interference with airport safety,
- Airport land use planning documents would represent navigation hazards to aircraft and hazards to people on the ground in areas exposed to aircraft overflight
- The central subsection of Agua Dulce Airport and Whiteman Airport are between 500 feet and 2 miles from the project footprint
- The Burbank subsection Hollywood Burbank Airport is 500 feet from the Project footprint
- Check rails, guard rails and derailment walls would be used in specific areas with a high risk or high impact from derailment areas

**Question:** Why would CHSRA build structures around airports that exceed the height limits established by the airports? Wouldn’t doing so interfere with air traffic controls?

4494-9569

**High-Speed Rail systems accidents**

- Train to train accidents are minimized by the use of the ACT (automatic train control), which can slow down the train or stop it entirely. It controls the electricity.
- TSA would minimize the crime and terrorist threats to the train and passengers
- The train would be going through high fire risk areas and might encounter land or mudslides and flooding

NEPA concluded that before mitigation of ALL building alternatives there were no adverse effects in these areas

- Valley fever
- Exposure risk from High risk Facilities
- Permanent Operational safety impacts
- Exposure to high risk facilities and fall hazards
- Permanent criminal and terrorist activity
- Safety hazards to schools
- Permanent exposure to wildfire hazards
- Post wildfire flooding and landslide risks
- Exposure of passengers to pollutant concentrations due to wildfires
- Fire and wildfire hazards from operations and maintenance

The Angeles National Forest stated: Although the train would not contain flammable materials, the presence of electrical facilities and operation of cars and trucks on new access roads could increase fire risks.

**Question:** What safety precautions is CHSRA establishing when introducing construction equipment in the Angeles National Forest and other fire-prone areas since most of this area is in a designated High Fire Hazard Severity Zone?

November 30, 2022  
Page 91 of 156

**CHAPTER 3.12: SOCIO-ECONOMICS AND COMMUNITIES**  
**APPENDICES 3.12-A, B, C**

4494-9570

This section uses data that relies upon 1978 regulations, instead of the revised regulations issued in September, 2020. Census figures are from 2015. 2014-15 year figures are used for construction. Housing prices are dated from 2008 and 2017. Employment and unemployment rates are dated from 2016. Arleta, Pacoima, Sun Valley, La Tuna Canyon, North San Fernando Blvd., Sylmar, Palmdale, L. A. County, Santa Clarita, and the Antelope Valley area all have different General Plans dated from 1996 to 2016. The "peak year" of construction is 2023. 2040 is the date given for projected growth.

**Question:** Why does CHSRA use outdated data throughout the DEIR? How can accurate projections be made if CHSRA is relying on data from years ago?

4494-9571

In addition to Palmdale and Burbank displacement and relocation, study areas include Lake View Terrace, Shadow Hills, Pacoima, Sun Valley, Acton, Agua Dulce, and Little Tujunga Canyon. Each of the Build Alternatives includes displacement of businesses which lack nearby relocation areas. Displaced people in both residential and commercial areas can get assistance from relocation agents as required by the 1970 Uniform Relocation Assist and Real Property Acquisition Policies Act. CEQA does not consider displacement an environmental concern.

**Question:** For local businesses that will be taken by eminent domain, what is the methodology CHSRA will implement to calculate fair compensation for those who have no place to relocate within their current customer base?

4494-9572

"Economic changes caused by the project would not lead to physical deterioration of local including items such as Noise and Vibration, Fugitive Dust, Demolition Plans which are to be part of relocation mitigation plans."

Economic effects used include changes in property and sales tax, revenue, employment, and school district funding, and agriculture. However, CEQA 15064 (e) states "economic and social changes resulting from a project shall not be treated as significant effects on the environment." Nevertheless, IMAF's (Impact Avoidance and Minimalization Features) are addressed and contractors must produce plans to minimize effects on low-income and minority residents as well as provide relocation assistance for displaced residents. These plans include items such as noise and vibration, dust emissions, spill, safety, and transportation.

Several residential communities would be divided in Agua Dulce and Lake View Terrace.

Communities which will have physical and visual barriers will be able to give feedback for the High-Speed Rail Authority "to develop enhancements to ameliorate effects associated with community cohesion and community division." Contractors will supply plans for noise, dust and exhaust control that could affect schools and parks. The contractor submits a "yearly health assessment."

**Question:** How does CHSRA propose to mitigate communities that will lose their character and cohesiveness when physically divided by a train? How can CHSRA mitigate intangible losses such as those that will be suffered by these communities?

4494-9573

According to the Authority, the No Project Alternative would still result in other projects due to "anticipated growth" that would require CQUA and NEPA compliance that would also disrupt and divide communities.

**Question:** On what data is CHSRA relying to project this "anticipated growth," when, for the first time ever, California lost a Congressional seat as the result of the 2020 Census results? Our population is growing, but at a rate slower than the national average.

4494-9574

**Questions:**

**Page 3.12-1** Why is the Draft EIR/EIS calling 2016 data, the "most recent available" for a document published in August, 2022? Why have a plan based upon obsolete figures?

4494-9575

**3.12-3** How can the DEIR presented in 2022 justify using 1978 data when CEQ regulations were adjusted 42 years later in September, 2020?

4494-9576

**3.12-3** How are people with Limited English Proficiency being made acquainted with the DEIR?

4494-9577

**3.12-3.** How would inconsistencies with Community Plans be mitigated?

4494-9578

**3.12-8** Are the listed General Plans the most recent ones? If not, why not?

4494-9579

**3.12-2** How are growth projections of cities to 2040 determined?

4494-9580

**3.12-3,4,5,6** In what ways are these tables from 2015 pertinent to the future time period for High-Speed Rail construction in these areas?

4494-9581

**Figure 3.12-8** On Map 7 where does E1 come above ground from Little Tujunga Canyon?

4494-9582

**3.12-9-10** E2 and E2A Build Alternatives are considered "inconsistent" due to a lack of available replacement units. Nevertheless, it is considered "consistent with the majority of regional and local policies and plans." Is this not a kind of double-speak? How can opposites be true?

4494-9583

**3.12-23** Why are Sylmar and San Fernando not included in the Study Area?

4494-9584

**3.12.24** When will the mitigation plans be released to the public? How much time before construction will the public learn of these plans? Who will be writing the mitigation plan?

4494-9585

**3.12-27** In footnote #4, 2023 "is considered to be the peak year of construction." How is that date possible?

4494-9586

**3.12.5-37** Why does the DEIR assume that the Courtship Ranch equestrian facility would be "an important element of community cohesions"? What evidence is there to support this claim?

4494-9587

**3.12.-37** Since the Covid outbreak has resulted in closed and minimally attended recreational facilities, how can these activities be verified as taking place in Sun Valley?

4494-9588

**3.12.-38** Housing figures from 2016 in this report have changed significantly when homeless populations, especially around Lake View Terrace and Hansen Dam have grown. What is the current homeless population for the area?

4494-9589

**3.12.46** Although Burbank has a substantial number of employees in media, hospitals, and the Burbank Airport, how many of them live in Palmdale or Lancaster and could use High-Speed Rail to get to work?

4494-9590

**3.12.46.** What is the purpose of depicting State and L.A. County employment and projected growth for 2015 and 2040? Is this growth projected to live by High-Speed Rail Stations? Have the exodus figures from the State in the last years been factored in?

4494-9591

**3.12-47** How have property taxes changed for the area since 2015?

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 92 of 156

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 93 of 156

4494-9592	3.12-47	Keeping in mind ADA changes in schools due to attrition, gaps in attendance after Covid, and decreases in population, how is table 3.12-15 useful?	4494-9608		How would property values of residences for neighbors of displaced homes be affected? Is there compensation for residences that remain but have lost revenue due to construction? Could property taxes be lowered as a result?
4494-9593	3.12-49	Stating that the No Project Alternative "could" have similar effects as the train from other, later projects ignores the possibility of the land remaining in its natural, undisturbed form. Why is a disruptive project the only option for the mountains?	4494-9609	3.12-77	Since "The displacement of sensitive populations by itself, is not environmental impact under CEQA," is there any required assistance for displaced sensitive people? If not, how can The High-Speed Rail Authority morally justify removing peoples' housing?
4494-9594	3.12-50.	Assuming that "188" was meant to be the 118 Freeway, how will the staging area where the two freeways join affect traffic when there is regular daily commuter backup going north on the 210 as well as west on the 118 to Simi Valley and east towards Pasadena?		3.12-77	Specifically how will High Speed Rail Authority be communicating with sensitive displaced individuals?
4494-9595	3.12-51	Why is the CMP not in the EIR, rather than developed at the time of construction? How much water, during this period of drought-produced water restrictions would be used to reduce dust?	4494-9610		What constitutes "substantial numbers of existing homes?" Why is this appraisal considered "less than significant" and not in need of mitigation when people and parts of communities will be uprooted?
4494-9596		If shielding light glare during night work is not sufficient, what recourse would local residents have to correct the problem?	4494-9611	3.12-79	Specialized businesses, especially those established 30 or more years ago, will have difficulty relocating, especially motion picture production businesses. What mitigation will be done to locate suitable sites and costs for needed relocation, including lost income and changes in taxes? Specifically, who will be in charge?
4494-9597	3.12-52	What mitigation measures will need to be addressed as the E2 Build Alternative emerges from Little Tujunga Canyon Road in Lake View Terrace?		3.12-79	How is it reasonable or even legitimate to assume that businesses can move to other areas? Has the DEIR actually measured the size and type of each business to be displaced and found comparable spaces in the other general locations named? For example, have similar sized locations been found for particular restaurants?
4494-9598	3.12-57	How closely does the Authority work with agents from The Uniform Act? Is there back and forth communication regarding sites? To whom do the agents answer?			How are businesses supposed to get assistance from the Rail Authority for rebuilding in different areas? Who determines the costs of losing the current locations and rebuilding in other locations?
4494-9599	3.12.6.2.	How much of the No Project Alternative is speculation? How much is substantiated?		3.12-81	Is stating that businesses "could relocate" in other communities not a supposition? How can this statement be verified?
4494-9600	3.12.6.3	To what extent would construction of the staging area for SR-14-W2 affect students at Broadus Elementary School?		3.12-82	Are the "Expanded Commercial and Industrial Resource Areas " for the E1 Build Alternative accurate for the date of actual construction? If not, what merit do they have?
4494-9601		Although communities may not be disturbed after construction, how long will they be disrupted during construction?		3.12-85	Has loss of revenue been considered, for example, for a business that would need to relocate from Shadow Hills to Pacoima as suggested for the E2 Build Alternative?
4494-9602	3.12-5.2	Are the activities listed here since Covid still in place with participants?	4494-9612	3.12-88	Once again CEQA does not consider displacement as an environment concern. Instead, the DEIR seems to focus upon the job market and regional growth. It states that, "...economic changes caused by the project would not lead to physical deterioration of local communities," making impacts "less than significant for all six Build Alternatives." What evidence is available to suggest that relocation would not result in community deterioration? How are individual owners and employees in dislocated businesses affected, especially since they are not likely to be the same people doing construction for High-Speed Rail since they are part of a different job market?
4494-9603	3.12-54	What will be mitigation for the division of residential communities in Acton and Agua Dulce?	4494-9613		
4494-9604	3.12-56	The E2 Build Alternative suggests that residential displacements in Lake View Terrace will not divide a neighborhood, but would affect it by reducing views and paths for walking. To what extent would paths be reduced? How is this not "social isolation"? What mitigation in addition to asking residents for solutions would be in place? How does that make the situation "less significant" as stated in the DEIR?	4494-9614		
4494-9605	3.12-57	How could Burbank, a separate city, be considered as a replacement property for the Los Angeles County Department of Social Services?		3.12-88	To what extent and how long will utilities be disrupted? Given current drought conditions leading to water shortages, what measures will be required to reduce water loss during construction? How often do routine shutdowns of the East Branch of the California Aqueduct occur? What are some ways that landowners will be helped to protect pipes and ditches when they are "worked with?"
4494-9606	3.12-71	How are 2017 housing figures pertinent to residential available units at the time of construction, especially since in 2022 at the time of the DEIR there is a housing shortage?			
4494-9607	3.12-76	What is the required time period for outreach to communities regarding relocation? Who does the outreach?	4494-9615		

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 94 of 156

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 95 of 156

4494-9616		If project construction is to be done by local workers, what are some examples of those jobs? What contractors would be hired to oversee them? Will they be replacing current workers hired by the High-Speed Rail Authority?	4494-9629		Explaining that mitigation measures may very well result in new environmental issues for neighborhoods is not particularly useful for affected communities. How are people to choose in favor of mitigations with little choice?
4494-9617	3.12-89	How long a period of time would 89 A-weighted decibels be evident? What grazing animals are in the vicinity of construction? What on-going decibel level is acceptable for grazing animals?	4494-9630	3.12-101	What specific jobs are going to be filled by local workers? Have local workers been surveyed? How do these jobs differ from those for workers currently being trained and used by the Authority?
4494-9618	3.12-90	The environmental effects from construction, including "fugitive dust and exhaust", and especially Valley Fever, can be life threatening, even for healthy construction workers. How are contractors experienced in this area? What exactly does "a fugitive dust control plan" consist of? What exactly is a "Valley Fever action plan"? How many workers have contracted Valley Fever during work in the Central Valley? This information is pertinent to future construction.	4494-9631		Repeatedly the DEIR calls 2023 the "Peak Year of construction." How is that possible?
4494-9619		Who supervises the contractor to follow federal guidelines for noise reduction for neighborhoods, schools, parks, and construction workers?	4494-9632	3.12-102	What is the cause of the increased sales tax? Is it from an influx of workers?
4494-9620		If a vehicle carrying hazardous waste were to overturn on the 5 Freeway near a school, how would students and the surrounding community's health be protected?	4494-9633		How can the Authority determine that there would be no long-term effects resulting from construction hazards upon children's health?
4494-9621		Since only the health of adults is considered, as opposed to children ("... There is no specific requirement in California for an analysis of children's health impacts separate from environmental impacts that could affect other individuals"), is this not an example of begging the question of whether or not children are important people?	4494-9634	3.12-111	If private land, for example in the forest, is sold and developed before construction of the chosen route, will new owners be displaced and referred to relocation assistance?
4494-9622		What recourse would schools and residents have when noise still exceeds minimal Federal requirement standards despite mitigation efforts?	4494-9635		<b>Appendix 3.12-A</b> The Uniform Act for relocation reimburses up to \$2,500 for searching for replacement property, loss of personal property, and cost of moving. Business reestablishment expenses and operations may receive up to \$20,000. Relocation Agents from the High-Speed Rail Authority will contact businesses. Examples of price differentials are provided in the 1970 Relocation brochure. Businesses, home owners, renters, mobile home owners and renters are eligible for assistance if they live in the U.S. They may choose their own replacement location if it meets required "decent, safe, and sanitary conditions." (DSS)
4494-9623	3.12-92	How can use of 2014-15 year figures be pertinent for real construction, which will take place in later years?	4494-9636		<b>Appendix 3.12-B</b> This appendix reviews effects on school district funding and bus transportation routes. A reduction in student attendance would reduce school funding. There would be revenue losses to school districts from parcel acquisitions with the greatest percentage in the Action – Agua Dulce School District. Five different school districts are affected. No schools would be affected by the No Project Alternative.  During construction there will be traffic diversions. Penrose Street in Sun Valley will be closed.
4494-9624	3.12-94	Kagel Canyon (correctly spelled) does not have room for replacement housing of houses for sale. To what extent has High-Speed Rail found housing in Tujunga, Sunland, and Sylmar?	4494-9637		<b>Appendix 3.12-C</b> Maps in Appendix C show the .05 footprint of all Build Alternatives in addition to focusing upon children's health which can be affected by respiratory impacts, noise, chemical use, and safety risks. There are 50 schools within .05 miles of the Build Alternatives. There are 28 parks: 15 passive and 13 active. The Rim of the Valley Trail, the San Gabriel Mountains Monument, Vasquez Rocks, Hansen Dam, Tujunga Ponds, and the Pacific Crest Trail are among the passive group, while Roger Jessup Park in Pacoima, Stonehurst, and the Sun Valley Recreation Center as well as playgrounds connected to schools are in the active category. There are also 182-233 community facilities located in the Build Alternative.
4494-9625	3.12-96	How many utility poles would be placed on Agricultural land?			
4494-9626	3.12-97	What is the State's threshold quantity of hazardous substances? What hazardous substances are expected to be stored outside of .25 mile of a school?			
4494-9627	3.12-97	Are there any schools within a .25 mile of above ground tracks? What degree magnitude earthquake might derail a train above ground?

**CHAPTER 3.14: AGRICULTURE, FARMLAND AND FOREST LAND**  
**CHAPTER 3.15: PARKS, RECREATION AND OPEN SPACE**  
**APPENDIX 3.1-B: USFS CONSISTENCY ANALYSIS**

4494-9638

Section 3.14.2.1 of the DEIR references a number of federal laws, regulations, and orders which govern use of the land within the borders of the Angeles National Forest (the "Forest" or the "ANF") and the San Gabriel Mountains National Monument (the "Monument" or the "SGMNM"), including the following:

1. The San Gabriel Mountains National Monument Management Plan, the purpose of which is to provide guidance for the management of the Monument; and
2. The USFS's 2005 Land Management Plan (the "LMP") for the Pacific Southwest Region, including the Forest, which is comprised of the following:
  - a. Part 1: Southern California National Forest Vision directs the long-term vision and strategic management of the ANF (USDA 2005a);
  - b. Part 2: Angeles National Forest Strategy describes the implementing objectives to achieve the vision described in Part 1 (USDA 2005b); and
  - c. Part 3: Design Criteria for the Southern California National Forests contains the guiding laws and standards during project planning and implementation (USDA 2005c).

Specifically, Part 3 of the LMP comprises the laws that the USFS will follow as the national forest implements projects and activities over time. "The rules include the laws, agency policy, standards, and the associated guidance that is referenced for use at the project level."<sup>55</sup> Part 3 includes two components: "The first component contains the forest plan standards and guidelines, and the second component contains the laws, policy or other direction that may be applicable to proposed activities. The standards are the fundamental requirements that define the parameters for the activities that the Forest Service anticipates."<sup>56</sup>

Section 3.14.3 ("Consistency with Plans and Laws") of the DEIR states that The Authority, "as the lead state and federal agency proposing to construct and operate the California HSR System, is required to comply with all federal and state laws and regulations and to secure all applicable federal and state permits prior to initiating construction on the selected Build Alternative. Therefore, **there would be no inconsistencies between the six Build Alternatives and these federal and state laws and regulations.**"

In reviewing the applicable laws and regulations governing the Forest and the Monument in comparison with CHSRA's plans, we have concluded that there are a number of inconsistencies between the six proposed Build Alternatives and the federal and state laws and regulations.

First and foremost, Section 3.14.2.1 of the DEIR references the Federal Land Policy and Management Act of 1976, which makes it law that "public lands be retained in Federal Ownership." Section 102(a)(8) of the FLPMA states that it is the policy of the United States that, "the public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values; that, where appropriate, **will preserve and protect certain public lands in their natural condition**; that will provide food and habitat for fish and domestic animals; and that will provide for outdoor recreation and human occupancy and use."

**Question:** How are CHSRA's plans with respect to the Federally-owned/controlled lands of the Forest, the Monument, and the Hansen Dam Open Space/Recreation Area consistent with the federal directive to preserve and protect public lands in their natural condition?

<sup>55</sup> USDA Land Management Plan; Part 2 Angeles National Forest Strategy, Applicable to the San Gabriel Mountains National Monument, p. 1

<sup>56</sup> USDA Land Management Plan (2005); Part 3 Design Criteria for Southern California National Forests, p. 1

4494-9638

**Question:** If CHSRA has determined that the impacted areas of the Forest, the Monument, and the Hansen Dam Open Space/Recreation Area do not qualify as "certain" public lands, for what reasons has CHSRA determined that these areas are not worthy of preservation and protection? For what reasons should the USFS, the USDA, and the ACoE agree with this determination?

The Parks, Forestry, and Public Property chapter of the Code of Federal Regulations (Section 36 CFR, Chapter II of the Forest Service, Department of Agriculture) sets forth a two-tiered screening process by which the USFS shall determine whether or not it may consider a Special Use Permit application. The first tier of the screening criteria includes the following two (of six total) criteria for consideration:

- (iv) *The proposed use will not create an exclusive or perpetual right of use or occupancy.*
- (v) *The proposed use will not unreasonably conflict or interfere with administrative use by the Forest Service, other scheduled or authorized existing uses of the National Forest System, or use of adjacent non-National Forest lands.*<sup>57</sup>

If the USFS determines that an application meets the minimum six criteria set forth in the first-tier screening, it may proceed to the second-tier screening.

**Question:** CHSRA proposes to introduce significant infrastructure within the Forest and the Monument, including over 20 miles of concrete tunnels beneath the surface. Does CHSRA have a plan to remove these tunnels at the end of the train's life cycle? If not, how do the proposed tunnels not create perpetual occupancy of Forest land? How is the creation of these tunnels (in addition to corollary infrastructure) not in violation of (iv) of the 36 C.F.R. § 251.54 (e)(2)?

**Question:** CHSRA's proposed alignments and infrastructure create significant impacts and pose significant threats to authorized existing uses of the Forest, including but not limited to use by wildlife, use by flora, and use by humans of the water resources within the Forest. How has CHSRA determined that its proposed high-speed rail system within the Forest does not unreasonably conflict or interfere with these uses?

**Question:** CHSRA has proposed to place not only portals, but also significant infrastructure related to portals (e.g., noise attenuation hoods, ventilation buildings, access roads, lighting, communication facilities, parking, and public utilities) immediately adjacent to Forest and Monument land (specifically near Aliso Canyon and the Big Tujunga Wash). How does the introduction of this significant infrastructure not unreasonably conflict or interfere with the use of adjacent non-National Forest lands?

**Question:** Based on the fact that CHSRA's proposed plans fail to meet the prerequisite conditions (iv) and (v) of the first-tier screening process, what leads CHSRA to believe that the USFS will allow it to move forward to the second tier of the screening process?

Per CHSRA's explanation on Page 3.1-B-5, "If USFS determines that an application meets the minimum requirements identified in the initial screening, then it proceeds to evaluate the application against the following five criteria, **any one of which would require rejection of the application**":

- (i) **The proposed use would be inconsistent or incompatible with the purposes for which the lands are managed**, or with other uses; or
- (ii) The proposed use would not be in the public interest; or
- (iii) The proponent is not qualified; or
- (iv) **The proponent does not or cannot demonstrate technical or economic feasibility of the proposed use or the financial or technical capability to undertake the use and to fully comply with the terms and conditions of the authorization**; or

<sup>57</sup> 36 C.F.R. § 251.54 (e)(2)

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

4494-9640

(v) There is no person or entity authorized to sign a special use authorization and/or there is no person or entity willing to accept responsibility for adherence to the terms and conditions of the authorization.<sup>58</sup> 4494-9641

We contend that USFS should deny the special use permit as CHSRA's plans do not meet the requirements set forth in 3.1-B-5(i) above. Table 4.3 ("Suitable Uses for Selected ANF, including SGMNM, Land Use Categories") sets for the Land Use categories as designated by the USFS and the types of development/infrastructure that is permitted (or not permitted) in each zone. CHSRA plans to construct its High-Speed Rail system through USFS designated as Back Country Motorized Use Restricted, Back Country Non-Motorized, and Critical Biological. However, as set forth in Table 4-3, the USFS has designated these categories as NOT SUITABLE for Major Transportation Corridors. Therefore, each of the Build Alternatives (and CHSRA's plans overall) are both inconsistent and incompatible with the purposes for which the land is managed. Per the requirements of the second-tier of the screening process, the USFS must reject any application by CHSRA for a Special Use Authorization as it failed to meet the criteria set forth in 3.1-B-5(i). 4494-9642

We further contend that the USFS should deny a Special Use Authorization as CHSRA cannot meet the economic feasibility requirement as set forth in 3.1-B-5(iv). There is simply not enough funding available now or in the foreseeable future to complete any project section beyond the initial Fresno to Bakersfield line (which is iffy at best). The only guaranteed funding currently is \$3.5 billion from the Federal Government (which must be and is being matched by California funds), plus \$9.95 billion from the bond issue. Those funding sources provide a total of \$17 billion, leaving a budget shortfall of \$89 billion. While CHSRA does receive cap & trade monies, this is an unstable revenue stream and will terminate at some point in time. CHSRA had originally relied on private investors as "matching funds" for both the bond funding and the federal grant requirements. However, private investors have failed to materialize. It was supposedly these private investors who would likely be the train operator; without a train operator, there will be no running trains. Without running trains, there is no ridership. Without ridership, there is no ridership revenue. This clearly fails the economic feasibility test on every level. 4494-9643

**Question:** Given that CHSRA has a budget shortfall of \$89 billion and no private investors in sight, on what grounds does CHSRA believe that it meets the economic feasibility requirement of the USFS to approve a special use permit? 4494-9644

**Question:** Given that if an applicant fails to meet any one of the five stated criteria, the USFS must reject the special use permit application, and further given that CHSRA fails to meet at least two of the five stated criteria, what leads CHSRA to believe that it will be able to secure a special use permit from the USFS? 4494-9645

4494-9641

President Obama's Proclamation designation of 346,177 acres of existing federal lands as the Monument underscored the significance of this land, which is a, "unique recreational and educational gateway to America's most urban national forest in the nation's most populous county."<sup>59</sup> While the Proclamation acknowledged that pre-existing uses for utilities and infrastructure would be permitted to continue, the intention of the proclamation is clearly to reduce the amount of infrastructure present in the Monument. This is evidenced by the fact that Federal lands and interests in lands within the boundaries of the Monument were withdrawn from location, entry, and patent under the mining laws, and from disposition under all laws relating to mineral and geothermal leasing. Additionally, in "Land Use Zones", the Monument Plan states that, "Mineral and energy resources exploration and development are not suitable within the Monument, except where valid rights already exist at the time of the Proclamation."<sup>60</sup> 4494-9646

**Question:** As many of the impacts of mining overlap with the impacts of tunneling for a high-speed train, and considering that new mining uses are not being permitted by the USFS within the Monument, what is the justification for allowing tunneling through the Monument?

<sup>58</sup> 36 C.F.R. § 251.54(e)(5)(i)-(v)

<sup>59</sup> San Gabriel Mountains National Monument Management Plan, p. 10

<sup>60</sup> San Gabriel Mountains National Monument Management Plan, p. 14

**Question:** Considering that mineral and energy resource exploration is less invasive than constructing a tunnel through the Monument, how can CHSRA not be in violation of the spirit of this federal directive?

The intention of the Presidential Proclamation is further underscored by the fact that, with respect to transportation, the stated goals of the Monument Plan are:

1. "Road density within the Monument remains stable or is decreasing;"<sup>61</sup> and
2. "Consider opportunities to reduce the size of the road system by decommissioning individual roads or converting them to non-motorized trails."<sup>62</sup>

**Question:** As the stated goal of the Monument Plan is to decrease road density within the Monument, how does CHSRA justify its plans to introduce access roads within the Monument?

The Presidential Proclamation (2014) states with respect to transportation that, "The Secretary shall limit all motor vehicle use to designated roads [and] trails."<sup>63</sup>

**Question:** If equipment such as bulldozers, scrapers, skid loaders, backhoe loaders, excavators, articulated haulers, motor graders, and similar vehicular pieces of construction equipment will be needed to create high-speed rail infrastructure in locations where there are no access roads now, how are CHSRA's plans not in violation of the Presidential Proclamation?

With respect to Biological Resources, there are only two stated desired conditions within the Monument Plan:

1. "Habitat conditions are stable or improving over time as indicated by the 2016 Angeles Land Management Plan Monitoring Strategy;" and
2. "Habitats of special status species (threatened and endangered and Forest Service sensitive) in the Monument are managed to preserve and protect these species."<sup>64</sup>

**Question:** How will habitat conditions stable or improving when construction is introduced within and immediately at the borders of the Monument? How are the proposed alignments within the Monument consistent with the federal guidelines set forth in the Monument plan?

With respect to "Designated Areas and Areas Recommended for Designation," the Monument Plan sets forth the following desired condition:

1. Designated Wilderness and Recommended Wilderness within the Monument are maintained as a naturally evolving and natural-appearing landscape that provides for **primitive and unconfined recreation use. The sense of remoteness and solitude is maintained.**

**Question:** How are CHSRA's plans to stage 7+ years of construction adjacent to the Wilderness Areas of the Monument in keeping with USFS directive to maintaining a sense of remoteness and solitude?

### Discussion of Water as it pertains to Fire in the Forest.

Any impacts to the groundwater caused by tunneling will remove the sources of water necessary to hydrate the Forest flora, thereby reducing their fuel moisture levels. This impact is all the more important during drought conditions like the ones we are currently experiencing. Dead and dying trees, chaparral, scrub, and other

<sup>61</sup> San Gabriel Mountains National Monument Management Plan, p. 11

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 100 of 156

4494-9646

vegetation will contribute to forest fuels and will increase the intensity of wildland fires and the potential for spread to the urban-wildland interface. The LMP explains that, "Excessive fuel loading will increase the scale of forest fires. Drought-caused mortality, making montane conifer forests susceptible to widespread insect and disease outbreaks that, in combination with excessive fuel loading, has set the stage for more large-scale, stand replacing wildland fires."<sup>65</sup>

As described in the LMP, Goal 1.1 of the Southern California National Forests Vision is to: "Improve the ability of southern California communities to limit loss of life and property and recover from the high intensity wildland fires that are a natural part of this state's ecosystem;" and Goal 1.2 is to: "Restore forest health where alteration of natural fire regimes have put human and natural resource values at risk."<sup>66</sup>

**Question:** How do the tunneling-associated risks of impact to groundwater sources within the Forest not contravene Goals 1.1 and 1.2 of the Southern California National Forests Vision as set forth by the USFS?

4494-9647

In **WL-1** of LMP2 which addresses Threatened, Endangered, Proposed, Candidate, and Sensitive Species Management, the USFS directive is to, "Use vegetation management practices to reduce the intensity of fires to reduce habitat loss due to catastrophic fires." On page 3.1-B-9 of the DEIR, CHSRA claims that its plans are consistent with this directive as, "Implementation of BIO-MM#54 involves preparation and implementation of an Annual Vegetation Control Plan (VCP). The Authority will prepare a VCP to address vegetation removal for the purpose of maintaining clear areas around HSR facilities and reducing the risk of fire."

**Question:** CHSRA's response is limited to "vegetation removal," but that only partially addresses vegetation management. Vegetation management includes ensuring that projects do not deplete natural water supplies within the Forest, which would decrease moisture content of the flora and increase fire fuels. Given that CHSRA is anticipating dewatering of Forest land as a result of tunneling, how are its plans consistent with directive WL-1?

4494-9648

In **FIRE-1** of the LMP2, the USFS sets forth directives with respect to Wildfire Prevention. One of those is to, "Reduce the number of human-caused wildland fires and associated human and environmental impacts." On Page 3.1-B-38, CHSRA claims that its actions are consistent with this directive as it plans to form a committee to "review issues that are critical to fire and life safety and security."

**Question:** CHSRA plans to introduce new electric lines within the Forest to power its adits and other facilities. Several of the proposed adits are near Gold Creek Road in Little Tujunga Canyon – an area that burned during the Creek Fire in 2017 (a fire that was caused by power lines). How will building new electric power lines in a high fire severity zone within the Forest serve to reduce the number of human-caused wildland fires?

4494-9649

In **FIRE-2** of the LMP2, the USFS sets forth directives with respect to Direct Community Protection, including the following: "Reduce the number of high risk/high value, and high and moderate risk acres."

**Question:** Given that CHSRA plans to introduce new power lines into high fire severity zones within the Forest, it will be increasing, not reducing, the number of acres at high risk of fire. How can CHSRA maintain that its plans are consistent with the FIRE-2 directive?

4494-9650

**Discussion of Water as it pertains to Watershed in the Forest.**

The importance of the naturally-occurring water sources in the Forest cannot be overstated. The USDA explains that, "In drought-prone California, the quantity, quality, and timely provision of our water are dependent on the health of our national forests. The forests supply, filter, and regulate water from upper watersheds and meadows, providing clean water throughout the year to communities, homes, and wildland

<sup>65</sup> USFS 2005 Management Plan, Part 1, p23

<sup>66</sup> USFS 2005 Management Plan, Part 1, p20

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 101 of 156

4494-9650

habitats. About 384,000 acre-feet of water per year come from the Angeles National Forest, or over 125 billion gallons per year. That equates to:

- Over 180,000 Olympic-size swimming pools
- Enough drinking water for California's population for more than 10 years, or
- Enough water for over 940,000 households for a year."<sup>67</sup>

In the LMP1, the USFS explains the importance of the Angeles National Forest Watershed, which "serves as quality, low-cost, local source of water consumed by the urban population of southern California. The national forests continue to serve as a recharge area for numerous reservoirs and groundwater basins that provide water for numerous communities, and for agricultural and industrial uses."<sup>68</sup> In the section on Watershed Function, the USFS sets forth the goal to, "Protect, maintain, and restore natural watershed functions, including slope processes, surface water and groundwater flow and retention, and riparian area sustainability," and, further, to, "restore, maintain, and improve watershed functions."<sup>69</sup>

According to the LMP1, "Watershed conditions, or watershed health, of the national forests vary depending upon the amount of disturbance that has occurred within each watershed, and the effect of the disturbance on the natural integrity of the watershed as a whole."<sup>70</sup> The USFS explains that, "The potential for creating or exacerbating geologic hazards and risks can be affected by many different activities. Some of these include wildland fire, encroaching urbanization, increasing recreation uses, and disturbance from land management activities such as construction, reconstruction, operation or maintenance of roads and trails, mines, energy mineral developments, dams, reservoirs and tunnels."<sup>71</sup>

**Question:** Given the known risks to groundwater sources within the ANF, how does CHSRA's tunneling proposal protect and/or improve watershed functions?

4494-9651

In the section on Water Management, the USFS sets forth the goal to, "Conserve and protect high quality water sources in quantities adequate to meet national forest needs."<sup>72</sup>

**Question:** Given CHSRA's proposed mitigation measure HYD-MM#4 as set forth in Appendix 3.8-C which calls for importing water to meet forest needs and maintain baseline water levels established before tunneling, how do CHSRA's proposed tunneling plans conserve and protect water sources in quantities adequate to meet forest needs?

4494-9652

On Page 3.1-B-14, CHSRA asserts that its plans are consistent with this directive, despite admitting that, "Tunnel construction under the ANF has the potential to alter hydrogeological conditions, resulting in inflows of groundwater into the tunnel and the subsequent depletion of groundwater aquifers. Depletion of groundwater aquifers could affect the hydrology of groundwater-dependent ecosystems, resulting in effects on species." CHSRA has set forth proposed mitigation measures that would be employed following implementation of its Adaptive Management and Monitoring Program, including, "providing supplemental water where needed, and remediating adversely effected aquatic, riparian and upland resources identified during monitoring. If restoration of affected areas is not successful, compensatory mitigation to offset impacts would be provided."

**Question:** Per the United States Environmental Protection Agency, "The amount and quality of compensatory mitigation may not substitute for avoiding and minimizing impacts."<sup>73</sup> How is it not a preferable choice for

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 102 of 156

4494-9652

CHSRA to simply avoid impacts by designing and selecting a route that does not tunnel through the Forest and jeopardize our natural water sources?

4494-9653

**Question:** The United States Environmental Protection Agency sets forth three distinct mechanisms for compensatory mitigation, the third and final of which is "In-Lieu Fee Mitigation." Under this scenario, the permittee (in this case, CHSRA) would provide funds to an in-lieu-fee sponsor (a public agency or non-profit organization; in this case, presumably the USFS) which will then build and maintain a mitigation site.<sup>74</sup> As CHSRA sets forth compensatory mitigation as a last resort in the event that its other mitigation measures have failed, the possibility exists that it will simply pay a fee to the USFS in the event that it is unable to restore adversely affected resources within the Forest. How will CHSRA calculate compensatory damages in this event? How is it not a preferable course of action to not cause unmitigatable damage in the first place?

4494-9654

**Question:** Given the myriad of mitigation measures proposed to address the very real possibility/likelihood of dewatering and the possibility/likelihood that wildlife, flora, and humans dependent upon the water sources in the Forest will be negatively impacted, and given the possibility that CHSRA will have to pay the USFS in the event that it cannot successfully restore the Forest to pre-tunneling conditions, how is it not a better plan to design and select a route that does not tunnel through the Forest and jeopardize our natural water sources?

4494-9655

On Page 3.1-B-15, CHSRA goes on to state that, "With implementation of IAMFs and mitigation measures, the Build Alternatives would not adversely affect aquatic, riparian or upland ecosystems as a result of indirect effects from tunnel construction."

**Question:** Given that one of the proposed mitigation measures is to pay financial remuneration to the USFS in the event that CHSRA's other mitigation measures fail to restore aquatic, riparian, or upland ecosystems to pre-tunneling conditions, how can CHSRA claim that the Build Alternatives will not adversely affect these ecosystems? Paying for damaged caused that can't be fixed does not mean that no damage was done.

4494-9656

**WAT-1** of LMP2 also sets forth the following directive with respect to Watershed Function: the USFS must, "Assess impacts of proposed groundwater extraction proposals to assure that developments will not adversely affect aquatic, riparian or upland ecosystems." On page 3.1-B-14 of the DEIR, CHSRA asserts that its plans are consistent with this directive, using the same justification as in previous sections – namely that because it plans to employ mitigation measures, "the Build Alternatives would not adversely affect aquatic, riparian or upland ecosystems as a result of indirect effects from tunnel construction."

**Question:** Some of CHSRA's proposed mitigation measures (e.g., grouting in the tunnels to minimize groundwater inflows) are pre-emptive measures that might enable CHSRA to avoid creating adverse impacts. However, most of CHSRA's proposed mitigation measures would be employed **because** it adversely affected Forest ecosystems. Habitat remediation as a mitigation measure would be employed **because** CHSRA had already adversely affected Forest ecosystems. "Providing supplemental water where needed" is a mitigation measure that would be employed **because** CHSRA had already depleted the natural water sources, thus adversely affecting Forest ecosystems. Providing "compensatory mitigation to offset impacts" in the event that its other mitigation measures failed is a mitigation measure that would be employed **because** CHSRA had already adversely affected Forest ecosystems to the point where they could not be otherwise restored. Why does CHSRA mistake "not adversely affecting" Forest resources with proposing mitigation measures that would be employed as a result of it causing these adverse impacts?

4494-9657

**WAT-1** of LMP2 also sets forth the following directive with respect to Watershed Function: the USFS must, "Manage Riparian Conservation Areas (RCA) to maintain or improve conditions for riparian dependent resources. Riparian Conservation Areas include aquatic and terrestrial ecosystems and lands adjacent to perennial, intermittent, and ephemeral streams, as well as around meadows, lakes, reservoirs, ponds,

<sup>74</sup> [https://www.epa.gov/sites/default/files/2015-08/documents/compensatory\\_mitigation\\_factsheet.pdf](https://www.epa.gov/sites/default/files/2015-08/documents/compensatory_mitigation_factsheet.pdf)

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 103 of 156

4494-9657

wetlands, vernal pools, seeps, and springs and other bodies of water. Riparian dependent resources are those natural resources that owe their existence to the area, such as fish, amphibians, reptiles, fairy shrimp, aquatic invertebrates, plants, birds, mammals, soil and water quality." The USFS notes that, "Some of the greatest threats to riparian and aquatic habitats are from diversion of surface water, removal of shallow groundwater, [and] the effects of prolonged drought conditions."<sup>75</sup>

On Page 3.1-B-16 of the DEIR, CHSRA claims that its actions are consistent with this federal directive because although, "the HSR Build Alternatives would impact riparian habitat, watersheds, streams, and other riparian-dependent upland ecosystems, these impacts would be minimized through implementation of compensatory mitigation for both temporary and permanent impacts to riparian habitat through habitat restoration and revegetation."

**Question:** The directive set forth in WAT-1 is to maintain or improve conditions for riparian dependent resources. CHSRA admits that its plans will negatively impact riparian-dependent resources. These impacts do not maintain (let alone improve) conditions; CHSRA proposes to damage conditions, then later set about to employ mitigation measures to restore the riparian-dependent resources to pre-tunneling conditions. During the time in between damage and restoration, the directive set forth in WAT-1 is violated, as conditions are not maintained. How can CHSRA claim that its actions are consistent with this directive?

4494-9658

Another directive of WAT-1 states that the USFS must, "Achieve and maintain natural stream channel conductivity, connectivity and function." In its response on Page 3.1-B-17 of the DEIR, CHSRA asserts that its actions are consistent with this directive, despite the fact that its first sentence admits that, "the HSR infrastructure could alter stream capacity, connectivity, and function." CHSRA then goes on to delineate a number of mitigation measures, including, for example, "augmenting water supplies for wells and surface water resources... to approximately match baseline conditions."

Again, CHSRA is mistaking implementing mitigation measures to correct damage with not causing the damage in the first place. On Page 3.1-B-18, CHSRA asserts that, "With implementation of these mitigation measures, the Build Alternatives would not result in a substantial adverse effect to the conductivity, connectivity, and function of natural streams as a result of indirect effects from tunnel construction."

**Question:** Trucking in water to replenish wells that CHSRA depleted does not mean that it has not created a substantial adverse effect on natural streams. In fact, exactly the opposite is true; if CHSRA needs to truck in water to replenish wells, it is **because** it has substantially adversely affected the function of natural streams. Given the foregoing, how can CHSRA assert that its plans are consistent with the directive set forth in WAT-1?

4494-9659

In **WAT-2** of the LMP2, the USFS sets forth the following directive with respect to Water Management: the USFS must, "Manage groundwater and surface water to maintain or improve water quantity and quality in ways that minimize adverse effects," including the requirement to, "Assess impacts of proposed groundwater and surface water extraction proposals to assure that developments will not adversely affect aquatic, riparian or upland ecosystems and other uses, resources or rights."

**Question:** On Page 3.1-B-20 of the DEIR, CHSRA asserts that its plans are consistent with this directive. Given that CHSRA is planning to truck in or pipe in water as a mitigation measure to restore baseline conditions in the Forest, then clearly the quantity of water will not have been maintained; it will have been depleted. How can CHSRA claim that its plans are consistent with the USFS directive to maintain or improve water quantity within the Forest?

4494-9660

Additionally, **WAT-2** of the LMP2 declares that the USFS must, "Promote water conservation at all national forest administrative and authorized facilities. When reviewing non-forest water-related projects that may affect

<sup>75</sup> USFS 2005 Management Plan, Part 1, p 42

November 30, 2022  
Page 104 of 156

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 105 of 156

4494-9660 national forest resources, include appropriate conservation and water quality mitigation measures in the review response.”

**Question:** Many of CHSRA’s mitigation measures involve the application of water. For example, in order to mitigate fugitive dust at construction staging areas within ANF borders, CHSRA intends to continually spray water for a construction duration of 7+ years. In response to depleting the natural sources of water in the Forest by tunneling, CHSRA proposes to truck in tens of millions of gallons of water to bring the watershed back to baseline levels. How are these proposed mitigation measures consistent with the USFS directive to conserve water at authorized facilities (any infrastructure, construction staging area, or area of CHSRA action or activity being considered an “authorized facility”)?

4494-9661 Another directive of WAT-2 establishes that the USFS must, “Conserve and protect high quality water sources in quantities adequate to meet national forest needs.”

**Question:** Considering that CHSRA proposes, as mitigation for depleting the natural water supply, to truck in water to meet the needs of the oak trees within the Forest, clearly CHSRA’s actions will create damage such that the water sources are no longer in sufficient quantities to meet Forest needs. How can CHSRA claim that its actions are consistent with the directive set forth in WAT-2?

4494-9662 In LMP3, in the section on “Soil, Water, Riparian, and Heritage Standards,” S45 states that: “All construction, reconstruction, operation and maintenance of tunnels on National Forest System lands shall use practices that minimize adverse effects on groundwater aquifers and their surface expressions.”<sup>76</sup>

**Question:** Given the litany of proposed “mitigation measures” CHSRA has planned to offset the damage to groundwater that is likely to be caused by its tunneling through the ANF, how is CHSRA using practices that minimize adverse effects on groundwater aquifers and their surface expressions?

4494-9663 In the same section, S46 states that: “Surface water diversions and groundwater extractions, including wells and spring developments will only be authorized when it is demonstrated by the user, and/or agreed to by the Forest Service, that the water extracted is excess to the current and reasonably foreseeable future needs of forest resources.”<sup>77</sup>

**Question:** As the loss of groundwater due to CHSRA’s interruption of naturally occurring springs and aquifers amounts to extraction, and as CHSRA proposes to import water to offset the loss due to its extraction, clearly the water extracted as a result of CHSRA’s tunneling is not excess to the current and foreseeable needs of forest resources. How are CHSRA’s tunneling proposals not in direct contradiction to the USFS policy directives?

**Discussion of Land Uses within the Angeles National Forest.**

4494-9664 In LMP2, the USFS declares that, “The legislative mandate for the management of national forests requires that public lands be *conservatively used and managed* in order to ensure their sustainability and to guarantee that future generations will continue to benefit from their many values.”<sup>78</sup>

**Question:** How is CHSRA’s proposal to tunnel through the ANF and build corollary infrastructure within the ANF to support a high-speed train system *not* a violation of the legislative mandate to use forest lands conservatively?

<sup>76</sup> USDA Land Management Plan (2005); Part 3 Design Criteria for Southern California National Forests, p. 10

<sup>77</sup> USDA Land Management Plan (2005); Part 3 Design Criteria for Southern California National Forests, p. 10

<sup>78</sup> USDA Land Management Plan; Part 2 Angeles National Forest Strategy, Applicable to the San Gabriel Mountains National Monument, p. 1

4494-9665

Pages 4, 5, and 6 of the LMP2 delineate what uses are considered suitable and unsuitable CHSRA plans for its train and supporting infrastructure to traverse the following categories of USFS land: Developed Areas Interface, Back Country, Back Country Motorized Use Restricted, Back Country Non-motorized, Critical Biological, and Experimental Forest. Table 2.1.3 states that Major Transportation Corridors are NOT A SUITABLE use in any of the following categories of USFS land: Back Country Motorized Use Restricted, Back Country Non-motorized, Critical Biological, and Experimental Forest.

Per the DEIR, CHSRA plans to install permanent infrastructure in portions of the ANF with the following land use designations: Back Country, Back Country/Non-Motorized, Back Country/Motorized Use Restricted, and Critical Biological.<sup>79</sup>

**Question:** How is CHSRA’s proposal to tunnel through the ANF and build corollary infrastructure within the ANF to support a high-speed train system (i.e., creating a Major Transportation Corridor) *not* a violation the USFS “Suitable Uses” as delineated in Table 2.1.3.? Given the USFS’s stated use guidelines, what leads CHSRA to believe that it will be granted a Special Use Permit by the USFS for the construction and operation of its high-speed rail system?

4494-9666

Much of CHSRA’s footprint within the ANF is set within land designated by the USFS to be “Back Country.” Per the LMP2, “although this zone generally allows a broad range of uses, the management intent is to retain the natural character inherent in this zone and limit the level and type of development.”<sup>80</sup>

**Question:** If the stated intention of the USFS is to limit the level and type of development within the Back Country zones, how is CHSRA’s proposal to tunnel through the ANF and build corollary infrastructure within the ANF to support a high-speed train system *not* a violation of the intent of the USFS?

4494-9667

In its chapter on “Commodity and Commercial Uses,” the USFS states that, “[non-recreation] special uses are authorized *only when they cannot be reasonably accommodated on non-National Forest System land.*”<sup>81</sup> CHSRA previously considered a number of alignments that did not traverse USFS lands, including routes following the 5 and 14 freeways. These alignments could have been reasonably accommodated, but were eliminated from consideration for political (not engineering or geotechnical) reasons.

**Question:** Given that high-speed rail alignments could be reasonably accommodated on non-National Forest System land, how is CHSRA’s proposal to tunnel through the ANF and build corollary infrastructure within the ANF to support a high-speed train system *not* a violation of the intent of the USFS?

4494-9668

In LANDS-2 of the LMP2, the USFS sets forth directives regarding Non-Recreation Special Use Authorizations, including the following: “Upon termination, restore special use authorization areas to a specified condition.”

**Question:** In the event that CHSRA secures a special use authorization from the USFS to build its train through the ANF, upon expiration or termination of that SUA, how will CHSRA restore the impacted areas to a specified condition? Assuming that the condition is baseline, pre-tunneling, how will CHSRA remove its significant infrastructure from Forest lands?

4494-9669

The LMP2 describes that the high-speed rail resource study area covers four USFS-designated “Places”:

1. Soledad Front Country;
2. Angeles Uplands West;

<sup>79</sup> Page 3.15-143

<sup>80</sup> USDA Land Management Plan; Part 2 Angeles National Forest Strategy, Applicable to the San Gabriel Mountains National Monument, p. 8

<sup>81</sup> USDA Land Management Plan; Part 2 Angeles National Forest Strategy, Applicable to the San Gabriel Mountains National Monument, p. 31

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 106 of 156

4494-9669

3. The Front Country; and
4. Big Tujunga Canyon.

For the designated Angeles Uplands West, the LMP2 states that, "Protection and enhancement of threatened, endangered, proposed, candidate and sensitive species such as the arroyo toad, California red-legged frog, southwestern willow flycatcher, San Diego horned lizard, two-striped garter snake, western pond turtle and rare and sensitive plants will be emphasized in all activities."<sup>82</sup>

**Question:** How will 7+ years of construction at multiple locations within the Angeles Uplands West emphasize the protection and enhancement of these species?

4494-9670

For the designated Big Tujunga Canyon Place, the USFS has two stated Program Emphases. The first is: "Forest health in terms of water quality and water needs will be managed to provide for forest ecosystem needs and instream flows necessary to support surface and subsurface resources."<sup>83</sup>

**Question:** Given the anticipated impacts that tunneling will have on naturally occurring water sources within this area, and given CHSRA's proposed mitigation measure to truck in or pipe in water to restore the watershed to base level conditions pre-tunneling, how is CHSRA's proposal to tunnel through the ANF *not* a violation of the Program Emphasis for this area?

4494-9671

The second stated Program Emphasis for Big Tujunga Canyon Place is that, "Protection and enhancement of threatened, endangered, proposed, candidate and sensitive species such as the Santa Ana sucker, California red-legged frog, arroyo toad, southwestern willow flycatcher, least Bell's vireo, San Diego horned lizard, two-striped garter snake, slender horned spineflower and other rare and sensitive plants will be emphasized in all activities."

**Question:** How will 7+ years of construction at multiple locations within the Big Tujunga Canyon Place, and specifically the construction of a viaduct structure through the Big Tujunga Canyon Wash, emphasize the protection and enhancement of these species? How will ongoing operation of a train crossing the Big Tujunga Canyon Wash emphasize the protection and enhancement of these species?

4494-9672

The Program Emphasis for the Soledad Front Country states that the, "Protection and enhancement of threatened, endangered, proposed, candidate and sensitive species, such as the unarmored threespine stickleback, arroyo toad, southwestern willow flycatcher, least Bell's vireo, San Diego horned lizard, two-striped garter snake and sensitive plants will be emphasized in all activities."<sup>84</sup>

**Question:** How will 7+ years of construction at multiple locations within the Soledad Front Country Place, and specifically the construction of at-grade and elevated structures through the Soledad Front Country Place, emphasize the protection and enhancement of these species? How will ongoing operation of a train crossing the Soledad Front Country Place at grade emphasize the protection and enhancement of these species?

4494-9673

Appendix L, *Glossary*, of LMP3 defines "aesthetics" as: "The study of science, or philosophy dealing with beauty in nature with judgments concerning beauty. In scenery management, it describes landscapes that give visual and sensory pleasure." LMP1 dictates that, "Scenic resources will emphasize conserving or restoring

<sup>82</sup> USDA Land Management Plan; Part 2 Angeles National Forest Strategy, Applicable to the San Gabriel Mountains National Monument, p. 48

<sup>83</sup> USDA Land Management Plan; Part 2 Angeles National Forest Strategy, Applicable to the San Gabriel Mountains National Monument, p. 52

<sup>84</sup> USDA Land Management Plan; Part 2 Angeles National Forest Strategy, Applicable to the San Gabriel Mountains National Monument, p. 71

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 107 of 156

4494-9673

aesthetic, recreation, and open space values, especially those of high-valued scenery such as scenic backdrops for local communities and increasingly rare values such as solitude.<sup>85</sup>

**Question:** Please describe how CHSRA's plans for the following give visual and sensory pleasure:

1. Construction staging areas located within the Forest;
2. Portals and the significant infrastructure surrounding portals located at the borders of the Forest, the Monument, and the Big Tujunga Wash; and
3. Millions of truck trips hauling spoils out of the tunnels, a significant portion of which will be ultimately dumped within the Forest.

**Question:** The Foothills of the San Gabriel Mountains provide the scenic backdrop for the communities along the Big Tujunga Wash. As CHSRA's proposed viaduct structure across the Big Tujunga Wash will destroy this scenic backdrop, how are CHSRA's plans for this area supporting the directive set forth in LMP1?

4494-9674

In the Landscape Character section of LMP2, the USFS sets forth the directive to, "Maintain the character of key places to preserve their intact nature and valued attributes:

- Maintain the integrity of the expansive, unencumbered landscapes and traditional cultural features that provide the distinctive character of the place;
- Promote the planning and improvement of infrastructure along federal and state scenic travel routes; and
- Promote the consideration of key landscape character in other landscape analyses such as Fireshed."<sup>86</sup>

**Question:** Every bit of infrastructure that CHSRA is proposing to introduce to the Forest and the Monument seemingly violates the directive to maintain the integrity of unencumbered landscapes. How can CHSRA maintain that there is no inconsistency between its plans and the federal laws and regulations?

**Question:** Considering that CHSRA has designed its alignments to run through the Forest and the Monument (i.e., not along existing transportation corridors as is required by Prop 1A), how is the introduction of infrastructure as CHSRA has proposed not in contradiction to the directive provided in the Landscape Character section of LMP2?

**Question:** As CHSRA's tunneling is likely to negatively impact the naturally occurring water sources in the Forest, leading to a reduction in moisture content of the flora and a corollary increase in dead and dying fire fuels, how are CHSRA's plans not in contradiction of the Landscape Character directives set forth by the USFS?

**Discussion of Other Applicable Federal Statutes.**

4494-9675

In LMP3, the USFS delineates a number of federal statutes which also apply to the management of the ANF, including the following:

1. **Act of September 3, 1954, Permits for Public Buildings and Other Public Works.** This Act authorizes permits, term permits, leases, or easements at the fair market value (not to exceed 30-years duration) to states, counties, cities, municipalities, or other public agencies without acreage limitation for the construction and operation of public buildings or other public works, exclusive of rights-of-way.

**Question:** Is there a time limit/expiration date of 30 years (or less) on CHSRA's proposed Special Use Permit from the USFS?

<sup>85</sup> USDA Land Management Plan (2005); Part 1, p. 27

<sup>86</sup> USDA Land Management Plan (2005); Part 2, p.113

November 30, 2022  
Page 108 of 156

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 109 of 156

4494-9676 **2. Clean Air Act of 1977, as amended.** The ANF is designated as a "Class I" area under the Clean Air Act of 1977. Class I "provides protection to designated wilderness lands by severely limiting the amount of additional human-caused air pollution from stationary sources that can be added to these areas."<sup>87</sup>

4494-9681

**Question:** CHSRA proposes 7+ years of construction at multiple locations within the Forest, and the extent of the pollution that will be generated during construction is extensive enough that it will require CHSRA to purchase offset credits. How is construction of this project within Forest lands not in violation of its Class I protection under the Clean Air Act?

Page 3.14-28 of the DEIR highlights the "permanent facility surface footprint(s)" within the ANF that would be required to be constructed as part of each of the Build Alternatives. These permanent facilities would include adit structures, electrical power lines, and, in several of the Build Alternatives, a temporary Construction Staging Area. CHSRA highlights the fact that these structures would be located on "private in-holding(s)" within the ANF and therefore CHSRA's permanent and temporary facilities "would not impact forest land."

4494-9677 **3. Federal Land Policy and Management Act (FLPMA) of 1976, as amended.**

This statute, "Requires that public land be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archaeological values."<sup>88</sup>

CHSRA has very strategically located its surface facilities to be either on private in-holdings within the ANF (in the case of the adit options) or immediately outside the boundary of the ANF/SGMNM (in the case of the portals in the Aliso Canyon area). While it may help CHSRA to secure a permit from the USFS as these facilities are not located on land managed by the USFS, it is not correct to state that these facilities will not impact forest land.

**Question:** Given the pollution that will be created during construction for seven years at a multitude of locations within the Forest, how is CHSRA's proposed project protecting the quality of air and atmospheric values as required by this statute?

Wildlife does not know the difference between a "private in-holding" within the ANF and the immediately surrounding land that is managed by the USFS. The sites selected as potential locations for adits and temporary Construction Staging Areas have recently had numerous sightings of California Black Bears and Mountain Lions, in addition to other wildlife that calls the area home. Seven+ years is a long time to be considered "temporary" in terms of wildlife habitat and patterns. Building a Construction Staging Area within habitat occupied by Black Bears and Mountain Lions — whether or not these facilities are technically located on "private in-holdings" will force these animals out of the area.

**Question:** Given the likely impacts to groundwater resources within the Forest, how is CHSRA's proposed project protecting the quality of water resource values as required by this statute?

The ANF and the SGMNM lie within the "California Floristic Province," an area designated by Conservation International as a Biodiversity Hotspot — an area where, "exceptional concentrations of endemic species are undergoing exceptional loss of habitat."<sup>92</sup> For context, there are only 36 total Biodiversity Hotspots identified in the entire world. Conservation International lists "threats from human activities and development" as a primary risk to the California Floristic Province ecosystems.

4494-9678 This statute also requires that public land be managed in a manner that, "Where appropriate, will preserve and protect certain public lands in their natural condition."

**Question:** How has CHSRA made the determination that the impact areas within the Forest are not appropriate for preservation and protection?

The area around Gold Creek in Little Tujunga Canyon, where CHSRA intends to build and operate a construction staging area for 7+ years, is teeming with native wildlife. There are Black Bears, Mountain Lions, Mule Deer, Coyotes, Bobcats, Ringtails, Raccoons, Squirrels — everything lives there. The bigger animals, like Black Bears and Mountain Lions, require territory that spans many miles.

4494-9679 This statute also requires that, "the United States shall receive fair market value of the use of the public land and their resources unless otherwise provided for by law."<sup>89</sup>

**Question:** How much is the CHSRA anticipating to pay for use of the Forest for housing of the high-speed rail system?

Right now, Los Angeles is at a critical point when it comes to our native wildlife, with Mountain Lions leading the way. The first incident of a Mountain Lion in Los Angeles born with a curled tail was evidence of a population that is beginning to lack the genetic diversity necessary to continue to survive here as a species. They are becoming inbred.

4494-9680 **4. Occupancy Permits Act of 1915, as amended.** This statute, "Authorizes term permits for structures or facilities on National Forest System land, and sets maximum limits of 80 acres and 30 years."<sup>90</sup>

**Question:** CHSRA's proposed alignments each plan to utilize more than 80 acres of NFS land. How are CHSRA's proposals not in violation of this statute?

The freeways cut off wildlife corridors, and mountain lions are stuck on "islands" throughout the Los Angeles area. There, they are becoming genetically distinct from their cousins across the freeway. The resource study area of the high-speed rail project within the Angeles National Forest hemmed in by the 210 freeway, the 5 freeway, the 2 freeway, and the 14 freeway. These animals are running out of areas to live. The individual territory required to sustain one Mountain Lion ranges in size from 50 to 200 square miles; the size of the territory of one individual Black Bear is between 15 to 70 square miles.

4494-9681 **Discussion of Wildlife.**

In LMP1, the USFS explains the significance of the Angeles National Forest specifically with respect to wildlife. The Forest, "provides habitat preserves within one of the most highly urbanized landscapes in the United States, and contains areas that are the only remaining habitat refugia for species imperiled by the loss or degradation of habitat off-forest."<sup>91</sup>

If we look at a map of the Los Angeles area, we can see that there are very few pieces of land left that offer this size of space — let alone with a lack of infrastructure to impact their habitat and behavioral patterns. Mountain Lions are particularly sensitive to human infrastructure and try to avoid it at all costs. Our activity directly affects their activity. It has been noted by local researchers that our Mountain Lions are more nocturnal and exhibit fewer active hours (e.g., ours are active from 12am-4am instead of from 9pm-6am) than their more rural counterparts who are less affected by human activity.

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 110 of 156

4494-9681

Now is the time when Los Angeles is looking at critical wildlife habitats and corridors. Other State and Federally-funded programs are striving to build infrastructure to protect Mountain Lions. For example, construction of the Wallis Annenberg Wildlife Crossing is underway in the Santa Monica Mountains National Recreation Area. When completed, the crossing will be, "the largest of its kind anywhere in the world and the most ambitious in such a densely human-populated region."<sup>93</sup>

**Question:** Infrastructure improvements like the Wallis Annenberg Wildlife Crossing reflect the values of this region: to counter the negative human encroachments on wildlife habitat with infrastructure that connects parcels of open space to provide safe passage for Mountain Lions and other wildlife. Why do CHSRA's proposals intentionally contravene these values, placing Construction Staging Areas and tunnel portals within and immediately adjacent to the Forest, an area designated as wildlife habitat?

4494-9682

**Question:** How can CHSRA possibly mitigate the impacts to Mountain Lions and Black Bears who will be disproportionately affected by the introduction of CHSRA's infrastructure elements into their habitat? "Relocating them" as has been suggested by CHSRA is not an acceptable option; we want them to continue to live in the Angeles National Forest.

4494-9683

In the Land Use section of the Monument Plan, the USFS addresses the Magic Mountain Wilderness Zone, including the following description: "The Magic Mountain Wilderness's chaparral-covered hillsides and oak-studded canyons provide a scenic vista and suitable habitat for the California condor." In its consistency assessment on Page 3.1-B-58, CHSRA asserts that the Wilderness Zone requirements are "Not Applicable" as, "The Build Alternatives would not encounter the Magic Mountain Wilderness Area."

While we often see birds sitting atop power lines unharmed, power lines pose a unique threat to California Condors. It is safe for birds to touch one power line, but touching two lines at one time can prove fatal. As California Condors are the largest birds in the United States (with a wingspan of nearly 10 feet), their size makes them likely to touch two lines at one time, making them vulnerable to the risk of death by electrocution.<sup>94</sup>

**Question:** CHSRA plans to build a traction power facility adjacent to its portal near the Vulcan Mine, approximately half a mile from the border of the Magic Mountain Wilderness Zone. Doesn't the introduction of new power lines immediately adjacent to the Magic Mountain Wilderness Zone put condors at risk of electrocution? Given that we are talking about birds, isn't a distance of half a mile from the Wilderness Zone reason to observe the standards applicable to the Wilderness Zone? Shouldn't the Wilderness Zone requirements as they pertain to birds apply to the significant infrastructure CHSRA intends to introduce within half a mile of the Wilderness Zone?

**Discussion of Impacts on Parks, Recreation, and Open Space Resources by Affected Build Alternatives as set forth by CHSRA in Section 3.15 of the DEIR.**

4494-9684

Impact PK#1 delineates the ways in which the build alternatives will necessitate the acquisition of Parks, Recreation, and Open Space Resources in the Forest and the Monument. Each of the build alternatives includes tunnel portals (either one, two, or three twin tunnel portals, depending on the alignment) located immediately adjacent to Forest land. While CHSRA intentionally designed these portals to technically fall outside of Forest land, these portals exist at the borders of the Forest and the Monument, and these portals will impact these lands both during construction and operation of the train. The E1, E1A, E2, and E2A alignments each feature two twin sets of portals entering and exiting the Monument within half a mile of each other. Additionally, land within the Forest and the Monument will be utilized for construction staging, with the acreage commandeered for such use ranging between 28 and 38 acres, plus another 23 – 36 acres for construction

<sup>93</sup> <https://www.curbed.com/2022/01/wildlife-crossing-liberty-canyon-los-angeles.html>

<sup>94</sup> <https://www.discovermagazine.com/planet-earth/shock-therapy-is-saving-endangered-california-condors>

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 111 of 156

4494-9684

staging for the adit locations. Permanent use of ANF land includes acreage for adits, access roadways, and electrical utilities and facilities.

**Question:** CHSRA claims that the Build Alternatives' "tunnel beneath the ANF would not result in operations impacts such as noise and vibration at the surface." Whether or not the tunnel boring machine will be seen, heard, or felt once it is 2,000 feet beneath the surface, all of the spoils will come through the portals which are located at the borders of the Forest and the Monument. How will millions of trucks hauling spoils for 7+ years at the borders of the Forest not result in noise and vibration impacts to the Forest?

4494-9685

In Impact PK#3, "Changes to Park Character," CHSRA asserts that operations and maintenance of permanent surface improvements within the Forest and the Monument, "would not result in a substantive change in character during project operations." The reasons given for this conclusion are that tunneling does not result in surface impacts; permanent surface impacts occupy a small percentage of the total land area of the Forest; and utilities will largely follow existing roadways and utility easements within the Forest.

**Question:** CHSRA is using the total acreage of the Forest as justification that overall impacts caused by its high-speed rail are negligible. The Forest is nearly the size of the State of Rhode Island. A project can have serious, irreparable impacts in one area, but not necessarily affect another. In determining impacts such as change of character, CHSRA should be considering the immediate area (i.e., most often the Resource Study Area), not the Forest as a whole. Considering the cumulative impacts of 7+ years of construction within the Forest and immediately at its borders, plus the permanent surface improvements, what is the rationale for stating that these manmade encroachments will not result in a change in character to the area of the Forest along/in proximity to the alignment?

4494-9686

In Impact PK#2, "Construction-Related Access, Noise, Vibration, Air Quality, and Visual Changes to Parks, Recreation, and Open Space Resources," CHSRA asserts that, "Visitors to the ANF, including the SGMNM, would have unobstructed views of the construction activities taking place at the... Build Alternative adits within the ANF. Temporary construction staging areas associated with adits would be visible, depending on the location and surrounding topography. Construction staging areas would introduce major visual changes to the immediate surroundings. However, these impacts would be temporary." Further, these staging areas, "would temporarily create a barrier for access or inhibit use of the trail."

**Question:** LM1 (Landscape Aesthetics) and LM3 (Landscape Character) of the USFS LMP Part 3 set forth the law and agency standards regarding management of landscapes to achieve scenic integrity objectives and maintaining the character and integrity of unencumbered landscapes. How does forcing visitors to the Forest to have unobstructed views of construction activities for 7+ years not violate LM1 and LM3 of the USFS LMP Part 3?

**Hansen Dam Open Space:**

4494-9687

In Impact PK#1, "Acquisition of Parks, Recreation, and Open Space Resources," CHSRA describes the viaduct that would be constructed in the Hansen Dam Open Space. CHSRA plans to take (permanently) 13 acres of the Hansen Dam Open Space to accommodate this structure. Further, CHSRA states that, "Compensation, replacement, or enhancement would be granted as deemed necessary."

**Question:** How is compensation determined for the taking of a public resource like Hansen Dam Open Space? How would replacement be proposed considering the lack of available open space within the City of Los Angeles?

4494-9688

In Impact PK#3, "Changes to Park Character," CHSRA describes the permanent impacts to the Hansen Dam Open Space, including the viaduct, piers, and tunnel portals, each of which would be, "highly visible and would contrast with the existing visual setting. Patrons of the open space area would be highly sensitive to these

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 112 of 156

4494-9688

visual changes, as the changes would impinge upon the natural harmony of the views in this area." Policy LU 6.3 of the Los Angeles County General Plan 2035 states that planning shall, "Encourage low density and low intensity development in rural areas that is consistent with rural community character, preserves open space, and conserves agricultural land."

**Question:** CHSRA has stated that as a state agency, it is not required to comply with County laws and ordinances. That being said, the introduction of the viaduct into the Big Tujunga Wash is an extremely egregious example of CHSRA's proposed alignments and infrastructure features completely contravening the LA County General Plan. Other than simply saying, "We aren't required to comply with county ordinances," what is CHSRA's justification of proposing alignments and infrastructure that are so out of sync with the County's laws and vision for land management?

4494-9689

**WL-1** of the LMP addresses Threatened, Endangered, Proposed, Candidate, and Sensitive Species Management. One directive is to, "Implement priority conservation strategies (see table 528 Angeles NF Conservation Strategy)." On page 3.1-B-9 of the DEIR, CHSRA states that its actions are consistent with this directive as, "The Authority designed the Build Alternatives such that they avoid significant wash and open space areas within the ANF to protect sensitive species." This is another example in which CHSRA is splitting hairs. It has designed two alignments such that portals are located on Forest land, and an elevated viaduct structure requiring a series of concrete pillars will be constructed to cross significant wash and open space areas immediately adjacent to the ANF. This particular wash area is known to house the endangered Santa Ana Suckerfish, among other sensitive species.

**Question:** How are CHSRA's alignments that introduce significant infrastructure into the Big Tujunga Wash not a violation of the spirit of WL-1?

4494-9690

In **LINK-1** of the LMP2, the USFS sets forth directives regarding Habitat Linkage Planning, including the following: "Actively participate with local government, developers, and other entities to protect national forest values at intermix and interface zones." On Page 3.1-B-26 of the DEIR, CHSRA maintains that its plans are consistent with this directive, "because the Build Alternatives would be located underground as they traverse the ANF."

**Question:** The emergence of the train through the portals at the border of the ANF and its continuation on an elevated viaduct across the Big Tujunga Wash is exactly the geographic setting described as being an intermix/interface zone. How is the introduction of portals and the significant infrastructure that they require, plus the construction of a viaduct atop a series of concrete pillars, a demonstration that CHSRA is protecting National Forest values at intermix and interface zones?

4494-9691

Impact PK#3 goes on to describe that despite the acquisition of 13 acres of land, "The resource would remain accessible in the long term, and users would be able to pass under the viaduct to move from one area of the open space to another. Noise from passing trains would be perceptible to patrons of the open space area."

The majority of the recreational use of the area described as being "under the viaduct" is comprised of equestrians. In addition to trail riders utilizing the trail system in the wash, also impacted will be the entirety of the Hansen Dam Horse Park. The Horse Park is a 38-acre facility at the eastern edge of the Hansen Dam Recreation Area, and immediately adjacent to the proposed viaduct. The Horse Park features boarding for up to 200 horses and 350 show stalls. Per HDHP, the facility offers, "turnouts, numerous riding rings, and access to miles of trails. Many different disciplines are represented by top trainers, including reining, dressage, and hunter/jumper. The facility is spacious, shaded, and peaceful. HDHP is the preferred location for a number of horse shows and clinics. There are six "A" rated hunter/jumper shows, five "B" hunter/jumper shows, ETI Coral #101, IEL, and a variety of other shows and clinics."<sup>95</sup>

<sup>95</sup> <https://hansendamhorsepark.com>

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 113 of 156

4494-9691

**Question:** As horses are flight animals, they will not respond well to the noise and visual impacts of a train moving at 200mph toward them, potentially posing a safety hazard to themselves and their riders. How will you mitigate the impacts that the train will have on equestrians in this area, both trail riders and riders utilizing the area's premiere horse park?

4494-9692

Further, CHSRA goes on to state that, "The changes described under Impact PK#3 would not inhibit the desirability of the resource to the extent that use would decrease."

**Question:** If the area closest to the viaducts is primarily used by equestrians, and knowing that horses will react negatively to the audio and visual impacts caused by a 200+mph train to the point where it becomes a safety concern for both horses and their riders, how can CHSRA conclude that use of the resource would not decrease?

4494-9693

In Impact PK#2, "Construction-Related Access, Noise, Vibration, Air Quality, and Visual Changes to Parks, Recreation, and Open Space Resources," CHSRA describes as a mitigation measure that, "the contractor will prepare a fugitive dust control plan and a noise and vibration technical memorandum documenting the pertinent federal guidance for controlling construction fugitive dust, noise, and vibration effects... the measures developed as part of the construction plans will ensure that temporary increases in dust, noise, and vibration would be reduced to a level that would allow the park to continue to operate."

**Question:** Please describe what mitigation measures might possibly be implemented that would allow Hansen Dam Horse Park to continue to operate during 7+ years of construction immediately adjacent to its facility?

**Tujunga Ponds Wildlife Sanctuary.**

4494-9694

In Impact PK#2, CHSRA notes that because the elevated viaduct will be located .8 mile to the west of the Ponds, construction, "would not result in temporary noise, vibration, air quality, or visual changes to this area," and, therefore, no mitigation measures are necessary.

Per LA County Parks, which manages the site, "The 13-acre Tujunga Ponds site in Sunland was acquired by the Department in 1978, following the CalTrans completion of the 210 (Foothill) Freeway through Tujunga wash, requiring CalTrans to create the pond site in mitigation for loss of similar habitat under the freeway. It was agreed that the site could be accessed by permit from the Department (Natural Areas) and existing trails around the ponds could be used by visiting groups for nature study, photography and similar passive recreation. The site contains 2 small lakes (ponds) and surrounding dense willow riparian woodlands and cottonwood riparian woodlands."<sup>96</sup>

Birdwatching is a primary passive recreational activity at this site, as the freshwater cattail marshes make the Tujunga Ponds a destination for not only small, sensitive bird species including the Least Bell's Vireo and the Southwestern Willow Flycatcher, but also large wading birds such as egrets and herons.

In, Chapter 8 of the book *Railway Ecology*, authors Juan Malo, Garcia de la Morena, Israel Hervas, Christina Mata, and Jesus Herranz examine, "Cross-scale Changes in Bird Behavior Around a High Speed Railway: From Landscape Occupation to Infrastructure Use and Collision Risk." In their study, Malo et al. noted that, "Regarding changes potentially introduced by the railway, it is noteworthy that total bird densities were reduced from approximately 550 birds/km<sup>2</sup> in 2010-2011 to values in the range 360-390 birds/km<sup>2</sup> range in the following years. This change occurred shortly after the trains began running..."<sup>97</sup> They further concluded that,

<sup>96</sup> <https://parks.lacounty.gov/tujunga-ponds-wildlife-sanctuary/>

<sup>97</sup> Borda-de-Agua, Luis, Barrientos, Rafael, Beja, Pedro; and Pereira, Henrique M., eds. *Railway Ecology* (2017): p. 121.

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 114 of 156

4494-9694

"the construction of the HSR resulted in a general decrease in bird density in the area, and modified the small-scale spatial patterns of the avian community."<sup>98</sup>

**Question:** Aren't birds going to be deterred from safe harboring at the Tujunga Ponds Wildlife Sanctuary during both 7+ years of construction immediately adjacent to the sanctuary and during operation of the train? What does an independent ornithologist say will be the impacts to birds resulting from construction and operation of the train immediately adjacent to the Tujunga Ponds sanctuary?

4494-9695

With respect to bird mortality resulting from the introduction of high-speed trains into their habitat, Malo et al. noted the following:

"The mortality of birds depends on the extent to which they are exposed to the risk of being over-run while flying, or being electrocuted by the HSR poles or catenary."<sup>99</sup>

"The potential relevance of the HSR is conditioned by the fact that the great speed of the trains, in most cases, precludes birds from avoiding train collisions. Additionally, it is hazardous for birds to fly above the train collision risk area where they may come in contact with the catenary, suspenders, power wire, feeder, earth cable, and tensors (5.3–8.5 m above the ground). Although there is a constant risk of collision with these elements even when trains are not running, the risk of collision with the catenary may be increased by the passage of trains due to the potential for turbulence generated by the moving train to destabilize the normal flight of birds. Thus, it is reasonable to assume that birds that cross the railway by flying between or below the catenary wires face the mortality risk from train-kill."<sup>100</sup>

"These data suggest that train speed determines mortality risk independent of particular species' characteristics, with the risk being a result of the fact that birds are not adapted to avoiding objects approaching at such high velocities."<sup>101</sup>

"...bird mortality may have a significant impact on the populations of some species, given the fact that birds cross the collision risk area frequently."<sup>102</sup>

**Question:** What mitigation measures will CHSRA employ to warn birds of an oncoming train to avoid avian mortality due to collision? What mitigation measures will CHSRA employ to deter birds from collision with the catenaries? In an effort to reduce overall avian mortality, what methods will CHSRA use to repel birds from its infrastructure elements, and what systems will it employ to decrease the frequency with which birds will fly through the viaduct area which CHSRA intends to introduce immediately adjacent to a sanctuary for birds and specifically waterfowl?

4494-9696

**Pacific Crest Trail.**

With respect to CHSRA's plans near the Pacific Crest Trail, CHSRA stipulates that, "PCT users would have unobstructed views of the construction activities. Staging areas would introduce major visual changes to the immediate surroundings with visually intrusive accumulations of stored material and equipment."

The Monument Plan specifically addresses the USFS goals for the PCT:

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 115 of 156

4494-9696

1. "The nature and purpose of the Pacific Crest National Scenic Trail (PCT) are to provide for outstanding journeys on foot or on horseback in the spectacularly wild landscapes of high Pacific mountain ridges. ***Tranquility and closeness with nature can be found consistently along the trail, evoking a feeling of extended retreat from civilization, even if only venturing out for a day.***"<sup>103</sup>

**Question:** How can tranquility and a feeling of extended retreat from civilization be maintained during 7+ years of construction within sight of the PCT? How are CHSRA's plans not in violation of the directive expressed in the Monument Plan?

The Monument Plan further sets forth the guidelines for recreation near the PCT:

1. "New recreation events, such as foot races or horseback endurance events and fundraising events should be limited to designated crossings only on the Pacific Crest National Scenic Trail (PCT) within the Monument. Existing recreation events may be allowed to continue at current levels;" and
2. "Within the Monument, new trails that are proposed to cross the PCT or to be built within the foreground of the PCT, should be designed to minimize conflicting uses and to minimize the scenic, aural, and resource impacts to the PCT."<sup>104</sup>

**Question:** The spirit of the law in these sections is clearly to minimize human impacts on the Monument and specifically on the PCT. If the USFS is restricting low-impact, one-day events such as horseback riding and foot races, why should they allow a highly invasive construction project that will go on for 7+ years?

4494-9698

The Monument Plan also sets forth the following restriction on activity within the foreground of the PCT:

1. "Within the Monument, the PCT foreground is not suitable for special-use authorizations for new communication sites and wind generation sites."<sup>105</sup>

**Question:** If the PCT foreground is not suitable for new communication sites and wind generation sites, how is placing a construction staging area within sight of the PCT not in violation of the spirit of the Monument Plan?

4494-9699

The USFS also sets forth guidelines for the PCT within the ANF Strategy. ANF S1 stipulates that it must:

1. "Protect scenic integrity of foreground views as well as from designated viewpoints. Where practicable, avoid establishing nonconforming land uses within the viewshed of the [Pacific Crest] Trail."<sup>106</sup>

**Question:** How do CHSRA's alignments and construction staging areas protect the scenic integrity of views from the Pacific Crest Trail? How do CHSRA's alignments and construction staging areas avoid the establishment of a non-conforming land use within the viewshed of the trail?

**Rim of the Valley Trail Extension.**

4494-9700

Not only do CHSRA's proposed routes intersect/cross the Rim of the Valley Trail Extension in several places, but Impact PK#1, "Acquisition of Parks, Recreation, and Open Space Resources," describes how CHSRA intends to commandeer 300 – 400 feet of the Rim of the Valley Trail Extension for use as a construction staging area.

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 116 of 156

4494-9700

**Question:** In ANF S1, the USFS sets forth the goals of the management of the Pacific Crest Trail. As the Rim of the Valley Trail extension will also fall within ANF boundaries, we can assume it will be managed by the same standards. S1 states that management of this resource will, "Protect scenic integrity of foreground views as well as from designated viewpoints. Where practicable, avoid establishing nonconforming land uses within the viewshed of the trail."<sup>107</sup> How does utilizing 300 – 400 feet of the Rim of the Valley Trail Extension as a construction staging area for 7+ years comply with the terms of S1?

4494-9701

In Impact PK#4, CHSRA asserts that the use of the Rim of the Valley Trail Extension, "would not increase or decrease with implementation of the... Build Alternatives."

**Question:** This conclusion is misleading as it does not take into account the impacts during construction. How will use of the Rim of the Valley Trail Extension not decrease when a section of the Trail will be commandeered for use as a construction staging area for 7+ years?

4494-9702

In Impact PK#1, "Acquisition of Parks, Recreation, and Open Space Resources," CHSRA states that, "Compensation, replacement, or enhancement would be granted as deemed necessary. These mitigation measures will ensure that each resource acquired would be accessible during construction. If construction would result in a permanent loss, the Authority will provide necessary compensation."

**Question:** How is compensation determined for a public resource like the Rim of the Valley Trail?

**Discussion of CEQA Conclusions:**

4494-9703

With respect to **Impact PK#1: Acquisition of Parks, Recreation, and Open Space Resources**, CHSRA concluded that acquisition of park/recreational resources would create a significant impact for the following resources in the study area:

- Palmdale Hills Trail (Proposed Extension)
- Vasquez Loop Trail (Proposed Extension)
- Littlerock Trail (Proposed Extension)
- Acton Community Trail (Proposed Extension)
- Santa Clara River Trail (Proposed Extension)
- Rim of the Valley Trail (Proposed Extension)
- Hansen Dam Open Space (Proposed Extension)

With respect to **Impact PK#2: Construction-Related Access, Noise, Vibration, Air Quality, and Visual Changes to Parks, Recreation, and Open Space Resources**, CHSRA concluded that project-related construction activities would create a significant impact for the following resources in the study area:

- Tejon Equestrian Park
- Palmdale Hills Trail (Proposed Extension)
- Vasquez Loop Trail (Proposed Extension)
- Acton Community Trail (Proposed Extension)
- Pacific Crest Trail
- Santa Clara River Trail (Proposed Extension)
- Rim of the Valley Trail (Proposed Extension)
- Hansen Dam Open Space (Proposed Extension)

<sup>107</sup> USDA Land Management Plan; Part 2 Angeles National Forest Strategy, Applicable to the San Gabriel Mountains National Monument, p. 76

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 117 of 156

4494-9703

With respect to **Impact PK#3: Changes to Park, Recreation, and Open Space Resource Character**, CHSRA concluded that the following resources would suffer a significant impact because operations of the build alternatives would alter park character by preventing its use or by creating physical or perceived barrier:

- Tejon Equestrian Park
- Palmdale Hills Trail (Proposed Extension)
- Vasquez Loop Trail (Proposed Extension)
- Acton Community Trail (Proposed Extension)
- Hansen Dam Open Space

It is worth noting that CHSRA concluded that with respect to Impact PK#3, the ANF, including the SGMNM, would experience "less than significant impact." We disagree with this conclusion as CHSRA is considering the entirety of the Forest in its analysis, concluding that the area impacted represents a small percentage of the overall resource. It is not reasonable to consider the Forest as a whole, as it is nearly the size of the State of Rhode Island. The only reason that CHSRA is considering the Forest as a whole is to dilute the impacts of its construction across 700,000 acres.

Considering solely the areas of the Forest that are impacted by CHSRA (i.e., in most respects, the Resource Study Areas), we maintain that those areas will suffer a significant impact with respect to Impact PK#1, Impact PK#2, and Impact PK#3.

Los Angeles County is the most populated county in the United States, with a population of over 10 million people; and the City of Los Angeles is the second most populated city in the United States, with a population of nearly 4 million people.<sup>108</sup> It is in this most urban of settings that the preservation of our National Forests, parkland, and open space is of the utmost importance.

There are a total of 28 parks, recreation areas, and open space resources within the resource study area that will be impacted by the construction and operation of a high-speed rail system. On page 3.15-120, CHSRA concludes that, "With the inclusion of the applicable IAMFs and implementation of the mitigation measures identified in Section 3.15.7, all six Build Alternatives would avoid, minimize, reduce, or compensate for impacts on these resources."

Per CEQA guidelines, CHSRA is required to address the cumulative impacts of a project," when the cumulative impacts are expected to be significant and when the project's incremental effect is cumulatively considerable."<sup>109</sup>

Taking into account the cumulative impacts on the 28 parks, recreation areas, and open space resources in the resource study area, including but not limited to the impacts studied in Chapter 3.15 (i.e., acquisition; construction-related access, noise, vibration, air quality, and visual changes; and changes to character), the impacts created by CHSRA outweigh any possible benefits that could result from the implementation of a high-speed rail system in the RSA.

As such, the only reasonable conclusion is that CHSRA – as well as all Officials with Jurisdiction – must support the NO PROJECT ALTERNATIVE.

<sup>108</sup> April 1, 2020 Census figures.

<sup>109</sup> State CEQA Guidelines Section 15130[a]

November 30, 2022  
Page 119 of 156

**CHAPTER 3.16: AESTHETICS AND VISUAL QUALITY**

4494-9704

**3.16.4.4 Method for Evaluating Impacts under NEPA**  
**Page 3.16-13/Footnote 1**

The CEQA issued new regulations, effective September 14, 2020, updating the NEPA implementing procedures at 40C.F.R. 1500-1508. However, because this project initiated the NEPA process before September 14, 2020, it is not subject to the new regulations. The Authority is relying on the regulations as they existed prior to September 14, 2020. Therefore, all citations to CEQ regulations in this environmental document refer to the 1978 regulations, pursuant to 40 C.F.R.1506.13 (2020) and the preamble at 85 Fed. Reg. 43340.

**Question:** Are there elements in this Project Section that would have had to be drastically modified/rerouted or even deleted if CHSRA followed the 2020 NEPA procedures considering that the ones that are being followed are almost 45 years old and so many environmental regulations have changed drastically during that time?

4494-9705

Page 3.16 -39, 40

Tunnel Portals: Tunnel portal access roads would follow existing drainage courses or existing roads to the extent possible.

**Question:** Where is the map for all the access roads that need to be built near the portals? Are they paved/will they be paved? Has the adverse impact of these roads been considered?

4494-9706

Lighting: like all of these Project Component parts, CHSRA states something will be done, but there is no way of knowing if it can be as there is not a mitigation plan, such as lighting pollution from the train, train construction, etc.

**Question:** How will CHSRA mitigate the lighting pollution and train lights?

4494-9707

Sound Walls: "Noise walls can be made from transparent materials or include surface design enhancements to blend with the area's visual context."

**Question:** How do you keep transparent materials clean day to day? How do you keep them from getting scratched and damaged?

4494-9708

Traction Power Substations (TPSS)

**Question:** Where will the TPSSs be located? If we don't know the locations, how can we be certain that they will not cause harm to our community? How will we know which property(ies)/asset(s) will be taken by CHSRA for the TPSS's location?

4494-9709

Switching Stations:

**Question:** Where will the switching stations be located? If we don't know the locations, how can we be certain that they will not cause harm to our community? How will we know which property(ies)/asset(s) will be taken by CHSRA to house the switching station(s)?

4494-9710

Communications Towers:

**Question:** Where will these 100-foot towers be located? If we don't know the locations, how can we be certain that they will not cause harm to our community? How will we know which property(ies)/asset(s) will be taken by CHSRA to house the communications towers? Would these be located near the Burbank Airport? It seems this

4494-9710

would cause interference with the airport's operations. Has the Burbank Airport been contacted regarding CHSRA-planned facilities that may interfere with its operations? What has been their response?

4494-9711

**3.16.6.4 Temporary Construction Impacts**  
**Page 3.16-40**  
**SR14**

*"During construction, spoils would be transported to both the Vulcan Mine and Boulevard Mine via conveyor belt systems installed along and within the Palmdale to Burbank Project Section alignment. The conveyor belt systems would appear highly industrial in nature; however, they would be visually compatible with the other industrial features in the area. Short-term aesthetic impacts would occur during construction as tunnel spoils would at times be visible traveling along the conveyor belt to the Vulcan and Boulevard Mines."*

**Question:** CHSRA believes that Sun Valley is so industrial that making it worse is not important, despite the best efforts of the community and the Sun Valley Area Neighborhood Council to rectify this? Do you believe the added conveyors to haul dirt would be acceptable to the community in addition to the noise, vibrations and pollution that will be occurring in their area?

**Question:** What happens to the Vulcan Mine and the Boulevard Mine once they are filled? The Boulevard Mine is in the heart of Sun Valley, which is in great need of a recreational park, especially since so many folks live in apartments. Would the land be usable for that purpose? Is there money in the budget to turn that land, which it is assumed the State will then own, into a first rate park with great facilities? Giving back to this underserved community would be the right thing to do.

4494-9712

**3.16.6.5 Permanent Construction and Operations Impacts**  
**Page 3.16-48**

Table 3.16-14 Change in Visual Quality of Landscape Unit 1 Key Viewpoints, Refined SR14 Build Alternative (also Appendix 3.16-A: Photographs of Existing Conditions and Visual Simulations with the Project, Page 3.16-A-15: [https://hsr.ca.gov/wp-content/uploads/2022/08/PB\\_03.16-AppxA\\_PhotosExistingConditions\\_a11y.pdf](https://hsr.ca.gov/wp-content/uploads/2022/08/PB_03.16-AppxA_PhotosExistingConditions_a11y.pdf))

**Question:** KVP 1.14: Pacific Crest Trail – For this famous trail, the destruction of the scenic view called out in Landscape Unit 1b: Central State Route 14 Corridor, is High for Viewer Sensitivity, and Adverse to the Degree of Change to Visual Quality. What will be done to remediate this condition for this important California asset, and what has the Pacific Crest Trail Association had to say about the impact?

4494-9713

**Page 3.16-82/83**  
**AVQMM#4 – Permanent Construction Impacts on Visual Quality**

*"Prior to operation and maintenance of HSR, the contractor shall plant trees (minimum 24-inch box and 8 feet in height) along the edges of the HSR rights-of-way in locations adjacent to residential areas to visually screen the elevated guideway and the residential area. The species of trees to be installed will be selected based on their mature size and shape, growth rate, hardiness, and drought tolerance. No species on the Invasive Species Council of California's list (ISCC 2010) would be planted. Upon maturity, the crowns of trees used would be tall enough to partially, or fully, screen views of the elevated guideway from adjacent at-grade areas. Upon maturity, trees would allow ground-level views under the crowns (with pruning if necessary) and will not interfere with the 15-foot clearance requirement for the guideway. The trees will be maintained. Irrigation systems would be installed within the tree planting areas..."*

**Question:** Where is CHSRA going to get all of these mature trees? Where is the water coming from to irrigate all of these trees used to screen the HSR? We don't have enough water for the needs of California as it is and by needing to plant trees (which of course is important but especially in urban areas), that is an additional

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 120 of 156

demand for water, besides all the water needed for the construction, that will be additional to California's needs.

4494-9714

Page 3.16-102

KVP 1.22: Lake View Terrace (E2 and E2A Build Alternatives) As shown in Figure 3.16-A-22a (in Appendix 3.16-A), KVP 1.22 shows the view from Kurt Street at Nadina Street in unincorporated Los Angeles County, looking northeast from the Lake View Terrace neighborhood toward scenic hills located within the ANF. The view features an open, grassy field surrounded by scenic hills. Electrical transmission towers and lines descend from the hills into the adjacent neighborhood, revealing the interface of wildlands and development. Natural harmony is moderately high and cultural order is high; hence, overall visual quality is moderately high. As shown in Figure 3.16-A-22b (in Appendix 3.16-A), the E2 and E2A Build Alternative alignments would emerge from a tunnel beneath the hills at a currently vacant field. The introduction of these project elements would be highly visible and contrast with the natural harmony of the view. Residential neighbors adjacent to this area would be highly sensitive to these visual changes, as they would impinge upon the natural harmony of the view from their foothill community, shifting the scene toward a more industrial character. Overall, the degree of change to visual quality would be adverse for the E2 and E2A Build Alternatives. (also: Appendix 3.16-A: Photographs of Existing Conditions and Visual Simulations with the Project, Page 3.16-A-24 [https://hsr.ca.gov/wp-content/uploads/2022/08/PB\\_03.16-AppxA\\_PhotosExistingConditions\\_a11y.pdf](https://hsr.ca.gov/wp-content/uploads/2022/08/PB_03.16-AppxA_PhotosExistingConditions_a11y.pdf))

This area that is so crucial to the Los Angeles equestrian community would be forever forfeited as the motion of a train much less the noise would not allow its use. Horses are flight animals, and despite the very uninformed study done years ago by the Mineta Transportation Institute dated Dec. 2015, (<http://static.politico.com/64/b3/d4e3ea7449e08a70005d2caf6ebd/mineta-transportation-institute-report-high-speed-rail-and-equine-issues.pdf>), horses and their riders could not safely coexist with a high-speed train. The wildlife in this area is vast and diverse, and no doubt the HSR would cause the rapid disappearance of most species. It is also a migratory route for countless birds where they stop off right where the train would be located, again, changing a centuries old flight path. The Tujunga Wash is a treasured area for Los Angeles. Its scenic vista provides breathtaking views especially during sunrises and sunsets. It is a go-to location for our local photographers, as is so beautifully showcased in this website: <https://www.tompulaphotography.com/gallery.html>. With so many wild, pristine areas being destroyed by ongoing development, losing this area to the HSR would be a tremendous, heart-breaking disaster.

**APPENDIX 3.16-A: PHOTOGRAPHS OF EXISTING CONDITIONS AND VISUAL SIMULATIONS WITH THE PROJECT**

4494-9715

Page 3.16 – A-31

The top photo on this page shows the NW viewpoint from Hollywood Way, but taken years ago. CHSRA's document is dated August 2022, so there is no reason why you should not be addressing the current condition of that land. What occupies that 61 acres now is the huge megaplex called Avion. It is made up of warehouses (such as Amazon), office buildings, stores, restaurants, condos, and apartment buildings. The *LA Times* stated that this project would cost over \$900 Billion to buy out, though we are unsure if that figure includes demolition costs – and, of course, added to that figure would be the costs of inevitable lawsuits. The land was purchased for \$75 million, so essentially CHSRA upped the overall budget by over one billion dollars by not buying the land when it was available. Are you really thinking that you can (and should) turn that land into what is depicted in the second photo, which is a complete demolition of the Avion complex, turning it into a parking lot with trees? And your description is priceless (but insulting):

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 121 of 156

4494-9715

*Simulated View: The project would add a parking lot and transit center along North Hollywood Way, as well as enhanced landscaping throughout, which would increase cultural order and natural harmony. Overall, the degree of change to visual quality would be beneficial.*

4494-9716

**Question:** How you are going to address the following when you demolish the Avion project?

- Paying for the endless and inevitable lawsuits that will occur when taking their land when you had the opportunity to purchase it but declined to do so. Is that amount in the current business plan? We were told at a meeting with CHSRA that you declined to purchase it at the time believing it was "too expensive." You admitted you knew about it being available, you turned it down, pushing a very expensive problem down the road. How does this demonstrate responsible planning and a responsible use of resources?
- Besides paying for the buyout and demolition, will the taxpayers also have to pay for the relocation and rebuilding of all of these businesses?
- Avion submitted a comprehensive document to CHSRA for the Burbank-Los Angeles Project Section (Submission 696, Timur Tecimer, OVERTON MOORE PROPERTIES, July 21, 2020), with one of your replies dated Sept. 2021: 696-781: "Once the design is final and the exact nature of impacts to the Burbank Avion Development is defined, the Authority will coordinate with the property owner and follow the procedures described in the Right-of-Way." Again, you are resorting simply to the "Right of Way." It is unbelievable that you allowed this property to be sold, developed, and completed, and yet you cite the Right of Way to solve this extremely expensive malfeasance on your part.

4494-9717

**Question:** Though the building materials are green, it is improbable that after demolishing, they could be repurposed, which means thousands of tons of materials will have to go into land fill. Where will all of the tons of materials go? Demolition of a newly built multi-million dollar project is not a green, carbon-neutral action.

The fact you have this "old" photo in your 2022 DEIR does not give us a feeling that you are being "transparent."

Since you are addressing this land in this report, you are violating CEQA as you are NOT dealing with how you plan to handle the situation of this mega complex which, with its demolition, will have wide-ranging consequences environmentally: air pollution, materials disposal, and of course the relocation of all the residents and businesses in the complex.

The above questions regarding the Burbank Station also apply to Vol 3: PEPD Record Set REV01, Burbank Station Area Plans.

**APPENDIX 2.0-I: SPOILS DISPOSAL ASSUMPTIONS USED FOR ENVIRONMENTAL ANALYSIS**

4494-9718

Page 2.0-I-3

**Refined SR14: Portal 10 - Spreading grounds (& other locations)**

50% of the spoils from this tunnel would be contaminated and require disposal at a facility licensed to accept potentially hazardous materials. Spoils disposal in existing mine pits would require a project design, which would include geotechnical investigation of the site, identification of disposal technology, site preparation, spoils transportation to an offsite treatment facility if spoils are hazardous, fill and compaction procedures, slope stability, monitoring, water treatment, and surface and vegetation restoration among other elements.

**Question:** What happens to the contamination itself? How is that disposed of? Is there a local company already set up to handle the decontamination process, or does one have to be created?

Page 2.0-I-3

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 123 of 156

4494-9719 **Refined SR14: Burbank Airport Station SEM Tunnel**  
Spoils would be off-hauled by truck. 100% of the spoils from the tunnel excavation would be contaminated and would need to be off-hauled to a suitable treatment site.

**Question:** In many of the conditions where the DEIR states that the spoils are contaminated and will be off-hauled by truck, are those closed trucks so none of the spoils can become windborne during transit? With thousands of tons of contaminated dirt needing transporting, how do you protect the community when loading and transporting? If the load shifts and the truck tips, how is the contamination contained?

4494-9720 **Page 2.0-I-4**  
**Refined SR14: Burbank Airport Station**

Spoils can be stockpiled in an area adjacent to cut-and-cover (within station footprint), to separate the spoils volume into layers to be hauled to disposal site daily (about 20 acres available during construction within the station area footprint). 100% of the spoils from the station cut-and-cover excavation would be contaminated and would need to be off-hauled to a suitable treatment site.

**Question:** It states that the contaminated spoils would be stockpiled over a period of 5.4 years. Where does that stockpiling occur? This is where the current Avion Project is located? If so, there does not appear to be 20 available acres without demolishing this project. Also, considering the soils under this project are no doubt very contaminated since it previously was the Lockheed Skunk Works and a Superfund site, how would the contaminated dirt be "sorted" so it does not float out to the community while it is being stockpiled, a community that has Santa Ana wind conditions?

4494-9721 **Page 2.0-I-15**  
**E2: Portal 4 (Tujunga Wash)**

1 year to excavate for Portal 4, and 5.1 years to excavate for the Tunnel. The damage to this pristine area of Los Angeles would be impossible to correct. The Tujunga Wash should not be considered a transportation route. The price is just too high.

4494-9722 **Page 2.0-I-19**  
**E2A: Intermediate window at Calmat Mine**

**Question:** Where is the Calmat Mine? It doesn't show up on this map (<https://geografika.maps.arcgis.com/apps/MapJournal/index.html?appid=ccac46af003e4a2da4528b2a7595141b>), nor on Google Maps, or Google. Is this the Cal Mat Pit? Where exactly is this located?

4494-9723 **Page 2.0-I-20/ Footnote 4**

Hazardous materials would be trucked/shipped to a classified/permitted disposal site.

**Question:** Why is the hazardous materials disposal site classified? How much tonnage from SR14 (including the Burbank Airport site) do you expect to dispose of in a hazardous materials site? How are these hazardous materials disposal sites protected?

**General Questions:**

Regarding this map:  
<https://geografika.maps.arcgis.com/apps/MapJournal/index.html?appid=ccac46af003e4a2da4528b2a7595141b>

4494-9724

**Question:** Is it an adit at Little Tujunga Canyon Rd. for SR14? What is Sand Canyon Rd going to be used for? Are you closing Sand Canyon Rd near Baker St. & Abe St to Little Tujunga Canyon Rd, then closing Little Tujunga Canyon Rd to the end of the blue line on the map?

4494-9725

**Question:** The bike path along San Fernando Road has cost a great deal of money and taken a great deal of time to plan and construct. Once CHSRA demolishes the bike path, will it be rebuilt to the exact design as it was before demolition?

4494-9726

**Question:** How are we to know just what is occurring with the properties depicted in the above map in orange that are tagged as being "partial acquisition?" Is there a document that we can obtain that outlines the intent for each property as it will be dealt with by CHSRA?

4494-9727

**Question:** How are you dealing with the schools and hospitals during construction with the noise, vibration, road closures and pollution? How will their comfort and safety be assured during this long process?

4494-9728

**Question:** Who will own the properties if they are no longer needed by CHSRA? Will they be cleaned up and put up for sale, or will they be given to the community for their use?

**Electrical:**

4494-9729

**Question:** How will CHSRA protect the Angeles National Forest and other combustible elements from sparks from the catenaries, especially during high winds? (please refer to this study: <https://ietresearch.onlinelibrary.wiley.com/doi/full/10.1049/els2.12043> )

**Question:** Will the trains be stopped and the power shut down?

4494-9730

**Question:** Is the power coming from DWP and PG&E to run the trains?

- If so, how can that be considered "clean energy" which is one of CHSRA's biggest talking points? DWP's goal is to reach 100% clean energy in the year 2035, years after CHSRA intends to commence construction on this project section.
- During flex alerts, will the trains be stopped so that residential customers receive the power they need?

4494-9731

By 2035, the governor has mandated that all new cars are to be electric. If someone can drive from Los Angeles to San Francisco with 5 people in the car, isn't that a lot cheaper than 5 people buying round-trip tickets on high-speed rail? How will the cost of over \$105 billion for a high-speed train make sense in 10 to 15 years? No matter the intent of trying mightily to install public transportation, San Francisco, Palmdale and Los Angeles are still car towns, and folks still need a car when they reach their destination, whether it is a taxi, car service, or rental.

**PB 3.09 – GeoPaleo**

4494-9732

**Question:** If a large discovery is made relating to Paleontology, such as a discovery of dinosaur bones, extinct mammals, ancient civilization artifacts, etc., is HSR willing to pause the project in order to do proper retrieval/excavation, or will they reroute? This condition has occurred in countless projects around the world when building infrastructure. How will HSR handle it?

**CHAPTER 3.17: CULTURAL RESOURCES**

4494-9733

This section details the archaeological, historical (pre and modern) sites, including locations currently or potentially eligible to be included on the National Register of Historic Places (NRHP), or the California Register

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 124 of 156

4494-9733

of Historic Places (CRHP). Pre-historic sites are places that were inhabited or used by Native Americans prior to 1769 (the date of European contact). Relevant terms include APE, Area of Potential Effect, and PA, Programmatic Agreement (to be determine after the DEIR is accepted and actual work plans are determined). This document is full of acronyms, so it is necessary to refer constantly to the guide at the end of the document.

Section 106 of the National Historic Preservation Act (NHPA) contains the rules for dealing with locations of historical importance to be taken into consideration in any Federal undertaking. Apparently, the State Historic Preservation Officer, Federal Railroad Administration and Advisory Council on Historic Preservation have agreed to modify some portions of Sec. 106 as follows:

1. Exempt certain properties deemed to have little or no potential to be eligible for NRPH protection;
2. Streamline documentation if significantly altered properties that have reached 50 years of age project section and prep a Memorandum of Understanding (MOU) for each project section that may adversely affect or has the potential to affect historic properties;
3. Prepare treatment plans for Historic Built properties and Archaeologic sites that tier off the MOU.

The next few sections detail the laws, interested parties (including Native American tribes), stakeholders, etc. Many of the interested parties did not respond to HSR's letters or communications. Included were regional and local entities, county, municipal, general and community planners.

Regarding historic properties, per the DEIR, if Refined SR14 or SR14A are not in accordance with Los Angeles Zoning Code LU-6.4, CHSRA will try to mitigate building which does not conform to this section, but no promises are made. The general consensus of this section of the DEIR is "we'll figure it out as we go along." The MOU for each section will be determined by HSR.

The exact location of non-historic sites may not be revealed per Federal and State laws. The build zone along the tracks will be 150 feet on each side.

There are only one or two historic locations along the Refined SR14 and SR14A routes. Several others are scattered around the other alternative routes.

**Environmental Consequences**

Due to the unavailability of access for archaeological surveys (likely from property owners refusing access to their properties after receipt of Permit to Enter letters), these surveys will be conducted in phases (Phased Evaluation).

**Question:** If there are no surveys granted by property owners, what is CHSRA's plan as construction moves forward?

4494-9734

**No Project Alternative**

Assumes Palmdale to Burbank section will not be built. CHSRA states that long-term plans for traffic improvements will cost the state increased overtime. There is nothing in this section to support that claim. CHSRA claims that Alternate Transportations Systems would need to be developed to carry the increased population and housing/retail/school needs. There is nothing in this section to support that claim.

**Question:** Is CHSRA saying that building the High-Speed train will have a lower impact on the region than not building it?

4494-9735

MOU signatories, concurring parties, and Tribal consulting parties will meet to determine preferred treatment and mitigation archaeological resources that cannot be avoided. Construction will be halted should there be an unanticipated arch discovery. If human remains are found, CHSRA will exercise caution when encountering

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 125 of 156

4494-9735

these sites. CHSRA will develop a geospatial layer to identify locations of burial sites. There will be sensitivity mapping, and the impact should be minimal per CHSRA.

**Question:** In the event that archaeological discoveries are found, how long does CHSRA anticipate it will take to remediate the situation?

If SR14 is chosen, there will be excavation under and around the CA Aqueduct, but no temporary or permanent damage is expected.

4494-9736

Grubbing and grading. These terms are used frequently but these is no definition in the DEIR for grubbing.

**Question:** What is the definition of grubbing and grading?

**CHAPTER 3.18: REGIONAL GROWTH**

4494-9737

In the context of transportation projects, a Regional Growth Analysis (RGA) examines whether the Palmdale to Burbank project section could directly and/or indirectly cause employment or population grown that exceeds projected population and job growth in a given area.

Per the DEIR, all 6 build alternatives have similar long-term regional construction costs and ridership projections and would result in similar near and long-term growth, and would not result in substantial increased land use consumption due to long-term population growth.

Employment growth refers to temporary or permanent jobs that would be created either directly or indirectly by the HSR build alternatives during construction or operation.

Population growth is the number of residents in the RSA, which analysis presents projections out to 2040 for the 6 alternatives and the No Project Alternative.

Housing considers available units of housing under the 6 alternatives and the No Project Alternative to determine if sufficient housing is available to meet projected demand from population growth.

It must not be assumed that growth in any area is necessarily beneficial, detrimental or of little significance to the environment. HSR is a war on cars. SCAG (Southern California Association of Governments) must put funding to projects that will reduce emissions and away from those that don't.

Alternate Planning Strategy (APS) will reduce emissions, but it is not a required component of the regional transportation plan and is less likely to be implemented.

The Palmdale to Burbank Project Section is projected to take 8-9 years to complete. Considering how long this project has taken so far with no track laid, it is difficult to have a high degree of confidence in this timeline.

Long-term employment growth is projected to be 102,000 jobs with 4,900 in Los Angeles County and 49% of the jobs in the Palmdale to Burbank Project Section.

Long-term Induced population growth. For every long-term job created on the Palmdale to Burbank route, a population growth of 2.17 people is assumed. People may move to exurban communities with lower housing costs.

**Question:** The figure of 2.17 implies that the long-term jobs created by CHSRA will be provided to people who live outside the area who will be moving themselves and family members into the area in order to accept the

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 126 of 156

4494-9737 CHSRA job opportunity. What benefit is there to the local population if the jobs created by CHSRA are given to people who reside outside the county?  
**Question:** Who is building all this new housing and when?

4494-9738 City of Los Angeles population size only grew by 277,000 between 2000 and 2015.  
**Question:** What about the census results from 2020 and the effects of Covid-related population changes?

4494-9739 Overview – No Build and Build Alternatives. Future projects aren't even in the early planning stage. Impacts cannot be determined, but the DEIR says it will be in compliance with CEQA and NEPA.  
If the No Build Alternative is selected, there would be no need for outside employees to move to the region. No Build would have the lowest impact and would not cause the excessive greenhouse gas emissions that would be caused by any of the 6 alternatives.

4494-9740 HSR claims that jobs will be created in low-income communities.  
Long-Term employment impacts compare 2040 employment estimates and projections of the 6 build alternatives and the No Build Alternative. Operations & Maintenance (O&M) of each alternative would be very similar, therefore all 6 alternatives would have similar direct effects on employment. Direct, indirect and induced employment would add 500 O&M jobs in Los Angeles County.  
**Question:** Where are they getting this number?  
Total Project Induced Employment .1% over the No Build Alternative.

4494-9741 First and Last Mile Connectivity. Starts when passenger boards HSR and ends when they reach their destination (might be by bus or van). There will be no reduction in station-to-station travel time until the project is completed to Union Station. Taking Antelope Valley residents off the streets will have no appreciable effect.  
US Forest Service. There are few residences and employment opportunities on USFS lands or adjacent. Policies don't address regional employment or population growth trends on USFS lands. Regional employment and population growth would not cause inconsistencies within the National Forest Management Plans. All 6 build alternatives are considered consistent with the policies in the ANF system. As a rule, only housing for USFS employees is permitted on ANF and SGMNM lands.  
Conclusion – The population of Los Angeles County is sufficient to meet employment demand during project construction. Construction employees are not expected to move to the RSA.  
In reviewing this section, it looks like employment and population numbers will only be slightly higher, regardless of choosing one of the six alternatives or the No Build Alternative. Non HSR long-term plans will not be much higher than expected regardless of the direction chosen.  
**Questions:**

4494-9742 **3.18-11** If workers are needed from other regions and local housing is not available, where will new workers be housed?

4494-9743 **3.18-12.** Since 2023, the "Peak Year" for construction, is already upon us, and since construction is estimated to take 8-9 years, what years are now projected for construction?

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 127 of 156

4494-9744 **3.18-14** Why confine the RSA to the current DEIR regional information and at the same time predict substantial environmental changes from growth resulting from construction of the project?

4494-9745 **3.18-28** How is HSR an environmental advantage over the No Project Alternative, when the 8 – 9 year construction environmental effects for building HSR are factored in?

4494-9746 **3.18-29** Wouldn't use of High-Speed Rail, even using current figures, be cost prohibitive at \$15,800 a year for most workers taking HSR trains from Palmdale to Los Angeles?

4494-9747 **3.18-30** Although CEQA cannot affect housing that has not been built, the growth cited as a result of housing needs connected with HSR use could indirectly affect the environment. How can those effects be ignored when future train use and operation is being counted?

**CHAPTER 4**

**CHAPTER 4: SECTION 4(F) AND 6(F) EVALUATIONS  
SUMMARIZES IMPACTS TO PARKS, WILDLIFE REFUGES, AND HISTORIC PROPERTIES  
IN ACCORDANCE WITH SECTION 4(F) OF THE DEPARTMENT OF  
TRANSPORTATION ACT OF 1966 AND SECTION 6(F) OF  
THE LAND AND WATER CONSERVATION FUND ACT**

4494-9748 Under Section 4(f), an operating administration of the U.S. Department of Transportation may not approve a project that uses protected resources, unless one of the following conditions is met:

- There is a finding of *de minimis* impact for use of a resource; or
- If there are no prudent or feasible alternatives to such use, and the project includes all possible planning to minimize harm to such resources.

**Question:** CHSRA previously considered numerous other alignments to connect the Palmdale and Burbank Stations, but eliminated them from consideration for political reasons (i.e., not geotechnical reasons). Given that there exist numerous prudent and feasible alternatives, why should the U.S. DOT approve the high-speed rail project?

4494-9749 On Page 4-2 of the DEIR, CHSRA states that it, "proposes to classify identified property uses as *de minimis*; therefore, further analysis of feasible and prudent Build Alternatives and measures to minimize harm and a least harm analysis have not been prepared."

**What is a de minimis impact?**

The Illinois Department of Transportation defines it as follows: "A *de minimis* impact means that the activities, features, or attributes of the property under protection of section 4(f) (for this project, Pyramid Park) will not be adversely affected by the transportation project."<sup>110</sup>

The U.S. Department of Transportation Federal Highway Administration defines *de minimis* as follows: "For publicly owned public parks, recreation areas, and wildlife and waterfowl refuges, a *de minimis* impact is one that will not adversely affect the activities, features, or attributes of the Section 4(f) property."<sup>111</sup>

**Question:** Given that at least portions of the Angeles National Forest, the San Gabriel Mountains National Monument, the Pacific Crest Trail, the Rim of the Valley Trail Extension, and the Hansen Dam Open Space

<sup>110</sup> [https://idot.illinois.gov/Assets/uploads/files/IDOT-Projects/District-9/IL-37-to-IL-148/Section%204\(f\).pdf](https://idot.illinois.gov/Assets/uploads/files/IDOT-Projects/District-9/IL-37-to-IL-148/Section%204(f).pdf)

November 30, 2022  
Page 128 of 156

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 129 of 156

4494-9749 qualify as properties under the protection of Section 4(f), how can CHSRA state that it will not adversely affect these resources? CHSRA has proposed myriad mitigation measures in order to offset the adverse effects that it will be causing to these resources.

4494-9750 On Page 4-3 of the DEIR, CHSRA states that it is released the following draft Section 4(f) statement for comment pursuant to 3 U.S.C. 237, 23 C.F.R. Part 774, and the NEPA Assignment MOU:

The Authority may not approve the use of a Section 4(f) property, as described in 49 U.S.C. 303(c), unless it determines that **there is no feasible and prudent alternative to avoid the use of the property** and the action includes all possible planning to minimize harm resulting from such use, or the project has a *de minimis* impact consistent with the requirements of 49 U.S.C. 303(d) (see Section 4.1.4.4 for a definition of *de minimis* impacts). An alternative is not feasible if it cannot be built as a matter of sound engineering judgment. In determining whether an alternative is prudent, the Authority may consider if the alternative would result in any of the following:

- i. The alternative does not meet the project's stated Purpose and Need;
- ii. The alternative would entail unacceptable safety or operational problems;
- iii. After reasonable mitigation, the alternative would result in severe social, economic, or environmental impacts; severe disruption to established communities; severe disproportionate impacts on minority or low-income populations; or severe impacts on environmental resources protected under other federal statutes;
- iv. The alternative would require additional construction, maintenance, or operational costs of an extraordinary magnitude;
- v. The alternative would pose other unique problems or unusual factors;
- vi. The project would entail multiple factors that, while individually minor, cumulatively cause unique problems or impacts of extraordinary magnitude.

**Question:** As stated previously, CHSRA considered, studied, and rejected numerous alignments. Under what reasoning can CHSRA conclude that there is no feasible and prudent alternative to avoid the use of Section 4(f) properties?

**Question:** Considering the six Build Alternatives CHSRA has presented in the DEIR, each of the six entails unacceptable safety and operational problems due to crossing numerous faults in a tunnel. The magnitude of these problems has not been sufficiently studied, as CHSRA has placed the burden of such research on contractors yet to be hired. Using its own guideline (ii) as set forth above, how can CHSRA not eliminate the six Build Alternatives from consideration?

**Question:** Considering the previous examinations of the impacts on the Angeles National Forest, the San Gabriel Mountains National Monument, the Pacific Crest Trail, the Rim of the Valley Trail Extension, and the Hansen Dam Open Space, it follows that the six Build Alternatives will cause severe impacts on environmental resources protected under other federal statutes. Using its own guideline (iii) as set forth above, how can CHSRA not eliminate the six Build Alternatives from consideration?

**Question:** Considering that the costs of tunneling through the San Gabriel Mountains are multiple times the cost of building a train system at grade to follow existing freeways, each of the six Build Alternatives would require additional construction costs of an extraordinary magnitude. Using its own guideline (iv) as set forth above, how can CHSRA not eliminate the six Build Alternatives from consideration?

**Question:** Considering the cumulative impacts of the six Build Alignments as detailed in 7,000 pages of this DEIR, the project cumulatively causes impacts of extraordinary magnitude. Using its own guideline (vi) as set forth above, how can CHSRA not eliminate the six Build Alternatives from consideration?

4494-9751 In a footnote on Page 4-3 of the DEIR, CHSRA states that:

4494-9751 "The Authority cannot make any determination that an action constitutes a constructive use of a publicly owned park, public recreation area, wildlife refuge, waterfowl refuge, or historic site under Section 4(f) without first consulting with FRA and obtaining FRA's views on such determination. Thus, any determinations of a constructive use by the Authority would be preliminary only. The Authority will provide FRA written notice of any proposed constructive use determination, and FRA will have thirty (30) calendar days to review and provide comment. If FRA objects to the constructive use determination, the Authority will not proceed with the determination."

**Question:** What is a constructive use?

According to 23 Code of Federal Regulation § 774.15 (Constructive Use Determinations):

"A constructive use occurs when the transportation project does not incorporate land from a Section 4(f) property, but the project's proximity impacts are so severe that the protected activities, features, or attributes that qualify the property for protection under Section 4(f) are substantially impaired. Substantial impairment occurs only when the protected activities, features, or attributes of the property are substantially diminished."

Although CHSRA has presented justifications as to why certain sections of the Angeles National Forest, the San Gabriel Mountains National Monument, the Pacific Crest Trail, the Rim of the Valley Trail Extension, and the Hansen Dam Open Space do not qualify for Section 4(f) protection, surely these areas then fall under the category of constructive use.

4494-9752 **Question:** Given the six Build Alternatives and CHSRA's evaluation of the various resources as being applicable or not applicable for protection under Section 4(f), in what locations does CHSRA intend to notify the FRA of proposed constructive use determinations?

4494-9753 On Page 4-4 of the DEIR, CHSRA explains that, "the FRA must also compare the alternatives to determine which alternative has the potential to cause the least overall harm in light of the preservationist purpose of the statute."

**Question:** Given that the No Project Alternative is the only one of the seven alternatives studied in the DEIR that will NOT cause harm to Section 4(f) resources, on what grounds would the FRA select any of the six Build Alternatives instead of selecting the No Project Alternative?

4494-9754 On Page 4-45 of the DEIR, CHSRA lays out its rationale for why it believes the majority of the Angeles National Forest should not qualify for protection under Section 4(f). Table 4-3 summarizes the Land Use Categories within the ANF and whether or not certain Land Uses are suitable or not suitable within each Category. Table 4-3, reviewed in conjunction with CHSRA's rationale on Page 4-45, highlights CHSRA's hypocrisy with respect to land use.

On Page 4-45, CHSRA asserts that because Back Country/Motorized Use Restricted zones and Back-Country/Non-Motorized zones allow for "communication sites by exception," they would not qualify for protection under Section 4(f). Table 4-3 demonstrates that in both Back Country/Motorized Use Restricted zones and Back Country/Non-Motorized zones, Major Transportation Corridors are NOT SUITABLE. Additionally, the USFS has determined that Back-Country/Non-Motorized zones are also NOT SUITABLE for the following land uses: Major Utility Corridors, Road Construction, and Developed Facilities.

Figure 4-7 is an overlay map that demonstrates the six Build Alternatives and their geographical relation to the various Land Use Categories within the ANF and the Monument. The six Build Alternatives go through many Land Use Categories, including Back Country/Non-Motorized and Back Country/Motorized Use Restricted.

Page 130 of 156

4494-9754

**Question:** If CHSRA is relying on the designations set forth in Table 4-3 as a rationalization for why major portions of the Forest are not protected under Section 4(f), by the same logic, shouldn't the high-speed rail system not be permitted within the Forest as the six Build Alternatives each go through the two Back Country zones which do not permit transportation corridors as an acceptable land use?

4494-9755

Beginning on Page 4-75 of the DEIR, CHSRA catalogues the various Section 4(f) resources and sets forth its rationale for concluding that both Permanent Use (i.e., when a portion of the resource will be permanently incorporated into a transportation project) and Temporary Occupancy (i.e., the resource will only be impacted during a temporary period of time, such as during construction) of these resources is *de minimis*.

At the outset of these evaluations, it is worth noting that we do not believe that any of the CHSRA proposed uses qualify as "Temporary Occupancy." Per CHSRA's definition as set forth in Section 4.1.4.2 of the DEIR:

A temporary occupancy of a Section 4(f) resource occurs when a Section 4(f) property is required for construction-related activities. Temporary occupancy would be considered use if the property is not permanently incorporated into a transportation facility, but the activity is considered adverse in terms of the preservationist purposes of the Section 4(f) statute. However, a temporary occupancy of property does not constitute a use of a Section 4(f) resource when the following conditions are satisfied:

- i. The occupancy must be of temporary duration (i.e., shorter than the period of construction) and must not involve a change in ownership of the property.
- ii. The scope of work must be minor, with only minimal changes to the protected resource.
- iii. There must be no permanent adverse physical impacts on the protected resource or temporary or permanent interference with activities or purpose of the resource.
- iv. The property being used must be fully restored to a condition that is at least as good as existed before project construction.
- v. There must be documented agreement of the appropriate OWJ over the resource regarding the foregoing requirements.

Given that CHSRA proposes to construct the largest infrastructure project in the State of California (and one of the largest in the United States), it is not reasonable for CHSRA to assert that its scope of work will be minor, with only minimal changes to the protected resource. In this DEIR, CHSRA includes thousands of pages of proposed mitigation measures intended to address the vast scope of changes/impacts that will be inflicted on the Section 4(f) resources.

**Question:** Given the foregoing, how can CHSRA assert that any of its uses qualify as Temporary Occupancy of Section 4(f) resources?

4494-9756

In evaluating the resources, it is worth restating the definition of *de minimis*:

A *de minimis* impact means that the activities, features, or attributes of the property under protection of section 4(f) (for this project, Pyramid Park) **will not be adversely affected by the transportation project.**<sup>112</sup>

On Page 4-75 of the DEIR, CHSRA describes the impacts/changes to the Pacific Crest Trail. Figure 4-21 shows the geographical relation of the Build Alternatives vis a vis the proposed realignment of the Pacific Crest Trail as well as the existing Pacific Crest Trail. In both cases, the Build Alignments introduce significant infrastructure that literally crosses the Pacific Crest Trail – specifically, an elevated/aerial structure which will carry a high-speed train, which hikers will presumably have to cross underneath in order to continue on the

<sup>112</sup> [https://idot.illinois.gov/Assets/uploads/files/IDOT-Projects/District-9/IL-37-to-IL-148/Section%204\(f\).pdf](https://idot.illinois.gov/Assets/uploads/files/IDOT-Projects/District-9/IL-37-to-IL-148/Section%204(f).pdf)

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 131 of 156

4494-9756

trail. This infrastructure represents a change in character to the portion of the project in proximity to the train. Yet somehow, CHSRA concludes that its Permanent Use of the Pacific Crest Trail is *de minimis*.

**Question:** How can the introduction of major infrastructure crossing the Pacific Crest Trail not be considered an adverse effect?

4494-9757

On Page 4-78, CHSRA describes its uses of the San Gabriel Mountains National Monument, including: an at-grade covered tunnel and portal which would be constructed within the Monument boundary (in/around the Vulcan Mine); construction activities, grading, utility installation, and roadway work (in/around Aliso Canyon); the construction of tunnel portals along with an elevated viaduct across the creek (in/around Aliso Canyon). CHSRA has concluded that the impacts on the Monument are *de minimis* on the grounds that effects, "would not substantially change the attributes or functions of the SGMNM."

Again, CHSRA is relying on the sheer acreage of the Monument and of the Forest to claim that because its activities are limited to a small percentage of acreage of the total, its impacts are *de minimis*.

**Question:** What would be the reasoning why the Officials with Jurisdiction for each resource should not consider impacts to the area immediately affected by the high-speed rail (i.e., the resource study area) as opposed to considering impacts to the entirety of the Monument and/or the ANF?

4494-9758

In Figures 4-22 and 4-23, CHSRA sets forth the following temporary and permanent improvements that would be constructed as part of its Build Alignments within the ANF and/or the Monument:

1. Permanent adit(s) within the ANF boundary
2. Construction staging area(s) ranging from 28-33 acres associated with the adit(s)
3. Permanent utility easements and the installation of overhead utility lines and electrical utility poles
4. Temporary water lines
5. Permanent ventilation/access building

CHSRA has again concluded that its impacts are *de minimis*. One factor is the categorization of areas within the ANF as not qualifying for protection under Section 4(f). The problem with this determination is that CHSRA's infrastructure elements are inextricably linked. CHSRA's tunnels all go through areas that qualify for Section 4(f) protection. Those tunnels necessitate infrastructure, which CHSRA has intentionally placed either at the borders of protected areas or immediately outside the borders of protected areas. At minimum, this would place those areas under the jurisdiction for protection under Constructive Use.

**Question:** When considering impacts within Section 4(f) resources, if the high-speed train tunnels through a Section 4(f) resource, shouldn't the Officials with Jurisdiction also consider the related infrastructure when determining whether or not an impact is *de minimis*?

4494-9759

On Page 4-92 of the DEIR, CHSRA addresses Temporary Occupancy of the Rim of the Valley Trail (Proposed Extension). Impacts include the following:

1. Two temporary construction areas of approximately 500 feet and 250 feet; and
2. A temporary construction area of approximately 23 acres; noting that
3. All six Build Alternatives would require construction activities adjacent to and within segments of the Trail extension.

CHSRA goes on to say that: "For the purposes of Section 4(f), such temporary occupancy of a Section 4(f) resource does not constitute use if each of the five conditions listed in 23 C.F.R. 774.13(d) are met (listed in Section 4.1.4.2)."

The second of the five conditions is as follows: "ii. The scope of work must be minor, with only minimal changes to the protected resource."

Page 133 of 156

4494-9759

On Page 4-92, CHSRA somehow maintains that the scope of work in proximity to the Rim of the Valley Trail Extension is minor. Construction staging areas occupying >20 acres, combined with construction activities generating noise, dust, vibration, etc. for a period of 7 or more years cannot be considered "minor" according to any reasonable evaluation.

**Question:** On what grounds should the Officials with Jurisdiction conclude that the five conditions listed in 23 C.F.R. 774.13 have been met, when any reasonable person would conclude that CHSRA has failed to meet the second of the five conditions?

4494-9760

On Page 4-93 of the DEIR, CHSRA asserts that its Permanent Use of the Hansen Dam Open Space area would be *de minimis*. CHSRA's justification for this decision is comprised of the following factors: (i) CHSRA will be permanently taking "only" 13 acres of the resource; despite visual and noise-related impacts from the elevated viaduct structure, the open space would "remain open and available to the public."

As explained in our evaluation of Chapter 3.15, equestrians (both those utilizing the trail system and those utilizing the Hansen Dam Horse Park) will be significantly impacted by the introduction of an elevated structure carrying a high-speed train – to the point that we expect use of these facilities to decrease, both during construction and operation of the train.

**Question:** Recalling that a *de minimis* impact means that, "the activities, features, or attributes of the property under protection of section 4(f) will not be adversely affected by the transportation project," how can CHSRA claim that (i) the taking of 13 acres of land is not an adverse impact; and (ii) the ability of the resource to be utilized and enjoyed by equestrians will not be adversely impacted?

**CHAPTER 5**

**CHAPTER 5 AND APPENDIX 5-A: ENVIRONMENTAL JUSTICE**

4494-9761

"Minority includes persons who are American Indian, Alaskan Native, Asian, Black or African American, Hispanic or Latino, Native Hawaiian and Other Pacific Islander and other individuals who are one other or two or more races." Low Income constitutes "a person whose median household income is at or below the Department of Health and Human Services' poverty guidelines." General Plans of areas involved date from 1993 (Palmdale) to 2035 (Burbank). After reviewing 10 plans and 20 policies, the Authority found only health impacts, displacement and unavailable replacement units in L.A. City inconsistent with requirements.

Census block groups with the highest minority populations include Sylmar, Pacoima, and Sun Valley for the SR14, 14A, E1A, and E1 routes while E2 and E2 A have fewer EJ residents. Lake View Terrace has two low-income census groups. Census block groups are defined as EJ or non-EJ blocks. Census figures are used from 2010-2014 instead of 2020 figures.

The case against the No Project Alternative argues that by 2040 other projects requiring environmental authentication would have been built in the RSA. These unknown projects could have negative effects upon citizens. Meanwhile, the only adverse effects upon Environmental Justice communities in the Build Alternatives would be from transporting spoils, displacements of businesses aesthetics and visual quality and, in several cases, community cohesion.

Chapter 5 proceeds to skim through most of the Chapter 3 sections with each of the Build Alternatives and a statement at the end of each: "Construction of each of the six Build Alternatives would not result in any adverse fill in blank (hydrology and water resources, hazardous materials and waste, safety and security, Parks, Recreation, and Open Space, Cultural Resources) effects." Since mitigations from these areas would be implemented, there would be no effects. Because there is a plan, there is an assumption that there would be

4494-9761

no adverse results. Most business displacements (70-80%) would take place in environmental justice communities. Many Pacoima and Sun Valley environmental justice displaced businesses would need to relocate out of their area. Much of this is also covered in Section 3.12: Socioeconomics and communities. Only one EJ community in Lake View Terrace would lose cohesion. There are permanent adverse Aesthetic and Visual effects in all six Build Alternatives. Adverse effects in EJ and non-EJ communities vary from four in the SR14 to eight in E2A. There would be adverse cumulative effects from spoils hauling for all Build Alternatives.

The High-Speed Rail Authority would see that EJ workers receive training through union programs and public assistance. 30% of construction dollars would come to small businesses. Resource topics with adverse effects on EJ communities are summarized with mitigation solutions: transportation (provide a management plan, widen intersections, provide turn lanes), air quality and global climate change (future reduction of intercity trips), safety and security (signals and ATC systems), and socio/economics (job training).

Despite the mitigation attempts, the Authority states that they have preliminarily concluded that, "...even after applying these measures, there remains a disproportionately high and adverse effect on minority and/or low-income populations from business displacements (all six Build Alternatives), and community cohesion (E2, and E2A Build Alternatives)."

**Questions:**

Page 5-14

If "All determinations are preliminary and subject to revision after any new information, public comment, or EJ input received after the release of the Draft EIR/EIS" as stated is correct, then how is the EIR/EIS to become final? How is the public to continue to provide more input?

Page 5-15

If "meetings have already been held "with representatives affecting the low-income population along the Build Alternatives, when, where, and with whom were those meetings conducted?"

Page 5-41

How many meetings that included low-income residents took place since 2014? Specifically what outreach efforts have taken place in EJ communities since 2019? How many of these meetings have been in-person as opposed to virtual meetings?

Page 5-48

Although the document references six meetings taking place in 2019 in six different areas, has any additional personal contact occurred since the DEIR became public?

5.7.1

How can suppositions about the No Project Alternative be made about the unknown?

Page 5.50

Where in the No Project Alternative RSA would there be population growth when there is lack of land for moving displaced people with the other Build Alternatives?

5.7.1.3

Considering the anticipated high-speed noise and vibration during the 8-9 years of construction that could impact low-income RSA with traffic carrying spoils on the 5 Freeway and then later noise and vibration at grade from trains in operation, how can the No Project Alternative be more problematic?

5.50

What specific projects affecting EJ are expected with the No Project Alternative? Are the projects purely speculative?

5.51

Considering the goal of California vehicles to be electric by 2035, how would traffic likely to be different from that predicted from each of the six Build Alternatives?

4494-9767	5.7.1.5	How would water resources, drainage, erosion, and storm water run-off for any future development for the No Project Alternative compare to water used for construction in Build alternatives?	4494-9780	5.7.2.6	Where will hazardous materials be stored? At what point during construction will hazardous waste be identified? What is the State threshold for hazardous substances in the Health and Safety Code?
4494-9768	Page 5-51	What hazardous materials could be used for development affecting the No Project Alternative by 2040 in the RSA? Given the limited space for rebuilding for displaced businesses, how could a quantity of possible No Project Alternative materials compare with high-speed rail construction? What specific "lands with existing environmental concerns" are present in the area?	4494-9781		What kinds of hazardous substances could arise during operation?
4494-9769	Page 5-52	The DEIR states, "Given that extensive tunneling would likely not be required, the No Project Alternative would be unlikely to generate similar quantities of hazardous spoils." Could this statement be an argument in favor of the No Project Alternative?	4494-9782	Page 5-66	What kinds of injuries/deaths have occurred during construction so far?
4494-9770	5.7.1.7	What are the current delays in emergency responders that would continue with the No Project Alternative?			What are examples of accidents possible during tunnel construction?
4494-9771	5.7.1.8	According to the 3.12 Socio/Economic of the DEIR, several communities would become divided. What evidence is there that this would happen with the No Project Alternative?		Page 5-67	Is Valley Fever airborne? If so, how far could it be carried, especially during Santa Ana winds? How are workers protected from Valley Fever? How many workers have gotten Valley Fever during High-Speed Rail construction? How can residents and facilities more than 0.25 mile avoid Valley Fever?
4494-9772	5.7.1.11	What are examples of proposed projects for the No Project Alternative?			Will there be detours on the 14, 5, or 210 Freeways?
4494-9773	Page 5-55	What effect will extra lanes in roads and added quantity of trucks have upon the roads themselves? What kinds of repairs will likely be needed as a result of weighted truck traffic?	4494-9783	Page 5-68	Since wildfire, earthquakes, flood, and landslides are considered local, how will the Authority be interfacing with local regions during emergencies?
4494-9774	Page 5-56-61	What are several specific examples from several block groups with EJ population where roadwork affected by high-speed train spoils would change traffic circulation as opposed to the No Project Alternative? How temporary would these spoils-related traffic effects be?	4494-9784	Page 5-72	Is there any special funding to assist displaced businesses who fall in the EJ category?
4494-9775	Page 5-62	Do pollution offsets purchased through the Cap & Trade program by the Authority decrease pollution affecting the local population? If offsets are not available, what difference does that make as far as air quality is concerned?	4494-9785	Page 5-77	Would the Community Benefits Agreement be geared at all to EJ job seekers? How would it work? Are there other programs to help EJ displaced workers?
4494-9776	Page 5-63	Does a fugitive dust plan further deplete California's water resources? Will trucks be powered by batteries rather than gas to reduce air pollution? How realistic is utilizing this new technology of EV trucks since it's unknown if contractors will be able to purchase a large enough fleet?	4494-9786	Page 5-78	Where would the new jobholders of "5,400 direct, indirect, and induced jobs in Los Angeles County" live?
4494-9777	Page 5-64	How can truck traffic be routed away from residential streets? What are at least 5 examples from 5 different neighborhoods? For how many years will noise and vibration persist during construction? How will workers be protected from noise and vibration?	4494-9787	Page 5-86	What is a "trail facilities plan?" What are examples of "permanent changes" to parks?
		During operation what "further analysis" of from N&V-MM#6 might be made for validity? If mitigations are in place, yet are not meeting federal and state regulations, what will follow for public protection? How can a contractor know the effectiveness of mitigations before production?	4494-9788	Page 5-87	If adverse effects to parks are not sufficiently mitigated and new parks are necessary, who will locate land and pay for new parks?
4494-9778	5-7.2.4	Would people with medical implants and equipment be screened in the same manner as airline screening?	4494-9789	Page 5-88	What makes a "physical change severe?" Wouldn't viewers' "sensitivities" vary?
4494-9779	Page 5-65	Where will groundwater basins be constructed? Have floodplains been identified? How many replacement groundwater recharge areas will be provided? How much water will be used for the tunnel construction?	4494-9790	Page 5-93	In addition to architectural resources with history, could cultural objects be found during excavation? If so, how will they be recognized and preserved? In addition to noise and vibration effects on the Blum Ranch farmhouse, how would produce farmed on the property be affected?
			4494-9791		Stating that because displacement, visual effects, and loss of community cohesion, which are adverse effects, are localized and not seen in "foreseeable projects," discounts their importance and severity. How can that thinking be justified?
					If a "disproportionately high and adverse" effect can be addressed further in the final EIR, why can it not be addressed in the draft version? What further mitigation measures are possible?
					How is it possible to predict future transportation needs without knowing and taking into consideration current Los Angeles City light rail and Metrolink plans for the northeast San Fernando Valley?

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 137 of 156

4494-9792	<b>Page 5-96</b>	What are several specific examples of how local intercity vehicle trips would be reduced along freeways through the High-Speed Rail system, especially with commuter traffic with destinations other than High-Speed Rail stations?	4494-9804		Tables using 2010-2014 census figures give demographics, age, population, Limited English Proficiency, linguistic isolation, and median household income are given for each Build Alternative. A list containing national, state, and/or County and City organizations that serve Environmental Justice communities follows with the statement that they will be "regularly tracked." An Outreach Team is to coordinate community events, take notes, and share feedback.
4494-9793		To what extent can anyone predict real ridership of High-Speed trains, keeping in account needed destinations and ridership costs?			
4494-9794		How would EJ communities in Sun Valley, especially those being displaced, benefit from the Burbank Airport Station?	4494-9805	<b>Questions:</b>	
4494-9795		Where specifically would training for new workers take place? After training, how long might a specific job last?		<b>5-A-2</b>	Beginning with 2016 and continuing through 2022, what specific dates and locations involved low income and EJ populations, including meeting community organizations; publishing information in local newspapers; contacting religious leaders and business groups?
4494-9796		What construction packages were awarded in 2013? How many EJ workers were hired? How many workers does a contractor of a construction package oversee?			What was the attendance at each meeting?
4494-9797	<b>Page 5-97</b>	How many years would spoils-related traffic continue through construction?			What additional groups were then contacted as a result of the above meetings?
4494-9798	<b>Page 5-98</b>	Since new locations for EJ displaced business can't be mitigated and workers from the area are to be trained for jobs, where can former businesses and training be found?			Should this outreach not have already occurred before drafting an EIR that chooses a final route?
4494-9799		How will the Authority advertise SO-MM#2 to receive input from residents in Lake View Terrace who have lost community cohesion?			Who conducts these meetings?
4494-9800	<b>Page 5-99</b>	Mitigations for aesthetic impairment suggest planting, screening stations and towers, and minimizing noise. Who would be responsible for permanent preservation and upkeep of plants? What materials would be provided for screening stations and towers? How would the screens be protected from graffiti? What noise, in particular, would need minimizing? Would it come from train operation as well as construction?	4494-9806	<b>5-A-3</b>	Is there a list of documents to be prepared? What is on the list?
4494-9801		Does saying that adverse, unmitigable effects affect both EJ and non-EJ groups suggest that these effects are less adverse?	4494-9807	<b>5-A-6</b>	What part in the decision-making process do EJ participants have?
4494-9802	<b>Page 5-101</b>	Should the DEIR be subject to change also due to population changes in the years between dates used for the DEIR and actual construction, especially since these dates may differ more than 10 years in addition to climate changes?	4494-9808	<b>5-A-9</b>	How does the decision-making work?
4494-9803		How much current congestion is caused by traffic between Palmdale and Burbank?	4494-9809	<b>5-A-12</b>	How can communities be engaged in changing air quality?
<b>APPENDIX 5-A: ENVIRONMENTAL JUSTICE OUTREACH PLAN</b>					
4494-9804		As required by Title VI of the amended Civil Rights Act of 1964 and Executive Order 12898, "each Federal agency shall make achieving EJ part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States." In response, the Authority states that it, "recognizes how important provisions of existing environmental, civil rights, civil, and criminal laws may be used to help reduce environmental impacts in all communities and environmental justice on the human element. The Authority has included environmental justice considerations in its planning for the statewide high-speed rail system since 2000, when it commenced a programmatic environmental review process." (California High-Speed Rail Authority, Title VI Annual Accomplishments Report, 2015). Under Executive Order 13166 (August 11, 2000) services must be provided to Limited English speakers.	4494-9810	<b>5-A-15</b>	What are examples of "tools, training, and resources" that CHSRA is using with LEP people?
			4494-9811	<b>5-A-16</b>	If "Many of these communities are experiencing rapid change," why is the DEIR using census figures from 2010-2014 when census data from 2020 is available in 2022?
					What area are the L. A. City figures encompassing? Shouldn't they be for the area along each Build Alternative?
					What is meant by "tracked and updated to the master Project Section database?" Is each organization to be contacted, or is it just part of a list? Will representatives from the Authority bring the groups to the community affected and, if so, at what point in the build process will this occur?
					What is expected from the list of organizations? What kinds of services are the EJ communities most likely to need? Which organizations do not look useful for the residents in each EJ Build Alternative?
					At what point in the construction process will EJ residents be informed of meetings?
					Where will meetings occur?
					What are examples of feedback expected from them?

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 139 of 156

4494-9811

What specifically EJ advocacy groups will be contacted? What is expected from them?  
How can activities be included in the DEIR with its current deadline of 12/1/22?  
Is there a specific Dept. of Justice guideline intended to be used?

4494-9812

5-A-17

Will directors be documenting attendance at gatherings? Is there a percentage of the populace that is considered healthy for attendance levels?

What methods would be used for follow-through? Are there examples from previous High-Speed Rail interfacing in other areas?

In reality, how many meetings might actually occur? Will construction have begun before these meetings take place?

5-A-19

How much advance notice will EJ communities receive before meetings?

Will schools be used for meetings?

How many translators will be at meetings?

Will residents be able to meet in small groups to express opinions?

Will contractors be present?

How will the summaries be used?

What is an example of a Project Section milestone?

Will attendees at meetings be personally notified before subsequent meetings?

4494-9813

5-A-20

How well attended and successful have webinars been in the past with EJ groups?

4494-9814

To what extent is the Authority aware of Native American locations of importance, in particular near Little Tujunga Road, for example?

4494-9815

How will contractors instruct workers to recognize artifacts from Native tribes during digging?

4494-9816

How often will Titleholder Working Group meetings be held?

4494-9817

How well has this system worked in other HSR areas, the Central Valley, for example? What has been learned from previous meetings there?

**CHAPTER 6**

**CHAPTER 6: PROJECT COSTS AND OPERATIONS  
APPENDIX 6-A: HIGH-SPEED RAIL OPERATING AND MAINTENANCE COST FOR USE IN EIR/EIS  
PROJECT-LEVEL ANALYSIS**

**Capital Costs**

There are a multitude of problems with this document, the most pervasive being CHSRA's use of different years' estimates ranging from 2015 to 2018. This is further exacerbated by their inconsistent use of stated year versus a "year of expenditure" year. For example, if 2018 is listed, that means the estimate is in 2018 dollars as if it were to be constructed in 2018. 2018\$YOE means that the cost includes estimated cost escalations and inflation. The DEIR sometimes uses the year and sometimes uses the YOE, so that it's profoundly difficult to compare apples to apples.

Although the most recent business plan was approved for 2022, no current estimates are used from this latest business plan. Instead, the Authority relies on stale numbers which do not include inflation at the highest rate in decades due to the pandemic's effect on supply chain problems. In addition, the cost of fuel is at its highest point in recent history, and fuel cost is the main driver of price increases across-the-board. 2018, the most recent year for any projection contained in the DEIR, was an entire year prior to the pandemic that threw the entire world into economic chaos which is still being experienced worldwide today. Russia's ongoing war on Ukraine is disrupting the global energy market, resulting in worldwide inflation with an unknown outcome. These drivers alone will increase the capital cost if and when the project is built.

If confronted with this obvious outdated estimate, CHSRA will state that they will rely on their contingencies contained in each cost category to allegedly remedy escalations or inflationary components. However, their contingencies range from 10% to 25%, which as we know today, will probably not be sufficient. Currently, annual inflation is nearly 10% -- in just one year. With no relief from escalating oil prices due to the Russian invasion of Ukraine and OPEC's cut in oil production, compounded inflation will probably be an issue for the next few years.

On page 1, this section states:

*"The sections below discuss both capital costs and O&M costs estimating methodology, assumptions, and costs. Additionally, vehicle and O&M<sup>113</sup> costs are based on the Authority's 2016 Business Plan for consistency with the environmental impact analysis."*

A footnote states there were few changes from the 2016 business plan compared to the 2018 and the 2020 business plans. But what about the 2022 business plan? The DEIR should rely on the latest available data, especially financial, for a DEIR which, when approved, will govern the project in its entirety. The lack of effort in updating the DEIR with the most updated information is a symptom of being lazy or deceitful or possibly both, especially in light of the fact that this project will be one of the most, if not the most, expensive infrastructure project in the history of the United States.

Depending on the cost category, CHSRA cherry picks which financial data they use. For example, O&M utilizes 2016 data, while just a few pages later, 2018 dollars are used for capital expenditures.

<sup>113</sup> O&M means operations and maintenance and are not part of the capital costs

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

4494-9818

There are three components of costs for this project:

1. Construction-Capital costs
2. Operations and Maintenance-Long term, ongoing costs
3. Finance charges

Table 6-1 Estimated Capital Costs of the Palmdale to Burbank Project Section Build Alternatives (2018\$ in millions)

Authority Cost Category	Revised SR14 Build Alternative	SR14A Build Alternative	E1 Build Alternative	E1A Build Alternative	E2 Build Alternative	E2A Build Alternative
10 Track structures and track	\$12,723	\$13,588	\$13,267	\$13,887	\$13,525	\$14,068
20 Stations, terminal, intermodal <sup>1,2</sup>	\$566	\$560	\$573	\$637	\$661	\$674
30 Support facilities yards, shops, administration buildings <sup>3</sup>	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable
40 Sidewalk, right-of-way, land, existing improvements	\$4,846	\$5,472	\$4,459	\$4,897	\$4,874	\$4,139
50 Communications and signaling	\$175	\$189	\$173	\$182	\$184	\$159
80 Electric traction	\$249	\$256	\$297	\$238	\$213	\$214
70 Vehicles	Considered a systemwide cost and not included as part of the Build Alternatives within individual project sections					
80 Professional services	\$2,950	\$3,189	\$2,985	\$3,110	\$3,036	\$3,138
90 Unallocated contingency <sup>4</sup>	\$801	\$861	\$803	\$834	\$799	\$824
100 Finance charges	Estimate to be developed prior to project construction.					
<b>Total<sup>5</sup></b>	<b>\$22,400</b>	<b>\$24,075</b>	<b>\$22,467</b>	<b>\$23,370</b>	<b>\$22,473</b>	<b>\$23,184</b>

The total of \$24,075 in 2018\$ (not YOY) in Table 6-1 is more than the 2020 and 2022 YOY \$16,775 in Table 22 below (from the 2022 Business Plan Capital Cost Basis of Estimate).

Table 22 Palmdale to Burbank Cost Estimate

Palmdale to Burbank	2020 Business Plan (YOY\$, Millions)	2022 Business Plan (YOY\$, Millions)
<b>TOTAL:</b>	<b>16,775</b>	<b>16,775</b>

**Question:** How can the 2018 cost be more than the Year of Expenditure 2022? (since the YOY should be higher because it includes inflation and escalations.)

Page 141 of 156

4494-9819

Chapter 6 and its appendices address only the capital costs and exclude finance charges. It can be argued that finance charges are indeed a component of capital costs and must be included in the total. When one takes out a vehicle loan, the finance charges are a line item, and are definitely part of the total liability. They cannot simply be excluded. For example, the \$9.95 billion bond liability alone will generate interest charges of around \$9.5 billion, bringing the total for principal and interest to \$19.9 billion.

Another mind-boggling exclusion from capital costs are:

*"Support facilities associated with the project, including equipment yards, shops, and administration buildings, are **not included** in the capital cost estimates."* (Emphasis added.)

We do know that Business Plans exclude finance charges, so the \$105 billion budget (originally \$33 billion in 2008) is grossly understated. If a station is included in project section EIRs (which they are), then equipment yards, shops, and administration buildings within each project section should also be included.

**Question:** Why are these equipment yards, shops, and administration buildings excluded?

**Question:** Does that mean that the \$105 billion is project cost contained in the 2022 Business Plan is understated?

**Question:** Are those costs excluded from project sections and included in another budget similar to the rolling train stock?

**Question:** What else is excluded?

4494-9820

CHSRA's numbers are suspect. They pick and choose which year(s) to include in the DEIR thinking that no one will check. Then, they mix that confusion with excluding billions in real, tangible costs from the overall budget. In some documents, they use 2029 as a Phase I operational base year. In others they use 2033 as a Phase 1 operational base year. Because of the mountain of delays of this project, 2033 (another published year) is likely the most accurate base year. Further, their use of dollars in a stated year in one document, and then using the Year of Expenditure in another document is inconsistent and confusing.

**Question:** Why did CHSRA not bother to use the most recent cost estimates since they were readily available (from the 2022 Business Plan)?

**Question:** Why did CHSRA not use consistent cost bases?

Page 142 of 156

4494-9821

## APPENDIX 6-A – O&M COSTS

CHSRA presented differing document names making it confusing to identify the most recent pertinent document. For example, the document entitled, "High-Speed Rail Operating and Maintenance Cost for Use in EIR/EIS Project Level Analysis Memorandum (2017)" was cited in another chapter as a document for "more information." A Public Records Request was initiated for this document but the document provided was actually already part of the DEIR but listed under a new name, "Appendix 6-A High-Speed Rail Operating and Maintenance Cost for Use in EIR/EIS Project Level Analysis." When questioned, CHSRA responded via email, "They are actually the same document. If you scroll past the cover page, which says August 2022, and get to page three of the PDF, you will see it is a four-page memorandum dated February 2017."

This four-page memorandum states:

*"This memo summarizes the assumptions used to estimate full system high-speed rail (HSR) operations and maintenance (O&M) costs published in the California High-Speed Rail Authority's 2016 Business Plan."* (Emphasis added.)

So, it's not from August 2022. It's not even from 2017. It's from the 2016 Business Plan. They merely slapped a new cover on an old document to make it appear current even though the data is six years old.

**Question:** Is this laziness, sloppiness, or deception?

4494-9822 As bad as it is for CHSRA to state their costs based on 2016 business plan dollars, it's even more atrocious that for most of the remainder of the O&M document, CHSRA relies on 2015 dollars. 2015 dollars. Barack Obama was still President. The pandemic was still 4 years in the future, and inflation was low. What cost \$100 in 2015 now costs \$122.49—so how can anyone believe the stated costs in this DEIR are even close to accurate?

4494-9823 Then, there's the inability to compare apples to apples. When stale numbers are drawn upon and included in DEIR, a reasonable person would want to know what these same items cost pursuant to a more recent business plan. However, in most cases, that is impossible because they present items through just enough of a different lens that it is unachievable. For example, in one document they may use the years 2029 and 2040. In another document (the 2022 Business Plan), it looks like the following chart:

Table 3.6.1: Phase 1 High, Medium and Low O&M Costs by Year (YOY \$ in Millions)

O&M Levels	2033	2034	2035	2040	2045	2050	2055	2060
High Operations and Maintenance Cost	842	1,690	1,828	2,226	2,588	3,039	3,521	4,125
Medium Operations and Maintenance Cost	770	1,545	1,671	2,035	2,366	2,779	3,219	3,771
Low Operations and Maintenance Cost	742	1,489	1,611	1,962	2,282	2,679	3,104	3,636

Because full funding for the system has not been identified, the phasing assumptions used for developing the forecasts and estimates are for illustrative purposes.

2022 BUSINESS PLAN // CALIFORNIA HIGH-SPEED RAIL AUTHORITY

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 143 of 156

4494-9823

From the start, CHSRA has stated that once the infrastructure is built, an independent/private contractor would take over operation of the train. An analogy that CHSRA offered years ago is our freeway system i.e., the government built and maintains the infrastructure, but it is used by the public.

**Question:** Why are estimates in the 2022 DEIR based on 2015 data (7-year-old cost assumptions)?

**Question:** Why are documents in different years' data presented in different manners (including line items and years of operation) so that an apple-to-apple comparison is nearly impossible?

**Question:** Why is maintenance (presumably to be the State of California's ongoing responsibility) lumped together with operations (presumably to be part of the train operator's obligation)?

4494-9824

From the Appendix 6.A, p. 3. Note that the Total Cost for 2029 High Scenario is \$798 million.

**Question:** If the operator is an independent private company, why is CHSRA including cost estimates for operations, dispatching, maintenance of equipment, station and train cleaning? Wouldn't these items presumably be the train operator's responsibility as operating costs?

**Question:** For comparison, Amtrak is a for profit company, but is government-owned because the federal government owns most of the stock. Is that what CHSRA envisions?

**Question:** Or, is it the "freeway model" where the government builds and maintains the tracks and other infrastructure but the public (in this case the operator is the "public")?

Table 2 below outlines high scenario O&M costs.

Table 2: Annual Operations and Maintenance High Scenario Cost Forecast (\$2015 millions)

Cost Category	2025 High Scenario Cost	2029 High Scenario Cost	2040 High Scenario Cost
Train Operations	\$31	\$263	\$311
Dispatching	\$14	\$32	\$33
Maintenance of Equipment	\$24	\$101	\$146
Maintenance of Infrastructure	\$58	\$131	\$133
Station and Train Cleaning	\$23	\$74	\$77
Commercial	\$46	\$56	\$103
General and Administrative	\$15	\$53	\$58
Insurance	\$29	\$57	\$57
Unallocated Contingency	\$10	\$32	\$38
<b>Total Cost</b>	<b>\$249</b>	<b>\$798</b>	<b>\$956</b>

Note: Numbers may not add due to rounding

## CHAPTER 7

### CHAPTER 7: OTHER CEQA

4494-9825

This Chapter presents environmental adverse unavoidable effects of the Palmdale to Burbank Project Section. They include: nitric oxide, carbon monoxide, particulate matter in the air during construction and along haul routes, excessive operational train noise minus noise barriers, paleontological destruction from tunneling, visual aesthetics, and impacts on historic built resources.

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 144 of 156

4494-9825

The Chapter also attempts to show benefits to Los Angeles County from High-Speed Rail: less than 3 hour travel time between Los Angeles and San Francisco, decreased air pollutants once the train is operating, job creations, and improvements to local transit.

“Short-term Use of the Environment and the Enhancement of Long-term Productivity” points out investment of materials, consumption of fossil fuels, and conversion of land necessary for construction. However, without High-Speed Rail, air quality will continue to deteriorate and travel time and congestion will increase. With High-Speed Rail greenhouse gases will be reduced and there will be more construction for workers to provide new services and housing.

In summation, there are “irreversible environmental changes” with the project: procurement of land, materials, and fossil fuels both above and below ground.

**Question:** This chapter lists environmental detriments to people during the project’s construction and uses the same list as positive influences on people during the train’s operation: acquirement of land and housing construction as examples. How can the same factors be both adverse and beneficial?

4494-9826

**Question:** This chapter shows that encroachment on land, destruction of natural resources, and interruptions and damage to peoples’ lives from impacts of the construction of High-Speed Rail are neglectable when compared with hypothetical gains to people later during the train’s operation. Is travel convenience for people superior to environmental destruction?

**APPENDICES NOT BUNDLED WITH CHAPTERS**

**APPENDIX 3.2-A: VEHICLE MILES TRAVELED METHODOLOGY**

**General Discussion**

4494-9827

CHSRA asserts that it will divert trips from auto, air, and conventional rail (CVR)<sup>114</sup> thus cutting greenhouse gas emissions. The problem is that there is no verifiable nor truly accurate way to project this data. California’s population grew only slightly from the 2010 census; in fact, it lost a Congressional seat. Further, the data that HSR cites was from 2015 and/or 2016, over 6 years prior to the release of this DEIR. It is also peculiar as to why HSR pulled data from its 2016 Business Plan when there has been a 2018 business plan, a 2020 business plan, and a 2022 business plan submitted and approved by the CHSRA board. CHSRA’s main and recurring “selling” point, whether it is true or not, is that it is a clean energy mode of transportation and will not contribute to greenhouse gasses from its operations, while further reducing greenhouse gas emissions by replacing miles traveled by vehicles, airplanes, and conventional rail.

Even if the high-speed train does indeed supplant other greenhouse gas-emitting modes of transportation when it becomes operational, the amount of greenhouse gasses it produces during construction is greater than any savings:

The non-partisan California Legislative Analyst’s Office states:

*“High-Speed Rail Would Initially Increase GHG<sup>115</sup> Emissions for Many Years. As mentioned above, in order to be a valid use of cap-and-trade revenues, programs will need to reduce GHG emissions. While the HSRA has not conducted an analysis to determine the impact that the high-speed rail system will have on GHG emissions in the state, an independent study found that—if the high-speed rail system met its ridership targets and renewable electricity commitments—*

<sup>114</sup> Not covered in this comment letter.

<sup>115</sup> Greenhouse Gas (GHG)

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 145 of 156

4494-9827

*construction and operation of the system would emit more GHG emissions than it would reduce for approximately the first 30 years.* While high-speed rail could reduce GHG emissions in the very long run, given the previously mentioned legal constraints, the fact that it would initially be a net emitter of GHG emissions could raise legal risks.”<sup>116</sup> [emphasis added]

The Reason Foundation’s findings are even more dire:

*“In a 2010 UC Berkeley study, Professors Mikhail Chester and Arpad Horvath estimated that the entire California high-speed rail project would generate 9.7 million metric tons of carbon dioxide during construction. Chester and Horvath estimated that it would take high-speed rail 71 years of operation at medium occupancy to offset its own construction-related greenhouse-gas emissions. Given the project’s delays and carbon reductions being achieved by new technology, like electric vehicles, it is possible that, if built, the rail system will never pay back the carbon investment required to build it.”<sup>117</sup> [emphasis added]*

**Question:** How can CHSRA claim that this project is a clean energy project when it is emitting massive amounts of greenhouse gas emissions over a period of well over a decade?

There are three reasons people use transportation: Commuting, business, and pleasure. The three motorized modes currently utilized are vehicles, air travel, and conventional rail (CVR). The CHSRA claims that it can divert a substantial amount of usage to the high-speed train resulting in greenhouse gas emissions.

**High-Speed Train v. Vehicles for Commuting**

The high-speed train is an expensive and therefore infeasible choice for commuters. The majority of greenhouse gasses are emitted from vehicles for commuting purposes. Driving from Palmdale to Burbank takes about 93 minutes and costs about \$24 round trip for fuel<sup>118</sup>. A hybrid would do much better at \$13.53<sup>119</sup>. The Antelope Valley Metrolink line running from Palmdale to Burbank takes 97 minutes at a round trip cost of \$19. The proposed high-speed train would take 13 minutes at a round trip cost of \$72.<sup>120</sup> Over the course of 48 weeks (assumes 2 weeks’ vacation and 10 paid holidays), the high-speed train “commuter” would spend \$17,280 for commute costs, while the Metrolink commuter would spend \$4,560, or \$12,720 less. A gasoline vehicle would cost about \$5,683 annually and a hybrid \$3,248, resulting in savings compared to the high-speed train of \$12,608 and \$14,043, respectively. An electric vehicle costs a mere \$1,102 annually, with a whopping savings of \$16,178. Because the commute cost of the high-speed train is prohibitive, it cannot be considered a feasible contender for replacing either an automobile or the existing Metrolink as a commute alternative.

COMMUTE COST BETWEEN PALMDALE TO BURBANK		
Mode	Annual Cost for Commuting	Commute Time 1-Way
High Speed Train	\$17,280	13 minutes
Metrolink AVL	\$4,560	97 minutes
Gasoline Vehicle	\$5,683	93 minutes
Hybrid Vehicle	\$3,248	93 minutes
Electric Vehicle	\$1,102	93 minutes

<sup>116</sup> <http://www.lao.ca.gov/analysis/2012/transportation/high-speed-rail-041712.pdf>. “Legal risks” refers to the fact that the California “cap & trade” program requires that beneficiaries of the generated revenue be “green.” The high-speed train currently is a beneficiary of 25% of these funds so if it’s legally challenged as to its standing, it is at risk for losing such funding from this revenue stream.

<sup>117</sup> <https://reason.org/commentary/california-overstates-bullet-trains-climate-benefits/>

<sup>118</sup> 51 miles each way at 28 mpg, gas cost per gallon of \$6.50

<sup>119</sup> 51 miles each way at 49 mpg, gas cost per gallon of \$6.50

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 146 of 156

4494-9828

Other sample city-to-city commutes are equally expensive using the High-Speed Train:

Route	Daily Round Trip	Annual
San Francisco to San Jose	\$52	\$12,480
San Jose to Gilroy	\$42	\$10,080
San Jose to Fresno	\$142	\$6,816

However, much has happened since 2016, the year that HSR relies on as its source:

1. Due to the pandemic, employers and employees discovered that working from home is a workable, practical, and successful way to conduct business. According to Ogletree Deakins, currently 22 percent of Californians work exclusively remotely and 15 percent have a mix of working remotely and working outside the home. Additionally, institutions of higher learning are increasing their online classes, thus saving professors and students fuel costs.
2. Gavin Newsom issued a mandate that all new vehicles sold in California commencing in 2035 must be electric (EV).
3. Even without a mandate, hybrid and EV vehicles continue to grow in popularity due to the lower maintenance costs and obvious fuel savings. The following automobile manufacturers are already producing, plan on producing, and/or are expanding their line of EVs: American Honda, BMW North America, Ford Motor Company, Jaguar Land Rover Limited, Kia Motors America, Mazda Motor Company, Mercedes-Benz USA, Mitsubishi Motors North America, Nissan North America, Stellantis North America, Subaru of America, Tesla Motors, Toyota Motor Sales, Volkswagen Group of America, and Volvo Group North America.

From 2011 to 2022, California's zero-emission vehicles' (ZEV) market share increased by a factor of 33—from .5% to 16.5% in only 11 years.<sup>121</sup> With the anticipated and funded major rollout of electric charging stations, consumer rebates, and other incentives, by the time the high-speed train becomes operational, this market share will likely eclipse fossil fuel burning vehicles thus rendering the high-speed train obsolete. Newsom's mandate that all new vehicles sold in California must be electric by 2035 furthers the argument that the high-speed train is simply not needed. The migration to ZEV is also boosted by the fact that California already has the infrastructure in place: A world-class freeway and highway system that provides easy and thorough connectivity across the state, not to mention being overseen by a well-established agency, CalTrans, which provides repair and maintenance services.

The high-speed train can ONLY reduce greenhouse gas emissions IF it REPLACES a normally-scheduled vehicle trip, AND the train is full or nearly full. If a driver who normally wouldn't schedule a trip from Los Angeles to San Francisco (or between any other of the cities on the route), decides to take the high-speed train instead of driving, that is adding a trip (net gain), not replacing a trip (zero sum) otherwise done by car. Further, if a majority of the train is empty, it is drawing upon electricity (which currently would not be drawing from a power plant powered by 100% renewable energy). The California High-Speed Rail Authority, when questioned about their assertion that they would only utilize 100% renewable energy

<sup>121</sup> California Energy Commission (2022). New ZEV Sales in California. <https://www.energy.ca.gov/zevstats>

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 147 of 156

4494-9828

and asked where they would pull their electricity from, stated that they would hook up to the local power companies along the way: PG&E (33% is renewable)<sup>122</sup>, Southern California Edison (50% is renewable)<sup>123</sup>, LA Department of Water & Power (60% is renewable)<sup>124</sup>. These stats are nowhere near 100% renewable, although it is unclear where they will be for the completion of Phase 1.

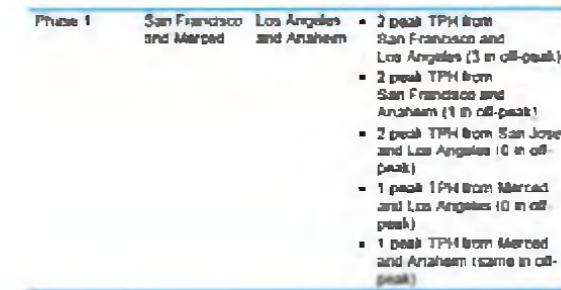

4494-9829

## High-Speed Train v. Air Travel

The Palmdale to Burbank Project Section is completely irrelevant to reducing air travel. In fact, an air passenger may decide to utilize the high-speed train from Palmdale for the sole purpose of catching a flight from Burbank Airport. Statewide, the project will ONLY be effective in reducing airplanes' emissions IF it actually eliminates flight(s). Obviously, no emission savings are realized if the same number of flights remain, and actually will increase greenhouse gasses as explained below.

We established above that the high-speed train is too expensive to be a commuter train. That leaves business and pleasure travel, discussed below.

Early on, the CHSRA claimed that at full build-out (Phase 1), trains would run every 5-7 minutes. However, the chart in the DEIR is quite different:

The San Francisco and Los Angeles termini assume only 2 trains per hour will run during peak times, and 3 trains per hour will run in off-peak. It is counter-intuitive that they would run fewer trains during peak hours for any scenario, much less the San Francisco and Los Angeles scenario while the other scenarios run more trains during peak hours than on off-peak hours.

**Question:** Why would the San Jose and Los Angeles scenario have a different number of trains since San Jose is not a terminus? Conceivably, since San Jose is relatively close to San Francisco, it would be the same train(s) passing through enroute to the terminus destination.

Assumed Headway Times

Page 149 of 156

4494-9829

Headway is the distance or duration between vehicles in a transit system measured in space or time. The above chart assumes 8 hours as headway for an airplane going from Burbank to San Francisco. Four air carriers provide 23 flights per day, or roughly 1.4 flights every hour. This is counter to what this chart provides.

4494-9830

### Efficiency: High-Speed Train Versus Other Modes of Transportation

As will be illustrated below, the high-speed train is probably not the best choice for business or pleasure travel. Business travel would likely be a one-person journey and is comparable to air travel. Assuming a trip to/from Burbank to/from San Francisco<sup>125</sup>:

Travel Activity	Airline	HSR
Pre-travel time*	1 hour 30 minutes	25 minutes
Travel time**	1 hour	3 hours 10 minutes
Post travel***	20 minutes	5 minutes
Total Time	2 hours 50 minutes	3 hours 40 minutes
Cost (round-trip)****	\$228	\$200

\*assumes carry-on luggage, parking, checking in/boarding pass, security check for airline; only parking and checking in for HSR  
 \*\*actual travel time including 5 minute stops at stations for HSR  
 \*\*\*assumes deboarding for airline travel only  
 \*\*\*\*average Southwest Airline fares October 2022; schedule p. 2-6 of 2020 Ridership Tech Document

The cost for travelling by airplane and the high-speed train is comparable, but the train takes nearly an hour longer. While the high-speed train is mandated to make the Los Angeles to San Francisco trip in 2 hours 40 minutes, it did not include stops at stations (there will be some "express" trains that will not stop at stations along the corridor). The time from Burbank to San Francisco non-stop is 10 minutes shorter than from Union Station in Los Angeles, or 2 hours 30 minutes.

For pleasure travel, it is likely that there will be at least 2 people travelling. This table compares the cost of travelling by air, HSR, and by vehicle:

	Air	HSR	Vehicle-Gas	Vehicle-Hybrid	EV
2 people	\$456	\$400	\$168.07	\$96.05	\$32.58
4 people	\$912	\$800	\$168.07	\$96.05	\$32.58
Total Time	2:50	3:20	5:44	5:44	5:44

362 miles each way, 28 MPG (gas), 49 MPG (hybrid), gas \$6.50, EV \$.045 per mile<sup>126</sup>

It's evident that for pleasure travel, a vehicle, especially an EV, is much more cost effective due to being able to carry more than 1 person at a time than either air travel or the high-speed train (although depending on the EV's range, charging may be needed along the way). This throws doubt on the CHSRA's assertion that the high-speed train will displace other modes of transportation.

Based on the above, if the high-speed train:

- Is not a cost-effective commuter train;
- Is not cost effective for pleasure trips, and
- Is not the best choice for business travelers who necessitate the shortest travel time, then ...what is its unique selling proposition?

<sup>125</sup> Assumes this particular train stops at every station, not one of the "express" trains.  
<sup>126</sup> www.ecocostsavings.com

**Question:** If it's not a feasible replacement for commuting, pleasure, or business travel... then what is it?

### CHSRA Claims the High-Speed Train Will Result in Substantial Flight Reductions

The California High-Speed Rail Authority claims that the train will replace thousands of flights annually.

The DEIR states:

*"1.1.4 Process to Estimate Differences in Air Travel and Air Service Needs  
 As noted in Section 1.1.1, the introduction of HSR will divert trips from auto, air, and CVR. Those diverted trips can be consistently and deterministically forecast by comparing the differences in forecast trips by mode between the build and no-build alternatives.*

*The determination of changes in air service needs are more difficult to estimate since the amount of air service provided by carriers is based on their individual responses to HSR and other factors. Based on the structure of the BPM-V3, air trip interchanges can be assigned to origin and destination airports.9 The average daily air passenger trips were multiplied by 365 to estimate annual intra-California air passenger trips. Each airport was assigned to one of six regions: San Francisco Bay Area, Sacramento Valley, San Diego, San Joaquin Valley, Southern California, and the Remainder of the state. The forecast no-build and modeled annual air trips were aggregated into tables of trips from airport region to airport region.*

*Annual passenger and flight data between California airports updated in May 2015 by the US Bureau of Transportation Statistics (BTS) were used to determine load factors for flights from each of the six regions. The detail of the BTS data allowed for the calculation of different load factors for flights internal to California and flights destined to locations outside of California.*

*The forecast airport region to airport region trips were then divided by the BTS derived load factor for the departure airport region to determine the number of annual flights required to serve the passenger loads based on load factors estimated from 2015 passenger and flight data. The reduction was then the estimated flights for the no-build forecast minus the estimated flights for the build forecast.*

*Flight reductions computed using the above approach represent what might be expected in the future. However, airline response to changes in air passengers due to the introduction of HSR might be different."*

CHSRA claims that in year 2029 (when Phase I is fully operational, although in other documents 2033 is the first year of operation), 24,736 annual flights (outgoing and return trip) in the Southern California area "might" be eliminated by passengers instead opting to ride the high-speed train. The airports in the Southern California Area include Long Beach, Los Angeles International, and Burbank. Passengers flying from these airports would likely only be flying to the Bay Area (Oakland and San Francisco).

# Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 150 of 156

4494-9830

Flight Reductions	2025	2029
Bay Area	(5,358)	(22,644)
Sacramento Valley	(915)	(4,294)
San Diego	(677)	(4,140)
San Joaquin Valley	(438)	(1,143)
Southern California	(6,031)	(24,736)
Rest of State	(232)	(684)
<b>Total</b>	<b>(13,651)</b>	<b>(57,641)</b>

24,736 round trips / 2 = 12,368 one-way  
12,368 / 365 = 34 per day  
34 per day / 2 (no. of airports in "Southern California") = 17 per airport  
(excludes Long Beach Municipal Airport because there are no non-stop flights)

The following charts shows the number of flights per day by carrier.<sup>127</sup> For Burbank, a daily 17 flight per day reduction equates to 33%, or one-third of Burbank's daily flights to Northern California. For flights from LAX, the per day reduction equates to nearly 50%. Blended average is 39%. These scenarios seem unrealistic.

It is important to note that the new Burbank Airport terminal will have more gates, but not more flights, therefore, no flight growth factor is, or should be, included in any analysis.

Would a passenger flying from Long Beach to Northern California opt for the high-speed train because no non-stop flights are available? It is doubtful that any passenger would book a flight from Long Beach to Northern California because all of them stop (or require changing planes) in either Salt Lake City or Phoenix with many taking 10-12 hours. A passenger would likely fly out of LAX or Burbank, or drive. Therefore, the train will not displace any Long Beach to Bay Area trips.

**Summary**

	SFO	Oakland	Total
Burbank to:	23	29	52
LAX to:	17	4	35
<b>Total</b>	<b>40</b>	<b>33</b>	<b>87</b>
<b>CHSRA Reduction Projection</b>			<b>-34</b>
<b>Net Flights</b>			<b>53</b>
<b>% Reduction</b>			<b>39%</b>

Besides this reduction being unrealistic, it doesn't make sense that in 2025 CHSRA includes airports in the Sacramento Valley and San Diego as those experiencing flight reductions because they are not in close proximity to any high-speed train station and in a year that doesn't even have an operational high-speed rail corridor; these stations will not be operational until Phase 2 is completed.

**Question:** Why did CHSRA include flight reductions for airports serving areas that will not even have High-Speed Rail at that point in time and are not within a reasonable distance to an airport that does?

It is also possible that even if an airline(s) eliminates flights in the Northern California/Southern California corridor, they would substitute other destinations. For revenue and profit, they rely on their revenue from operations: **Flying.**

**Question:** Why does CHSRA believe that its service will result in airlines reducing actual flights between Northern and Southern California, and will not simply substitute another route?

The following HSR chart states that in 2029, HSR will divert 85% from autos, 8% from air, and 3% from conventional rail. Based on the foregoing, this does not seem credible.

Source: Cambridge Systematics

To their credit, CHSRA admitted the following:<sup>128</sup>

*"The BPM-V3, like any travel model, is based on a limited number of variables. While the BPM-V3 has been calibrated to reasonably reproduce travel for a base year, much of the "unexplained" variation in travel is "explained" through calibrated model constants. The constants account for unknown input variables that affect travel. In effect, the constants assume that the impacts of those unknown variables do not change over time.*

*The information and results presented in this technical memorandum are estimates and projections that involve subjective judgments, and may differ materially from the actual future ridership and revenue. This technical memorandum is not intended, nor shall it be construed, to constitute a guarantee, promise, or representation of any particular outcome(s) or result(s). Further, the material presented in this technical memorandum is provided solely for the Authority's planning purposes and should not be used for any other purpose."* [Emphasis added.]

The CHSRA is admitting that the information contained in the DEIR involves subjective judgments and may be materially different from the actuals. Also, it is not intended to represent an outcome—so it begs the question, "What is it then?"

**Question:** If the train does not save passengers time and/or money, why would they ride?

**APPENDIX 3.4-C: NOISE AND VIBRATION MITIGATION GUIDELINES**

4494-9833 This section describes the noise levels (in terms of dBa) and vibration on the effect of the areas surrounding the construction and operation of the High-Speed Rail (HSR).

<sup>128</sup> Chapter 3.2A – Vehicle Miles P. 40

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 153 of 156

4494-9833

Noise is one of the principle environmental impacts associated with rail construction and operation. 40dBa represents a quiet ambient noise level in a rural environment. 90dBa represents a jackhammer at 50 feet.

High-Speed Rail noise source shows that a train going 150 mph generates a noise level of 90 dBa. A train traveling at 200 mph generates a dBa of 105.

Construction of the HSR is estimated to take up to five years. Based on previous timelines presented by the HSR, this is probably a low estimate.

During the construction, there will be many phases. A few are:

Phase	dBa produced at 50 feet from source	Estimated timeline
Mobilization	91	2 years
Site Preparation	90	3 years
Tunneling	90	Over 5 years
Retaining Wall Construction	88	3 years
Earthmoving	88	4 years
Cut-and-Cover	89	Over 6 months
Demolition	89	Over 8 months

In addition, the estimated thirty-three types of construction equipment, including pile drivers, rock drills, graders, dozers, etc. will generate typical noise emission levels ranging from 76 dBa to 101 dBa (50 feet from source).

The criteria of the Federal Railroad Administration (FRA) is not to exceed 80 dBa for daytime noise levels and 70 dBa for nighttime noise levels. Noise levels from the construction of each of the six Build Alternatives would exceed these criteria for both daytime and nighttime activities for sensitive receptors. The Burbank to Palmdale Section will not be able to comply with 10 of the 12 policies with respect to noise and vibration criteria set forth during the construction phase. Mitigation measures associated with the build would only decrease the noise and vibration to the extent feasible, and would still be well above the acceptable criteria levels.

Construction within the Angeles National Forest would exceed noise levels at the surface, therefore affecting wildlife. The FRA does not provide guidance for assessing noise and vibration impacts on wildlife and livestock. The Burbank to Palmdale Project Section traverses through equestrian communities and the Angeles National Forest and will have a potentially devastating impact on such animals. HSR construction would result in noise and vibration impacts for nearby sensitive receivers along the alignment where trains would travel at high speeds. Wildlife and human sensitive receivers could be startled or annoyed. Wildlife communication could be affected. It has been shown that communication among wildlife, especially songbirds, is affected by increased noise and vibration. Wild animals depend on calls and song for species identification, mate attraction, and territorial defense. Continuous noise levels above 60 dBa within habitat areas can affect the suitability of the habitat. Many regulatory agencies state that noise levels above 60 dBa is detrimental to a suitable habitat.

4494-9834

In addition, "startle effects" occur with each pass-by of a train. With a train speculated to pass by every six minutes, according to this DEIR, all domestic animals and wildlife located near the project corridor will be affected each time a train passes by. "Startle effects" occur when animals are subjected to noise levels of 100 dBa or higher. As stated previously, trains traveling at 200 mph produce noise levels around 105 dBa. The DEIR excludes dBa references for "tunnel boom" which is a loud boom sometimes generated by high-speed trains when they enter tunnels. These shock waves can disturb nearby residents and damage trains and nearby

November 30, 2022  
Page 154 of 156

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 155 of 156

4494-9834 structures.<sup>129</sup> There are no mitigation measures that effectively reduce these noise levels to acceptable levels, and therefore the No Project Alternative is the only feasible alternative to prevent the harmful effects of noise and vibration on sensitive subjects, domestic animals, livestock, and wildlife. (Please note that wildlife is not exclusive to the Angeles National Forest. There is abundant wildlife in neighboring areas to the forest.)

4494-9835 Construction vibration is assessed for areas where there is a potential for impact from construction activities (including blasting, pile driving, demolition). The only local standard that references vibration states that the perception threshold shall be a motion velocity of 0.01 in/sec over the range of 1 to 100 Hertz. According to the Los Angeles County Ordinance Section 12.08.350, "operating or permitting the operation of any device that creates vibration that is above the vibration perception threshold of any individual at or beyond the property boundary of the source if on private property, or at 150 feet from the source on a public space is prohibited." The Authority's "commitment" to minimizing construction noise and vibration impacts, since there are too many inconsistencies, is to prepare and submit a memo documenting their guidelines for minimizing noise and vibration when work is being conducted within 100 feet of sensitive receivers. This is completely unacceptable. Mitigation measures for noise and vibration concerns need to be specified before construction begins. There needs to be a specific plan to address noise and vibration in sensitive areas such as the wilderness and areas with livestock and other animals, as well as other sensitive subjects. Since the Authority is unable to comply with noise and vibration criteria, the No Build Alternative is the only solution.

In conclusion, the DEIR completely overlooks the effect of increased noise levels on wildlife, domestic animals, and livestock, stating that there will be less than significant effects after mitigation efforts (which they have failed to outline). There is a complete lack of specific plans to address the environmental impact of noise and vibration during both the construction phase and during the operation of the train.

We know that the effects of fireworks (up to 150 dBA), thunder (which produces a dBA of 100), and other loud noises have a startle effect on wildlife, domestic animals, livestock, and sensitive subjects.

4494-9836 **Question:** How can this report state that the noise impacts from the construction and operation of the train have "Less Than Significant" impact?

Even after mitigation efforts, the operational train noise impacts will be "significant and unavoidable" for sensitive receivers.

4494-9837 **Question:** How can you not correlate this same impact to wildlife, domestic animals and livestock?

Since the noise and vibration of the HSR cannot be mitigated to an acceptable level, the only alternative is the No Project Alternative.

**MISCELLANEOUS COMMENTS/QUESTIONS**

4494-9838 Businesses and residences that are permanently lost due to CHSRA acquisition currently generate the following revenues to the state (which are then allocated back to cities, counties, school districts, special districts, public safety, local transportation, etc.):

<sup>129</sup> People perceive this sound similarly to that of a sonic boom from supersonic aircraft. However, unlike a sonic boom, tunnel boom is not caused by trains exceeding the speed of sound. Instead, tunnel boom results from the structure of the tunnel preventing the air around the train from escaping in all directions. As a train passes through a tunnel, it creates compression waves in front of it. These waves coalesce into a shock wave that generates a loud boom when it reaches the tunnel exit. The strength of this wave is proportional to the cube of the train's speed, so the effect is much more pronounced with faster trains. (Wikipedia)

- Property Tax
- Business Tax
- Utility Users Tax
- Income Tax (state and federal)
- Sales Tax
- Franchise Fees
- Transient Occupancy Tax
- Payroll Tax

CHSRA suggests that there will be little negative impact because displaced businesses and residents will be able to find suitable replacements nearby. Yet, one cannot read the news for an extended period of time without seeing the phrase "Los Angeles housing crisis." CHSRA also states that there will be a temporary increase in sales tax revenue because contractors will have to purchase construction supplies. However, that is only true (for any project section actually) IF they purchase the items in the same city for which they seized businesses/housing. Sales tax is generated at point of purchase and then allocated back to the city (incorporated or unincorporated) that generated it, so if a contractor purchases items in Glendale or any jurisdiction outside of the city of Los Angeles (assuming the lost business was in the city of Los Angeles), then Los Angeles loses that sales tax revenue, and it is instead transferred to Glendale.

Businesses that are forced to shut down will also have to lay off employees. This will result in a loss of state and federal income taxes and payroll taxes (Social Security and Medicare) paid by both the businesses and the employees.

4494-9839 **Question:** Where will displaced residents find suitable replacement housing?

4494-9840 **Question:** Where will displaced businesses find suitable replacement buildings that have the same character, location, and customer base?

4494-9841 **Question:** How can CHSRA guarantee that contractors purchase their supplies in the city of Los Angeles (or any city that had businesses acquired for the project)?

4494-9842 **Question:** How will the Utility Users Tax, which will be based on usage drawn from LADWP and Southern California Edison, be calculated and then remitted to Palmdale, City of San Fernando, City of Los Angeles, and unincorporated areas of Los Angeles County?

4494-9843 **Question:** Is CHSRA planning on backfilling temporary and permanent lost tax revenue to cities due to their acquisition of businesses and residences?

4494-9844 **Question:** For better transparency, and to help build public trust, please explain in greater detail how the inconsistencies between federal, state, regional and local laws for each build alternative will be resolved.

4494-9845 **Question:** What are the details of the construction management plan (CMP) so that the public can better understand how construction impacts within the Angeles National Forest will be maintained below applicable standards?

4494-9846 **Question:** Why are there no alternatives that don't disturb the Angeles National Forest? Considering all the hazards identified within each build alternative, it is irresponsible not to include a safer and less costly alternative. The No Build Alternative option should be selected.

4494-9847 **Question:** For each build alternative, please list the estimated acres of Angeles National Forest land that would be permanently acquisitioned under this project. The Angeles National Forest belongs to the people. It's one thing to drill a tunnel under the forest floor but another thing to appropriate land from the Angeles National Forest for this project. How will the people be compensated for this federal land acquisition?

## Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

DEIR Comment Letter Palmdale to Burbank  
November 30, 2022  
Page 156 of 156

- 4494-9848 **Question:** For each build alternative, what are the estimated gallons of water that will be removed from aquifers within the Angeles National Forest during the construction phase, and what are the impacts this removal will have on humans, animals, and plants?
- 4494-9849 **Question:** For each build alternative, what are the maximum acres within the Angeles National Forest that will be impacted temporarily during construction activities, as well as acres permanently impacted by this project?
- 4494-9850 **Question:** For each build alternative, please describe in detail all equipment for electrification and infrastructure that will be built within the Angeles National Forest. What will this look like? How will it change the current conditions in the Angeles National Forest? Will there be many new buildings and structures in the forest? If so, how many and how tall and wide will they be? How large and what types of electrification equipment will be installed? What are the dimensions and weight of things like transformers, substations, power stations, poles, etc.? How will it change the view and serenity in the forest? Please include photos and detailed drawings so the public can see what the Angeles National Forest currently looks like and then what it will look like post construction.
- 4494-9851 **Question:** How many miles of access roads will be built within the Angeles National Forest for each build alternative?
- 4494-9852 **Question:** How many helicopter access points will be built within the Angeles National Forest for each build alternative?
- 4494-9853 **Question:** Will an updated biological study be performed prior to final selection to ensure the most accurate information is used?
- 4494-9854 **Question:** Could you please provide an updated cost-benefit analysis that reflects recent changes in population as well as ridership due to more and more people working from home?
- 4494-9855 **Question:** How much power per day and per year will each build alternative consume from the power grid, and how will this impact residents and businesses within each build alternative who already encounter problems with too much demand?
- 4494-9856 **Question:** Will this power need to be shut down during high winds to prevent forest fires?

### CONCLUSION

- 4494-9857 Based on the foregoing discussion, which raises a multitude of alarming questions arising from legitimate concerns, the only route that can be considered for the Palmdale to Burbank Project Section is the No Project Alternative. All other six proposed build alternatives are fraught with risks and impacts which are real and easily verifiable: nearly 30 miles of deep-bore tunneling through an active seismic and high fire hazard zone, permanently losing precious water, destroying habitat, building acres of infrastructure within a national forest and a national monument, emitting years of greenhouse gasses during construction, pushing most of the logistical and technical burdens of serious design considerations onto contractors with no specified amount of oversight, utilizing the failed 15/85 design build model, and so on. Yet, the "benefits" of this project are based solely on CHSRA's pure and untested speculation that ridership will be so vigorous (notwithstanding that there is no real reason for train ridership) that it will recoup the \$105 billion capital cost and the tons of greenhouse gas emissions generated during construction in a matter of months. It is clear that CHSRA's ridership projections are aggressive and deeply flawed. This project is all cost and no benefit. The only acceptable alternative presented by CHSRA for consideration is the No Project Alternative.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022)

### 4494-9174

The commenter, Save Angeles Forest for Everyone, describes its membership and interests, and refers to a comment letter containing comments and questions organized by the environmental document's chapters. The commenter's review and comment on the Draft EIR/EIS is appreciated.

### 4494-9175

The commenter indicates that the cumulative analysis conducted for the Palmdale to Burbank Project Section covers cumulative impacts contributed by other projects and fails to analyze the cumulative impacts from the project itself (i.e., the whole California HSR System). The commenter also states because of this omission and the numerous cumulative impacts that will occur, of which many cannot be mitigated, they prefer the No Project Alternative be selected. Section 3.19.3 in the Draft EIR/EIS identifies the methodology used to evaluate cumulative impacts. The first step in the methodology is to define the geographic boundary or resource study area (RSA) for the cumulative effects analysis of each resource. This is consistent with CEQA Guidelines section 15130 (b) (3), which states that "lead agencies should define the geographic scope of the area affected by the cumulative effect and provide a reasonable explanation for the geographic limitation used." The Draft EIR/EIS provides a robust explanation of the geographic scope of cumulative impacts, per resource topic, in Section 3.19.3.1. Each resource topic has a different geographic scope and, therefore, the cumulative impacts for each resource topic would vary by resource topic. In other words, a certain cumulative project might not apply for a certain resource topic but would apply for another resource topic. All the potential cumulative projects are listed in Appendix 3.19-A of the Draft EIR/EIS. Please note that the Bakersfield to Palmdale and the Burbank to Los Angeles Project Sections of the California HSR System are listed in Appendix 3.19-A, and are therefore considered in the cumulative impacts analysis. As shown in Table 3.19-1, the geographic scope for the majority of the resource topics is localized and other sections of the California HSR System would not be within the geographic scope and would therefore not contribute to cumulative impacts. Air Quality, Greenhouse Gas Emissions, and Energy do have a geographic scope of the State of California; however, the Authority does account for the whole California HSR system in its EIR/EIS and its overall benefit related to reducing vehicle and plane trips. The Authority has accurately characterized cumulative impacts based on the geographic scopes appropriate for the resource topic, determined whether the project's incremental contribution to significant cumulative impacts would be cumulatively considerable under CEQA (assuming implementation of mitigation measures previously identified for the respective resource), and therefore no additional analysis is required.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9176

Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS.

The commenter expressed concern regarding the length of the Draft EIR/EIS and the length of the review period, and stated they were not able to review the entire document - and thus the Authority should not interpret their lack of commentary on a particular section or issue to mean they did not have questions or concerns. The Palmdale to Burbank Project Section Draft EIR/EIS was initially circulated for 60 days as required by CEQA, but in response to agency and stakeholder requests and in consideration of limitations caused by the novel coronavirus (COVID-19) pandemic, the Authority extended the comment period by 30 days to lengthen the review period to a total of 90 days.

The commenter also states that numerous documents they desired to review were not available on the Authority website, and some of their requests for these documents were met with delays in their receiving them. The Draft EIR/EIS document which consists of Volume 1 which is the EIR/EIS itself, Volume 2 which includes technical appendices, and Volume 3 which includes the alignment plans, was available in electronic format for download from the Authority's website. Technical reports referenced in the EIR/EIS were available in electronic form by request via the Authority's website or by calling the Authority office at (800) 630-1039. The Authority made an effort to promptly respond to all requests for technical reports and other supporting documents. The commenter made such a request and the Authority provided the requested documents to the commenter during the public review period.

The commenter expressed concern regarding the age of data used throughout the analysis, including for costs. As noted in Chapter 6 of the Final EIR/EIS, Project Costs and Operations, the analysis presented in the Draft EIR/EIS was initiated using the Authority's 2016 Business Plan. Given that there are minimal differences between the 2016 Business Plan, 2018 Business Plan, 2020 Business Plan, and the 2022 Business Plan, the costs included in this document rely on the 2016 Business Plan. For concerns regarding the age of data used, see Section 3.1.4.5, Affected Environment in Section 3.1, Introduction, of the Final EIR/EIS for an explanation of how the data used by the Authority in the Draft EIR/EIS is appropriate. Refer to Standard Response PB-

### 4494-9177

The commenter requests additional information about spoils hauling and impacts of trucks on the local and regional roadway network.

The commenter asks what the total truck trips are for the duration of the project and the total amount of contaminated or hazardous material that will require special handling. Overall, the project would result in between 1.3 million and 4.9 million construction spoil haul trips throughout the construction duration, depending on the Build Alternative selected (extrapolated from Appendix 2.0-I of the Draft EIR/EIS). A conservative analysis was conducted regarding the amount of potential hazardous spoils for each of the Build Alternatives; it is likely that each of the Build Alternatives would produce a smaller quantity of hazardous spoils than estimated. Hazardous materials would be handled in accordance with the Certified Unified Program Agencies (CUPA) regulations and disposed of off-site at a properly licensed/maintained facility located within the state of California. Many of the sites containing hazardous spoils and/or hazardous materials are associated with the PEC sites listed in Section 3.10.5.3 of the Draft EIR/EIS. Contaminated materials would be removed from the tunnel construction areas and could be temporarily stockpiled onsite before being hauled to a suitable hazardous waste treatment site. IAMFs will require the contractor to implement a series of plans and procedures to minimize hazards associated with use, storage, transportation, and disposal of hazardous material and waste. With HMW-IAMF#3 through HMW-IAMF#8, the impact would be less than significant under CEQA. Based on a formula that the commenter provided, the commenter calculated an estimate of truck trips. The commenter calculated 2.4 million one-way truck trips, 4.9 million round-trip truck trips, and 10.9 million cubic yards of contaminated soils. The commenter asks why the Authority believes 4.9 million round-trip truck trips is acceptable. The estimated total number of one-way and round-trip trucks is correct for the SR14A Build Alternative; the other Build Alternatives would generate fewer construction truck trips. These volumes would occur over a number of years. The analysis for impacts from spoils hauling involved the identification of where the Build Alternatives would degrade level of service (LOS) to unacceptable levels. While automobile delay is not considered a significant environmental impact under CEQA, these impacts are considered adverse under NEPA, as spoils hauling would have effects exceeding the significance thresholds for the six Build Alternatives. Table 3.2-47 in Section 3.2, Transportation of the Draft EIR/EIS identifies the number of roadway segments, intersections, and freeway segments that

### 4494-9177

would be adversely affected by spoils hauling. As described in Chapter 1, Purpose and Need of the Draft EIR/EIS, the Palmdale to Burbank Project Section is being proposed, despite the significant and unavoidable impacts or adverse impacts, based on the benefits the Build Alternatives would create for the State. The Palmdale to Burbank Project Section would involve benefits in transportation, environment, and economy and employment. Please refer to Chapter 1, Purpose and Need of the Draft EIR/EIS for further details. The commenter provides a table summarizing truck hauling during construction and asks what specific mitigation strategies will be implemented to limit truck traffic during peak times. As stated in Section 3.2.6.3 of the Draft EIR/EIS, spoils hauling is anticipated to take up to 6.4 years in total, depending on location and Build Alternative. However, the activity and duration of construction would vary depending on the spoils removal location and the means of off-hauling the spoils. In other words, not all spoil generation sites would be active during the entire construction period. The maximum construction spoils hauling truck trips were calculated separately for each of the six Build Alternatives using this information. More information on the spoils hauling activities and calculations are presented in Appendix 2.0-I, Spoils Disposal Assumptions used for Environmental Analysis. Impacts TRA#1 through Impact TRA#4, under Section 3.2.6.3 of the Draft EIR/EIS, presents the spoils hauling effects on intersections, roadway segments, freeway off-ramps, and freeway segments. The analysis prepared to identify these impacts accounted for the peak time of truck activity, the period during the about 6 years of construction that the most spoils hauling trips would occur. TR-IAMF#1, TR-IAMF#2, TR-IAMF#6, TR-IAMF#7, and TR-IAMF#8 will minimize impacts. In addition, the mitigation program, especially TR-MM#12, would reduce impacts associated with haul route traffic, including the scheduling of a majority of travel during off-peak hours (i.e., avoiding the typical weekday AM and PM peak commute periods), station traffic control officers, develop alternative routes to reduce trucks on sensitive facilities, and develop and implement an outreach program. The AM peak period typically occurs between 7:00 a.m. and 9:00 a.m., and the PM peak period is typically between 4:00 p.m. and 6:00 p.m. To provide additional roadway space to accommodate spoils hauling trucks, transit vehicles, bicycle lanes, or pedestrian facilities, the temporary removal of on-street parking may be required. This is documented as part of the Construction Management Plan in TR-IAMF#2. TR-IAMF#3 describes the Authority's commitment to identifying adequate off-street parking to accommodate all construction-related vehicles. This would be required as part of the Construction Management Plan

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9177

documented in TR-IAMF#2. Spoils hauling impacts, including impacts to the transportation network and impacts associated with hazardous materials, were assessed in further detail in the technical reports that support the analysis. Implementation of the IAMFs and Mitigation Measures would be the responsibility of the Authority, and under the purview of the Mitigation Monitoring and Enforcement Plan (MMEP). The air quality and noise impact findings associated with spoils hauling were supported by a robust and conservative analysis. As described in Section 3.3, Air Quality and Global Climate Change in the Draft EIR/EIS, the Palmdale to Burbank Project Section engineers provided detailed assumptions related to earthwork, equipment specifications, and hauling routes for trucks carrying spoils and other materials to and from the construction staging areas. These assumptions were used to produce the associated emissions impacts analysis. Additional detailed construction emission calculations are provided in Appendix D of the Air Quality Technical Report (Authority 2020). Impact N&V#2 in Section 3.4, Noise and Vibration, analyzes noise impacts of spoils hauling, by calculating the existing noise levels based on existing traffic volumes on roadways, and compared existing levels with the projected noise levels from haul trucks operating on the roadways. Due to the Build Alternatives' proximity to sensitive receivers, some receivers may still experience noise in exceedance of acceptable noise limits even after implementation of mitigation, which represents a significant and unavoidable impact for the Refined SR14, E1, E1A, E2, and E2A Build Alternatives. The commenter raises the issue of workers' vehicle travel and parking at the work sites, and asks what is considered peak time, how will workers get to and from the work site, and where they will park. The peak period extends for several hours in both the AM and PM periods; the AM peak period typically occurs between 7:00 a.m. and 9:00 a.m., and the PM peak period is typically between 4:00 p.m. and 6:00 p.m. TR-IAMF#2: Off-Street Parking for Construction-Related Vehicles describes the Authority's commitment to identifying adequate off-street parking for all construction-related vehicles for the construction duration. The actual location of the parking spaces will depend on the final plans for each spoils generation area or construction site. The Construction Management Plan (CMP), which is required as part of TR-IAMF#2, will address construction employee arrival and departure schedules and employee parking locations. To address the travel patterns of construction workers, the CMP could encourage alternative modes of travel such as walking, biking, and taking transit, where feasible. The commenter asks where construction vehicles and equipment would be

### 4494-9177

stored. All construction equipment will be stored at the construction site in laydown areas. The commenter states that the Authority places the burden of implementing IAMFs and mitigation on contractors and asks who is ultimately responsible for any failures pertaining to the IAMFS. The Authority is responsible for implementation of IAMFs, which are design features integrated into the project to avoid and minimize impacts. The IAMFs are considered as part of all six Build Alternatives. The Authority would implement IAMFs during design and construction of the selected Build Alternative. The description of each measure details the means and effectiveness of the measure in avoiding or minimizing impacts, as well as the environmental benefits of implementing the measure. The IAMFs are included in the Mitigation Monitoring and Enforcement Plan to enhance implementation tracking, identify the responsible party, and clarify implementation timing.

### 4494-9178

The commenter makes statements about the spoils hauling traffic analysis and results of the evaluation of roadway segments, intersections, and ramps.

Under CEQA, LOS and traffic delay are not considered significant environmental impacts. The results of the operational analysis presented in the Draft EIR/EIS are only provided at the locations where construction of the relevant Build Alternative would result in LOS below the applicable standard. For the Refined SR14 and SR14A Build Alternatives, Table 3.2-20 presents the six locations where poor operating conditions would occur during construction (some locations would be affected under multiple scenarios). However, as documented in the Transportation Technical Report, nine locations were studied. As noted in the comment, spoils hauling trucks are longer than regular passenger vehicles. For the technical analysis, each truck was assigned a passenger car equivalent of three (Transportation Research Board 2010). See the Addendum to the Transportation Technical Report, April 2019, Section 6.5.1.1, for additional information.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9179

The commenter questioned the applicability and effectiveness of construction-related mitigation measures discussed in the Draft EIR/EIS.

Overall, a feasible construction mitigation program was developed, as documented in the Draft EIR/EIS and explained below. Construction activities are anticipated to occur approximately 8 hours per day for most spoils removal locations; however, some locations would require two shifts with activities totalling 16 hours a day. TR-IAMF#6 restricts construction hours to off-peak travel times. When implemented, this would result in more truck activities during the midday (between 9:00 a.m. and 4:00 p.m.), which would not cause light pollution or stress the power grid, as suggested by the commenter. If spoils are being generated for longer periods, they would be stored on-site to be disposed of during available times. Because of noise and light regulations, spoils generation and hauling would not be conducted during overnight hours. Spoils collection areas are locations where the spoils are excavated from underground and held prior to being loaded on the spoils hauling trucks. This approach allows for more efficient disposing of the spoils. Spoils collection areas would be identified in the Construction Management Plan (CMP), as required by TR-MM#12, and would be within the project footprint as analyzed in the Draft EIR/EIS.

TR-IAMF#7 also requires the contractor to utilize appropriate truck routes and avoid impacts on streets not designed to accommodate truck traffic. In addition, Mitigation Measure TR-MM#12 incorporates the preparation of a CMP that includes several elements to minimize the effect of construction traffic on local and regional transportation facilities. The detour routes, as noted in the discussion of mitigation measures, are needed for local traffic to be rerouted around construction zones. Typically detour routes have a minimal impact on air pollution and GHG qualities, as these detours are temporary and the potentially longer trip is offset by the reduction in delays that occur if vehicles wait for flaggers at the construction zone. In addition, with full closure of roadways, the construction duration can be reduced, which can also result in less total air pollution and GHG emissions.

As noted in TR-MM#12, it may be possible to temporarily restripe roadways to maximize the efficiency of intersections and streets. Any changes to the roadway network proposed by the Authority would need to follow the design standards of the affected

### 4494-9179

jurisdiction, LADOT, and Caltrans, as appropriate. In general, jurisdictions have minimum lane width standards that would need to be adhered to (for example, the LADOT has a standard lane width of 12 feet and a minimum lane width of 10 feet, as documented in the 2020 Manual of Policies and Procedures - Application and Design for Striping, Channelization and Special Signing). These standards are adopted to reduce the likelihood of vehicle accidents. In addition, the affected jurisdiction would need to approve any design that deviates from the standard, and demonstrate that it would not have a detrimental effect on safety. As such, an increase in collisions due to the narrowing of lanes is not anticipated. However, if an increase in collisions does occur because of narrowed lanes, or the implementation of other mitigation measures, the Authority would work with the local and regional agencies to identify countermeasures to reduce the chance for vehicle crashes.

Locations where narrowed lanes would be needed, and whether reductions in on-street parking would be required, are unknown at this time. At any locations where this need is identified, the Authority would work with the affected jurisdiction to identify temporary replacement parking, as needed. As described above, implementation of TR-MM#12 requires the development of the CMP, which will include means to facilitate the flow of traffic in and around the construction zone. One measure is the stationing of traffic control officers at major intersections during peak times. Traffic control officers can override the pre-timed traffic signal phasing and green times, and thus can better adjust for high volumes and account for delays at critical movements. Another CMP measure is the development of alternative routes around sensitive facilities. Alternative routes differ from detour routes in that detour routes are established to direct traffic around roadway closures or where construction activities are occurring, whereas alternative routes are minor shifts in traffic which can be applied to detour routes or regular roadways. As such, these can be effective strategies to address construction activities.

Another typical measure associated with a CMP, which would be implemented as part of TR-MM#12, is a program to facilitate coordination and outreach with the public as well as with business owners. This program would distribute information about the construction process and facilitate coordination with business owners to minimize impacts during construction activities. The Authority will provide affected business owners individualized assistance and within the limits established by law and regulation,

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9179

minimize the economic disruption that could occur to property owners affected by project construction. More information on business disruption can be found in other portions of the EIR/EIS, including Section 3.12, Socioeconomics and Communities.

TR-MM#2 would include modifying signal timing and TR-MM#3 would include modifying signal phasing to accommodate construction-related activities. Traffic signals can operate on a pre-timed basis (where the green times for individual movements are fixed - either the same throughout the day, or vary by time of day) or actuated basis (where the green times are activity adjusted to reflect traffic volumes). Because of construction spoils truck activities and potential road closures, traffic patterns may change in the area during each phase of construction. These mitigation measures would require the Authority to modify the signalization plan to reflect different traffic volumes, thus improving the efficiency of the signal. At locations that have actuated traffic signals, the Authority could adjust the minimum and maximum green times per each approach to ensure that vehicular delays are minimized. TR-MM#4 would include installing temporary traffic signals to existing intersections generally within existing right of way.

In general, these signals could be beneficial when there would be an increase in vehicles at unsignalized intersections during construction. As traffic volumes increase, the provision of new traffic signals would improve operating conditions and the delay per vehicle. Note that signals would only be installed where the applicable traffic signal warrants would be met. The cost of the temporary signals would likely be less than a permanent signal and would be paid for by the Authority as a project mitigation requirement. As noted in TR-MM#6, there may be locations where the intersection could be widened by adding an additional through travel lane to mitigate the impact of construction activities. This would most likely be applied in rural locations or where additional right-of-way is available. Any changes to the roadway network proposed by the Authority would need to follow the design standards of the affected jurisdiction, LA DOT, and Caltrans, as appropriate. TR-MM#8 includes the reconfiguration of the intersection geometry to improve operating conditions and reduce delays. In these locations, the configuration of the intersection, in terms of the number of lanes at each approach, and their allowable movements would be modified to optimize operations (for example, a left-turn pocket could be provided with exclusive left-turn signal timing to replace a shared left-through lane). In combination, these mitigation measures would

### 4494-9179

help address operational issues to intersections, roadways, ramps, and freeway segments that would result from construction of the project, and the Authority would work with the applicable jurisdictions to design and implement the measures.

While the commenter suggests that the mitigation measures in the EIR/EIS are not feasible and will not work, the commenter does not provide evidence supporting this claim. The IAMFs and mitigation measures described in the Draft EIR/EIS, as summarized above, are feasible and implementable.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9180

Refer to Standard Response PB-Response-N&V-5: Impacts of Spoils Hauling (Noise).

The commenter notes that the responsibility of mitigating roadway impacts within the ANF and SGMNM is placed on the construction contractor.

As addressed in the Draft EIR/EIS, Appendix 3.1-C: Standardized Mitigation Measures, a Mitigation Monitoring Enforcement Plan (MMEP) is required, which identifies the responsibility and timing for each mitigation measure. Specifically, the Authority is accountable for the overall administration of the MMEP and for assisting in oversight and reporting responsibilities. The commenter states that roadways in the ANF and SGMNM are not built to accommodate the volume and weight of construction spoils hauling trucks. In the event that damage occurs to roadways within the ANF and SGMNM, TR-IAMF#1 would be implemented. This IAMF describes the Authority's commitment to returning public roadways to the equivalent of their original pre-HSR construction structural condition or better. Prior to construction, the Contractor shall provide a photographic survey documenting the condition of the public roadways along truck routes providing access to the project site. The photographic survey shall be submitted for approval to the agency responsible for road maintenance and the Authority and the Contractor shall be responsible for the repair of structural damage to public roadways caused by HSR construction or construction access, returning damaged sections to the equivalent of their original pre-project construction structural condition or better. To reduce the effect of construction-generated activity during times when the roadway network is most congested, TR-IAMF#6 restricts construction hours to minimize traffic impacts (generally between 7 a.m. and 9 a.m. and between 4 p.m. and 6 p.m. on weekdays). This may result in somewhat higher activities during non-peak periods (i.e., between 9 a.m. and 4 p.m.); however, roadways typically have lower volumes during these times and thus can better accommodate additional vehicles without the degradation of conditions and substantial increases in delays. Requiring construction activity to occur outside the peak hours will avoid creating the noise and air quality concerns raised by the commenter. Refer to PB-Response-N&V-5: Impacts of Spoils Hauling (Noise), for additional information regarding concerns of noise generated from spoils hauling associated with each of the Build Alternatives.

### 4494-9181

The commenter projects that the project construction may generate more greenhouse gases than the project will save. The Authority has calculated the payback of Greenhouse Gas (GHG) Emissions for the six Build Alternatives at 4 to 6 months of project operation (Draft EIR/EIS Table 3.3-44). In other words, the Authority predicts it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions. After that, the project will produce net benefits by reducing greenhouse gas emissions (Draft EIR/EIS page 3.3-126). The commenter contends that the HSR has been "the largest recipient of cap-and-trade funds," but "has achieved 0 tons of GHG reductions. . ." It reproduces data from the Cap-and-Trade Auction Proceeds 2021 Annual Report. The 2022 Scoping Plan, however, lays out a path to achieve targets for carbon neutrality and reduce anthropogenic greenhouse gas emissions by 85 percent below 1990 levels no later than 2045, as directed by Assembly Bill 1279. As transportation accounts for 38 percent of the State's current GHG emissions inventory (CARB 2022), public transportation projects of all kinds are critical to meeting the reduction goals (see CARB 2022, p. 194). There have been several studies and business plan models that reflect the current assumptions at the time of the study. The methods used to quantify the regional emissions are summarized in Section 3.3.4.3 of the Draft EIR/EIS. As such, projected GHG emissions reductions from the project, and the entirety of the larger HSR project, vary accordingly. In all cases, however, the project is predicted to reduce GHG emissions. The comment suggests that other projects could have more "efficacy" compared to the HSR. Inasmuch as the comment suggests that the project is not as valuable or cost-effective as other unrelated existing large-scale initiatives in reducing statewide GHG emissions, this is not a "significant environmental issue" associated with the project requiring a response under CEQA (see CEQA Guidelines section 15088(a)). NEPA does not require the cost-benefit analysis that the commenter seeks. Regarding the difference between the GHG reductions in the EIR/EIS and the 2021 CCI Climate Report, the EIR/EIS is based upon the 2016 Business Plan whereas the CCI Climate Report is based on the 2020 Business Plan. That 2020 Business Plan was not available when the Authority was developing the project baseline.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9182

The commenter inquires as to why there is a discrepancy in the data reported in the 2020 Business Plan and the data reported in the Draft EIR/EIS with respect to GHG reductions. The GHG emission reductions listed in Exhibits 1.4 and 1.5 of the 2020 Business Plan focus on cumulative emissions; the emission reduction for a specific year is the sum of the reduction for that year and all of the previous years. The Draft EIR/EIS presented emission reductions for specific, stand alone analysis years. In all cases, however, the project is expected to reduce GHG emissions (for example, as shown in Table 3.3-46 of the Draft EIR/EIS, the project is expected to reduce annual GHG emissions by 1.1 to 1.8 million metric tons per year). Regarding the difference between the GHG reductions in the EIR/EIS and the 2020 Business Plan, the EIR/EIS is based upon the 2016 Business Plan as opposed to the 2020 Business Plan. For the Draft EIR/EIS, the Authority used the 2016 information when developing its baseline. Using the 2016 Business Plan as a baseline, GHG emissions are still reduced compared to the 2020 Business Plan. Impact AQ#13 of the Draft EIR/EIS describes the statewide GHG reductions from operation of the Palmdale to Burbank Project Section. Please refer to Section 3.1.4.5 of the Final EIR/EIS, which provides additional information about the baseline used in the Draft EIR/EIS and why it is appropriate.

### 4494-9183

The commenter suggests that the California Climate Investments summary present data on the HSR. The Authority has no control over what data is included in reports prepared by other organizations, such as California Climate Investments (mentioned in the comment). Table 3.3-43, in Section 3.3 of the Draft EIR/EIS, shows the anticipated total GHG construction emissions for each of the six build alternatives. Table 3.3-44, in Section 3.3 of the Draft EIR/EIS, shows the payback of Greenhouse Gas Emissions for the six Build Alternatives. Depending on the Build Alternative and Ridership Scenario, construction-related GHG emissions would be paid back in 4 to 6 months of project operation, meaning that it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions. In summary, "[a]fter a maximum of 6 months, the Build Alternatives would result in net annual emissions reductions and a GHG benefit" (Draft EIR/EIS, p. 3.3-126). The California High Speed Rail Project is listed in the AB 32 Climate Change Scoping Plan (2008) under Recommended Actions: Emissions Reduction Measures #12 and also in the "2017 Scoping Plan Update as a component of a sustainable transportation system and would be consistent with the State's plan to achieve GHG emission reductions in the long run" (Draft EIR/EIS, pp. 3.3-126, 3.3-129). The 2022 Scoping Plan lists investment in public transit and expansion of planned networks of transportation infrastructure as strategies for achieving success under AB 32 (CARB 2022, p. 194). Thus, the project is considered a critical part of meeting the State's GHG emissions reduction goals under AB32 and certainly "would not impede the State from meeting the statewide GHG emissions reductions target" (Draft EIR/EIS, p. 3.3-129). Inasmuch as the comment suggests that the project is not as valuable or cost-effective as other unrelated existing large-scale initiatives in reducing statewide GHG emissions, this is not a "significant environmental issue" associated with the project requiring a response under CEQA (see CEQA Guidelines section 15088(a)). NEPA, too, does not require the cost-benefit analysis that the commenter seeks.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9184

The commenter inquires how the project will meet the requirements of AB 32. The commenter also cites the Due Diligence report and question how the project would achieve cost-effective reductions in GHG emissions.

The Due Diligence report referenced in the comment was published in 2013 and pre-dates the environmental studies performed for the project and is therefore not based upon project-specific assumptions and parameters. The Due Diligence report states that the Greenhouse Gas (GHG) emissions payback period for the project is expected to be 71 years. The Authority has calculated the Payback of GHG emissions for the six Build Alternatives at 4 to 6 months of project operation (Draft EIR/EIS Table 3.3-44). In other words, the Authority predicts it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions. After that, the project will produce net benefits by reducing greenhouse gas emissions.

The California High Speed Rail Project is listed in the AB 32 Climate Change Scoping Plan (2008) under Recommended Actions: Emissions Reduction Measures #12 and also in the "2017 Scoping Plan Update as a component of a sustainable transportation system and would be consistent with the State's plan to achieve GHG emission reductions in the long run" (Draft EIR/EIS, pp. 3.3-126, 3.3-129). The 2022 AB 32 Scoping Plan lists investment in public transit and expansion of planned networks of transportation infrastructure as a strategies for achieving success under AB 32 (CARB 2022, p. 194). Consequently, the project is considered a critical part of meeting the State's GHG emissions reduction goals under AB 32 and certainly "would not impede the State from meeting the statewide GHG emissions reductions target" (Draft EIR/EIS, p. 3.3-129).

Inasmuch as the comment suggests that the project is not as valuable or cost-effective as other unrelated existing large-scale initiatives in reducing statewide GHG emissions, this is not a "significant environmental issue" associated with the project requiring a response under CEQA (see CEQA Guidelines section 15088(a)). NEPA, too, does not require the cost-benefit analysis that the commenter seeks.

### 4494-9185

The commenter inquires how GHG emissions during operation of the project were calculated and if they account for construction emissions as well. The commenter also asks for the net increase or reduction in project emissions and questions how the payback period for GHG emissions was calculated. The commenter also references SB 32. Table 3.3-43 in Section 3.3 of the Draft EIR/EIS shows the anticipated total GHG construction emissions for each of the six build alternatives. Construction GHG emissions would be generated starting in year 2020 and end in year 2029. Table 3.3-44 in Section 3.3 of the Draft EIR/EIS shows the payback of greenhouse gas emissions for the six Build Alternatives. Note 1 of Table 3.3-44 explains how construction emissions factored into the calculations of GHG emissions payback. Payback periods were estimated by dividing the total GHG emissions generated during construction from year 2020 to year 2029 by the annual GHG emission reduction during operations. As shown in Table 3.3-44, depending on the Build Alternative and Ridership Scenario, construction-related GHG emissions would be paid back in 4 to 6 months of project operation, meaning that it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions. In summary, "[a]fter a maximum of 6 months, the Build Alternatives would result in net annual emissions reductions and a GHG benefit" (Draft EIR/EIS, p. 3.3-126). More specific detail can be found in the Air Quality and Global Climate Change Technical Report prepared for the project (see <https://hsr.ca.gov/programs/environmental-planning/project-section-environmental-documents-tier-2/palmdale-to-burbank-environmental-documents/>). The California Legislative Analyst's Office evaluation referenced in the comment was prepared in 2012 and pre-dates the environmental studies performed for the project and is therefore not based upon project-specific assumptions and parameters. In addition, the evaluation, and the way it is discussed in this comment, assessed the HSR project in its entirety, and not any one specific segment, such as the project. The Berkeley study referenced in the comment also pre-dates the environmental studies performed for the project and is not based upon project-specific assumptions and parameters. The Berkeley study does not represent the project as currently proposed. Regarding SB 32 (referenced in the comment), as stated in the Draft EIR/EIS, because of the net-negative effect of the project, "o]peration of any of the Build Alternatives would help the State reach the goal established in SB 32 (reduce GHG emissions to a level that is 40 percent below 1990 conditions by the year 2030)" (p. 3.3-129). As the project is unlikely be fully constructed and operational by

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9185

2030, this statement has been revised in the Final EIR/EIS to reflect how the project would help the state reach the goal established in AB 1279 for year 2045 goals of an 85 percent reduction below 1990 conditions (see Final EIR/EIS, p. 3.3-129) The comment references "SB 32," although it was likely referencing AB 32. In reference to that bill, the California High Speed Rail Project is listed in the AB 32 Climate Change Scoping Plan (2008) under Recommended Actions: Emissions Reduction Measures #12 and also in the "2017 Scoping Plan Update as a component of a sustainable transportation system and would be consistent with the State's plan to achieve GHG emission reductions in the long run" (Draft EIR/EIS, pp. 3.3-126, 3.3-129). The 2022 AB 32 Scoping Plan lists investment in public transit and expansion of planned networks of transportation infrastructure as a strategies for achieving success under AB 32 (CARB 2022, p. 194). Consequently, the project is considered a critical part of meeting the State's GHG emissions reduction goals under AB 32 and certainly "would not impede the State from meeting the statewide GHG emissions reductions target" (Draft EIR/EIS, p. 3.3-129).

### 4494-9186

The comment disputes the Authority's conclusions that it will, in the long-run, vastly decrease greenhouse gas (GHG) emissions. The Authority's calculations demonstrate that this project section, in particular, will only take six months of operations to offset its construction GHG emissions (Draft EIR/EIS Table 3.3-44). The commenter disputes the timelines and the mechanisms that the Authority will use to mitigate its GHG emissions. It fails to recognize that building a project of this size and scope requires time and investment for long-term benefits. At the Legislature's direction, the Authority has developed an ambitious project with ambitious timelines and an ambitious scope to benefit all Californians. The Draft EIR/EIS reflects that investment and those benefits. For details, service on the constructed portions of the California HSR system is expected to start in 2025 (Draft EIR/EIS, p. 2-197). The construction period for the entirety of the Palmdale to Burbank segment will vary between 8.33 and 9.25 years (Draft EIR/EIS, p. 2-198). As stated in the Draft EIR/EIS, because, on net, the project reduces greenhouse gas emissions: "[o]peration of any of the Build Alternatives would help the State reach the goal established in SB 32 (reduce GHG emissions to a level that is 40 percent below 1990 conditions by the year 2030)" (p. 3.3-129). SB32 effectively codified and replaced the directives in EO B-30-15 (Draft EIR/EIS, p. 3.3-10). However, as the project is unlikely be fully constructed and operational by 2030, this statement has been revised in the Final EIR/EIS to reflect how the project would help the state reach the goal established in AB 1279 for year 2045 goals of an 85 percent reduction below 1990 conditions. (see Final EIR/EIS, p. 3.3-129) Construction GHG emissions will, essentially, be offset by the net negative effect of project operation. As shown in Table 3.3-44, depending on the Build Alternative and Ridership Scenario, construction-related GHG emissions would be paid back in 4 to 6 months of project operation, meaning that it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions. In summary, "[a]fter a maximum of 6 months, the Build Alternatives would result in net annual emissions reductions and a GHG benefit" (Draft EIR/EIS, p. 3.3-126). The comment confuses GHG emissions and off-set credits. The comment suggests that the project emissions will exceed "AQMD emission levels in 7 of the 9 years of construction." Offset credits will not be purchased through SCAQMD for GHG emissions. The Authority will purchase credits from SCAQMD for other project-related construction air quality impacts, like volatile organic compounds (VOC), NOx, and particulate matter (PM10 and PM2.5). As explained in AQ-MM#1 (Draft EIR/EIS, p. 3.3-130 and Table 1 of the CHSR Standard Mitigation Measures), the Authority will use offsets to demonstrate that, during construction, those pollutant emissions will not

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9186

conflict with the State Implementation Plan (SIP) (see, e.g., Draft EIR/EIS, pp. 3.3-2, 3.3-72, 3.3-73, 3.3-79). As indicated in the comment, even with the purchase of a variety of offset credits vis-a-vis AQ-MM#1 through AQ-MM#3, the Draft EIR/EIS shows that for Impact AQ#2, Impact AQ#3, and Impact AQ#5, construction of the project would indeed lead to significant and unavoidable impacts after implementation of AQ-IAMF#1 through AQ-IAMF#6 (see Table 3.3-48). However, all other air quality impacts related to construction would be less than significant. Inasmuch as the comment suggests that the project may not fully comply with an investment plan prepared by the department of finance, this is neither a component of the project, nor is it a "significant environmental issue" associated with the project requiring a response under CEQA (see CEQA Guidelines section 15088(a)). For its part, NEPA does not require analysis of financial impacts, only environmental impacts.

### 4494-9187

The comment asks how the Authority can receive cap-and-trade funds for greenhouse gas (GHG) emissions while needing to purchase offset credits. The comment is conflating pollutant categories. For GHG emissions, Table 3.3-44 in Section 3.3 of the Draft EIR/EIS shows the payback of greenhouse gas emissions for the six Build Alternatives. Depending on the Build Alternative and Ridership Scenario, construction-related GHG emissions would be paid back in 4 to 6 months of project operation, meaning that it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions. In summary, "[a]fter a maximum of 6 months, the Build Alternatives would result in net annual emissions reductions and a GHG benefit" (Draft EIR/EIS, p. 3.3-126). Offset credits will not be purchased through SCAQMD for GHG emissions. The Authority will purchase credits from SCAQMD for other project-related construction air quality impacts, like volatile organic compounds (VOC), NO<sub>x</sub>, and particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>). As explained in AQ-MM#1 (Draft EIR/EIS, p. 3.3-130 and Table 1 of the CHSR Standard Mitigation Measures), the Authority will use offsets to demonstrate that, during construction, those pollutant emissions will not conflict with the State Implementation Plan (SIP) (see, e.g., Draft EIR/EIS, pp. 3.3-2, 3.3-72, 3.3-73, 3.3-79). No offset credits are proposed for GHG emissions (see Section 3.3.7).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9188

The comment asks if the Authority will return funds to the Greenhouse Gas Reduction funds. The comment inaccurately assumes that the HSR will not reduce greenhouse gas (GHG) emissions. Table 3.3-44 in Section 3.3 of the Draft EIR/EIS shows the payback of greenhouse gas emissions for the six Build Alternatives. Depending on the Build Alternative and Ridership Scenario, construction-related GHG emissions would be paid back in 4 to 6 months of project operation, meaning that it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions. In summary, “[a]fter a maximum of 6 months, the Build Alternatives would result in net annual emissions reductions and a GHG benefit” (Draft EIR/EIS, p. 3.3-126). The comment provides no evidence or analysis that suggests that the project will not result in a net negative reduction in GHG emissions. Inasmuch as the comment raises issues associated with government funding for the reduction of GHG emissions, this is neither a component of the project, nor is it a “significant environmental issue” associated with the project requiring a response under CEQA (see CEQA Guidelines section 15088(a)). Under NEPA, as well, project funding changes do not impact the human environment.

### 4494-9189

The commenter asks if there is “any possibility that CHSRA will not be permitted to purchase the entirety of credits necessary to offset its construction emissions?” It is anticipated that agreements will be in place with each air district to ensure that offset credits or other mechanisms account for the project’s construction emissions. The offset credits are required to demonstrate that the project’s criteria pollutant emissions generated during construction will not conflict with the State Implementation Plan (SIP) (see, e.g., Draft EIR/EIS, pp.3.3-2, 3.3-72, 3.3-73, 3.3-79). For details on the public’s opportunity to review and respond to the project and its environmental analysis, refer to Section 1.2.1 of Chapter 17 the Final EIR/EIS.

### 4494-9190

The commenter initially summarizes the construction activities that were evaluated in the Draft EIR/EIS. The commenter then proposes calculations of CO2 emissions that might have been generated by the manufacturer for the cement that would be used during the construction of the tunnels.

The commenter’s detailed assumptions and calculations are noted and appreciated. However, as shown in Table 3.3-3 (Key Topics and Issues for Air Quality and Global Climate Change Impacts) in Section 3.3, Air Quality and Global Climate Change, of the Draft EIR/EIS, the air quality and greenhouse gas analyses did include the emissions associated with the operation of concrete batch plants. These emissions included the delivery of the materials, including cement, required to manufacture the concrete and the trucks required to transport the finished product to the construction site.

As explained in the discussion of Impact AQ#12: Total Regional Construction Greenhouse Gas Emissions and Impact AQ#13: Statewide and Regional Operations Greenhouse Gas Emissions Analysis in Section 3.3 in the Draft EIR/EIS, all Build Alternatives for the Palmdale to Burbank Project Section, and the Statewide HSR System, would result in reductions in GHG emissions over the life of the project due to reductions in vehicle and aircraft travel. These GHG emissions reductions would offset the short-term GHG emissions associated with project construction, resulting in net reductions of GHG emissions, after the initial 4 to 6 months of operations. These GHG emissions reductions would continue in the long term over the life of the project. Thus, the project would have a long-term beneficial effect on GHG emissions and global climate change.

The Draft EIR/EIS does not evaluate GHG emissions generated upstream (e.g., material manufacturing) and downstream (e.g., recycling) of construction. Lifecycle emissions for cement and aggregate manufacturing, which is upstream of the concrete batching process, have been studied in various literature. Any indirect GHG emissions generated upstream and downstream of construction would not materially change the magnitude of the substantial GHG emissions reductions and beneficial climate change effects over the life of the project as disclosed in the Draft EIR/EIS.

The analysis in the Draft EIR/EIS is consistent with the California Natural Resources

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9190

Agency's Final Statement of Reasons for Regulatory Action Amendments to the State CEQA Guidelines (2018), which states that "a full 'lifecycle' analysis that would account for energy used in building materials and consumer products will generally not be required" under CEQA. The analysis in the Draft EIR/EIS also is consistent with the Council on Environmental Quality's interim NEPA Guidance on Consideration of Greenhouse Gas Emissions and Climate Change (88 Fed. Reg. 1196 [Jan. 9, 2023]), which states that "the rule of reason should guide the agency's analysis and the level of effort can be proportionate to the scale of the net GHG effects and whether net effects are positive or negative, with actions resulting in very few or an overall reduction in GHG emissions generally requiring less detailed analysis than actions with large emissions."

### 4494-9191

The commenter asks if the Draft EIR/EIS included the greenhouse gas emissions associated with the creation of the cement that would be used to build the tunnel portions of the project. Please refer to Response to Comment #9190.

### 4494-9192

The commenter asks about the source of concrete for the concrete/cement tunnel linings and asks "[h]ow many tons of CO<sub>2</sub> will be emitted during the production of the concrete needed to construct the remaining 492 miles connecting San Francisco to Los Angeles?" The commenter also asks if California Climate Investments is aware of the emissions figures. Regarding the questions about the source of concrete for concrete/cement tunnel linings, the pre-fabricated concrete tunnel lining segments would be produced locally at a precast plant installed by the contractor, or at existing pre-cast concrete plants adapted to produce the segments, which will depend on the contractor's means and methods planning. As required by AQ-IAMF#6, prior to construction of any concrete batch plant, the contractor will provide the Authority with a technical memorandum documenting consistency with the Authority's concrete batch plant siting criteria and utilization of typical control measures to reduce fugitive dust and emissions. Regarding the question about the transportation of pre-fabricated concrete tunnel lining pieces and associated GHG emissions, first the Authority would like to clarify that the commenter's estimate for the number of pre-fabricated lining segments is not correct. As documented in Volume 3 of the Draft EIR/EIS (PEPD Record Set REV02 Tunnel Plans, Dwg TNC0202), precast segments are typically 5.25 feet and not 40 feet as identified by the commenter. Emissions from truck material hauling and concrete production are included in the emissions modeling for the project, pursuant to assumptions made for the project (see Draft EIR/EIS, pages 3.3-1, 3.3-23 [Table 3.3-3], 3.3-27 to 3.3-28). Please see Section 3.3.6.3 of the Draft EIR/EIS, as well as the Palmdale to Burbank Project Air Quality and Global Climate Change Technical Report for additional emissions modeling details (see <https://hsr.ca.gov/programs/environmental-planning/project-section-environmental-documents-tier-2/palmdale-to-burbank-environmental-documents/>). Impact AQ#2 summarizes the regional air quality impacts; Impact AQ#4 summarizes the health risk assessment for construction emissions, including truck trips; Impact AQ#5 summarizes the localized construction effects of the air quality emissions; and Impact AQ#12 summarizes the total regional construction GHG emissions. For information on air emissions for other HSR segments, please refer to the other Tier 2 environmental documents for those segments, available at <https://hsr.ca.gov/programs/environmental-planning/project-section-environmental-documents-tier-2/>. Regarding the question as to how many tons of CO<sub>2</sub> will be generated during the production of concrete, the EIR/EIS calculates the total CO<sub>2</sub> emissions produced during construction for each of the six Build Alternatives. This calculation includes CO<sub>2</sub> emissions associated with concrete production and hauling to the construction sites. As reported in Table 3.3-43, the total amount of CO<sub>2</sub> generated

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9192

during construction ranges from a low of 5,372 Metric Tons (Refined SR14) to 7,167 Metric Tons (E2A). Regarding whether California Climate Investment is aware of the project and its CO<sub>2</sub> emissions, on Page 9 of the California Climate Investments 2023 Annual Report (CCI 2023), available at [https://ww2.arb.ca.gov/sites/default/files/auction-proceeds/cci\\_annual\\_report\\_2023.pdf](https://ww2.arb.ca.gov/sites/default/files/auction-proceeds/cci_annual_report_2023.pdf), includes the following statement: "The High Speed Rail Project predates California Climate Investments and has distinct approaches and methodologies for spending funds and tracking and assessing project benefits. Because of these differences, the 2023 Annual Report no longer includes High Speed Rail expenditures in the calculation of total implemented dollars in order to increase consistency with how the High Speed Rail Project is treated relative to all other programs and to provide increased clarity and transparency on the activities of the High Speed Rail Project and all other programs. "Page 50 of the CCI 2023 Annual Report includes the following estimate of the long-term GHG benefits of the HSR project: "Implementation of the High Speed Rail Project provides a variety of benefits to Californians. Estimated GHG emissions reductions from the High Speed Rail Project are 84 to 102 MMTCO<sub>2</sub>e over its first 50 years of operating life. "Therefore, CCI reports the long-term operational benefits of the HSR project but does not include them in the cumulative statistics included in Appendix A of the 2023 Annual Report. In as much as the comment questions the knowledge of another organization not under the control of the Authority, this is neither a component of the project, nor is it a "significant environmental issue" associated with the project requiring a response under CEQA (see CEQA Guidelines section 15088(a)). Emissions estimates for the other project segments can be found in the applicable EIR/EIS.

### 4494-9193

The commenter asks what the impact of the concrete required to reinforce sections of the tunnels will have on the project's greenhouse gas emissions.

The quantified greenhouse gas emissions from construction of the HSR Palmdale to Burbank Section is presented in Section 3.3, Air Quality and Global Climate Change of the Draft EIR/EIS (see Impact AQ#12). HYD-IAMF#6: Tunnel Lining Systems describes the types of linings that would be installed under various conditions.

As described in Section 3.3.4.3 of the Draft EIR/EIS, the Authority used a set of assumptions in quantifying greenhouse gas emissions. The assumptions used to quantify greenhouse gas emissions included the installation of a second concrete tunnel lining where conditions require it, pursuant to HYD-IAMF#6. Table 3.3-4 in the Draft EIR/EIS includes the construction activities for the project, including those for tunneling, and these assumptions were based, in part, on the quantities that would be needed for a second tunnel lining. Quantities of concrete lining, including those needed for the secondary lining of tunnels, are presented in Appendix D of the Air Quality Technical Report. See the Palmdale to Burbank Project Air Quality and Global Climate Change Technical Report for additional emissions modeling details (see <https://hsr.ca.gov/programs/environmental-planning/project-section-environmental-documents-tier-2/palmdale-to-burbank-environmental-documents/>).

As such, the analysis presented in the Draft EIR/EIS accounts for the greenhouse gas emissions associated with the limited installation of a second concrete tunnel lining. In addition, the project has an extensive sustainability program that aims to recycle as much material as possible and requires the use of materials with a low carbon footprint. Please also refer to response to comment #9190, which discusses lifecycle emissions analysis.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9194

The commenter inquires if tunnel spoils would be recycled to use as concrete for the tunnels and notes that the Palmdale to Burbank Project Section would result in more emissions than the Merced to Fresno Section which is of similar length.

The Draft EIR/EIS discusses the potential suitability for the reuse of tunnel spoils on pages 2-21 to 2-213. The use of tunnel spoils depends on the in-situ rock quality and the tunnel excavation method. Tunnel spoils coming from rock formations can be suitable to fill embankments, to produce drainage gravels or base layers and—in case of adequate rock material quality—for processing aggregates for concrete production. The Authority will evaluate the feasibility of using tunnel spoils for concrete production. The use of tunnel spoils is conditioned by the chemistry, mineralogy and particle size generated during excavation. It is also required to process these materials because excavation materials are not standard aggregates from a geometric, physical, and petrographic point of view. Furthermore, the quality of this materials is subject to variations in quality during tunnel driving, depending on the geological conditions and the applied excavation methods. As stated in the Draft EIR/EIS, however, the analysis “conservatively assumes that all of the spoils created during excavations would require off-hauling to disposal or re-use sites” (p. 2-12). The Authority continuously looks for opportunities to reduce emissions, including fuel and energy conservation; recycling and reusing steel, concrete and other materials during construction; specifying use of materials with lower global warming potentials; and using renewable energy. Please see the 2022 Sustainability report for HSR, for more information: <https://hsr.ca.gov/wp-content/uploads/2022/10/Sustainability-Report-Final-2022-1011-A11Y.pdf>.

The commenter states that the Palmdale to Burbank segment is only 28 miles. That is incorrect. Page 3.3-105 of the Draft EIR/EIS states that the Build Alternatives range in length from 31 to 38 miles long. The commenter also states that the Palmdale to Burbank segment would generate 400,000 to 1,000,000 tons of CO<sub>2</sub>. That is also incorrect. Depending on the build alternative, the project would generate 134,297 to 179,164 MTCO<sub>2</sub>e (Table 3.3-43 of the Draft EIR/EIS). Compared to the Madera to Fresno segment, the higher emissions associated with this segment of the HSR are due to the longer length and the tunneling required.

### 4494-9195

The commenter inquires as to why the project would not use existing transportation corridors rather than tunneling if tunneling produces much more GHG emissions. The commenter also references planting trees to reduce CO<sub>2</sub> emissions.

Please see response to comment #9194. While the emissions associated with a tunnel alternative are higher than an at-grade alternative, the emissions per mile are not 30 times greater. The commenter's calculations on tree-planting are similarly inaccurate. As this segment of the HSR project would generate 134,297 to 179,164 MTCO<sub>2</sub>e (Table 3.3-43 of the Draft EIR/EIS) the emissions are 4.5 to 6 times greater than those generated by the Madera to Fresno segment. Compared to the Madera to Fresno segment, the higher emissions associated with this segment of the HSR are due to the longer length and the tunneling required.

See Chapter 2 of the Draft EIR/EIS, Section 2.4.2 which describes the range of alternatives evaluated and why some were eliminated from further consideration. The Authority evaluated alternatives that would be more at-grade and follow the SR14 freeway more closely. However, these alternatives would result in substantial impacts to existing communities within the project area (see, e.g., Draft EIR/EIS, p. 2-47). In response the Authority developed alignment alternatives to avoid these adverse community impacts. Avoiding these communities requires diverting away from the SR14 freeway corridor. Because of the rugged terrain, this requires tunneling. By tunneling the alignment, alternatives avoid impacts to local communities, existing land uses, habitat, and resources at the surface. Please refer to the 2022 Sustainability Report for more information: <https://hsr.ca.gov/programs/green-practices-sustainability/sustainability-report/>.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9196

The commenter inquires if the project would plant 90 million trees, similar to the Madera to Fresno Project Section.

Table 3.3-44 in Section 3.3 of the Draft EIR/EIS shows the payback of greenhouse gas emissions for the six Build Alternatives. The Authority concluded that planting trees is unnecessary to reduce construction-related greenhouse gas (GHG) emissions. Depending on the Build Alternative and Ridership Scenario, construction-related GHG emissions would be paid back in 4 to 6 months of project operation, meaning that it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions. In summary, "[a]fter a maximum of 6 months, the Build Alternatives would result in net annual emissions reductions and a GHG benefit" (Draft EIR/EIS, p. 3.3-126). As shown in Table 3.3-10 of the Final EIR/EIS for the Merced to Fresno Project Section, the GHG emissions associated with the construction of the Merced to Fresno Project Section would be paid back within 2 to 4 months of project operation. The project is committed to being a net-zero GHG project - please refer to the 2022 Sustainability Report for more information: <https://hsr.ca.gov/programs/green-practices-sustainability/sustainability-report/>.

### 4494-9197

This comment contains only information and quoted text from a magazine article. No response required.

### 4494-9198

The commenter asks if the electrical requirement estimates shown in Table 3.6-22 (Estimated Energy Consumption for Construction of the Build Alternatives) in Section 3.6 of the Draft EIR/EIS include the energy required to run multiple tunnel boring machines (TBMs) a day with each boring machine requiring up to 3,500 kwh. The commenter then provides their own calculations for the GHG emissions that they estimated for the TBM electricity usage.

As detailed below, Table 3.6-22 in Section 3.6 in the Draft EIR/EIS does include the energy required for operation of TBMs during construction. Regarding the commenter-provided estimate, it is noted that the commenter relies on the EPA's online Greenhouse Gas Equivalencies Calculator for their calculation. As stated on the webpage of this calculator (<https://www.epa.gov/energy/greenhouse-gas-equivalencies-calculator>), the estimates provided by the calculator are approximate and should not be used for emission inventories or formal carbon emissions analysis. Values shown in Table 3.6-22 in Section 3.6 of the Draft EIR/EIS include the total energy that would be consumed for the construction of trackway, stations, and ancillary facilities; production and transportation of construction materials; and the operation and maintenance of construction equipment, including TBMs. However, as explained further below, the Authority used different assumptions about electricity use in the Draft EIR/EIS than the commenter. The commenter does not provide the source for the assumption that each TBM requires 3,500 kWh of electricity per day. The energy consumption of TBMs depends on various factors, such as the geological conditions, the operational parameters, the cutterhead design, and the drive system. The daily energy consumption can differ throughout the complete construction period. In addition, the GHG emissions related to this energy consumption is determined by the energy mix used for electricity generation at each moment, as the project would connect all TBMs to the existing electrical grid. The estimate of the maximum power requirements for TBM tunneling operations based on TBM specifications for similar tunnels (28 feet diameter, excavation in rock) is 15 MW (15,000 kW), with the following assumptions: two TBMs (Hard Rock Type) and their auxiliary services per tunnel portal; 15 MW (15,000 kW) of maximum demand power, considering both machines working full-load; the tunneling works will last several months, operating 24 hours per day, 7 days per week. These assumptions, based on information from TBM operation during construction of the Barcelona Metro Line 9 (Spain), are used in Table 3.6-22 of the Draft EIR/EIS. The particular construction

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9198

process of the tunnel will determine the energy consumed every day, but it will never reach the maximum power required multiplied by the operating time, as there are many circumstances where the TBMs will run at low power, will not run at the same time, or will completely stop due to routine maintenance operations. As such, the estimated energy consumption for construction of the Build Alternatives shown in Table 3.6-22 uses different assumptions than those identified by the commenter and the assumptions used by the Authority are based on estimates that consider the specific conditions associated with the project. In summary, the analysis as summarized in Table 3.6-22 of the Draft EIR/EIS includes energy required for operation of TBMs during construction. Although the calculations provided by the commenter differ in several ways from the estimates in the Draft EIR/EIS, the methodology used in the EIR/EIS is appropriate and supported by substantial evidence.

Regarding comments about GHG emissions associated with electricity use of TBMs, as discussed in Chapter 6, Methods of Evaluating Impacts, of the Air Quality Technical Report, GHG emissions generated by electricity used to power tunnel boring equipment were quantified using activity data (e.g., MWh) provided by the Palmdale to Burbank Project Section design team and the statewide grid average emission factors (Illanes pers. comm.; USEPA 2020b). The GHG emissions associated with that consumption are approximately 46,000 metric tons of carbon dioxide equivalent (CO<sub>2</sub>e) in total, six times higher than the estimate provided by the commenter. Note that the ratio used to translate electricity demand to GHG emissions in the Draft EIR/EIS analysis is different from that of the EPA calculator used by the commenter, because California's electricity is cleaner than what is assumed in the EPA calculator. As discussed in Impact AQ#12 of the Draft EIR/EIS, the total GHG construction emissions, including GHG emissions from TBM, would be less than 0.03 percent of the total annual statewide GHG emissions. Furthermore, the increase in GHG emissions generated during construction would be offset in less than one year by the net GHG reductions from HSR Phase 1 operations of the Palmdale to Burbank Project Section. As Table 3.3-46 of the Draft EIR/EIS shows, the project is predicted to have a beneficial effect on (i.e., reduce) statewide GHG emissions, when compared with the existing and 2040 future No Project baselines.

### 4494-9199

The comment asks whether the Draft EIR/EIS greenhouse gas (GHG) emissions estimates include GHG emissions generated by operation of the tunnel boring machines (TBMs). Yes, those emissions are included in the GHG emissions modeling for the project. Please see Section 3.3.6.3, Impact AQ#12, of the Draft EIR/EIS as well as the Palmdale to Burbank Project Air Quality and Global Climate Change Technical Report for additional emissions modeling details (see <https://hsr.ca.gov/programs/environmental-planning/project-section-environmental-documents-tier-2/palmdale-to-burbank-environmental-documents/>).

### 4494-9200

The commenter asks if SCE and/or LADWP can provide the electricity required for the project, notes that there is an electrical requirement for cement production, and provides GHG emissions estimates from the electricity needed for cement production. Impact PUE#11: Permanent Operations Energy Demand and Section 3.6.5.10 in Section 3.6, Public Utilities and Energy of the Draft EIR/EIS analyze the electricity generation and transmission capacity impacts. With implementation of PUE-IAMF#1, project operation would not place a substantial demand on regional energy supply, require significant additional capacity, or significantly increase peak- and base-period electricity demand, nor would it conflict with or obstruct a state or local plan for renewable energy or energy efficiency. The commenter also references the electricity required to produce the cement needed for the project and CO<sub>2</sub> emissions from cement production. The Draft EIR/EIS energy analysis calculates energy usage from construction activities, focused on emissions generated within the project study area. The energy required to produce the cement would be used at an off-site facility upstream of construction and through activities for which the Authority has no practical control. Therefore, the energy required to produce cement used in concrete was not considered. Please see response to comment #9190 for additional information about greenhouse gas emissions associated with cement production during project construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9201

The comment asks if the Draft EIR/EIS included the greenhouse gas (GHG) emissions associated with the electricity required to mix the concrete. No, the Authority did not include those emissions because the GHG emissions from electricity to power the concrete mixers was negligible. However, the air quality and GHG emissions analyses did include the emissions associated with the diesel concrete trucks. Table 3.3-44 of the Draft EIR/EIS shows the Payback of Greenhouse Gas Emissions for the six Build Alternatives. Depending on the Build Alternative and Ridership Scenario, construction-related GHGs would be paid back in 4 to 6 months of project operation. Adding the GHG emissions from electric mixers would have no effect on the project's payback period. With implementation of PUE-IAMF#1, project operation would not place a substantial demand on regional energy supply, require significant additional capacity, or significantly increase peak- and base-period electricity demand. The project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. The commenter remarks on the state, regional, and local air quality standards for sensitive receptors. As described in Draft EIR/EIS Section 3.3.5.5, the people in some locations are considered more sensitive to adverse effects from air pollution than in others. These locations, termed "sensitive receptors," include schools, daycare facilities, elderly care establishments, medical facilities, and other areas with people considered particularly vulnerable to the effects of poor air quality. Residential uses are also considered sensitive because people in residential areas are often at home—and therefore exposed to pollutants—for extended periods of time. Recreational areas are considered moderately sensitive to poor air quality because vigorous exercise associated with recreation places a high demand on the human respiratory function.

### 4494-9202

The commenter inquires why Angeles National Forest, the San Gabriel Mountains National Monument, the Big Tujunga Wash, and Hansen Dam are not included as sensitive receptors. The commenter also states that the construction period is noted in the Draft EIR/EIS to start in 2020 and that geotechnical investigations will still need to be conducted. National and state parks were not identified in the Draft EIR/EIS as per se sensitive receptors, as indicated in the comment. The South Coast Air Quality Management District (SCAQMD) defines sensitive receptors to be "any residence including private homes, condominiums, apartments, and living quarters, schools, preschools, daycare centers, and health facilities such as hospitals or retirement and nursing homes, long term care hospitals, hospices, prisons, and dormitories or similar live-in housing" ([http://www.aqmd.gov/docs/default-source/compliance/advisory\\_1470.pdf](http://www.aqmd.gov/docs/default-source/compliance/advisory_1470.pdf)). In addition, in Section 4.6.4 of their 2015 Air Toxics Hot Spots Program Guidance Manual, the California Office of Environmental Health Hazard Assessment (OEHHA) defines sensitive populations to "include young children and chronically ill individuals" and "may require that locations with high densities of sensitive individuals be identified (e.g., schools, nursing homes, residential care facilities, daycare centers, and hospitals)" as sensitive receptor locations (<https://oehha.ca.gov/media/downloads/cnr/2015guidancemanual.pdf>). Therefore, sensitive receptors represent locations where people congregate or occupy for long durations. Unless they include camping or educational areas, national parks are more of a transitory use and are not typically included. Figure 3.3-5 through Figure 3.3-14 of the Draft EIR/EIS show the 1,000-foot analysis buffer and identify the locations of sensitive receptors evaluated within the buffer for each modeling case, including recreational areas. As shown in Figure 3.3-13 of the Draft EIR/EIS, a recreational receptor was identified in the Big Tujunga Wash. Although the project alignment would traverse near or through the Angeles National Forest/San Gabriel Mountains National Monument, no sensitive receptors (i.e., no camping or educational areas) would be present in these areas. The Hansen Dam was not evaluated because this area was not within the 1,000-foot buffer. Regarding the project's construction schedule, Page 3.3-28 in the Draft EIR/EIS states the following, "Construction emissions calculations are included for each year of Build Alternative construction, which was assumed to occur from 2020 to 2029 at the time this analysis was conducted. While the year 2020 has passed, the listed construction years remain the same for purposes of this environmental analysis because the scope and scale of impacts on air quality are based on the number of construction

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9202

years and activities, which would remain the same in an updated construction timeline." Therefore, the use of this construction timeline and schedule would not result in additional adverse impacts.

Regarding information related to the project's geotechnical investigations, please refer to the response to comment 8844.

### 4494-9203

The commenter inquires why construction schedule includes dates that have already passed and notes that vehicle exhaust would be a significant impact under CEQA.

Regarding the project's construction schedule, Page 3.3-28 in Section 3.3 of the Draft EIR/EIS states the following, "Construction emissions calculations are included for each year of Build Alternative construction, which was assumed to occur from 2020 to 2029 at the time this analysis was conducted. Although the year 2020 has passed, the listed number of construction years remain the same for purposes of this environmental analysis because the scope and scale of impacts on air quality are based on the number of construction years and activities, which would remain the same in an updated construction timeline. If construction activities were to change in the future (i.e., improved technology leading to greater efficiencies), these changes would lead to less construction-related emissions." Therefore, the use of this construction timeline and schedule would not result in additional adverse impacts. The impact discussed on page 3.3-133 of the Draft EIR/EIS (Impact AQ#5), referenced in the comment, states that the impact will be significant and unavoidable, even after implementation of IAMFs and MMs, for two air pollutants under four worse-case scenarios.

### 4494-9204

The commenter inquires if emissions from spoils hauling trucks are included in the emissions modeling for the Palmdale to Burbank Project Section. Emissions from truck material hauling is included in the emissions modeling for the project, pursuant to assumptions made for the project (see, e.g., Draft EIR/EIS, pp. 3.3-1, 3.3-23 [Table 3.3-3], 3.3-27 to 3.3-28). Please see Section 3.3.6.3 of the Draft EIR/EIS as well as the Palmdale to Burbank Project Section: Air Quality and Global Climate Change Technical Report for additional emissions modeling details (see <https://hsr.ca.gov/programs/environmental-planning/project-section-environmental-documents-tier-2/palmdale-to-burbank-environmental-documents/>). Please see Section 3.3 of the Final EIR/EIS for updated information on emissions, including truck trips. Impact AQ#2 summarizes the regional air quality impacts; Impact AQ#4 summarizes the health risk assessment for construction emissions, including truck trips; Impact AQ#5 summarizes the localized construction effects of the air quality emissions; and Impact AQ#12 summarizes the total regional construction GHG emissions.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9205

The commenter inquires as to what the consequence of significant vehicle exhaust emissions is and if a Statement of Overriding Conditions will be prepared for significant and unavoidable impacts. The commenter also states that there is no evidence that the project will lead to a reduction in airline travel because airline tickets are cheaper and are faster.

The Authority will prepare a Statement of Overriding Conditions for any significant and unavoidable impact for which mitigation is not available or would not reduce the impact to a less than significant level, and provides Findings as to the reasons for doing so, pursuant to CEQA Guidelines sections 15093 and 15091. These Findings will be included with the Final EIR/EIS and be part of any Board approval of the project. There is no plan at this time to present the Statement of Overriding Conditions to the State Legislature, nor is that required under CEQA. For its GHG emissions analysis, the Draft EIR/EIS assumed a reduction in aircraft emissions when compared to the No Project baseline as a result of some intrastate travelers shifting to HSR (Draft EIR/EIS, p. 3.3-114). Assumptions regarding flight reductions due to the project can be found in the Business Plan analyses.

### 4494-9206

This comment refers to analyzing flight reductions under different assumptions than were used in the Authority's Business Plan and does not offer any authority or evidence supporting these modified assumptions. Refer to response to comment 9205 for information on the assumptions used in the Draft EIR/EIS associated with a reduction in flight emissions and the GHG analysis. Refer to response to comment 9183 for a description of how the project is considered a critical part of meeting the State's GHG emissions reduction goals under AB 32. Inasmuch as the comment suggests that the project is not as valuable or cost-effective as other unrelated existing large-scale initiatives in reducing statewide GHG emissions, this is not a "significant environmental issue" associated with the project requiring a response under CEQA (see CEQA Guidelines section 15088(a)). NEPA, too, does not require the cost-benefit analysis that the commenter seeks.

### 4494-9207

The comment asserts that the Authority "cannot demonstrate that it can achieve cost-effective reductions in GHG emissions." The facts demonstrate otherwise. The California High Speed Rail Project is listed in the AB 32 Climate Change Scoping Plan (2008) under Recommended Actions: Emissions Reduction Measures #12 and also in the "2017 Scoping Plan Update as a component of a sustainable transportation system and would be consistent with the State's plan to achieve GHG emission reductions in the long run" (Draft EIR/EIS, pp. 3.3-126, 3.3-129). The 2022 AB 32 Scoping Plan lists investment in public transit and expansion of planned networks of transportation infrastructure as a strategy for achieving success under AB 32 (CARB 2022, p. 194). Thus, the project is considered a critical part of meeting the State's GHG emissions reduction goals under AB 32 and certainly "would not impede the State from meeting the statewide GHG emissions reductions target" (Draft EIR/EIS, p. 3.3-129). Section 3.3.6.3 of the Draft EIR/EIS presents air quality impacts associated with project air emissions. Some impacts for some build alternatives will remain significant and unavoidable, even after implementation of IAMFs and MMs. CEQA does not require an EIR to demonstrate that all project-related air quality impacts be reduced to less than significant; it only requires that an EIR disclose all possible air quality impacts associated with a project and consider feasible mitigation measures to reduce impacts (see, generally, CEQA Guidelines §§15126.2, 15126.4). NEPA, too, does not require an agency adopt any particular mitigation measure. It only requires analysis. Although this comment does not offer any potential mitigation measures to reduce air quality impacts, the Draft EIR/EIS includes three feasible measures to reduce impacts. Inasmuch as the comment suggests that the project is not cost-effective enough to receive government funding or cap-and-trade auction proceeds from unrelated programs and projects associated with a reduction in GHG emissions, this is not a "significant environmental issue" associated with the project requiring a response under CEQA (see CEQA Guidelines section 15088(a)). NEPA, too, does not require the cost-benefit analysis that the commenter seeks.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9208

The commenter inquired about what actions will the Authority take to minimize the impacts of EMI/EMF, inquired about a different project section, and asked about methods to ensure contractor compliance.

In Final EIR/EIS Section 3.5, Electromagnetic Interference and Electromagnetic Fields, EMI/EMF-IAMF#2 includes measures to avoid potential impacts via coordination with the Federal Aviation Administration's spectrum engineering office and airport staff, identification of existing airport radio systems, and selection of systems to prevent EMI with identified airport uses. In addition to EMI/EMF-IAMF#2, the Implementation Stage Electromagnetic Compatibility Program Plan (ISEP) and Electromagnetic Compatibility Program Plan (EMCPP) would require monitoring and evaluation of systems performance to ensure compatibility with airport systems (FAA 2014a, of Section 3.5, Electromagnetic Interference and Electromagnetic Fields).

The mechanism for ensuring compliance with all regulations and contractual obligations by the selected contractors (for the entire California HSR system, including the Merced to Fresno Project Section and Fresno to Bakersfield Project Sections which are now under construction, as well as the Palmdale to Burbank Project Section) includes adherence to all IAMFs (i.e., EMI/EMF-IAMF#2). IAMFs are design features and will be required to be implemented for the entire California HSR system.

During development of the design package, the IAMFs will be reaffirmed to be compliant with the design package and any other avoidance or minimization measures that are required during coordination with third parties. With compliance of IAMFs, any impacts regarding electromagnetic interference will be avoided and/or minimized where applicable. In addition, Section 3.5 of the Final EIR/EIS describes a mitigation measure proposed to be implemented to reduce impacts of the project on EMI/EMF. In summary, the Authority will ensure that appropriate standards related to EMI/EMF are met through implementation of its design features (i.e., IAMFs), which the Authority has committed to implement as part of the design of the California HSR System, as well as through application of mitigation.

### 4494-9209

The commenter inquired about mitigation measures for sensitive receptors within the Resource Study Area (RSA) include impacted businesses, homes, schools, and wildlife. The commenter expresses concern regarding the Palmdale to Burbank Project Section's operation emitting EMI during infrastructure emergencies. Sensitive receiver and radio interference RSAs used to analyze EMI/EMF impacts include the rail alignments, station areas, and ancillary facilities capable of producing EMI/EMFs, including substations, power lines, and electrical interconnections. As noted in Section 3.5, Electromagnetic Interference and Electromagnetic Fields, the sensitive receiver and radio interference RSAs include urban and developed areas in Palmdale, Los Angeles, Burbank, and unincorporated portions of Los Angeles County that encompass the Angeles National Forest. Computer modeling predicts that the EMF level would decay to less than 2 mG at 200 feet from either side of the HSR right-of-way centerline. However, to be conservative, a 500-foot buffer on either side of the HSR alignment centerline (a 1,000-foot-wide corridor) was used for the sensitive receiver RSA. Sensitive receivers within the 500-foot screening distance of the alignment could be impacted by implementation of the Build Alternatives, whereas sensitive receivers outside of this area would be unlikely to experience effects (Authority 2010a). For sensitive receivers such as Sierra Hospital, mitigation measure EMI/EMF-MM#1 will be implemented, which includes requirements of contacting affected third parties to explore relocation or shielding affected equipment to eliminate interference. As also noted in Section 3.5, Electromagnetic Interference and Electromagnetic Fields, right-of-way fencing would prevent larger wildlife from traveling in proximity to harmful EMF levels. For smaller wildlife traveling near the Build Alternative alignments, the effects would be minimal as the wildlife would be exposed in short durations of time, therefore limiting the effects of EMF levels. Because of the fencing, it is unlikely that wildlife would be exposed to high levels of EMF for an extended period of time. Therefore, no impact would occur.

As shown in Table A3.5-1, Band B6 is 200MHz (or 0.2 GHz) to 2.2 GHz and Band B7 is 2.0 GHz to 6.0 GHz, which includes the VHF and UHF bands. HAM radio, which is amateur radio, may be granted permission to transmit emergency communication in certain situations. Emergency HAM Radio is not mentioned explicitly in this EIR/EIS since it is not a part of the existing ambient environment.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9210

The commenter inquired about the exclusion of HAM radiofrequencies above 2,000 Megahertz (MHz), the use of radio frequency (RF) environment capped at 6 Gigahertz (GHz), questioned why the RF environment was capped at 200 MHz for Table A3.5-1, and why RF impact on HAM radios was not analyzed in the Draft EIR/EIS.

Baseline measurements to characterize the RF environment were taken in a range from 10 kilohertz (kHz) to 6 GHz, which does include 2000 MHz (2GHz). The 10 KHz to 6 GHz range is used for characterizing the existing ambient environment. Emergency operation is not captured in ambient measurements. As shown in Table A3.5-1 in Appendix 3.5-A, Electromagnetic Measurement Survey Summary of the Draft EIR/EIS, Band B6 is 200 MHz (or 0.2 GHz) to 2.2 GHz and Band B7 is 2.0 GHz to 6.0 GHz, which includes the VHF and UHF bands. HAM radio, which is amateur radio, may be granted permission to transmit emergency communication in certain situations. Emergency HAM radio is not mentioned explicitly in the Draft EIR/EIS since it is not a part of the existing ambient environment. To minimize interference from HSR communication systems, the HSR Build Alternative would employ dedicated, exclusive-use radio bands (Authority2016a). In addition to the use of frequency bands dedicated to the HSR system, the Authority would require communications equipment procured for HSR use, including commercial and noncommercial off-the-shelf products, to comply with FCC regulations designed to prevent EMI with other equipment, as called for in EMI/EMF-IAMF#2. Potential impacts would be avoided through implementation of EMI/EMF-IAMF#2, which would provide the necessary third-party coordination through the EMCPP and ISEP. During the planning stage through system design, the Authority would perform additional EMC/EMI safety analyses. Furthermore, emergency radio operators are expected to be operating with FCC compliant radio communication equipment, also on dedicated frequency bands. Lastly, frequencies in the SHF and EHF range are typically reserved for high precision systems, which require direct line-of-sight, and is beyond the range of what would be typical radiocommunications.

### 4494-9211

The comment inquires if the Authority decided to use renewable energy to power the project because of Senate Bill 100 (The 100 Percent Clean Energy Act). The Authority's decisions to use renewable energy power preceded the Governor's signing of Senate Bill 100 in September 2018. As explained in Section 3.6.6.3 of the Draft EIR/EIS, the Authority adopted a policy goal of using renewable energy for all traction power in 2008, and adopted its further goal to purchase 100 percent of the entire system's power from renewable energy sources in 2018. Accordingly, these commitments were not made on the basis of Senate Bill 100.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9212

The commenter questions the validity of the project energy requirements due to the age of the analysis, which the commenter states is 10 years old.

Data in Table 3.6-22, Estimated Energy Consumption for Construction Build Alternatives, in Section 3.6 of the Draft EIR/EIS is based on the Fuel Consumption and Power Usage Matrix prepared in 2017. Operational energy consumption is based on the Authority's 2016 Business Plan. The baseline year for the analysis of project impacts was established after the CEQA Notice of Preparation and NEPA Notice of Intent were issued in 2014, with a public scoping period for the project, and at the onset of environmental analysis (see Draft EIR/EIS, Section S-7, pages 3.3-23 to 3.3-24). CEQA Guidelines section 15125(a)(1) supports establishing baseline physical conditions in this manner, therefore, the use of 2016 data in the Draft EIR/EIS is appropriate.

Additionally, the Authority has adopted a sustainability policy under PUE-IAMF#1 as part of the Build Alternatives that establishes design elements and policies intended to reduce energy consumption, including but not limited to, energy-saving equipment, energy-saving measures during construction, and regenerative train braking. With implementation of PUE-IAMF#1 and standard BMPs, project construction would not result in wasteful, inefficient, or unnecessary consumption of energy resources. Construction of the Palmdale to Burbank Project Section would also be consistent with state and local plans and policies related to renewable energy and energy efficiency. With adherence to the Authority's policy on sustainability under PUE-IAMF#1, construction of the Build Alternatives would not result in a substantial demand on regional energy supplies, require additional energy capacity, or substantially increase peak or base period electricity demand.

The commenter identifies the addition of renewable power sources to the grid. Page 2-30 of Chapter 2 of the Draft EIR/EIS indicates the Authority's commitment to using 100 percent clean, renewable energy sources. As such, the addition of more renewable energy sources would improve the future conditions of reliable clean energy to power the California HSR system. The commenter also identifies the expanding electrification of automobile transportation. According to the California Energy Commission, at the end of 2022, battery electric vehicles accounted for 2.6 percent of total light-duty vehicles in California, compared to 0.5 percent in 2016 (<https://www.energy.ca.gov/data->

### 4494-9212

[reports/energy-almanac/zero-emission-vehicle-and-infrastructure-statistics/light-duty-vehicle](https://www.energy.ca.gov/data-reports/energy-almanac/zero-emission-vehicle-and-infrastructure-statistics/light-duty-vehicle)). While electrification of automobile transportation is expanding, the vast majority (97.4%) of light-duty vehicles are not electric, and the difference (an increase of 2.1 percentage points) would not measurably alter the estimated energy consumption in Table 3.6-22 in Section 3.6, nor modify the findings or conclusions in the Draft EIR/EIS. Further, as noted previously, it is appropriate for the Draft EIR/EIS to use data from 2016.

### 4494-9213

The commenter asks what discussions have occurred between the Authority and SCE, LADWP and BWP. Please refer to Draft EIR/EIS Chapter 9: Public and Agency Involvement for additional information. Section 9.6 Log of Public and Agency Meetings and Table 9-5 lists outreach and related meetings for the Palmdale to Burbank Project Section. Meeting with SCE occurred on July 8th, 2020 and with LADWP on November 7, 2018. Federal, state, regional, and local agencies, tribes, elected officials, neighborhood councils, organizations, businesses, and the general public participated in these meetings to obtain project information and provide feedback. Additional public and agency meetings have occurred between 2017 and 2021. Due to the COVID-19 pandemic, meetings in 2020 through September 2021 were held virtually over Zoom Meetings. In addition, the Authority will carry out detailed coordination with the California Independent System Operator and California Public Utilities Commission to determine and resolve any applicable regulatory issues as the Authority approaches important milestones, including initiating interconnection agreements. For additional information regarding energy, please refer to the Authority's 2022 Sustainability Report, which can be accessed here: <https://hsr.ca.gov/wp-content/uploads/2022/10/Sustainability-Report-Final-2022-1011-A11Y.pdf>.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9214

Refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption.

Refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption. The commenter asks if the Utilities have committed to supplying 100 percent green electricity for the project during various scenarios, including during peak power requirements and heat waves. The commenter also asks about the Authority's planned power backup capabilities. Please refer to Section 2.3.7 of the Draft EIR/EIS and Standard Response PUE-1: Energy Usage and Consumption, which provides information about how the Authority has verified the feasibility of powering the California HSR System with 100 percent renewable energy sources. Regarding coordination with Utility providers for renewable energy, the Authority will carry out detailed coordination with the California Independent Systems Operator and California Public Utilities Commission to determine and resolve any regulatory issues as the Authority approaches important milestones, including initiating interconnection agreements. For additional information regarding energy, please refer to the Authority's 2022 Sustainability Report, which can be accessed here: <https://hsr.ca.gov/wp-content/uploads/2022/10/Sustainability-Report-Final-2022-1011-A11Y.pdf>.

Regarding power back up capabilities, please refer to Appendix 2-D: Design Baseline Report (page 2-35 "Backup and Emergency Power Supply Sources for Stations and Facilities") in the Draft EIR/EIS. During normal system operations, power would be provided by the local utility or a TPSS. Should the flow of power be interrupted, the system would automatically switch to a backup power source: an emergency standby generator, an uninterruptable power supply, or a direct current (DC) battery system. For the Palmdale to Burbank Project Section, permanent emergency standby generators are anticipated to be located at passenger stations and terminal layup/storage and the Maintenance Facility. Standby generators are required to be tested (typically once a month for a short duration) in accordance with National Fire Protection Association (NFPA) 110/111 to verify readiness for backup and emergency use. If needed, portable generators could also be transported to other trackside facilities to reduce the impact of power interruptions on system operations.

### 4494-9215

Refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption.

The commenter asks if the Authority has provided peak/normal/minimal power supply requirements to Southern California Edison (SCE), Los Angeles Department of Water and Power (LADWP), and Burbank Water and Power (BWP) and whether these utilities have committed to increasing their infrastructure to meet power requirements for the California HSR System.

As discussed in Section 3.6.4.3 in Section 3.6, Public Utilities and Energy, of the Draft EIR/EIS, the energy analysis focuses on the Palmdale to Burbank Project Section's demand on regional energy supply and the potential need for additional electrical generation capacity to support operations, peak-period electricity demand for operations, overall statewide energy consumption for transportation, and construction-related energy consumption, primarily derived from extending electric utilities to HSR tunnel portal areas during construction. Because the analysis was based on the peak-period energy demand for operation of the project, which provides a worst-case scenario, there is no need to analyze "normal" and "minimal" power demands. The operation energy analysis uses a dual baseline approach. That is, the Palmdale to Burbank Project Sections energy impacts evaluated against existing conditions (2015) and expected 2040 No Project conditions. Impacts in the opening year of HSR operations were also considered. The Authority calculated operation energy consumption for medium and high ridership scenarios for the Phase 1 HSR system. The medium and high scenarios are based on the 2040 level of ridership as presented in the Authority's 2016 Business Plan. As explained in Section 3.1.4.5 of the Final EIR/EIS, the latest 2024 Business Plan shows a lower ridership compared to the 2016 Business Plan. The analysis related to energy use from project operation relied on the assumptions in the 2016 Business Plan. Lower ridership would correlate with reduced energy offsets. However, energy use offsets would still be expected given that vehicle and aircraft trips would still be replaced by rail trips. Therefore, the analysis in this section would still be accurate despite the lower ridership projected in the 2024 Business Plan. Please refer to Standard Response PB-PUE-1: Energy Usage and Consumption, which directs readers to Impact PUE#6: Temporary Energy Consumption during Construction for information regarding temporary energy requirements for project construction and Impact PUE#11: Permanent Operations Energy Demand for details regarding operational

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9215

energy requirements. The complete statewide analysis is included in Appendix 3.6-A, with detailed calculations on the reduction in energy consumption from transportation.

The Authority has met with SCE, LADWP, and BWP to discuss rail system power needs and potential electrical interconnections to each system. Please refer to the utility owner contact logs within Appendix 3.6-A, High Risk & Major Utility Impact Report, for detailed records on coordination with utility providers.

As discussed in Section 2.3.7 and Impact PUE #11: Permanent Operations Energy Demand in Section 3.6, Public Utilities and Energy, of the Draft EIR/EIS, the Palmdale to Burbank Project Section would not include the construction of a separate power source, but instead, would require the extension of underground or overhead power transmission lines to a series of power substations positioned along the HSR corridor. These power substations would be needed to even out the power feed to the train system. Working in coordination with power supply companies and per design requirements, the Authority has identified frequency and right-of-way requirements for these facilities. Power for the Palmdale to Burbank Project Section would be supplied either by SCE or LADWP transmission lines. SCE has indicated that serving the Palmdale to Burbank Project Section could require reconstruction of some existing lines. This could consist of reconductoring or of installing new power poles. Where electrification of the system is required, power companies would design and implement changes to their transmission lines, which include environmental review and clearance of the reconstruction. If the engineering design for new or upgraded SCE or LADWP facilities involves new or different significant environmental impacts, additional environmental review, and analysis of the new equipment, including reconstruction of transmission lines, would be completed as part of the California Public Utilities Commission permit application process prior to construction.

The Authority has designated staff to collaborate with utilities and renewable energy developers (who may construct facilities that contribute wind, solar, or other renewable sources to the power grid). The utilities coordination staff have a strong understanding of HSR system electricity demands and of how these demands impact negotiations with utilities and renewable energy developers. Furthermore, the Authority is developing a strategic renewable energy procurement plan that requires extensive collaboration and

### 4494-9215

can be supported through stakeholder engagement, internal and external working groups, and creation and selection of efficient and effective instruments for power procurement. The Authority will continue to gather and synthesize information to develop this plan for the California HSR System, pursuant to the Authority's 2011 Technical Memorandum TPS Interconnections to Utility (TM 300.01).

It is important to note that potential impacts from the California HSR System would not affect statewide electricity reserves or transmission capacity. Additionally, the HSR system in California will run entirely on electricity generated from renewable sources, such as solar, wind, geothermal, and bioenergy. Not only will the trains use 100 percent renewable energy, but the stations and maintenance facilities have been designed to be sustainable. Furthermore, as described in PUE-IAMF#1, the California HSR System design incorporates utilities and design elements that minimize electricity consumption (e.g., regenerative braking, energy-saving equipment on rolling stock and at station facilities, implementation of energy-saving measures during construction, and automatic train operations to maximize energy efficiency during operations). The net change in energy use (i.e., after the energy savings from reduction in roadway vehicle miles traveled and in air trips are factored in, inclusive of the Palmdale Subsection and the Maintenance Facility) would result in statewide energy savings of 15,427,699 million British thermal units (MMBtu) (or 4,521,412 megawatt-hours [MWh]) per year under the medium ridership scenario and 23,641,108 MMBtu (6,928,525 MWh) per year under the high ridership forecast compared to the 2040 No Project Alternative.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9216

The commenter asks how much power is to be delivered to each power distribution station and if electrical infrastructure will need to be upgraded as a result of the project and who will pay for that upgrade. Please refer to the Appendix 2-D: Design Baseline Report in the Draft EIR/EIS. Based on the California HSR System's estimated power needs, each Traction Power Substation (TPSS) would need to be approximately 32,000 square feet (200 feet by 160 feet) and be located at approximately 30-mile intervals. Each TPSS would have two 115/50-kV or 230/50-kV single-phase transformers. These transformers would interconnect the TPSS to two breaker-and-a-half bays, built at a new utility switching station within the fence line of an existing utility facility. Interconnection would be made by a short section of 230-kV transmission or 115-kV power lines (tie-lines). Per Authority requirements, the proposed interconnection points would need redundant transmission (i.e., double-circuit electrical lines) from the point of interconnection, with each interconnection connected only to two phases of the transmission source. A new utility switching station would encompass approximately 32,200 square feet (160 by 220 feet) and include an approximately 975-square-foot (15 by 65 feet) control building, a 525-square-foot (15 by 35 feet) battery building, and, if required, a retention basin.

Regarding network upgrades, the Authority has coordinated with Pacific Gas and Electric Company and Southern California Edison and determined that network upgrades would be required to meet the projected power demands of the 345-mile portion of the California HSR System within the two utilities' respective service territories. Detailed engineering of electrical interconnections and network upgrade components has not been undertaken and would not be completed until closer to the time of construction. Network upgrades could include modifications to existing infrastructure such as expansion of existing substations and reconductoring of existing electrical lines (i.e., replacement of power structures [poles and lattice steel towers] and electrical conductors with taller structures and more efficient electrical wires or new electrical lines). Anticipated network upgrades are included in the Build Alternative footprint and would be implemented pursuant to California Public Utilities Commission General Order 131-D. The Authority would construct and pay for the necessary utility infrastructure needed to support project operations. For further information, please refer to Chapter 6 Project Costs and Operations in the Draft EIR/EIS. Please refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption which

### 4494-9216

discusses the Authority's policy goal which is to use 100% clean, renewable electricity for the operation of the HSR.

### 4494-9217

The commenter inquires as to whether the cost of additional electrical infrastructure required to power HSR has been included in the latest Palmdale to Burbank Project Section cost projections. The project costs presented in the Draft EIR/EIS include costs associated with providing electrical infrastructure during construction as well as electrical infrastructure within the Project Section for operations.

### 4494-9218

The commenter asks about interagency and utility provider coordination associated with utilities and high fire danger. Regarding the comment about wildfire, the Authority considered the potential impacts of wildfire from operation of the HSR Palmdale to Burbank Project Section in Section 3.11, Safety and Security, of the Draft EIR/EIS. Please refer to Impact S&S#19, which discusses SS-IAMF#1 and SS-IAMF#2, which will implement fire and life-safety programs during design, operations, and maintenance of the Palmdale to Burbank Project Section to reduce the risk of wildfire from the Build Alternatives. Regarding a contingency plan in place to address the potential for local utility blackouts: please refer to Appendix 2-D: Design Baseline Report (page 2-35 "Backup and Emergency Power Supply Sources for Stations and Facilities") in the Draft EIR/EIS. During normal system operations, power would be provided by the local utility or a TPSS. Should the flow of power be interrupted, the system would automatically switch to a backup power source: an emergency standby generator, an uninterruptible power supply, or a direct current (DC) battery system. For the Palmdale to Burbank Project Section, permanent emergency standby generators are anticipated to be located at passenger stations and terminal layup/storage and the Maintenance Facility. Standby generators are required to be tested (typically once a month for a short duration) in accordance with National Fire Protection Association (NFPA) 110/111 to verify readiness for backup and emergency use. If needed, portable generators could also be transported to other trackside facilities to reduce the impact of power interruptions on system operations.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9219

The commenter asks about how electricity would be obtained during a planned power outage, as well as prioritization of electricity use. Please refer to Appendix 2-D: Design Baseline Report (page 2-35 "Backup and Emergency Power Supply Sources for Stations and Facilities") in the Draft EIR/EIS. During normal system operations, power would be provided by the local utility or a TPSS. Should the flow of power be interrupted, the system would automatically switch to a backup power source: an emergency standby generator, an uninterruptible power supply, or a direct current (DC) battery system. For the Palmdale to Burbank Project Section, permanent emergency standby generators are anticipated to be located at passenger stations and terminal layup/storage and the Maintenance Facility. Standby generators are required to be tested (typically once a month for a short duration) in accordance with National Fire Protection Association (NFPA) 110/111 to verify readiness for backup and emergency use. If needed, portable generators could also be transported to other trackside facilities to reduce the impact of power interruptions on system operations. This process would not require the prioritization of electricity use.

### 4494-9220

Refer to Standard Response PB-Response-S&S-1: Wildfire.

The commenter requested further information on measures that would be implemented to mitigate wildfire hazards from the project. This topic is further discussed in Standard Response PB-Response-S&S-1: Wildfire.

### 4494-9221

The commenter asks about temporary power and associated infrastructure. Please refer to Appendix 2-D: Design Baseline Report (page 2-33) in the Draft EIR/EIS, which clarifies that during construction and operation, portals, adits, temporary work sites, and certain other ancillary facilities would require power supplies. These power supplies would generally connect to the nearest existing overhead transmission lines. The Authority will be responsible for the cost, installation and removal of any temporary infrastructure required. No power rates have been negotiated at this stage of the project. The Authority will continue to coordinate with electricity suppliers during subsequent stages of the project.

### 4494-9222

The commenter asks whether the Authority has considered alternative electrical power supplies, including placing solar power arrays at power distribution stations, above ground rights-of-way above the tracks, and electrical train connections. The Authority did consider alternative energy methods, and the Draft EIR/EIS discussed that the project would use renewable energy sources. The Authority welcomes the suggestion of placing solar arrays at power distribution stations, above ground rights-of-way above the tracks, and electrical train connections. The Authority is proposing an energy net positive design criterion for stations and facilities, which aims to generate at least 5 percent more energy than is needed to meet the building requirements. At stations and facilities, this could take the form of solar arrays. Please refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9223

The commenter questions the use of the 2016 baseline data in Section 3.6 of the Draft EIR/EIS. They also question the accuracy of the 9 percent VMT regional increase by 2040 and expected 0.7 percent VMT reduction by 2040 with implementation of the SCAP RTP, including the HSR project.

The baseline year for the analysis of project impacts was established after the Notice of Preparation was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis (see Draft EIR/EIS, page S-7, 3.3-23 to 3.3-24). CEQA Guidelines section 15125(a)(1) supports establishing baseline physical conditions in this manner, therefore, the use of 2016 data in the Draft EIR/EIS is appropriate.

While the analysis is generally from 2016, the fundamental concepts and conclusions presented remain correct and accurate. Under the No Project scenario, VMT (the commenter references "MVT") would increase without the HSR project (see Draft EIR/EIS Table 3.6-19 and Section 3.6.6.2 in Section 3.6, Public Utilities and Energy). The energy use under the No Project versus with Project scenario is further clarified in Table 3.6-26 of the Draft EIR/EIS, which shows the Estimated Change in Energy Consumption due to the Palmdale to Burbank Project Section. Table 3.6-26 shows that the project would result in substantial overall energy reductions when compared to the No Project scenario.

The commenter raises two specific issues that they believe need to be updated in the No Project analysis. This includes the rapid increase in solar infrastructure (utility solar farms, rooftop solar, the increase of home solar battery systems, the rapid development and acceptance of electric vehicles, the government support of electrical charging stations along interstate and state highways, and the State of California's commitment to be Carbon Neutral by 2045) and population decreases. Regarding the population trends, population projections are always snapshots, reflecting the historical data available, and the analysis of trends, growth capacities, and growth constraints apparent at the times the projections are prepared. More important than the specific population projection is the recognition and examination of how the HSR system, and its project sections would operate in the context of anticipated growth. Updating the document with more recent population projections for 2040 would not change the impact determinations presented

### 4494-9223

in Section 3.6, as the HSR Palmdale to Burbank Project Section would reduce overall VMT and provide a benefit, related to energy reduction. Regarding the comment about rapid increases in solar infrastructure, this trend would not overall affect the abilities of the California HSR system to reduce energy demand, by decreasing VMT. Trends in increased solar infrastructure, this does not take away from the fact that the California HSR System would reduce energy demand. As indicated by the commenter, and acknowledged in Section 3.3, Air Quality and Global Climate Change, the State of California has a goal to be Carbon Neutral by 2045. The increase in solar infrastructure is certainly one component to help achieve that goal. The California HSR system too is a component to help achieve that goal.

### 4494-9224

The commenter expresses concern about interruptions in utility service during construction. IAMFs are incorporated as part of the Build Alternatives design to help avoid and minimize these potential impacts. PUE-IAMF#2 requires new or relocated irrigation systems to be operational prior to disconnecting the original system, to the extent feasible. PUE-IAMF#3 requires the contractor to prepare and adhere to a public communication plan where utility service interruptions are unavoidable. PUE-IAMF#3 also requires construction to be coordinated to avoid interruptions of utility services to hospitals and other critical users. PUE-IAMF#4 identifies the Authority's commitment to minimize or avoid utility service interruptions during construction by requiring the preparation of a technical memorandum documenting how construction activities would be coordinated with service providers to minimize or avoid interruptions. With implementation of PUE-IAMF#2 through PUE-IAMF#4, utility relocations associated with the HSR Palmdale to Burbank Project Section will be minimized and temporary disruptions will be limited to short durations during construction. For additional information, please refer to Impact PUE#1 in the Draft EIR/EIS.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9225**

The commenter asks whether data in Table 3.6-22 of the Draft EIR/EIS includes the electrical energy required to run multiple tunnel boring machines (TBMs). The estimates in Table 3.6-22 include the electricity demand to run TBMs. Please refer to Response to Comment #9198 for a detailed discussion of the electricity demand of TBMs.

### **4494-9226**

Refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption.

The commenter questions if the project would increase base or peak power demand during project construction because Tunnel Boring Machines (TBMs) would be running 24 hours, 7 days a week.

The Draft EIR/EIS provides information as to the power demands during construction (see Table 3.6-22 in Section 3.6, Public Utilities and Energy, which includes the electrical energy required to run multiple TBMs). Values shown in Table 3.6-22 include the energy that would be consumed for the construction of trackway, stations, and ancillary facilities; production and transportation of construction materials; and the operation and maintenance of construction equipment (including TBMs). The estimate of power requirements for TBM tunneling operations is 15 megawatts (MW), assuming 2 TBMs (Hard Rock Type) and their auxiliary services. 15 MW is the maximum power demand, considering both machines working full load. The average power demand, however, is much lower and is around 4 to 5 MW. This means that the Authority can assume conservatively that a TBM will utilize around 5 MW (5,000 kW) during excavation operations. Assuming 16 hours of excavation and 8 hours of maintenance and other operations per day, this means that the power consumption would be about 80,000 kWh per day. The maximum number of TBMs that would be working at any given time is 10, according to the proposed construction schedule, and that would happen only during a 3-month period. With an average electricity consumption of 80 MWh per day and per TBM, this means that the energy demand during this peak quarter would total 72,000 MWh. Comparing this figure with the production capacity of California for 2018 (reference year), described in Section 3.6.5.10 of the Draft EIR/EIS, electricity consumption from TBMs would represent 0.1 percent of the total capacity of the system, assuming that the production is linearly distributed around the year. The Authority is assuming a total yearly production of 285,488 GWh for California to calculate this number, which translates into 71,372 GWh per quarter.

At each portal, a new substation will be provided to allow matching the voltage of the electrical grid with the voltage needed by the machines (if necessary), and to produce low voltage (LV) power to supply the auxiliary services. The voltage connection is preferably at medium voltage (around 33 kilovolts [kV]). Considering that there is

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9226

adequate electric infrastructure already in place, the usual procedure is to lay down a 10- to 50-kV line to feed the TBM to the nearest distribution substation or connect directly to one of the existing distribution lines included in the project plan. For these reasons, there will be no need to build additional power generation facilities or transmission lines to power the construction of this project.

As described in Draft EIR/EIS Section 3.6.6.3 under Impact PUE#6: Temporary Energy Consumption during Construction, "The temporary demand for energy utilized during construction would not require additional permanent electricity transmission capacity and would not increase peak- or base-period demands for electricity from the electrical grid system."

An industry survey was conducted in April 2013 for the Renewable Energy Feasibility Highlights Memorandum, which indicated that there is sufficient renewable energy capacity to meet the system demand of the operation of the California HSR System (Authority 2014b). For an overview of how energy demand from operations of the HSR Palmdale to Burbank Project Section would be met, please refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption. Data in Table 3.6-22, Estimated Energy Consumption for Construction Build Alternatives, is based on the Fuel Consumption and Power Usage Matrix prepared in 2017. Operational energy consumption is based on the Authority's 2016 Business Plan. The baseline year for the analysis of project impacts was established after the CEQA Notice of Preparation and NEPA Notice of Intent were issued in 2014, with a public scoping period for the project, and at the onset of environmental analysis (see Draft EIR/EIS, page S-7, 3.3-23 to 3.3-24). CEQA Guidelines section 15125(a)(1) supports establishing baseline physical conditions in this manner. Additionally, the Authority has adopted a sustainability policy under PUE-IAMF#1 as part of the Build Alternatives that establishes design elements and policies intended to reduce energy consumption, including but not limited to, energy-saving equipment, energy-saving measures during construction, and regenerative braking. With implementation of PUE-IAMF#1 and standard BMPs, project construction would not result in wasteful, inefficient, or unnecessary consumption of energy resources. Construction of the Palmdale to Burbank Project Section would also be consistent with state and local plans and policies related to renewable energy and energy efficiency. With adherence to the Authority's policy on sustainability under PUE-

### 4494-9226

IAMF#1, construction of the Build Alternatives would not result in a substantial demand on regional energy supplies, require additional energy capacity, or substantially increase peak or base period electricity demand.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9227**

The commenter asks why the utility conflicts identified in Appendix 3.6-A have not been updated (since the last communication of 2016); whether the Authority validated Appendix 3.6-A; and whether there has been further communication to validate Appendix 3.6-A.

Consistent with CEQA Guidelines Section 15125(a)(1), the baseline year for the analysis of project impacts was established after the Notice of Preparation was filed with the State Clearinghouse on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environment analysis (see Draft EIR/EIS, pages S-7, 3.3-23 to 3.3-24). The commenter does not provide any specific information about missing utilities that might have been added since 2016. Based on its expertise and experience, the Authority expects that critical utility infrastructure is relatively consistent with the conditions in 2016. Notably, moving utilities often requires new easements, such that utility providers often continue to use the already existing footprints. As such, new utility footprints since 2016 are unlikely. Therefore, the 2016 baseline is considered sufficient, and updating the list of critical utility infrastructure near each of the proposed route alternatives would not modify or alter environmental impacts disclosed in the Draft EIR/EIS.

As noted in Appendix 3.6-A Section 4, Utility Information Collection of the Draft EIR/EIS, the design team reached out to both public and private utility owners whose facilities would potentially be affected by the proposed footprint of all Build Alternatives. The first solicitation effort to acquire as-built and utility service maps was to send letters with exhibits depicting the proposed alignments to all utility owners within the potential project footprint. Site visualization and Google Earth map were also used to identify and/or confirm various above ground and aerial facilities. The next course of action was to follow up with emails and phone calls if the utility owner was not responsive. A utility owner contact log has been established as a living document to record the due diligence taken during the information gathering stage. In addition, as the project progresses, utility record drawings and as-built information will be collected from various sources including public agencies (navigatela.lacity.org), third-party drawings, and respective stakeholders.

As noted in the comment, critical infrastructure within the Build Alternative Resource

### **4494-9227**

Study Areas (RSA) has been identified and presented in Appendix 3.6-A of the Draft EIR/EIS. During the detailed design phase, additional coordination with utility providers within the RSA for the preferred alternative will be conducted to more precisely identify, locate, and plan for any relocations or other changes that may be necessary. As described in Impact PUE#2, PUE-IAMF#4 would be implemented to limit impacts to utilities by requiring that the contractor prepare a technical memorandum prior to construction, documenting how construction activities would be coordinated with service providers to minimize or avoid utility service interruptions. In addition, California Government Code Section 4216 establishes procedures for identifying buried utilities prior to excavation, thus the Palmdale to Burbank Project Section would be unlikely to result in accidental disruption of utility systems. The Draft EIR/EIS provides appropriate procedures via its IAMFs to minimize impacts, if in the future, additional utilities are found to be located within the footprint. The Authority will continue coordination with utility providers during the detailed design phase; however, the Draft EIR/EIS has appropriately disclosed the potential impacts related to utility conflicts based on the best data available at the time.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9228

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter provides estimates, based on their assumptions, about how much water may be needed for boring the tunnels of the SR14A Build Alternative. The commenter provides a low estimate of 1,283 acre feet and a high of 2,305 acre feet. The commenter makes note of drought conditions and asks where the Authority expects to obtain this water for construction. The Authority provides the following information about its water use estimates assumed for tunneling construction: - For tunnels excavated with a tunnel boring machine (TBM) with an internal diameter of 28 feet, the advance rate and water consumption assumed are 43.3 feet/day and 55,000 gallons/day/TBM, respectively. - For tunnels excavated with a TBM and an internal diameter of 31.5 feet, the advance rate and water consumption assumed are 33.3 feet/day and 70,000 gallons/day/TBM, respectively. - For tunnels excavated with a TBM and an internal diameter of 36 feet, the advance rate and water consumption assumed are 33.3 feet/day and 103,000 gallons/day/TBM, respectively. - For tunnels excavated with a TBM and an internal diameter of 31.5 feet and crossing fault areas, the advance rate and water consumption assumed are 6.7 feet/day and 70,000 gallons/day/TBM, respectively. - For tunnels excavated using the sequential excavation method (SEM) with an internal diameter of 28 feet, the advance rate and water consumption assumed are 13.3 feet/day and 40,000 gallons/day/tunnel, respectively. - For tunnels excavated using the SEM method with an internal diameter of 45 feet (single tunnel for double track), the advance rate and water consumption assumed are 6.7 feet/day and 40,000 gallons/day, respectively. - For tunnels excavated using the SEM method with an internal diameter of 64 feet (single tunnel for three tracks), the advance rate and water consumption assumed are 3.3 feet/day and 40,000 gallons/day, respectively. Based on water demand rates shown on Table 3.6-4 of the Draft EIR/EIS and the information detailed above, the total water demand for Build Alternative SR14A tunnels is estimated to be approximately 2,176 acre feet. The commenter's highest range for the estimated water consumption required for SR14A construction is in the same order of magnitude. Please note that these are total water demand calculations for all the tunneling construction required for the project. Regarding the commenter's question about water sources, please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides information about the sources of water for the Project, including during dry and multiple dry-year conditions.

### 4494-9229

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter asks if the Authority will require a reduction in water allocation for all residents and the agricultural sector, as well as what benefits would be obtained from water reductions that would be required to build the Palmdale to Burbank Project Section. The Authority will not require a reduction in water allocation for all residents of California or the agricultural sector. As summarized in Section 3.6.4.5 in Section 3.5, Public Utilities and Energy of the Draft EIR/EIS, CEQA requires that the Authority consider whether there would be sufficient water supplies available to serve the Palmdale to Burbank Project Section and reasonably foreseeable future development during normal, dry, and multiple dry years. The Authority's analysis, which has been revised in the Final EIR/EIS to include additional information about water supplies, included an analysis of the Project's water demand in relation to existing water demand, as well as projected water demand in normal, dry, and multiple dry years. As such, the analysis included in the Final EIR/EIS accounts for the Project's effect on water demand within the context of existing and future water demand, and concludes that there would be sufficient water supply to serve the project, as well as reasonably foreseeable future development after mitigation, in all three scenarios. Furthermore, the Authority has no jurisdiction regarding who gets water. Water is provided by water agencies and if there are drought conditions, any purchaser of water, including the Authority, would be subject to their requirements to reduce water delivery quantities, as required by their Water Shortage Contingency Plan. However, in this scenario, this would be water reductions as a result of the requirements from the water agency and not the Authority. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage and Impact PUE#3 in Section 3.5, Public Utilities and Energy of the Final EIR/EIS, which provides information about the Project's water use and water supplies. The Authority has identified the benefits of the California HSR System in Section 1.2.5 of the Draft EIR/EIS.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9230

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter asks if there will be sufficient water to support ongoing Authority activities once the Authority completes the HSR Palmdale to Burbank Project Section. Operational water supply demand is addressed in Impact PUE#8 in Section 3.6 of the Draft EIR/EIS. As stated therein, operation of all six Build Alternatives would result in 164.8 acre-feet per year of water demand total for the Palmdale to Burbank Project Section, representing a fraction (0.58 percent) of projected available water supplies. The operation of the Burbank Airport Station, which represents the largest operational water use, would result in a 15 percent decrease in water use when compared with existing land uses. Therefore, the impact from water demand generated by operations of the Burbank Airport Station would be less than significant under CEQA for the Refined SR14, SR14A, E1, E1A, E2, and E2A Build Alternatives. In other words, sufficient water would be available to support ongoing Authority activities upon completion of the Palmdale to Burbank Project Section.

The commenter references Table 3.6-4: Water Demand Rates for Construction Activities, in the Draft EIR/EIS Section 3.6. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which identifies a portfolio of water supplies that could meet the project's temporary water demand for construction during normal years, as well as dry and multiple dry years.

This comment also includes the calculations for the estimates made by the commenter for construction water use. These calculations are summarized in Comment #9228. Please refer to Response to Comment #9228, where the Authority provides a response to the calculations made by the commenter. The commenter further summarizes the impact conclusion for Impact PUE#3: Effects from Water Demand during Construction, as less than significant with mitigation. The commenter correctly identifies the Authority's CEQA conclusion. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides additional information about how the Authority identified that impacts related to construction water demand, usage, and water supply would be less than significant after mitigation.

### 4494-9231

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter provides a table with three impacts (Impact PUE#1: Planned Temporary Interruption of Service; Impact PUE#2: Accidental Interruption of Utility Systems; and Impact PUE#3: Effects from Water Demand During Construction) and asks how the Authority can consider these impacts to be less than significant given the current drought conditions.

Drought conditions have no effect on impacts related to the planned interruption of service (Impact PUE#1) or accidental interruption of utility systems (Impact PUE#2). The rationale for why these impacts would be less than significant, including the IAMFs and Mitigation Measures that would reduce impacts, is provided in Section 3.6, Public Utilities and Energy of the Draft EIR/EIS.

With respect to effects from water demand during construction (Impact PUE#3), please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides additional information about how the Authority identified that impacts related to water demand, usage, and water supply would be less than significant after mitigation.

### 4494-9232

The commenter asks who will be stipulating recovery plans, who will be carrying them out, and who will be paying for them. As stated in the paragraph on Recovery Plans on page 3.7-4, the Secretary of the Interior and the Secretary of Commerce develop and implement recovery plans. The USFWS and NMFS are the responsible agencies under the Department of Interior and Department of Commerce.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9233

The commenter asks about the time period when the Authority has been in coordination with the U.S Forest Service (USFS) with respect to the Angeles National Forest. The USFS agreed to participate as a Cooperating Agency, involved in the NEPA review process, by letter dated August 25, 2014. The commenter asks what communications were available to the public. If members of the public had sought communications between the Authority and USFS regarding the NEPA process, the NEPA regulations describe the process for requesting those materials in 40 C.F.R. 1506.6(f). Additionally, the Authority has received and responded to Public Records Act (PRA) requests for public records and information on the Palmdale-Burbank Section under Government Code section 7920.000 et seq.. Coordination and communications between the Authority and USFS were provided in response to a PRA request, and included non-exempt public records containing copies of the MOU and agreements between the Authority and the USFS, and meeting minutes from a May 19, 2015 meeting between the Authority and USFWS.

The commenter also asks about compliance with California Assembly Bill (AB) 498. The Authority assumes the commenter is referring to AB 498, signed into law in October 2015, that amended Sections 1797.5, 1930, and 1930.5 of the Fish and Game Code and that pertains to wildlife conservation and corridors, declaring that it would be the policy of the state to encourage, wherever feasible and practicable, voluntary steps to protect the functioning of wildlife corridors. Specifically the "project applicants" may receive advance mitigation credits for investing in a mitigation bank that protects habitat connectivity for affected fish and wildlife resources, and would further provide that the fact that a project applicant does not take voluntary steps to protect the functioning of a wildlife corridor prior to initiating the application process for the project shall not be grounds for denying a permit or requiring additional mitigation beyond what is otherwise required by law to mitigate project impacts. The Authority has fully complied with applicable law, and additional detail about wildlife movement mitigation follows.

The Draft EIR/EIS identified several mitigation measures to reduce impacts to wildlife movement, such as BIO-MM#64 (Establish Wildlife Crossings), which would require installation of one wildlife crossing south of the California Aqueduct (Soledad Siphon) and one wildlife crossing east of Una Lake to improve the permeability of SR14A and Refined SR14. Other mitigation measures were also developed to further reduce

### 4494-9233

impacts, including: preparation and implementation of a restoration and revegetation plan [BIO-MM#6 (Prepare and Implement a Restoration and Revegetation Plan)]; installation of aprons or barriers within security fencing [BIO-MM#36 (Install Aprons or Barriers within Security Fencing)]; minimize effects on wildlife movement corridors during construction [BIO-MM#37 (Minimize Effects on Wildlife Movement Corridors During Construction)]; establish environmentally sensitive areas [BIO-MM#58 (Establish Environmentally Sensitive Areas and Nondisturbance Zones)]; limit vehicle traffic and construction site speeds [BIO-MM#60 (Limit Vehicle Traffic and Construction Site Speeds)]; implement wildlife height requirements for enhanced security fencing [BIO-MM#77 (Implement Wildlife Height Requirements for Enhanced Security Fencing)]; install wildlife jump-outs [BIO-MM#78 (Install Wildlife Jump-outs)]; and implementation of measures intended to reduce, avoid and minimize effects on wildlife movement [BIO-MM#83 (Measures Intended to Reduce, Avoid, and Minimize Effects on Animal Movement)].

### 4494-9234

The commenter asks if all contractors working in the ANF are familiar with each of these listed Acts and Codes. As described in Bio-IAMF#3, all construction personnel will be required to take a project specific training on these regulations as they apply to the Build Alternatives.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9235

The commenter asks if the Authority is exempt from Forest Service regulations. Although Forest Service regulations do not bind the Authority directly, when the Authority takes actions on land managed by the Forest Service, relevant Forest Service regulations apply to those actions. A summary of the Forest Service authorities is provided on Draft EIR/EIS page 3.7-9. Information and analysis of consistency with laws, regulations, plans, and policies relative to portions of the Build Alternatives that would occur within the ANF, including within SGMNM, are discussed in Section 3.7.11, United States Forest Service Impact Analysis, and in Appendix 3.1-B, USFS Policy Consistency Analysis.

The commenter asks for an example of a mitigation measure that would minimize removal of native vegetation. BIO-MM#6 requires the Project Biologist, before ground-disturbing activity occurs, to implement appropriate measures to restrict project vehicle traffic within the limits of construction to established roads, construction areas, and other permissible areas. Separately, BIO-MM#58 will minimize removal of native vegetation. Prior to any ground disturbing activity in a project work area, the Project Biologist will use flagging to mark Environmentally Sensitive Areas (ESAs) that support some special-status species.

### 4494-9236

The commenter asks (3.7-12) for an example of an unavailable RSA and what the process is for identifying species through aerial photography interpretation. All RSAs described on page 3.7-12 were assessed as described in the document. By the term "unavailable RSAs," the commenter is presumably referring to areas within an RSA that were inaccessible because, for example, permission to enter had not been granted by a landowner. Examples of inaccessible areas in an RSA include the private inholdings in the ANF. The methods used to determine species habitats are included in Section 3.7.4.4. While aerial photography is one tool used to identify vegetation communities, landforms, and potentially suitable sensitive species habitat within the various RSAs, the photography by itself is not used to identify species, but instead vegetation and landform types that may be suitable as habitat for particular species.

### 4494-9237

The commenter inquires about the amount of training that would be provided and requests an example of WEAP training materials. The commenter also asks for an example of a special status plant that might be encountered as well as if workers would be distracted from identifying plants while working.

BIO-IAMF#3, summarizes the requirements for WEAP training and materials, and is fully described in Appendix 2-E in Volume II of the Draft EIR/EIS. Special status plant species that may be encountered are identified in Section 3.5.7.3 and include, e.g., Branton's milk vetch and Nevin's barberry. The biologists and biological monitors will have already surveyed work areas and marked known occurrences of special-status plants prior to construction personnel commencing work, and the WEAP training will effectively alert construction personnel to flagged areas as well as the general appearance of the protected species should they be encountered outside of the flagged areas.

### 4494-9238

The commenter asks (1) how many Project Biologists will be working in an area, (2) whether there will be video cameras at night to track animal life, (3) how wildlife movement corridors will be identified, (4) what materials will be used to clean vehicles, (5) whether rodenticides be used, given that they are harmful to animals, including owls and mountain lions.

The number of Project Biologists working on the project at any time will be based on the type and location of work being done at the time. Cameras will be used to identify wildlife as describe in Bio-MM#96. The method to identify wildlife movement corridors is described in Section 3.7.4.4. Wildlife movement corridors identified within the Project area are discussed in Section 3.7.5.12. Construction vehicles will be cleaned in accordance with Bio-IAMF#10. The use of rodenticide will be governed by any permits issued for the project as well as BIO-IAMF#11.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9239

The commenter asks for examples of modeling tools. Modeling tools used for the project are described in Section 3.7.4.4 (Draft EIR/EIS pages 3.7-26-3.7-27). Habitat models bring together information about environmental attributes, species life history, and environmental requirements to create a spatially explicit model of suitable habitat at a regional scale. For example, a species habitat model could be developed using spatial data describing vegetation communities, soil types, elevation, and species range to predict where habitat suitable for a given species, based on the species life history requirements, could occur.

### 4494-9240

The commenter asks if field surveys, aside from red-legged frog, were conducted. Field surveys are described in Section 3.7.4.4 (Draft EIR/EIS pages 3.7-24 -3.7-26) and were not limited to the California red-legged frog. Reconnaissance field surveys, special-status plant and wildlife surveys in the Angeles National Forest, unarmored three-spine stickleback habitat assessment, vernal pool assessment, and California red-legged frog protocol surveys were conducted.

### 4494-9241

The commenter asks how the 5 species were chosen as focal species for the wildlife corridor assessment. They state that black bears are also prevalent in the San Gabriel Mountains and ask why they were not included. The CHSR Palmdale to Burbank Project Section: Wildlife Corridor Assessment Report (Authority 2019c) includes a description of the selection process for the five focal species. As described in Section 2.2.3.8 of the Wildlife Corridor Assessment, the five focal species were selected because they represent a broad range of species that utilize the habitat within the habitat within the Wildlife Corridor Study Area (WCSA) and was comparable to previous regional modeling, specifically the South Coast Missing Linkages (South Coast Wildlands 2008) and the California Desert Renewable Energy Conservation Plan (BLM 2016). Black bears are also present in the San Gabriel Mountains but their movement is represented by the focal species, mountain lion, mule deer, and American badger that inhabit similar habitats.

### 4494-9242

The commenter asks what the special-status plants are and how many are there. Special-status plants are defined in Section 3.7.5.3 of the Draft EIR/EIS. Background literature review identified 98 special-status plant species with low to high potential to occur within the Refined SR14, SR14A, E1, E1A, E2, and E2A special-status plant RSAs, based on the species range, known occurrences, and presence of potential habitat. Of these, 62 species were removed from consideration because of their low potential to occur within the special-status plant RSA as a result of lack of suitable habitat. The remaining 44 special-status plant species have a moderate or high potential to occur in the special-status plant RSA. Please see Table 3.7-5 on page 3.7-51 in the Draft EIR/EIS for a list of special-status plants within the special-status plant RSA.

### 4494-9243

The commenter questions whether the Los Angeles River watershed is largely polluted, and requests evidence supporting that water from this area cannot be used. The commenter also asks how spoils hauling will affect vegetated communities. Section 3.7.5.1 on page 3.7-32 does not suggest the Los Angeles Watershed is largely polluted or cannot be converted or used. The text says the following "Pollutants from dense clusters of residential, industrial, and other urban development have impaired water quality in the middle and lower portions of the watershed." The Authority believes this is an accurate description of the Los Angeles River watershed. Impacts to vegetation communities resulting from hauling of spoils materials include potential deposition of dust onto vegetation communities immediately adjacent to the haul routes. The Authority is committed to requiring the construction contractor to prepare a fugitive dust plan (AQ-IAMF#1) for each project segment prior to any ground disturbing activities. This plan will include measures to minimize and control fugitive dust emissions and reducing potential indirect impacts to vegetation communities adjacent to the project haul routes. Additionally, BIO-IAMF#8, BIO-IAMF#9, and BIO-IAMF#10 require the Authority to address vegetation community impacts as relates to spoils and spoils hauling.

# Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

**4494-9244**

The commenter inquires how wildlife in Significant Ecological Areas will be affected by vibrations of the train, how vibrations may affect animals and wetlands, and what area of the Hansen Dam is under the jurisdiction of the Army Corps of Engineers. Section 3.7.5.9 describes the Significant Ecological Areas. The SEAs impacts are described in the Draft EIR/EIS in Impact BIO #11 and BIO#18. The potential wildlife and wetland impacts associated with operational vibration along surface alignment alternatives are discussed in Section 3.4, Noise and Vibration, and Section 3.7, Biological and Aquatic Resources. These impacts include potential avoidance of the habitat adjacent (behavioral, auditory mating cues, stress response) to segments of surface alignment. The impact analysis is specific to mammals and birds which are especially sensitive to vibrational impacts. These impacts are anticipated to be localized to within 40-50 feet of the above-ground alignment. The entirety of the Hansen Dam (embankment) is under the jurisdiction of the U.S. Army Corps of Engineers. When the project is in tunnel, as it is under the Angeles National Forest, it is deep enough where there would be no noise or vibration impacts at the surface. One reason for tunneling under these areas is to avoid impacts to surface resources.

**4494-9245**

Refer to Standard Response PB-Response-BIO-3: Wildlife Movement Corridors.

The commenter inquires if any of the Build Alternatives go on the ground in any part of the 275,000 acres of "protected areas" referenced on page 3.7-92 of the Draft EIR/EIS. The footprints of the HSR Alternatives would impact areas identified in the California Protected Areas Database (2017) and California Conservation Easement Database (2016) maintained by the California InfoNetwork and funded by the California Natural Resources Agency and the California Department of Water Resources. Impacts on protected lands are summarized as follows (i.e., acres impacted by each alternative within protected or conserved land).

**Table 1 –Acres impacted by each alternative within protected or conserved land.**

HSR Alternative	Acres
Refined SR14	3,019.8
SR14A	2,473.9
E1	1,423.0
E1A	1,422.9
E2	695.3
E2A	695.3

The mitigation measures discussed in Section 3.7.7 of the Draft EIR/EIS would be applied to areas or resources within protected or conserved land that would be directly or indirectly impacted by the Build Alternatives. Specifically, BIO-MM#6 (Prepare and Implement a Restoration and Revegetation Plan) would involve implementation of a Restoration and Revegetation Plan to ensure that all temporarily disturbed areas would not be adversely affected in the long term. In addition, implementation of BIO-MM#47 (Prepare and Implement a Compensatory Mitigation Plan for Impacts on Aquatic Resources) and BIO-MM#53 (Prepare and Implement a Compensatory Mitigation Plan for Species and Species Habitat) would ensure that the biotic viability of protected areas to function as habitat for wildlife and plant species would be preserved, and impacts to aquatic resources, species, and species habitat would be offset.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9245

BIO-MM#50 (Implement Measures to Minimize Impacts During Off-Site Habitat Restoration, or Enhancement, or Creation on Mitigation Sites) stipulates that the Authority will implement applicable Impact Avoidance and Minimization Features (IAMFs) and mitigation measures discussed in Section 3.7.7 of the Draft EIR/EIS to avoid or minimize impacts on species habitat and aquatic biological resources during habitat restoration, enhancement, or creation activities.

The commenter also inquires if there are any wildlife corridors known to the Forest Service. The Angeles National Forest, Land Management Plan (USFS 2005) identifies three wildlife corridors, including Big Tujunga Canyon Place, I-5 Corridor Place, and the Sheep Mountain Wilderness Area. The Land Management Plan generally defines Big Tujunga Canyon as downstream from the Big Tujunga Dam to Pipe Canyon, flanked by the steep canyon walls. This lower section of the canyon ranges in elevation from about 2,000 feet at Pipe Canyon up to 2,290 feet at the Big Tujunga spillway within the project area. Big Tujunga Canyon Place's riparian area is an important wildlife corridor. Alternatives E2 and E2A are the only alternatives in the vicinity of Big Tujunga Canyon, and the Alternatives cross Big Tujunga Wash well downstream of this corridor and cross the wash via an elevated viaduct segment where the adjacent areas are developed on both sides with the Lake View Terrace and Shadow Hills communities. Pipe Canyon is over 4.5 miles upstream of where Alternatives E2 and E2A cross Big Tujunga Wash.

The Angeles National Forest Land Management Plan (USFS 2005) describes the I-5 Corridor Place as running north and south along both sides of Interstate 5. This landscape is commonly defined as the area between Marple Canyon at the southern end, and the intersection of California State Highway 138 at the northern end. The east and west boundaries are defined by the ridges visible from Interstate 5. The western boundary of this area is shared with the Los Padres National Forest. Marple Canyon is located at the southern end of the Castaic Lagoon, which is approximately 14 miles from the nearest location of the Refined SR14 and SR14A alternatives. As described above, a majority of the Build Alternatives would be permeable (i.e., no impediments to wildlife movement), in areas with known wildlife corridors. Where the Build Alternatives would be elevated on a viaduct or underground in a tunnel, the Build Alternatives would be permeable to wildlife movement because wildlife can travel above tunneled segments or under elevated viaducts. Tunnels and viaducts provide almost unimpeded connectivity for wildlife and would have no impact on wildlife movement and connectivity. As a result, the Authority (2019c) concluded that as long as there is a viaduct/tunnel/at-grade transition and/or drainage structure within 1.0-mile intervals for large crossings and 0.3-

### 4494-9245

mile intervals for small crossings, wildlife movement would not be impeded. Despite the extensive tunnel and viaduct segments, the Authority determined that mitigation measures were required to address significant impacts related to at-grade segments near Una Lake and the California Aqueduct (See Draft EIR/EIS 3.7.6.3). From this analysis, the Authority developed BIO-MM#64 to require installation of one wildlife crossing south of the California Aqueduct and one wildlife crossing east of Una Lake to improve the permeability of SR14A. Other mitigation measures were also developed to further reduce impacts, including: preparation and implementation of a restoration and revegetation plan (BIO-MM#6); installations of aprons or barriers within security fencing (BIO-MM#36); minimize effects on wildlife movement corridors during construction (BIO-MM#37); establish environmentally sensitive areas (BIO-MM#58); limit vehicle traffic and construction site speeds (BIO-MM#60); implement wildlife height requirements for enhanced security fencing (BIO-MM#77); install wildlife jump-outs (BIO-MM#78); and implementation of measures to reduce, avoid, and minimize effects on wildlife movement (BIO-MM#83). Standard Response PB-Response-BIO-3: Wildlife Movement Corridors, provides detailed information regarding the methodology and analysis used to analyze the project's effects on wildlife movement.

### 4494-9246

The commenter asks what wildlife, including but not limited to mountain lions, have been killed on SR 14 freeway. To the best of the Authority's knowledge, data on the types of wildlife killed on the SR 14 freeway, including but not limited to mountain lions, is not available. The Authority coordinated with Caltrans regarding available roadkill data, and Caltrans indicated they do not track roadkill data on SR 14.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9247

The commenter asks what exactly is meant by "would affect." The potential effects resulting from construction of the six Build Alternatives are described in Impact BIO#1 - Impact BIO#13. The potential effects from operation of the project are described in Impact BIO#14- Impact BIO#19. Each of these impacts describe in detail how construction of the Build Alternatives "would affect" biological and aquatic resources. See also 40 C.F.R. Section 1508.1(g) ("Effects or impacts means changes to the human environment from the proposed action or alternatives that are reasonably foreseeable . . ."), (g)(4) ("Effects include ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative. Effects may also include those resulting from actions which may have both beneficial and detrimental effects, even if on balance the agency believes that the effects will be beneficial.").

### 4494-9248

The commenter asks to what extent are special status plants protected by law. In addition, the commenter asks for the meaning of "range of impact" and clarification of the "acres of impact" used in Table 3.7-10. Section 3.7.2 describes the Laws, Regulations, and Orders as they pertain to special-status plants, which are individual plant species listed by federal, state, or local regulators. The "range of impact" means that plants located in these areas could be destroyed. The "areas of impact" signifies the acreage that will be temporarily and permanently impacted by the Build Alternatives and not the amount of habitat within the study area.

### 4494-9249

The commenter asks what will be done to mitigate the loss of threatened, endangered, and rare plants. Please see Impact BIO#1 that describes project construction effects on habitat for special status plants and communities. Implementation of BIO-IAMF#1-3, 5, 8-11 will reduce the potential for impacts to occur and BIO-MM#1, 2, 4, 5, 6, 32-34, 38, 50, 53, 54, 55, 56, 58, and 61 will mitigate the loss of threatened, endangered, and rare plant species. In addition, indirect impacts on special-status plants will be minimized by monitoring ground-water dependent surface water resources (HYD-MM#4) and mitigated by implementing an Adaptive Management Plan for Groundwater Effects on Species and Habitat (BIO-MM #93). Pages 3.7-112 through 3.7-114 of the Draft EIR/EIS describe how and why the mitigation measures reduce the impacts to a less-than-significant level.

### 4494-9250

The commenter asks how the destruction of each plant community will specifically affect wildlife (mammals, birds, fish) that depend on the plants for shelter or food. Section 3.7.6.3 discusses and quantifies the amount of each plant community that will be impacted. Impact BIO#3 (Birds), Impact BIO#4 (Fish), and Impact BIO#6 (Mammals) describe and quantify the amount of impact to habitat for each special-status species per taxa. Those sections specifically reference impacts on the vegetation communities, and the amount of species habitat impacted within each Build Alternative is derived from that species association with each plant community.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9251

The commenter asks if workers will be allowed to smoke during construction. Workers smoking on a project construction site can introduce a health hazard to fellow employees through their exposure to tobacco smoke. Use of tobacco products also introduces fire/life safety concerns that would increase the potential risk of workspace injuries to construction workers and potentially to the public in the event of a workplace accident, such as a fire or explosion, that resulted in off-site consequences.

As described on page 3.11-50 in Section 3.11 of the Draft EIR/EIS, the Authority acknowledges that worksite safety, including construction worksite safety, is governed by provisions of Title 8 of the Cal. Code Regs. and is overseen by Cal-OSHA. To minimize worker exposure from other employees smoking tobacco products, Title 8, Section 5148 prohibits California employers from allowing smoking in an enclosed space at a place of employment. In non-enclosed areas of a project construction site, implementation of the Authority's Standard Safety Procedures (Authority 2014) and SS-IAMF#2 will require preparation and implementation of a Construction Safety and Health Plan (CSHP) for each construction phase. The plan will establish the minimum safety and health standards for contractors of, and visitors to, project construction sites. Implementation of the CSHP, in compliance with Title 8 and other legal requirements, would reduce risks to human health during construction by establishing protocols for safe construction operations.

### 4494-9252

The commenter asked for additional details on how particular impacts could qualify as "temporary." The Authority has identified temporary impacts, impacts that will not persist once the project construction and subsequent restoration is complete. While the Authority has identified placement of staging and other temporary construction activities to be placed within permanent disturbances as a priority, temporary impacts could occur within areas that are needed only temporarily during construction. These areas would be restored to pre-disturbance conditions once construction is complete. However, as described in Section 3.7.6.3, for the purposes of quantifying acreages of habitat impacts, temporary impacts are considered permanent impacts due to the length of the construction period.

The commenter asked how many biologists would be present on-site during construction. The number of Project Biologists working on the project and on the ground at any particular time will be decided by the Authority in conjunction with the USFWS, USFS, and CDFW based on the type, location, and seasonality of work being done at the time.

The commenter asked for examples of WEAP training. WEAP stands for Worker Environmental Awareness Program. BIO-IAMF#3, describe the requirements for WEAP training and materials and is fully described in Appendix 2-E in Volume II of the Draft EIR/EIS. Construction spoils and waste will be disposed of in accordance with BIO-IAMF#9 which requires any excavated waste materials unsuitable for treatment and reuse will be disposed at an off-site location, in conformance with applicable State and federal laws. Construction vehicles will be cleaned in accordance with BIO-IAMF#10 and will include primary and secondary containment to hold water and materials dislodged from equipment preventing it from draining into the adjacent areas and habitats. In addition, not all equipment washing uses water and compressed air is often used to dislodge organic materials at wash stations. Construction spoils would be hauled away from construction sites to be deposited at approved disposal sites in the area such as the Boulevard Mine site or in the case of the SR14A and Refined SR14 Build Alternative some spoils would be deposited at the Vulcan mine site and used to re-grade the area to reflect a more natural topography. Waste generated from construction would be hauled away and deposited in appropriate waste disposal facilities and/or landfills in the area. The change in groundwater levels during construction were described as a

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9252

temporary indirect impact to special-status plants. As described in Section 3.7, tunnel construction under the Angeles National Forest has the potential to alter hydrogeological conditions, resulting in inflows of groundwater into the tunnel and the subsequent change in groundwater levels. Changes in groundwater levels for aquifers could affect the hydrology of groundwater dependent ecosystems, resulting in effects on vegetation. Groundwater-dependent species were determined through a review of the literature and an assessment of species habitat requirements, especially those habitats that are riparian in nature and have greater sensitivity to changes in surface water availability.

The Authority considers changes in groundwater conditions due to construction to be temporary because pre-construction conditions will return once construction is completed. Special-status plant species and vegetation communities with the potential to occur in the tunnel construction RSA were evaluated to determine if they are groundwater dependent. Species were considered to be groundwater dependent if they require aquatic or riparian conditions to exist and complete a significant part or portion of their life cycle. For all species determined to be groundwater dependent, the habitat suitability models developed for the project section were overlaid with the tunnel construction RSA and Risk Areas to review the amount of modeled suitable habitat that could be adversely affected for each species. All modeled suitable habitat within the Risk Areas was quantified and considered to be potentially affected. Changes in groundwater levels during tunnel construction could result in indirect impacts on special-status plants.

The Authority has incorporated HYD-IAMF#5, Tunnel Boring Machine Design, HYD-IAMF#6, Tunnel Lining Systems, and HYD-IAMF#7, Grouting, into the design and construction methods for tunnels under the ANF to avoid or minimize groundwater inflows into and around tunnels during construction. As discussed in Impact HWR#5 in Section 3.8, Hydrology and Water Resources, although HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 will reduce the amount of potential changes in groundwater levels due to tunnel construction, based on the available information and based on prior tunnel construction experience elsewhere, some groundwater inflow into the tunnels could still occur during construction. This groundwater flow could result in localized changes of groundwater level that could have temporary indirect effects on the hydrology of groundwater-dependent surface water features, including springs, seeps, and perennial

### 4494-9252

streams that provide habitat for special-status plants and special-status plant communities. The areas of greatest potential impact would be within riparian habitat areas and within mesic habitat areas (habitat with a moderate or well-balanced supply of moisture) where special-status plants and special-status plant communities depend on soil moisture that could be altered by changes in surface water from tunneling. The duration of temporary impacts to special-status plants would depend on the hydrologic conditions, subsurface conditions, and amount of groundwater inflow into the tunnel, none of which can be precisely estimated at this time as discussed under Impact HWR#5 in Section 3.8, Hydrology and Water Resources. The duration of groundwater inflows into the tunnels at any one location is expected to be a matter of months; and the potential period of effect on groundwater levels due to tunnel construction could be months to several years after tunnel completion (post project monitoring of surface water features near the Arrowhead Tunnels in the San Bernardino Mountains in southern California found that groundwater recovery from tunnel construction took up to 5 years for some features.

### 4494-9253

The commenter asks if there was groundwater recovery from tunnel construction as mentioned in the Arrowhead Tunnels and if so, how did that affect vegetation recovery? As noted on page 3.7-103 of the Draft EIR/EIS, groundwater levels recovered after construction of the Arrowhead tunnels was completed. While ecological recovery of vegetation was not the focus of the Arrowhead tunnel analysis, it was noted that an additional 2 years beyond groundwater recharge were required to achieve pre-disturbance levels.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9254

The commenter asks how the Authority can justify destroying plants living in the San Gabriel Mountains National Monument. They asked if that land is protected and if endangered species of plants and animals are present, aren't they federally protected. The national monument, and any federally listed species present, are federally protected. The Build Alternatives, including the Authority's preferred alternative, tunnel under the San Gabriel Mountains such that impacts to surface resources, including plants within the forest, would largely be avoided except potentially in the vicinity of portal construction. As described in Section 3.7 of the Draft EIR/EIS, pages 112-114, impacts to special-status plants from construction are distributed throughout the resource study area in the relatively undeveloped regions between Palmdale and the San Fernando Valley. These impacts would be avoided, minimized, and mitigated through mitigation measures discussed in Section 3.7, principally BIO-MM#1, BIO-MM#2 and BIO-MM#38. With application of these mitigation measures, impacts to special-status plants would be reduced to less than significant levels.

### 4494-9255

According to the commenter, in 2015 the Authority's regional director for this project section, Michele Boehm, reportedly stated in a meeting in Pacoima that "[i]f any routes affect the watershed, then they won't be selected." No transcript of that meeting is available to provide context. While all Build Alternatives would have impacts on aquatic resources, none would have watershed-level effects (see Impact BIO#8 in Draft EIR/EIS Section 3.7, Biological and Aquatic Resources. The Authority, in coordination with USEPA and USACE, closely examined practicable alternatives for the alignment to avoid and minimize impacts to aquatic resources. USACE and USEPA concurred on December 17, 2020, and December 16, 2020, respectively, with the range of alternatives recommended in the Checkpoint B Summary Report for inclusion consideration in the EIR/EIS. The SR14A Build Alternative has been identified as the preliminary LEDPA, which has been recorded in Checkpoint C (established by the Memorandum of Understanding - National Environmental Policy Act [42 U.S.C. 4321 et seq] and Clean Water Act Section 404 [33 U.S.C. 1344] and Rivers and Harbors Act Section 14 [33 U.S.C. 408] - Integration Process for the California High-Speed Train Program).

### 4494-9256

The commenter noted that tree communities communicate underground, and their well-being depends upon this communication. The commenters asks how forest communities of special-status trees will survive when their habitats are interrupted. The Build Alternative alignments within the ANF are proposed within tunnels constructed deep below the ground surface and well below the root zone for forest communities within the project footprint. As such, the tunnels would not interrupt habitat as suggested in the comment. Each of the Build Alternatives would require permanent facilities on private in-holdings and along existing utility and roadway corridors in the ANF (see Figures 3.14 11 through Figure 3.14 15). Limiting permanent above ground facilities and construction within the ANF to in-holdings and along existing utility corridors and roadways would also protect forest communities by utilizing areas that have already been disturbed by development.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9257

The commenter requests specific details on how surveys will be conducted for Special-Status Plant Species and Communities and requests specifics on seed banks, replanting, and monitoring of replanting. The commenter also asks for clarification of the vernal pool work restriction and oversight, for an example of associated plants in relation to BIO-MM#32 and BIO-MM#33, and asks how long aquatic resource monitoring would continue during train operations.

As required by BIO-MM#1: Conduct Presence/Absence Pre-Construction Surveys for Special-Status Plant Species and Special-Status Plant Communities in Section 3.7, Biological and Aquatic Resources in the Draft EIR/EIS, special-status plant species and sensitive plant community surveys will be conducted using a pedestrian transect survey methodology following protocols developed by the CDFW and USFWS, in collaboration with the California Native Plant Society (CDFW 2018 and USFWS 2001). Surveys will be performed during the appropriate blooming season of the year for the given focused species to enhance detection ability (e.g., diagnostic flowering or vegetative elements are more easily detected). Often, the special-status plant species surveys occur across multiple years to account for the amount and timing of annual precipitation (e.g., surveys during drought years may not be valid for establishing presence/absence).

All restoration seed collection will strictly follow a restoration plan (refer to BIO-MM#2 Prepare and Implement Plan for Salvage and Relocation of Special-Status Plant Species) approved by the Authority, and CDFW and/or USFWS as appropriate. This plan will include appropriate seed storage requirements (e.g., temperature, humidity, minimizing pests, etc.) until the seeds are used in restoration planting activities. The Project Biologist will oversee and monitor the restoration activities in conjunction with Authority-approved restoration biologists. Vernal pool work restrictions (refer to BIO-MM#4 Implement Seasonal Vernal Pool Work Restriction) are intended to avoid or minimize construction activities within 250 feet of vernal pools or, if unavoidable, the work would occur when the features are not inundated and are at less risk to potential impacts.

An example under BIO-MM#32 Restore Temporary Riparian Habitat Impacts and BIO-MM#33: Restore Aquatic Resources Subject to Temporary Impacts includes recontouring, removing weeds, and planting salvaged seeds and native plants within the

### 4494-9257

temporarily disturbed habitats. The seeds and plants will include both native sensitive and non-sensitive plants known to occur within the affected riparian and aquatic habitats. Restoration would begin following completion of construction activities and would include site preparation, irrigation installation, seeding and/or planting. Monitoring of restoration areas is generally expected to occur for five years, but may go longer or shorter, based on when the restored community successfully re-establishes and meets the approved success criteria identified in the Restoration and Revegetation Plan (RRP). In addition, please refer to BIO-MM#6 Prepare and Implement a Restoration and Revegetation Plan. Success criteria will be specific to the type of vegetation community being restored, the expected timeline for each specific community to successfully re-establish, the community-specific metrics indicating successful restoration, and the proposed restoration and revegetation activities. Should success criteria be met prior to the start of train operations, monitoring would not take place during train operations. As required pursuant to applicable permits, the RRP is subject to review and approval by the appropriate regulatory agencies prior to RRP implementation.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9258**

The commenter asks for details related to compensation in BIO-MM#38 and the methods for restoring sensitive plant species after construction. BIO-MM#38 addresses compensation from impacts to listed species. Compensation refers to replacing the habitat impacted as a result of the construction or operation of the project. The Authority, through coordination with CDFW and the USFWS, determines the appropriate acreage/ratio of mitigation to offset potential impacts for each sensitive species and vegetation community relative to the type of habitat potentially impacted. BIO-MM#38 states that a minimum compensatory mitigation ratio of 1:1 will be provided to offset impacts to federal and state-listed plant species. Compensatory mitigation is most commonly fulfilled through purchase of mitigation credits at an established and permitted mitigation bank or creation of like habitat in proximity to the impact. These mitigation credits or off-site habitat preservation would require the protection of this habitat in perpetuity. BIO-MM#38 states that a compensatory mitigation plan will be implemented following the methodology in BIO-MM#53, which will further define the species, habitat types, how they are evaluated, impact estimates, mitigation strategies, and management actions. A work restriction most typically takes the form of exclusionary fencing around the sensitive resource to prevent direct impact to the resource. This fencing keeps construction workers and equipment from entering and damaging sensitive areas. The Authority as the lead agency for the project has the primary responsibility for implementing mitigation. BIO-MM#54 requires the preparation and implementation of an annual vegetation control plan. The plan will be implemented throughout construction activities and updated annually. While the vegetation control plan would be updated on a yearly basis, implementation of the plan would not be limited to an annual basis. The focus of the vegetation plan is the removal and ongoing treatment of non-native plant species within areas of ground disturbance during construction. Furthermore, BIO-MM#6 outlines the requirements of the Restoration and Revegetation Plan that will be prepared and implemented. The Compliance Reporting Program, including the components, is described in detail in BIO-MM#61, and will allow the Authority to monitor and document the success of restoration efforts. BIO-MM#6 addresses the preparation and implementation of a Restoration and Revegetation Plan which includes information as to success criteria including that the restoration success criteria will include limits on invasive species, as defined by the California Invasive Plant Council, to an increase of no greater than 10 percent compared to the pre-disturbance condition, or to a level determined through a comparison with an appropriate reference site consisting of similar

### **4494-9258**

natural communities and management regimes. Restoration is deemed successful when success criteria are met. The timeframe for achieving success varies by location and type of restoration and can typically take 1-3 years.

### **4494-9259**

The commenter asks when surveys and habitat assessment were conducted for red-legged frog populations, if the observations were done in person, and if so, by whom? As described on page 3.7-25 and 3.7-26 of the Draft EIR/EIS, protocol presence/absence surveys for California red-legged frog were performed in 2017. The habitat assessments and surveys were conducted from March until July 2017. The protocol surveys were conducted in-person by individual Regional Consultant biologists familiar with the identification of California red-legged frog and other amphibians and determined to be qualified by the Authority and USFWS.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9260**

The commenter asked how the Authority knows that destruction to aquatic breeding habitats would be temporary (3.7-116), how often the BIO IAMFs will be employed, and whether workers will be on the job at night. Temporary impacts could occur within areas that are needed temporarily during construction and would not be part of the permanent project disturbance. These temporary impact areas would be restored to pre-disturbance conditions once construction is complete. While page 3.7-116 of the Draft EIR/EIS describes the potential temporary impacts to aquatic breeding habitats, page 3.7-95 of the Draft EIR/EIS states "However, for the purposes of quantifying acreage of habitat impacts, temporary impacts are considered permanent impacts due to the length of the construction period." Therefore, temporary impacts are considered permanent and mitigated as such.

Implementation of BIO-IAMF#1 (Designate Project Biologist, Designated Biologists, Species-Specific Biological Monitors and General Biological Monitors), BIO-IAMF#2 (Facilitate Agency Access), BIO-IAMF#3 (Prepare WEAP Training Materials and Conduct Construction Period WEAP Training), BIO-IAMF#5 (Prepare and Implement a Biological Resources Management Plan), BIO-IAMF#8 (Delineate Equipment Staging Areas and Traffic Routes), BIO-IAMF#9 (Dispose of Construction Spoils and Waste), BIO-IAMF#10 (Clean Construction Equipment), and BIO-IAMF#11 (Maintain Construction Sites) (described in Section 3.7.4.2); and BIO-MM#6 (Prepare and Implement a Restoration and Revegetation Plan), BIO-MM#7 (Conduct Pre-construction Surveys for Special-Status Reptile and Amphibian Species), BIO-MM#8 (Implement Avoidance and Minimization Measures for Special-Status Reptile and Amphibian Species), BIO-MM#32 (Restore Temporary Riparian Habitat Impacts), and BIO-MM#33 (Restore Aquatic Resources Subject to Temporary Impacts) (described in Section 3.7.6.3) will ensure that mitigation measures (listed in Impact BIO#2, in Section 3.7.6.3 of this Final EIR/EIS) are applied prior to and during project construction and actively monitored and enforced throughout the construction period, in order to minimize surface construction impacts on aquatic breeding habitat. The intent of the temporary impact area restoration is to return these areas to pre-disturbance conditions. Collectively, these mitigation measures would provide avoidance, minimization, and compensatory mitigation for direct and indirect surface construction impacts on aquatic breeding habitat for special-status species.

### **4494-9260**

The Authority will avoid conducting ground-disturbing activities within known wildlife habitat during nighttime hours, to the extent feasible. If nighttime work is necessary, the Authority will minimize impacts on adjacent habitat through implementation of BIO-MM#99 (Implement Lighting Minimization Measures During Construction), and BIO-MM#100 (Implement Lighting Minimization Measures for Operations) because they will limit the work areas where nighttime activities are allowed during construction and will minimize the lighting during operations to only those areas deemed necessary for health and safety. BIO-MM#72 (Implement Avoidance of Nighttime Light Disturbance for California Condor) would minimize the use of lighting that may pose a risk or otherwise disturb or harm condors during construction, such that impacts on individuals and habitat of this fully protected bird species would be avoided.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9261

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF.

The commenter asks how the Authority can compensate for "unavoidable impacts" to groundwater resources and drinking water wells.

Pursuant to the Authority's 2019 Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest and 2019 Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest (referenced in Section 3.8 of the EIR/EIS), based on observed impacts on groundwater from past tunnel projects, no impacts to wells are expected to occur outside the tunnel construction resources study area (more than 1 mile from the centerline of each Build Alternative). Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail the options that the Authority would consider to address impacts to private water supply wells outside the Angeles National Forest (ANF), including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. For wells within the ANF (including in Kagel Canyon) that are determined through modeling and monitoring to be adversely affected by groundwater reductions caused by the HSR, the Adaptive Management and Monitoring Plan (AMMP) included in Mitigation Measure HWR-MM#4 requires modifications to the affected wells or by providing supplemental water. Supplemental water would only be provided if monitoring indicates that the HSR construction caused groundwater impacts. However, the Authority has identified several IAMFs to avoid and minimize the potential for impacts to water supply wells and the need for supplemental water. HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 require design features and construction methods to address potential groundwater intrusion, including the installation of a tunnel liner(s) capable of effectively controlling inflows into the tunnels. As such, groundwater inflow

### 4494-9261

during construction would likely be minimal and temporary. Please refer to both Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest and Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest for additional information regarding hydrogeologic impacts, impacts to wells, and correlating mitigation measures and IAMFs.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9262

The commenter asks about the source of the surveys, restoration plans, and minimization measures for the Project, and if they have been used in other high-speed rail construction projects. The commenter also asks how successful they have been and for examples of construction activities and monitoring measures that can reduce impacts on nesting habitats. The commenter also asks when a species is lost, how it is compensated for. The Authority is ultimately responsible for the implementation of biological surveys, developing restoration plans, and developing mitigation measures but relies on consultants with subject matter experts to conduct biological resource surveys and data collection, develop restoration plans, and formulate effective mitigation measures. These measures have been successfully used in other HSR projects including HSR work under construction in the Central Valley. The IAMFs and mitigation measures discussed in Section 3.7 of the Draft EIR/EIS were developed to reduce potential impacts to nesting habitats. These include but are not limited to BIO-MM#14, BIO-MM#15, BIO-MM#16, BIO-MM#66, BIO-MM#68, BIO-MM#69, BIO-MM#71, BIO-MM#74, BIO-MM#79, BIO-MM#80, BIO-MM#81, and BIO-MM#82. Compensation for impacts to species habitat is dependent on the species, the type of habitat impacted, and the species conservation status. Compensatory mitigation for species and habitat are set out in BIO-MM#35, BIO-MM#38, BIO-MM#39, BIO-MM#43, BIO-MM#44, BIO-MM#46, BIO-MM#47, BIO-MM#53, BIO-MM#61, BIO-MM#67, BIO-MM#70, BIO-MM#93, BIO-MM#95, BIO-MM#97, and BIO-MM#103. For species where a take permit can be issued, the compensation and amount of take are also defined in the permit. Examples of construction activities and monitoring measures that can reduce impacts include full time monitoring of active nests during construction activity and halting activities and expanding the no-work buffers if birds begin to display stress behaviors due to the proximity to construction activities. By monitoring active nests during construction, nest failures due to construction are avoided.

### 4494-9263

The commenter cites the Draft EIR/EIS page 3.7-122 and asks for clarification about weed control, the use of rodenticides, the eradication of *Arundo*, and requested examples that would need reduced traffic speeds and if these roads are shared with other vehicles not related to High-Speed Rail construction. The commenter also asks about frequency of compliance reports and who will receive them. The commenter also asks for examples of construction activities that can reduce impacts on breeding habitat for amphibians and if there will be workers who specialize in construction in wetlands. Page 3.7-122 provides a summary of various mitigation measures that apply to Impact BIO#2: Project Construction Effects on Special-Status Amphibian Habitat. The full text of each of these mitigation measures is provided in Section 3.7.7. These measures address many of the questions raised in the comment. For example BIO-MM#55 requires the Authority to develop a weed control plan to control the spread of weeds. This approach to weed control is anticipated to utilize a wide range of measures that may include herbicides. *Arundo donax* would be a species included in the weed management plan to control the population and potential spread of the species within the project footprint. The Authority would only use rodenticide in accordance with federal, state, and local regulations and outside of sensitive species habitat in areas where no direct and indirect mortality to native wildlife would occur (See BIO-IAMF#11). The roads referred to in BIO-MM#60 are project access roads which are not shared roads and would have reduced speeds as a measure to reduce dust generation, enhance worker and public safety, and avoid impacts to wildlife crossing or basking on the roadways. The only traffic that would be expected to adhere to project-specific speed limits would be related to project construction. Compliance reports are typically generated weekly, monthly, quarterly, and annually and submitted to the Authority and subsequently to resource agencies coordinating with the Authority or that have jurisdictional responsibility over the resources (See BIO-MM#61). Examples of construction activities that can reduce impacts on breeding habitats for amphibians include seasonal restrictions in suitable or occupied breeding or dispersing habitats to avoid disruption of breeding behaviors and dispersal of juvenile amphibians (BIO-MM#58). The Authority expects construction workers to have been provided training on wetland resources and resource protection (BIO-IAMF#3) and be monitored by the Project Biologist while working adjacent to aquatic resources (BIO-MM#34).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9264

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife.

The commenter asks how mitigation measures will make impacts on amphibians less than significant in all cases when construction has not started and whether construction will continue from February to September during nesting months for the five FESA-listed bird species.

The mitigation measures to address potential impacts to amphibians included in the Draft EIR/EIS have been successfully implemented for other HSR projects, including those in the Central Valley, and are typically required through permitting authorizations issued by agencies with regulatory oversight. The Authority is currently implementing similar mitigation measures during construction of the Merced to Fresno and Fresno to Bakersfield Project Sections and they are effective at avoiding, minimizing, and mitigating impacts. The mitigation measures listed prior to page 3.7-123 are only summaries of the mitigation measures to be implemented to reduce construction impacts on special-status amphibians. Refer to Section 3.7.7 in the Final EIR/EIS for the full text of these measures applicable to amphibians.

While the Authority believes the mitigation measures presented in the Draft EIR/EIS are adequate for addressing potential impacts to amphibians, Mitigation Measures BIO-MM#7 and BIO-MM#8 have been revised in the Final EIR/EIS to provide additional protection for amphibians. BIO-MM#7 (Conduct Pre-construction Surveys for Special-Status Reptile and Amphibian Species) was revised to state that surveys would be conducted in accordance with applicable required agency protocols, including CDFW Survey and Monitoring Protocols and Guidelines (<https://wildlife.ca.gov/Conservation/Survey-Protocols#377281282-amphibians>) and the USFWS Survey Protocols and Guidelines (<https://www.fws.gov/library/collections/survey-protocols-and-guidelines-recovery-permits-pacific-southwest-region>).

As stated in the Draft EIR/EIS, surveys would be conducted prior to the start of any ground-disturbing activities. BIO-MM#7 was also revised in the Final EIS/EIS to describe that the results of the focused survey would guide the placement of ESAs, protective

### 4494-9264

fencing, and species relocation. For federal or state-listed species, relocations will be undertaken in accordance with regulatory authorizations issued under the FESA and/or CESA and/or Fish and Game Code §§1002, 1002.5, 1003 and/or Cal. Code Regs., tit. 14, §650. The qualified Project Biologist will also prepare a Reptile and Amphibian Relocation and Avoidance Plan that includes species-specific avoidance buffers of at least 50 feet, and if needed, the approach for relocating individuals out of harm's way and moving to suitable sites outside of the Project footprint. This Plan would be reviewed by CDFW and USFWS prior to any clearing, grading, or excavation work on the Project site. BIO-MM#7 would be effective because it identifies and documents amphibians and their habitat within the project footprint, informs methods for the species' avoidance, protective fencing placement, and relocation activities. BIO-MM#8 (Implement Avoidance and Minimization Measures for Special-Status Reptile and Amphibian Species) was revised to describe that the materials used to establish the exclusion buffer around an environmentally sensitive area (ESA) would not be made of solid material such that the species becomes entrapped within the buffer area. Additionally, the ESA exclusion buffer would include an area of suitable habitat around the species observation such that the species has suitable area to perform normal life history functions and is able to move away from the project site of its own volition. The ESA buffer would be maintained at 50 feet from the point where the species was observed, and the resulting ESA individuals would not be isolated within the construction site from adjacent suitable habitat for the species. This measure requires the Project Biologist to monitor all initial ground disturbing activities that occur within suitable habitat for special-status amphibians and to conduct clearance surveys of suitable habitat on a daily basis to reduce impacts on special-status reptiles and amphibians and their habitat.

In addition, if impacts on special-status amphibians and/or their habitats are not able to be avoided or minimized, implementation of BIO-MM#47 (Prepare and Implement a CMP for Impacts on Aquatic Resources) and BIO-MM#53 (Prepare and Implement a CMP for Species and Species Habitat) would provide compensatory mitigation subject to approval by the applicable regulatory agencies. Please also refer to Standard Response PB-Response-BIO-2, which provides additional information about each species-specific survey, avoidance, minimization, and compensatory mitigation measure.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9264

Identification of special-status amphibian locations and their habitat allows for the implementation of several facets of BIO-MM-7 and BIO-MM-8 including avoiding the habitat impact altogether (with species-specific avoidance buffers) or relocating the special-status species to other nearby suitable habitat (through measures that will be detailed in the Reptile and Amphibian Relocation and Avoidance Plan). Any movement of special-status listed species would require proper regulatory authorizations to ensure that the relocation of the listed species would not result in additional secondary impacts. Implementation of the revised BIO-MM#7 and BIO-MM#8, as described in the Final EIR/EIS, would ensure that impacts to special-status amphibians remain less than significant.

The commenter also asked whether construction will continue from February to September during nesting months for the five FESA-listed bird species. If it is not feasible to avoid the bird nesting season for any of the protected bird species, including FESA-listed bird species, measures will be implemented prior to the start of construction, as well as extend into construction if needed, to avoid and minimize impacts to nesting birds. These measures include BIO-MM#14 (Conduct Pre-construction Surveys and Delineate Active Nest Buffers Exclusion Areas for Breeding Birds), BIO-MM#15 (Conduct Pre-construction Surveys and Monitoring for Non-Special Status Raptors), BIO-MM#16 (Implement Avoidance Measures for California Condor), BIO-MM#65 (Conduct Pre-construction Surveys and Monitoring for Bald and Golden Eagles), BIO-MM#66 (Implement Avoidance Measures for Active Eagle Nests), BIO-MM#68 (Avoid Impacts on White-tailed Kite), BIO-MM#69 (Conduct Surveys and Implement Avoidance Measures for Active Tricolored Blackbird Nest Colonies), BIO-MM#71 (Implement California Condor Avoidance Measures During Helicopter Use), BIO-MM#74 (Implement Bird Nest and Avian Special-Status Species Avoidance Measures for Helicopter-Based Construction Activities), BIO-MM#79 (Conduct Surveys for Coastal California Gnatcatcher), BIO-MM#80 (Conduct Surveys for Least Bell's Vireo), BIO-MM#81 (Conduct Surveys for Southwestern Willow Flycatcher) and BIO-MM#82 (Conduct Surveys for Western Yellow-billed Cuckoo). Please refer to Section 3.7.7 in the Final EIR/EIS for the full text of these measures applicable to nesting birds.

### 4494-9265

The commenter asks how the Authority can conclude that no California Condors breeding activity is known from within 10 miles of the Build Alternatives. The Authority concluded that there is no known breeding activity within 10 miles of the Build Alternatives, based on the literature review and consultation with resource agencies as described in Section 3.7.4.4.

### 4494-9266

The commenter asks if the appropriate Biologists for specific areas plan ahead to coordinate with bird nesting habits. As described in BIO-IAMF#1, the qualifications of the Project Biologist (appropriate Biologist) would be approved ahead of ground disturbing activities. The biological monitoring team will schedule preconstruction activities ahead of proposed construction activities to coordinate exclusionary buffers around occupied nesting habitats. Please see Appendix 2-E page 2-E-5 for more information about the qualifications and responsibilities of the biologists.

### 4494-9267

The commenter asked, related to BIO-IAMF#2, what happens if, during a meeting among agencies such as the United States Fish and Wildlife Service, issues arise. This IAMF describes the Authority's commitment to allowing the USFWS, USACE, NMFS, CDFW, and SWRCB to access the project site during the construction period. It explains that, if an agency visits the project site and raises an issue, the Project Biologist will prepare a memorandum within 3 business days after the visit. The Project Biologist will report any issues regarding regulatory compliance raised by agency personnel to the Authority. If a Project Biologist reports an issue, the Authority will review that report and take appropriate steps to ensure that it is complying with all of its legal obligations and commitments.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9268

The commenter asks how long WEAP training should be so that it is certain that workers understand the training materials and how workers are evaluated to confirm their understanding. They also ask whether training materials will be available in the primary language of each worker. As described in the full text of BIO-IAMF#3 in Appendix 2-E of the Draft EIR/EIS, the dissemination of the WEAP training materials is initiated prior to ground disturbing construction activities and the materials continue to be provided to new project construction and operation staff as they are onboarded and begin supporting the project. Training participants are asked questions and queried to ensure adequate comprehension. Materials are typically provided in multiple languages including but not limited to English and Spanish.

### 4494-9269

The commenter asks for an example of a penalty for noncompliance of a regulation. The take prohibition of the California Endangered Species Act (CESA) specifically states that no person shall import into this state, export out of this state, or take, possess, purchase, or sell within this state, any species, or any part or product thereof, that the commission determines to be an endangered species or a threatened species, or attempt any of those acts (Fish & G. Code, §2080; Cal. Code Regs., tit. 14, §783.1). In this context, the term “take” is defined by Fish and Game Code section 86 as hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill. Penalties for violating section 2080 range from \$25,000 to \$50,000 for each violation, one-year imprisonment, or both fine and imprisonment (Fish & G. Code, §12008.1). However, CESA contains several exceptions to the take prohibition and CDFW may permit the take of candidate, threatened, or endangered species for individuals or businesses carrying out otherwise lawful activities.

### 4494-9270

The commenter asks about BIO-IAMF#5 and at what point in the building process is the Resources Management Plan compiled? As explained in BIO-IAMF#5, the Biological Resources Management Plan is prepared prior to any ground-disturbing activities related to project construction. Please see Appendix 2-E, page 2-E-7 for more details.

### 4494-9271

The commenter asks for examples of type of erosion control materials appropriate for protection of a particular species and asks if the Project Biologist will conduct daily inspections for wildlife. Prior to ground-disturbing activities, the Project Biologist will be responsible for identifying acceptable material for use, including but not limited to geomembranes, coconut coir matting, tackified hydroseeding compounds, and rice straw wattles. Please see BIO-IAMF#6 (Establish Monofilament Restrictions) in Appendix 2-E. The commenter does not specify between general wildlife and special-status wildlife that will be inspected for on a daily basis. During construction, a Project Biologist will likely be surveying for wildlife along the Palmdale to Burbank alignment at some point every day. The type of work, location of work activity, the type of habitat present, the likelihood of special-status species to be present, etc. are all factors to determine if inspections for wildlife should occur on a daily basis.

The Authority will implement BIO-IAMF#1 (Designate Project Biologist, Designated Biologists, Species-Specific Biological Monitors and General Biological Monitors) to reduce potential biological resource impacts through designating Project Biologist(s), Designated Biologist(s), Species-Specific Biological Monitor(s), and General Biological Monitor(s) retained to conduct biological resource monitoring activities and implement avoidance and minimization measures. These positions are approved by the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS) and California Department of Fish and Wildlife (CDFW). The positions are responsible for overseeing timely implementation of biological resource mitigation features and permit conditions, overseeing regulatory compliance and monitoring construction activities. The positions provide on-the-ground field inspection to verify that the project is implemented consistent with all biological resource terms and conditions.

Several of the mitigation measures described in Section 3.7 require monitoring throughout construction, including on a daily basis for several special-status reptiles, amphibians, birds, and aquatic wildlife. BIO-MM#8 (Implement Avoidance and Minimization Measures for Special-Status Reptile and Amphibian Species) requires the Project Biologist to monitor all initial ground disturbing activities that occur within suitable habitat for special-status reptiles and amphibians and to conduct clearance surveys of suitable habitat in the work area on a daily basis. BIO-MM#18 (Implement Avoidance and Minimization Measures for Swainson’s Hawk Nests) requires that Swainson’s hawk

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9271

nests be monitored daily by the Project Biologist. BIO-MM#34 (Monitor Construction Activities within Jurisdictional Waters) requires monitoring of construction activities that occur within or adjacent to aquatic resources. BIO-MM#52 (Conduct California Glossy Snake, California Legless Lizard, Coast Patch-Nosed Snake, Coastal Rosy Boa, Coastal Whiptail, Blainville's Horned Lizard, San Bernardino Ringneck, San Bernardino Mountain Kingsnake, South Coast Garter Snake, Two-Striped Garter Snake, and Western Pond Turtle Monitoring, and Implement Avoidance and Minimization Measures) specifies that clearance surveys will be conducted daily unless the Project Biologist determines that the surveys are no longer necessary. BIO-MM#87 (Prepare and Implement Spill Prevention and Containment Measures) requires daily water quality monitoring during concrete pouring operations.

Two measures, however, BIO-MM#56 (Conduct Monitoring of Construction Activities) and BIO-MM#58 (Establish Environmentally Sensitive Areas and Nondisturbance Zones) do not require daily inspections; rather, they are up to the discretion of the Project Biologist. BIO-MM#56 requires monitoring during any initial ground disturbing activity to verify compliance, establish ESAs and install wildlife/construction exclusion fencing. Following completion of initial ground disturbing activities, the Project Biologist will visit the project construction site(s) once per week or once every two weeks, depending on the Project Biologist's assessment of the level of disturbance, to verify compliance with mitigation measures. BIO-MM#58 requires regular monitoring of Environmentally Sensitive Areas, wildlife exclusion fencing, and construction exclusionary fencing, but does not require daily inspections.

### 4494-9272

The commenter asks about BIO-IAMF#8 and how much space will be used by staging areas and traffic routes, about the timing for restoration of temporarily disturbed areas, and the size of permanent staging areas.

The project footprint that has been identified and evaluated in the Draft EIR/EIS for each Build Alternative includes space for staging construction activities. These areas will be located in areas that would be occupied by permanent facilities where possible. The biological impacts of these staging areas have been included in the Draft EIR/EIS analysis. The Authority will flag and mark access routes to ensure that vehicle traffic within the project footprint is restricted to established roads, construction areas, and other designated areas. Locating the temporary disturbance areas within areas where permanent facilities will be built, when possible, will avoid and minimize additional impacts to special status species and their habitats. BIO-MM#6 requires that prior to any ground disturbing activity, the Project Biologist will prepare a Restoration and Revegetation Plan (RRP) to address temporary impacts resulting from ground disturbing activities within areas that potentially support special-status species, wetlands and any other aquatic resources. In addition, BIO-MM#32 requires that temporarily disturbed riparian areas will be revegetated within 90 days of completing construction in a work area.

### 4494-9273

The commenter asked, in response to BIO-IAMF#9, whether the Authority would build new facilities for storing construction spoils and waste and what the IAMF means by "treatment." No new facilities are anticipated or included in the project design for storing construction spoils or waste. It is expected that the contractor will store spoils on-site within the project footprint before being hauled or conveyed to its final deposition site. Much of the spoils are anticipated to be deposited at the Vulcan mine and Boulevard mine sites, see Appendix 2.0-1 Spoils Disposal Assumptions for further details. In the context of "BIO-IAMF#9, "treatment" refers to biological, thermal, chemical, or physical remediation techniques (3.7-19).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9274

The commenter asks about BIO-IAMF#10 and where cleaning locations will be, how large and disruptive to the forest they will be, and what materials will be used to clean the equipment. The cleaning locations would be located within the construction footprint established for each Build Alternative. Because they would be located within the construction footprint, no additional disturbance to the surrounding area is anticipated. Cleaning may be done by washing with water, blowing with compressed air, brushing, or other hand cleaning. See Appendix 2-E, page 2-E-8 for more details.

### 4494-9275

The commenter inquires whether rodenticides that could harm wildlife would be used, and requests details regarding the methodology for ensuring that HSR construction/maintenance workers abide by standard construction site housekeeping practices.

Construction and operations and maintenance activities may require the use of rodenticides in limited instances. Pesticide use, including rodenticides, would be in accordance with federal and state requirements and guidelines. Through adherence to state and federal requirements and guidelines, the use of rodenticides in certain limited instances is not expected to result in harm to non-target wildlife. It should be noted that there is currently a moratorium on the use of second-generation anticoagulant rodenticides pursuant to the Ecosystems Protection Act. Under the Act, the moratorium would only be lifted for rodenticides that are determined by the California Department of Pesticide Regulation to not have a significant adverse effect on non-target wildlife. As specified in BIO-IAMF#11, the Authority will prepare a construction site Best Management Practice (BMP) field manual. The manual will contain standard construction site housekeeping practices required to be implemented by construction personnel. The manual will identify BMPs for rodenticide use and other general construction site cleanliness measures. All construction personnel will receive training on BMP field manual implementation prior to working within the project footprint. All personnel will acknowledge, in writing, their understanding of the BMP field manual implementation requirements. The BMP field manual will be updated by January 31st of each year. The Authority will provide, on an annual basis, training updates to all construction personnel (BIO-IAMF#4). BIO-IAMF#4 (Conduct Operation and Maintenance Period WEAP Training) will provide training to HSR operations and maintenance workers on regulatory agency terms and conditions contained in permits and approvals, federal and state environmental regulations, and project avoidance features and mitigation measures. BIO-IAMF#11 has been revised in the Final EIR/EIS to indicate that the BMP Manual shall be reviewed and approved by USFS if the activities occur within USFS lands (see Appendix 2-E of the Final EIR/EIS).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9276

The commenter asks about the efficacy of BIO-IAMF#12 and whether construction will avoid the breeding season of birds. BIO-IAMF #12 in Appendix 2-E provides guidance on design of facilities to address the potential for electrocution and collision with birds. The Authority has identified additional mitigation measures to address potential impacts from construction, including habitat fragmentation and nest disturbance. BIO-MM#14 requires that prior to any ground disturbing activity, including vegetation removal, scheduled to occur during the bird breeding season (February 1 to September 1), the Project Biologist will conduct visual pre-construction surveys within the work area for nesting birds and active nests (nests with eggs or young) of non-raptor species listed under the MBTA and/or the Fish and Game Code. These surveys will be conducted in accordance with required protocols. In the event that active bird nests are observed during the pre-construction survey, the Project Biologist will delineate no-work buffers. No-work buffers will be set at a distance of 75 feet unless a larger buffer is required pursuant to regulatory authorizations. Consistent with standard practice, no work buffers will be set from the base of the nesting site. No-work buffers will be maintained until nestlings have fledged and are no longer reliant on the nest or parental care for survival, or the Project Biologist determines that the nest has been abandoned. This measure will ensure nests are not disturbed by construction activities including construction period noise. The following mitigation measures provide additional requirements specific to different bird species that may be present in the project area - BIO-MM#15, BIO-MM#16, BIO-MM#66, BIO-MM#68, BIO-MM#69, BIO-MM#71, BIO-MM#74, BIO-MM#79, BIO-MM#80, BIO-MM#81 and BIO-MM#82. The Authority has also included mitigation measures requiring compensatory mitigation for any loss of habitat which would mitigate impacts of habitat loss and fragmentation. See measures BIO-MM#43, BIO-MM#44, BIO-MM#67, BIO-MM#70 which require compensatory mitigation for the loss of nests associated with specific bird species as well as habitat loss.

### 4494-9277

The commenter asked the Authority to apply Executive Order 11990, Protection of Wetlands, 42 Fed. Reg. 26961 (May 24, 1977). That order directs agencies to "consider factors relevant to a proposal's effect on the survival and quality of the wetlands," and to ensure that "the proposed action includes all practicable measures to minimize harm to wetlands." That order does not focus on protecting nesting birds. Nonetheless, the Authority intends to take thorough measures to protect nesting birds. The commenter asks (1) how the Authority will survey to reduce impacts on nesting birds, (2) who will conduct those surveys, and (3) how the Authority will ensure construction workers abide by those protections.

The commenter asks if construction will ever cease, so it will not harm birds. The Authority will take several steps. It will survey for active nests and, when it finds them, it will take measures to protect them. To identify active nests, biologists will conduct pedestrian surveys, plant community identification, and observations of the habitat for nesting behavior. Pre-construction nesting bird surveys are described in BIO-MM#14 and 15. When the Authority's biologists discover active nests, they will place around the nest a no-disturbance buffer to avoid or to reduce impacts on the nest. Results are translated to workers in the form of a no-work buffer being identified in work areas, where they overlap. The Authority will not disclose the exact location of a nest to anyone who does not need to know that location, and that confidentiality is also important to protect the nests.

The commenter asks about impacts on the California Condor. Under BIO-MM#16, the Authority will not perform work within 0.5 mile of a roosting condor, and that mitigation measure will protect condors. Moreover, the Authority will properly dispose of trash and will contain construction materials. If condors appear in the work area, those efforts will prevent them from becoming entangled or ingesting harmful/foreign materials. Stopping work activities that can harm a condor until the condor vacates the area will avoid construction activity related harm to condors. The comment asks how locating Swainson's hawk nests or burrowing owl nests will protect the species. The Authority will protect those nests by applying a no-work buffer around the nests to protect Swainson's hawk and burrowing owl nests. Those efforts will protect those members of the species. BIO-MM#14 and 15 apply to general nesting birds and raptors, and BIO-MM#16, 17, 18, 20, and 21 apply to Swainson's hawks, condors, and burrowing owls, and will be used

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9277

for their protection. Restoration of habitat is described in BIO-MM#6, 32, and 33.

### 4494-9278

The commenter asks how the Authority will document mitigation measures. The Authority will prepare a Mitigation Monitoring Report which will be used to monitor, track and ensure that mitigation measures committed to by the Authority are being implemented and effective.

The commenter asks evidence is there that habitat restoration will cause birds to return to a previous area. By restoring the habitat to predisturbance successional stages, the Authority expects a quicker return to secondary succession or re-colonization of the restored site to occur. As these habitats develop and provide suitable environmental elements (space for individual and population growth, cover or shelter, food, water, nutritional or physiological requirements, sites for breeding and rearing offspring, and habitat that are representative of historical geography and ecological distributions of the species) individuals and then populations of birds will return to the area.

The commenter asks specifically will weeds be controlled. The Authority will implement BIO-MM#54 and BIO-MM#55 to address vegetation removal for the purpose of maintaining clear areas around facilities, reducing the risk of fire, and controlling invasive weeds during the operational phase and establish approaches to minimize and avoid the spread of invasive weeds during ground disturbing activities during construction and operations and maintenance. The commenter asks how the Authority will confine noise from construction. The Authority will do so by taking periodic noise readings in areas with sensitive biological resources such as nesting birds and halting construction that exceeds USFWS and CDFW published thresholds for each species, by establishing Environmentally Sensitive Areas no-work areas around sensitive resources, by installing wildlife exclusion fencing (WEF), and by installing construction exclusion fencing (exclusion fencing). See Appendix 3.1-C-25.

The commenter asks questions about the Compliance Reporting Program. Generally, the Project Biologist will prepare monthly and annual reports that document compliance with all IAMFs, mitigation measures, and other requirements, and the Authority will review and decide whether to approve them. See Appendix 3.1-C-26 to -28. The comment requests an example of construction speed limits. The Project Biologist will establish, for example, vehicle speed limits of no more than 15 mph for unimproved access roads and for temporary and permanent construction areas within the

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9278**

Construction Footprint. See Appendix 3.1-C-26.

The commenter asks how a Work Stoppage "is the same as 'reduced'" impacts on wildlife. In the event that any special-status wildlife species is found in a Work Area, a work stoppage would reduce impacts on those members of the species. See Appendix 3.1-C-28 to -29.

### **4494-9279**

The commenter asks how the Authority will relocate eagle nests and who would do that. Active bald eagle and golden eagle nests can be relocated through the use of a federal eagle nest take permit issued by the USFWS under the authority of the Bald and Golden Eagle Protection Act. However, pursuant to California Fish & Game Code 3511, golden eagle are fully protected and active nests cannot be relocated. Please see Response to Comment #10391 for further discussion regarding nest relocation.

The commenter asks what measures the Authority will undertake to avoid effects on white-tailed kite nests within the construction footprint under BIO-MM#68. For construction between February 1 and August 31, the Project Biologist will survey for kites. If the biologist finds kites, the biologist will establish no-disturbance buffers until the young have fledged. The commenter asks who will identify Tricolored Blackbird nesting habitat and active nests, what method that person will use to identify the colonies, and what other mitigation measures the Authority will use. The Project Biologist will locate the nests. The methods used to identify Tricolor Blackbird habitat and active nests include pedestrian surveys, plant community identification, and observations of the habitat for active nesting behavior. As described in BIO-MM#14, active nests would be protected through no-work buffers. The commenter asked how the Authority will avoid [impacts from] helicopter use. As described in BIO-MM#74, for construction activities involving the use of a helicopter, the buffer for nesting birds will be 200 feet horizontal and 150 feet vertical. Buffers will be measured from the location of the nest. If a nest is located on a tower or a tree, the vertical buffer begins from the nest location. For raptors that are not state or federal special-status raptors the default buffer is 300 feet. Under BIO-MM#71, prior to construction-related uses of helicopters, the Project Biologist will coordinate with USFWS to establish that no California condors are present in the area. If California condors are observed in the area where helicopters will operate, including the helicopter's flight pattern from its origination, during construction use, and the return flight, helicopter use will not be permitted until the Project Biologist has determined that the California condors have left the area. The commenter asked how the light will affect migrating birds. As described in BIO-IAMF#12 and BIO-MM#99, appropriate project lighting techniques will be utilized if construction activities are required at night. The commenter asked how the Authority will protect the California Condor. The Authority has developed a range of IAMFs and MMs to avoid or minimize impacts to California Condor (see e.g., BIO-MM#72). The commenter asked what is an

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9279

example of a "helicopter-based construction activity." As described in Chapter 2, page 2-199, geotechnical investigations are an example of an activity carried out with the use of helicopters. The commenter asked how bird nest surveys reduce impacts. Bird nest surveys allow for the identification of active nests, which then requires implementation of the no-work buffers identified in BIO-MM#14, BIO-MM#18, BIO-MM#21, BIO-MM#66, BIO-MM#68, BIO-MM#69, BIO-MM#74, BIO-MM#79, BIO-MM#80, BIO-MM#81, and BIO-MM#82.

### 4494-9280

The commenter asks from where and the method the Authority would be delivered supplemental water for fostering wildlife habitat. The Authority would implement BIO-MM#93 adaptive management to provide supplemental water as necessary to support riparian vegetation, wildlife breeding cycles, aquatic wildlife or protect tree health. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which addresses the commenter's question about the water sources for supplemental water.

The commenter also asks how the Authority would use compensatory mitigation. BIO-MM#2, BIO-MM#46, BIO-MM#47, and BIO-MM#53 require compensatory mitigation which may include purchasing credits from an approved mitigation bank, acquiring habitat and preserving it in perpetuity, participating in an in lieu fee program, or a combination of all these options. Through the protection and long-term management of habitat, the project related habitat impacts would be offset.

### 4494-9281

The commenter asks how mitigation involving biologists, planning, training, waste disposal, traffic, and maintenance of workspace and tools ensure that special status fish are protected.

While the commenter did not specifically reference BIO-IAMF#1 (Project Biologist), BIO-IAMF#2 (Facilitate Agency Access), BIO-IAMF#3 (WEAP Training), BIO-IAMF#8 (Designated Traffic Routes), BIO-IAMF#9 (Disposal of Spoils), BIO-IAMF#10 (Clean Construction Equipment), BIO-IAMF#11 (Maintain Construction Sites), the Authority believes the comment is in reference to the effectiveness of these features to protect special status fish. The Authority developed the following: BIO-IAMF#1 to require that a qualified biologist oversee compliance with biological and wetland avoidance and minimization features; BIO-IAMF#2 to ensure that the Palmdale to Burbank Project Section site and construction activities comply with all regulatory procedures intended to avoid and minimize impacts on applicable resources; BIO-IAMF#3 to educate all construction workers on the importance and specific requirements of identifying and avoiding sensitive biological resources; BIO-IAMF#8 to delineate roadways for construction equipment and to avoid driving through and injuring, killing, or removing sensitive biological resources; BIO-IAMF#9 to prevent disposal of construction spoils and waste in sensitive biological habitats and resources that would could result in injury or death of individuals of the species or reducing the habitat quality; and BIO-IAMF#10 and BIO-IAMF#11 to maintain construction sites and equipment in accordance with identified best practices.

In summary, implementation of BIO-IAMF#1, BIO-IAMF#2, BIO-IAMF#3, BIO-IAMF#5, and BIO-IAMF#8 through BIO-IAMF#11 will ensure that mitigation measures are applied in a timely manner, such that construction activities comply with all regulatory procedures intended to avoid and minimize impacts to applicable resources, and that biological resources are appropriately identified and preserved. The above IAMFs have been incorporated into project design to reduce impacts on special-status fish.

Impact BIO#4 in Section 3.7 of the Draft EIR/EIS concluded that surface construction associated with each of the six Build Alternatives would have a substantial adverse effect on habitat for special-status fish species, but finds that implementation of the IAMFs listed above would minimize impacts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9281**

While it is assumed that the commenter is not raising specific issues with mitigation measures (based on the information in the comment), it should be noted that Impact BIO#4 (Page 3.7-142 through 3.7-144 of the Draft EIR/EIS) also describes how each applicable mitigation measure (i.e., in addition to the IAMFs discussed above as part of project design) would reduce surface construction impacts on special-status fish. The suite of mitigation measures described in this section provides a multi-tiered approach to avoiding/minimizing impacts to special-status fish and their associated habitat. This multi-tiered approach includes measures intended to avoid/minimize impacts, followed by restoration or relocation, as needed. Monitoring is applied where restoration/relocation occurs to ensure that mitigation efforts are successful.

Furthermore, if avoidance/minimization of impacts to special-status fish species is not possible, compensatory mitigation would be applied. As described in Section 3.7.4.6 of the Draft EIR/EIS, the project would result in a significant impact (pursuant to CEQA's mandatory findings of significance) if it would substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, or substantially reduce the number or restrict the range of an endangered, rare, or threatened species. The Draft EIR/EIS determined that, with implementation of mitigation, none of the Build Alternatives would result in a significant impact per the conclusion identified herein. Implementation of the IAMFs as part of project design, in conjunction with the multi-tiered approach to mitigation during project construction and operations, will ensure impacts remain less than significant.

The commenter also asks how much time would be allowed for these measures. The time allocated to implement each measure varies depending on what the measure is intended to achieve. Each measure will take the time necessary to ensure its effectiveness. Some measures will be completed prior to ground disturbing activities, while others would remain ongoing throughout construction. For each mitigation measure set forth in the Final EIR/EIS, the Mitigation Monitoring and Enforcement Plan (MMEP) identifies the action being monitored, responsibility for implementation, the schedule for implementation, and the mechanism that verifies when monitoring is effectively complete.

### **4494-9282**

The commenter asks at what point in the construction would riparian habitat be restored. Within 90 days of completing construction in a work area, the Project Biologist will direct the revegetation of any riparian areas temporarily disturbed as a result of the construction activities. Please see the full text of BIO-MM#32 on page 3.7-218 for requirements for riparian habitat restoration.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9283

The commenter asks for descriptions of the process for restoring aquatic resources and of the difference between temporary and permanent impacts to fish as they relate to BIO-MM#33. The full text of BIO-MM#33 can be found in Section 3.7.7 in Section 3.7, Biological and Aquatic Resources of the Final EIR/EIS.

The process for restoring aquatic resources will return temporarily impacted aquatic resources back to approximate pre-project conditions. The details of the process will be specific to the impacted area based on factors such as, but not limited to, the type, condition and size of the impacted aquatic resource and the type and duration of construction activity impact to the area. The process will be described in detail in a Restoration and Revegetation Plan (RRP), as required in BIO-MM#6 (Prepare and Implement a Restoration and Revegetation Plan), which must be prepared prior to any ground disturbing activity. The RRP will be provided to the relevant aquatic resource regulatory agencies, such as the USACE, SWRCB and/or CDFW, for review and approval.

The process that will be described in the RRP may include, but is not limited to, grading impacted areas to approximate pre-disturbance conditions, re-vegetating impacted areas with native plant species, and using certified weed-free straw and mulch. The RRP will also include process details such as, at a minimum, pre-project condition documentation procedures; sources of plant materials and methods of propagation; parameters, methods, and schedules for maintenance, monitoring and reporting; success criteria; and remedial measures to be taken if success criteria are not met. These will be adhered to during implementation of BIO-MM#6 and BIO-MM#33 (Restore Aquatic Resources Subject to Temporary Impacts). BIO-MM#33 requires that the Authority begin to restore aquatic resources that were temporarily affected by the construction, as laid out in the approved RRP, within ninety days of the completion of construction activities in a work area. If the impacts to aquatic resources would also result in permanent or temporary impacts on federal and state-listed species and their habitat, fish and wildlife resources regulated under Section 1600 et seq. of the Fish and Game Code, and other certain other special-status species, a Compensatory Mitigation Plan (CMP) that addresses that species and its habitat would be prepared and implemented, as required in BIO-MM#53: Prepare a CMP for Species and Species Habitat. The CMP would also be subject to the review and approval of the relevant

### 4494-9283

resource agencies, such as CDFW or USFWS.

Temporary impact areas are areas that can be restored to approximate pre-project conditions following the completion of short-term construction activities, such as the establishment of laydown and storage areas, temporary construction access routes, or work areas needed to construct permanent project components but that are ultimately not part of the final project footprint, and are not subject to effects for longer than a period agreed to by the relevant regulatory resource agencies, and as approved in the RRP. Permanent impacts to aquatic resources result from the permanent removal or fill of the aquatic resources where the aquatic resource cannot be restored in that location. As discussed in Impact BIO#8: Project Construction Effects on State and Federally Protected Aquatic Resources, some areas would be restored when construction is complete, but because the construction schedule is longer than two growing seasons, all direct impacts during construction are considered permanent for the purpose of the analysis in the Draft and Final EIR/EIS.

### 4494-9284

The commenter is asking how monitoring construction activities (BIO-MM#34) helps to reduce impacts on fish, and what is one activity that would have an effect in protecting a special status fish. The Authority developed BIO-MM#34 as part of Section 3.7 of the Draft EIR/EIS to monitor construction activities within jurisdictional waters and avoid or minimize impacts to these resources. These aquatic resources often serve as suitable habitat for special-status fish communities, and monitoring can alert Project Biologists to the presence of special-status fish. Implementation of BIO-MM#34 would reduce construction-related disturbance, degradation, and pollution to these resources, such that impacts on special-status fish species and habitat would be reduced. The Project Biologist will monitor construction activities that occur within the aquatic resource to ensure these activities are implemented in a way that do not impact special status fish.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9285**

In relation to BIO-MM#45, the commenter asks how the appropriateness of compensatory mitigation is determined, who receives compensation, and what is the follow-up process to offset the loss. BIO-MM#46 requires that, pursuant to Fish and Game Code section 1600 et seq., the Authority will compensate for permanent impacts on riparian habitats at a ratio of 2:1 unless a higher ratio is required by agencies with regulatory jurisdiction over the resource. Compensatory mitigation may occur through habitat restoration, the acquisition of credits from an approved mitigation bank, or participation in an in-lieu fee program. The determination as to the appropriateness of compensatory mitigation is done in consultation with the California Department of Fish and Wildlife under Fish and Game Code section 1600 et seq. or other agency with jurisdiction over the affected resource. As noted in BIO-MM#46, compensatory mitigation often takes the form of acquiring mitigation credits from an approved mitigation bank. Under BIO-MM#46, the Authority will need to provide the California Department of Fish and Wildlife confirmation that the required credits have been purchased, habitat restoration completed, or payment of in-lieu fees has occurred to verify that the compensatory mitigation (offset as noted in the comment) has occurred.

### **4494-9286**

The commenter asks if aquatic resources are to be replenished and what the source would be. The Authority will prepare and implement a CMP that identifies mitigation to address temporary and permanent loss, including functions and values, of aquatic resources as defined as WOTUS under the CWA and/or waters of the state under the Porter-Cologne Act. The compensatory mitigation will meet state and federal policies on no net loss of functions and values of wetlands. Compensatory mitigation may involve the restoration, establishment, enhancement, and/or preservation of aquatic resources through one or more of the following methods:

- Purchase of credits from an agency-approved mitigation bank.
- Preservation of aquatic resources through acquisition of property.
- Establishment, restoration, or enhancement of aquatic resources.
- In-lieu fee contribution determined through consultation with the applicable regulatory agencies.

Please see the full text of BIO-MM#47 on page 3.7-220 for compensatory mitigation requirements for impacts to aquatic resources. Temporary impacts to aquatic resources will be addressed as described in BIO-MM#6, BIO-MM#32 and BIO-MM#33, found on pages 3.7-124 and 3.7-218.

### **4494-9287**

The commenter asks what is done with offset compensation. Please see the full text of BIO-MM#53 on page 3.7-222 for a description of how compensatory mitigation will be provided to offset permanent and temporary impacts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9288

The commenter asks how construction can reduce special-status fish disturbance, and what power the Project Biologist would have in enforcing these mitigations. The commenter also asks to what extent does the construction contractor follow the biologist's recommendations. Section 3.7 of the Draft EIR/EIS indicates that construction activities that occur while closely following the prescribed BIO IAMFs and BIO MMs will avoid or minimize disturbance to special status fish habitat. BIO-MM#63 gives the Project Biologist the authority to halt work to prevent death or injury of a special status species. The construction contractor will be contractually obligated to adhere to all BIO IAMFs and BIO MMs, and is required to follow the Project Biologist's direction regarding avoidance of resource impacts including through implementation of BIO IAMFs and BIO MMs.

### 4494-9289

The commenter is asking who is responsible for compiling and reporting on implementation of mitigation measures (BIO-MM#61), and how does a report reduce impacts on special-status fish? Please see the full text of BIO-MM#61 on page 3.7-225 for a description of the compliance monitoring program. Regular monitoring and then reporting to the Authority and regulatory resource agencies is a tool to maintain and document compliance with IAMFs and mitigation commitments. Documentation and reporting allows the Authority to identify and track any potential non-compliance with these commitments, and regular reporting insures timely implementation of corrective actions and reducing the probably of repeating non-compliances in the future. Using this reporting method, the Authority will reduce impacts to special status fish species. The Authority as the lead agency for the project has the primary responsibility for ensuring compliance with the IAMFs and mitigation measures.

### 4494-9290

The commenter is asking for an example of a mitigation measure to reduce an impact on special-status fish should dewatering occur. Dewatering would be necessary prior to any construction activity that occurs within open or flowing water. A dewatering plan would be prepared and would be reviewed and approved by the applicable regulatory agencies prior to implementation. The plan will incorporate measures to minimize turbidity and siltation and the project biologist will monitor the dewatering. Please see the full text of BIO-MM#62 on page 3.7-227 for surveys and activities required for special-status species.

### 4494-9291

The commenter is asking how likely is it that work will be stopped for a fish species and references BIO-MM#63? As described in BIO-MM#63, in the event that any special-status wildlife (including fish) species is found in a work area, the Project Biologist will have the authority to halt work to prevent death or injury of the species. Any such work stoppage will be limited to the area necessary to protect the species. Work may be resumed once the Project Biologist determines that the individuals of the species have moved out of harm's way, or the Project Biologist has relocated them out of the work area (relocation not applicable to fully protected species). Any such work stoppages and the measures taken to facilitate the removal of the species, if any, will be documented in a memorandum prepared by the Project Biologist and submitted to the Authority within two business days of the work stoppage. Work stoppage is not anticipated for non-special status fish species.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9292

The commenter is asking what is meant by "relevant guidelines for all special-status fish species". Please see the full text of BIO-MM#76 on page 3.7-230 for a description of the wildlife rescue measures. "Relevant guidelines" consist of any CDFW guidance on addressing the process to manage injured or trapped wildlife species, including special-status fish. This includes the possession of a Wildlife Rehabilitation Permit and Memorandum of Understanding required for any person or facility to possess and rehabilitate wildlife in California. While project-specific guidelines have not been issued by CDFW, the following is a list of agency-wide source documents: Possession of Wildlife and Wildlife Rehabilitation; Restricted Species Laws and Regulations Manual; Importation, Transportation and Possession of Live Restricted Animals; Permits for Restricted Species; Humane Care and Treatment Standards; Release of Animals into the Wild.

### 4494-9293

The commenter asks how knowledgeable of three-spine stickleback the construction workers are expected to be, and how will workers demonstrate their knowledge from an awareness program. The commenter also asks why contaminants will be allowed to enter the Santa Clara River channel. Construction workers are expected to fully understand the site-specific restrictions including activities that may result in impacts to the species and those activities that are approved during construction. During WEAP training, photos of each of the sensitive species (including three-spine stickleback and their habitat) and resources (aquatic features including the Santa Clara River) are provided to each construction worker and applicable mitigation measures as described in Section 3.7 of the Draft EIR/EIS are detailed for the construction crews. Refresher WEAP training is provided to the construction crews during safety tailboards, which also includes clear guidance on when to ask the Project Biologist for clarification. The WEAP training will educate workers as to the restrictions on the introduction and handling of concrete or other contaminants, and debris and vegetation disposal. This will ensure that contaminants are not allowed to enter the Santa Clara River channel. The Authority will also implement as required by HMW-IAMF#6 a spill prevention, control and countermeasure plan to prevent hazardous material releases. In addition the Authority will implement BIO-MM#85 which requires the establishment of construction zones and environmentally sensitive areas around stickleback and its habitat (the Santa Clara River). This measure requires that no construction activity occur within 10 feet of the wetted channel and that barrier fencing being installed. These measures will ensure that contaminants, including workers will not enter the wetted channel of the Santa Clara River.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9294

The commenter asks for examples of expected weather or seasonal work restrictions. Weather restrictions are described as follows "Prior to scheduling any bridge or bank stabilization concrete pours for construction or maintenance, a clear weather window, defined for this project as a less than 40 percent chance or less of 0.10 inches or greater of precipitation in the next 48 hours as forecasted by National Oceanic and Atmospheric Administration, will be required. If a bridge or bank stabilization-related concrete pour is in progress and an un-forecasted rain event occurs, bridge or bank stabilization related concrete pours will be suspended." Seasonal work restrictions are "All permanent bridge pier and structure construction in the Santa Clara River riverbed will be completed during the dry season, defined as June 1 through November 1, and all work will completely avoid the wetted channel during construction and maintenance." Please see the full text of BIO-MM#86 on page 3.7-233 for weather and seasonal restrictions.

### 4494-9295

The commenter asks for examples of spill-proof measures. Spill containment may include installation of K-rail barriers at the perimeter of work areas, between work areas and the wetted channel and/or underslung tarps to intercept all potential uncured concrete flows to the Santa Clara River. Please see the full text of BIO-MM#87 on page 3.7-234 for details on spill prevention and containment measures.

### 4494-9296

The commenter asks which debris prevention measures in BIO-MM#88 are expected to be most effective. All preventative measures indicated in BIO-MM#88 (an underslung tarp, debris platform or equivalent barrier extending at least 10 feet beyond the width of the wetted channel) are anticipated to be effective in minimizing degradation of water quality and avoiding or minimizing impacts to special-status fish in the Santa Clara River.

### 4494-9297

The commenter asks for the seasonal restriction dates for the unarmored three-spine stickleback. Construction activities in areas susceptible to winter flood flows will be conducted from May 1 through November 30, when winter flood flows do not occur in the Santa Clara River. Other construction activities in areas not at risk of flood flows may be constructed year-round. Please see the full text of BIO-MM#89 on page 3.7-234 for details on seasonal restrictions.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9298**

The commenter is asking if dewatering decreases water in the Santa Clara River and at what point will construction dewatering results begin again. The commenter also asked if pollutants expected to enter the river, and how planned mitigations result in less than significant impacts. Lastly the commenter asks how habitat areas are measured to determine whether mitigation measures have been successful, at what point does measurement take place, and who receives the compensation. While it isn't clear what the commenter means by "at what point will construction dewatering results begin again", the Authority will implement BIO-MM#90 which is intended to ensure that any dewatering is conducted in a manner that does not affect Santa Clara river flow (3.7-235).

The Authority will monitor daily surface water elevations upstream, adjacent to, and downstream of the extraction points, to assess any critical flow regimes susceptible to excessive draw down before, during, and after groundwater dewatering activities. This measure is also intended to prevent pollutants from entering the river during construction dewatering activities. Typical pollutants include oil and lubricants from construction equipment, contaminants on the surface of the equipment deposited when the equipment was previously used at a different construction location out of the project. BIO-IAMF#10 requires all construction equipment to be cleaned prior to arriving onsite or being used in project construction activities. This measure is intended to not only remove invasive species but mud and debris that could contain contaminants prior to entering the construction areas. BIO-MM#87 and BIO-MM#88 are intended to prevent discharge of chemicals or debris into the Santa Clara River. Specifically implementation of measures BIO-MM#62 would identify the presence of special status fish within the Santa Clara River and avoiding dewatering activities when fish are present, BIO-MM#86 would require seasonal no-work restrictions to avoid the wetted channel when special status fish are present, and BIO-MM#87 and BIO-MM#88 would avoid water quality degradation by restricting inadvertent discharges into the Santa Clara River and avoiding impacts to sensitive fish and their habitat. BIO-MM#90 would require monitoring of surface water levels within the Santa Clara River and halting dewatering if surface water levels in the river decrease the wetted channel where sensitive fish species are present.

The commenter asks who will "receive compensation" if the restoration of affected

### **4494-9298**

habitat areas is not successful. The Authority refers to "compensatory mitigation" as efforts to compensate for the loss of habitat through purchase of mitigation bank credits or property with the same resource values as replacement for impacted resources.

### **4494-9299**

The commenter asks how the mitigation measures listed on page 3.7-146 of Section 3.7 of the Draft EIR/EIS prevent construction activities, off-road traffic, and chemical runoff into habitats of special-status invertebrate habitats. Section 3.7 indicates that implementation of the listed IAMFs (BIO-IAMF#1, BIO-IAMF#2, BIO-IAMF#3, BIO-IAMF#5, BIO-IAMF#6, BIO-IAMF#7, BIO-IAMF#8, BIO-IAMF#9, BIO-IAMF#10, and BIO-IAMF#11) along with the listed mitigation measures (BIO-MM#3 and BIO-MM#4) will reduce or avoid impacts to special status invertebrates and their habitat. These measures, described on pages 3.7-18 to -19 and 3.7-213 of the Draft EIR/EIS, are designed to avoid construction activities when sensitive resources are present and provide qualified compliance monitors to oversee construction activities to insure adherence to the BIO IAMFs and BIO MMs listed above.

### **4494-9300**

The commenter asks if surveying the area for wildlife species changes construction. Although BIO-MM#3, referenced by the commenter, addresses vernal pool wildlife species specifically, the comment references wildlife species generally. Pre-construction wildlife surveys will be conducted as described in the full text of BIO-MM#3, 7, 14, 15, 17, 20, 25, 28, 29, 52, 65, 96, and 102 of the EIR/EIS. The survey results will provide information that can lead to modification to construction activities, such as setting up exclusionary buffers to restrict ground disturbances in areas that are not authorized for disturbance or contain sensitive resources and are restricted during certain times of the year. Detection of the species during preconstruction surveys conducted according to these mitigation measures could also provide for restrictions on construction activities or changes to construction schedules, such as rescheduling activities to take place when vernal pools are not inundated and/or outside of the rainy season.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9301

The commenter asks for an example of vernal pool restrictions for a particular species and if work would stop during that period. To the extent feasible, ground disturbing activities will not occur within 250 feet of vernal pools or seasonal wetlands during the rainy season (October 15 to April 15). In the event ground disturbing activities are to occur within the buffer area during the rainy season, such activities should, to the extent feasible, be undertaken when the aquatic features are not inundated. Please see the full text of BIO-MM#4 on page 3.7-213 for potential vernal pool work restrictions.

### 4494-9302

The commenter asked how a revegetation plan, even if implemented, will bring back a butterfly, and when and how would its success be determined.

The Authority has revised BIO-MM#6 (Prepare and Implement a Restoration and Revegetation Plan) in the Final EIR/EIS to require the restoration and revegetation plan to include success criteria for re-established vegetation communities, including demonstration of an increase in density of host plants or overall acreage of vegetation communities compared to baseline conditions.

Restoring the habitat by providing additional host and nectar plants can support additional or expanded populations of a butterfly species. BIO-MM#6 will reduce direct and indirect impacts on the San Gabriel Mountains elfin butterfly and San Emigdio blue butterfly by replacing the removed or damaged host plants at a density or overall acreage greater than the pre-disturbance amounts. The Authority also revised BIO-MM#6 in the Final EIR/EIS to specify that the Restoration and Revegetation Plan will outline sources of plant materials containing host plants for native special-status invertebrates as well as success criteria for re-establishing vegetation communities, including an increase in density of host plants. BIO-MM#53 (Prepare and Implement a CMP for Species and Species Habitat) has been developed by the Authority to further offset impacts to species and species habitat, which will include butterfly habitat, through compensatory mitigation including offsite habitat restoration or enhancement. BIO-MM#53 indicates that where compensatory mitigation is identified as the preferred approach, mitigation ratios will be identified pursuant to regulatory authorizations issued under CESA (monarch butterfly) and USFS (San Gabriel Mountains elfin butterfly and San Emigdio blue butterfly). In addition, BIO-MM#54 (Prepare and Implement an Annual Vegetation Control Plan) and BIO-MM#55 (Prepare and Implement a Weed Control Plan) were modified to include specific limitations on the application of herbicides and pesticides within proximity to occupied Monarch butterfly habitats. BIO-MM#95 (Provide Compensatory Mitigation for Impacts on Monarch Butterfly Habitat) includes a compensatory mitigation ratio of 1:1 for impacts to occupied overwintering, breeding, and/or foraging habitat to offset impacts to monarch butterfly populations. Implementation of BIO-MM#6, BIO-MM#53, BIO-MM#54, BIO-MM#55, BIO-MM#94 (Avoid Direct Impacts on Monarch Butterfly Host Plant), and BIO-MM#95 would improve the quality and increase the quantity of suitable habitat for butterfly species. As a result,

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9302

impacts on butterfly species and habitat would be reduced to less than significant.

### 4494-9303

The commenter asks generally what kind of compensatory mitigation can be expected under BIO-MM#39. BIO-MM#39 discusses that the Authority will provide compensatory mitigation for impacts on vernal pool fairy shrimp and tadpole shrimp habitat and refers to BIO-MM#53 for the compensatory mitigation methods. Please see the full text of BIO-MM#53 on page 3.7-222 and Appendix 3.1-C-23 for details on potential compensatory mitigation options. They include purchasing mitigation credits from an agency-approved mitigation bank, protecting habitat by acquiring it in fee or through a conservation easement, and paying into an existing in-lieu fee program.

### 4494-9304

The commenter asks for an example of an offset for a species. Offsets could include compensatory mitigation in the form of purchase of mitigation credits from an agency approved mitigation bank, protection of habitat through acquisition of fee-title or conservation easement and funding for long-term management of the habitat, or payment to an existing in-lieu fee program. Please see the full text of BIO-MM#53 on page 3.7-222 for details on potential compensatory mitigation options to offset impacts to a species.

### 4494-9305

The commenter asks who will supervise and carry out the mitigation measures and how will restoration be measured. As described on page 3.7-212 of the Draft EIR/EIS, the Authority will oversee the implementation of the mitigation measures. The Authority's contractor will generally be responsible for monitoring with Authority oversight. The Authority would be responsible for compensatory mitigation and long-term mitigation monitoring. BIO-MM#6 describes the requirement to prepare and implement a Restoration and Revegetation Plan and specification of success criteria, remedial measures, monitoring and reporting. The restoration plans will include annual and overall success metrics that must be met before the Authority will consider them complete.

### 4494-9306

The commenter asks for an example of a Compensatory Mitigation Plan for a specific species (BIO-MM#53).

The Authority has prepared Compensatory Mitigation Plan for other sections of the California HSR System. For an example, please see the Preliminary Compensatory Mitigation Plan prepared for the San Jose to Merced Project Section of the California HSR System, which is available at this link: [https://hsr.ca.gov/wp-content/uploads/docs/programs/san\\_jose\\_merced/HSRA\\_JM\\_Checkpoint\\_C\\_2020\\_Summary\\_Report\\_Appendix\\_A\\_Redacted.pdf](https://hsr.ca.gov/wp-content/uploads/docs/programs/san_jose_merced/HSRA_JM_Checkpoint_C_2020_Summary_Report_Appendix_A_Redacted.pdf)

This Preliminary Compensatory Mitigation Plan provides an example of several state and federally regulated fish and wildlife resources, including: Swainson's hawk, burrowing owl, and least Bell's vireo to name a few. Mitigation ratios for specific species will be identified pursuant to regulatory authorizations issued under FESA and CESA. Based on these ratios the Authority will purchase mitigation credits from an agency-approved mitigation bank. Alternately, this could take the form of protection of habitat through acquisition of fee-title or conservation easement and funding for long-term management of the habitat.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9307

The commenter requests further details regarding BIO-MM#55 on who would prepare and implement the Weed Control Plan. BIO-MM#55 in 3.7.7 on page 3.7-224 states the Project Biologist will develop the Weed Control Plan. The implementation of the plan will be the responsibility of the Authority.

### 4494-9308

The commenter asks about the relationship of authority between the Authority's contractors and the Project Biologist. As described in BIO-IAMF#1, BIO-IAMF#3 in Appendix 2-E, BIO-MM#61, and BIO-MM#63, the Project Biologist will be responsible for training the construction crews on compliance, monitoring compliance during construction, and reporting all compliance and non-compliance issues to the Authority in a timely fashion. In addition, as described in BIO-MM#63, the Project Biologist will have the authority to halt work to prevent death or injury of any special-status species found in a work area. The commenter also asks if the Project Biologist will be "present at all construction activities which could impact invertebrate species habitat." The Project Biologist or approved biological compliance monitors will be present during all construction activities near or within special status species habitats. A biologist may not be present in work areas that do not support, or are not near, a resource that requires construction monitoring in accordance with the measures included in the EIR/EIS.

### 4494-9309

The commenter asks what would be a "safe speed for a particular construction vehicle in an endangered butterfly zone." The appropriate speed depends on the type of road (two-track, unimproved gravel, paved, multilane highway) and the type of sensitive resources in a particular area. As described in the full text for BIO-MM#60, the Project Biologist will establish vehicle speed limits of no more than 15 miles per hour for unimproved access roads and for temporary and permanent construction areas within the construction footprint. Implementation of construction site and vehicle traffic limits will minimize special-status invertebrate species habitat degradation, including damage to host plants for the San Gabriel Mountains elfin butterfly and San Emigdio blue butterfly, from vehicles during construction. Therefore, impacts on special-status invertebrate species would be reduced.

### 4494-9310

The commentor asks how often compliance reports are prepared and to whom they are submitted. Please see the text of BIO-MM#61, on Draft EIR/EIS pages 3.7-225 to -227, for details on frequency of compliance reports and agencies that will receive them. It describes pre-activity reports, daily compliance reports, monthly compliance reports, and annual reports.

### 4494-9311

The commenter asks for an example of work stoppage or reduction. In the event that any special-status wildlife species is found in a work area, the Project Biologist will have the authority to halt work to prevent death or injury of the species. Any such work stoppage will be limited to the area necessary to protect the species. Work may be resumed once the Project Biologist determines that the individuals of the species have moved out of harm's way, or the Project Biologist has relocated them out of the work area (relocation not applicable to fully protected species). Please see the full text of BIO-MM#63 on page 3.7-227 for details on when a work stoppage may be implemented.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9312

The commenter asks how construction workers will recognize Monarch Butterfly host plants (BIO-MM#94) and about the kind of compensatory mitigation that would be provided for Monarch Butterfly.

BIO-MM#94 (Avoid Direct Impacts on Monarch Butterfly Host Plant) has been modified in the Final EIR/EIS to remove the reliance of host plant identification by construction personnel. BIO-MM#94 in the Final EIR/EIS includes the following sentence: "If monarch butterflies are observed in suitable habitat, the Project Biologist shall establish a 50-foot exclusion buffer from all identified host plants to ensure that construction personnel avoid these areas." Please see the full text of BIO-MM#94 of the Final EIR/EIS for details on surveys and identification of host plants prior to construction. BIO-MM#3 (Prepare WEAP Training Materials and Conduct Construction Period WEAP Training) and BIO-MM#4 (Conduct Operation and Maintenance Period WEAP Training) requires that Worker Environmental Awareness Program (WEAP) Training be provided to workers and include full text descriptions of plants along with photos of the plant in various vegetative and flowering stages. Therefore, if construction personnel remain outside of the exclusion buffer around the host plants identified and established by the Project Biologist, then impacts to the monarch butterfly host plants will be avoided. To answer the commenter's question, the Authority has included mitigation that would require an exclusion buffer to avoid impacts in the first place.

Compensatory mitigation for monarch butterfly would be provided with implementation of BIO-MM#95 (Provide Compensatory Mitigation for Impacts on Monarch Butterfly Habitat), which includes a compensatory mitigation ratio of 1:1 for impacts to occupied overwintering, breeding, and/or foraging habitat to offset impacts to monarch butterfly populations. The ultimate mitigation option, or a combination of options, shall be determined in coordination with CDFW and USFWS, and may include additional actions to guide management of habitats (e.g., grazing, weed control), monitor populations, and identify methods to establish or reestablish populations, as required.

### 4494-9313

The commenter asks how above ground mitigation measures are guaranteed to be effective and, thus, considered less than significant.

This comment is part of a series of comments on page 3.7-148 of the Draft EIR/EIS. Page 3.7-148 of the Draft EIR includes the significance conclusion for Impact BIO#5: Project Construction Effects on Special-Status Invertebrate Habitat. This section describes how each applicable mitigation measure would reduce surface construction impacts on special-status invertebrates. The suite of mitigation measures described in this section provides a multi-tiered approach to avoiding/minimizing impacts to special-status invertebrates and their associated habitat. This multi-tiered approach includes measures intended to avoid/minimize impacts, followed by restoration or relocation, as needed. Monitoring is applied where restoration/relocation occurs to ensure that mitigation efforts are successful. The measures listed below would be implemented to avoid and/or minimize impacts to special-status invertebrates. These measures would employ several approaches, including using presence determination to avoid species, avoiding identified habitat, and establishing compliance/work stoppage protocols as follows: BIO-MM#3 (Conduct Pre-construction Surveys for Vernal Pool Wildlife Species), BIO-MM#4 (Implement Seasonal Vernal Pool Work Restriction), BIO-MM#5 (Implement and Monitor Vernal Pool Avoidance and Minimization Measures within Temporary Impact Areas), BIO-MM#55 (Prepare and Implement a Weed Control Plan), BIO-MM#56 (Conduct Monitoring of Construction Activities), BIO-MM#58 (Establish Environmentally Sensitive Areas and Nondisturbance Zones), BIO-MM#61 (Establish and Implement a Compliance Reporting Program), BIO-MM#63 (Work Stoppage), BIO-MM#94 (Avoid Direct Impacts on Monarch Butterfly Host Plant), BIO-MM#102 (Conduct Surveys and Implement Avoidance Measures for Crotch Bumble Bee), and BIO-MM#60 (Limit Vehicle Traffic and Construction Site Speeds). If avoidance/minimization of impacts is not possible, compensatory mitigation would be applied as set forth in BIO-MM#47 (Prepare and Implement a Compensatory Mitigation Plan for Impacts on Aquatic Resources) and/or BIO-MM#53 (Prepare and Implement a Compensatory Mitigation Plan for Species and Species Habitat).

Implementation of mitigation, as well as implementation of IAMFs built in as part of project design, will ensure impacts remain less than significant. As described in Section 3.7.4.6 of the Draft EIR/EIS, construction and operation of the Project would result in a

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9313

significant impact (pursuant to CEQA's mandatory findings of significance) if it would substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, or substantially reduce the number or restrict the range of an endangered, rare, or threatened species. The Draft EIR/EIS determined that, with implementation of mitigation, none of the Build Alternatives would result in a significant impact consistent with the conclusion identified herein.

### 4494-9314

The commenter asks about the likelihood of mountain lions straying into human-populated areas as a result of the construction disturbance and how loss of mountain lions will be determined and tabulated. Construction and operation of the project would not attract or result in mountain lions straying into populated areas. The EIR/EIS analysis indicates that the project would have minimal effects on wildlife movement because much of the project would be underground. In areas where the project would be above ground, there are either existing barriers to wildlife movement (SR 14 freeway), the project will include bridges and large culverts to facilitate movements; or, wildlife crossings are proposed to facilitate wildlife movement. The impact to mountain lions is based on the acreage of potential mountain lion habitat that would be directly affected by the project.

### 4494-9315

The commenter asked how project lighting could be changed and/or modified to discourage insects and prevent attracting and disorienting bats during construction and operation. The Authority is committed to avoiding construction and operational lighting from shining into adjacent wildlife habitat and modifying the use of that habitat by resident wildlife populations. The use of project lighting will be minimized by avoiding, to the extent feasible, any nighttime work. If nighttime work becomes required, the use of lighting will be limited to the shortest duration feasible, and all lighting will be shielded to minimize light trespass. The implementation of BIO-IAMF#3, BIO-IAMF#5, BIO-IAMF#12, BIO-MM#37, BIO-MM#99 and BIO-MM#100 is expected to reduce nighttime lighting effects through strategies including resource training for construction workers, use of sensors to reduce time that lights are illuminated, light shielding, and adherence to approved lighting levels and standards.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9316

The commenter is asking how listed BIO-IAMFs work for recognition of badger presence and survival (3.7-150). BIO-IAMF#1 includes having a Project Biologists onsite during construction. The biologist responsibility will be to review work areas ahead of ground disturbing construction activities that might crush an occupied badger burrow. If present, the burrows would be set with a no-work ESA buffer preventing construction activity from crushing the burrows. BIO-IAMF#3 includes the development and application of worker education program required by every construction worker prior to starting the job. This training will include photographs of American badger, badger dens and a complete description of how to recognize and the requirements to avoid badgers and their dens. BIO-IAMF#5 requires the development and implementation of a biological resource management plan with the objective of compiling and further defining biological resource avoidance and minimization measures including identification and avoidance of American badger and their dens during construction activities. Through recognition and avoidance of American badger and their dens, injury and death of individuals are not anticipated. The commenter also asks what does preservation "to the extent feasible" actually mean for a special-status mammal, such as a badger or bat. The Authority is committed to preserving natural badger and bat habitat within the project construction footprint and areas identified for permanent or temporary impacts. However, construction timing and methodology may result in damage or removal of these habitats and the restoration or compensatory mitigation to offset these impacts. The commenter asks what studies are referenced by "previous monitoring of tunnel effects?" Those studies are related to Arrowhead Tunnels in the San Bernardino Mountains in southern California (Berg 2012). Educating workers (BIO-IAMF#3 and BIO-IAMF#4), development of Biological Resources Management Plans (BIO-IAMF#5), preventing entrapment (BIO-IAMF#7), delineating work areas and traffic routes (BIO-IAMF#8) would assist in the recognition of badger presence and allow for their protection.

### 4494-9317

The commenter asks how revegetation plans could be made for ringtails. BIO-MM#6 requires the restoration and revegetation of areas temporarily disturbed during construction. While ringtail specific vegetation plans would not be developed, the revegetation plans would include area that may be habitat suitable for ringtail. Hence, revegetating the temporarily disturbed areas would restore habitat for ringtails where it had existed prior to construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9318

The commenter asks how mitigation will be determined to be successful for bats, specifically BIO-MM#25 (Conduct Surveys for Bat Species). Mitigation Measure BIO-MM#25 is intended to provide direction for performing surveys for bat species and include methods to avoid or minimize disturbance to bats. No more than one year (but with at least one maternity season remaining) prior to the replacement or modification of any bridges or removal of other structures (typically abandoned), and trees with large cavities or dense foliage identified as suitable bat habitat and where access is available, the Project Biologist will conduct a survey of the bridges and other suitable bat habitat looking for evidence of roosting bats within the expected project footprint and a 500-foot buffer. If bats or bat sign are detected, biologists will conduct an evening visual and acoustic emergence survey (with monitoring using full spectrum bat detectors) of the bridges, structures, and/or trees with large cavities or dense foliage for a minimum of two nights.

The purpose of these emergence surveys is to confirm presence/absence at each location, determine the species of bats, including whether the bats are non special-status species (not protected by any regulation) or special-status species (protected pursuant to the California Fish and Game Code; CFGC), and estimate population size. The biologists will analyze the bat call data using appropriate software and will prepare a report that will be submitted to the Authority, including an assessment of the significance of the roost relative to local bat populations, particularly if the bats present are special status-species, and thus protected pursuant to the CFGC. Because bats are highly cryptic, the visual and acoustic emergence surveys will be conducted during the appropriate time of year when bats are actively emerging from and returning to their roosts, generally March 1 –October 15, but may be extended outside of this timeframe depending on temperature and other weather-related factors.

Emergence surveys will not be conducted when bats are in torpor (i.e., hibernacula; semi-hibernating during months with colder temperatures) when detection is unlikely. If it is determined that bats are within the expected project disturbance footprint or 500-foot buffer, avoidance will be the first option considered. If avoidance is not possible, bats will be passively evicted using exclusion and deterrence methods, only when outside of hibernation (i.e., torpor) and maternity roosting periods as described in BIO-MM#27. Should hibernacula or maternity roosts be detected within the expected project

### 4494-9318

disturbance footprint or 500-foot, and avoidance will not be possible, the Authority will coordinate with CDFW regarding available options, as described in BIO-MM#26, with removal/relocation as a last and least preferred option. If removal/relocation is necessary, the Project Biologist will coordinate with CDFW to prepare and implement a bat removal/relocation plan. This approach would only be considered if feasible and anticipated to provide equivalent or superior protection for bats. Mitigation Measure BIO-MM#25 is anticipated to be effective because it would require identification and documentation of bat roosts (when bats are actively emerging/returning to the roost) within 500 feet of proposed construction work areas, determine if the bats are special-status or non special-status species, determine population size, and guide additional protective actions and next steps, such as avoidance, passive eviction or active relocation methods. BIO-MM#25 would have no impacts on roosting bats because non-invasive survey techniques would be used, and bats would not be disturbed during hibernating or maternity roosting periods before it can be determined if the bats are special-status species. Refer to Final EIR/EIS, Section 3.7.7, for the full text of mitigation measures pertinent to bats.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9319

The commenter asks what method the Authority would use to relocate bats. Mitigation Measures BIO-MM#27 (Implement Bat Exclusion and Deterrence Methods) and BIO-MM#26 (Bat Pre-construction, Avoidance, and Removal/Relocation Methods) were revised in the Final EIR/EIS to provide additional clarity regarding passive eviction and active relocation methods. BIO-MM#27 was revised to describe that during the survey efforts (whether the initial survey conducted well in advance of construction per BIO-MM#25 or the pre-construction survey per BIO-MM#26), if non-breeding or non-hibernating (i.e., non-torpid) individuals or groups of bats are found roosting within the project disturbance footprint or 500-foot buffer, the Project Biologist will facilitate the passive eviction (i.e., exclusion and deterrence) of the bats by either opening the roosting area to change the lighting and airflow conditions, installing one-way doors, or implementing other appropriate passive eviction methods used for evicting bats according to guidelines provided by CDFW. Typical ideal periods for successful eviction are March 1 –April 15 and September 1 – October 15, when outside of the hibernation period and when young bats are volant (capable of flying). Implementation of passive eviction may be extended outside of these timeframes depending on temperature and other weather-related factors. To the extent feasible, the Authority will leave the evicted roost area undisturbed by project activities for a minimum of one week after implementing passive eviction methods, and through follow-up monitoring, will ensure that all bats have left the roost area.

Exclusion and deterrence features will be left in place before and through construction to prevent bats from returning and re-occupying the previously evicted roost. Should hibernacula or maternity roosts be detected, if feasible and anticipated to provide equivalent or better protection, maternity roosts and hibernacula may be actively removed/relocated subject to the criteria outlined in a removal/relocation plan prepared and implemented in coordination with CDFW (refer to BIO-MM#26).

For special-status bat species, the removal/relocation plan will also cover passive eviction activities and require the identification of alternative suitable natural roosting habitat or construction of artificial roosting habitat. If bats are non-special-status, passive eviction activities do not require plan preparation. BIO-MM#26 was revised to describe that if avoidance is not possible and bats are actively emerging/returning from the roost (not hibernating and/or the young have actively begun flying), eviction methods will be

### 4494-9319

implemented. If avoidance is not possible and bats are not actively emerging, the Project Biologist will coordinate with CDFW to prepare and implement a bat removal/relocation plan. This plan would only be considered if feasible and anticipated to provide equivalent or superior protection for bats. The removal/relocation plan for removal and relocation of hibernacula and maternity roosts would include, but not be limited to, the following:

- Identification of alternative bat roost location(s) at least 500 feet outside of the work area and/or construction of artificial bat roosts (if needed, e.g., bat houses)
- Methods for removal/relocation, understanding that special-status bat species may addressed differently than non special-status species
- Timing for removal/relocation
- Responsibilities and oversight for implementing removal/relocation
- Success criteria and follow-up monitoring of the alternative bat roosts to ensure effectiveness
- Adaptive management and contingency measures should alternative methods be necessary to ensure effectiveness relevant to avoidance/minimization of impacts to bats
- Methods to be implemented relative to bat protection during future project operations and maintenance
- Coordination with CDFW to ensure acceptable methods are implemented
- If the bats species being addressed are special-status, eviction methods will also be included in a removal/relocation plan.

Any new roost sites (whether natural or artificially created) would provide a stable microclimate and be in place and functional prior to the commencement of construction activities to allow sufficient time for bats to become established at the new roost site. Implementation of BIO-MM#26 could trigger secondary environmental impacts to bats, if active relocation is necessary. However, to minimize impacts to bats subject to removal/relocation, particularly the protected special-status species, all eviction and/or removal/relocation methods would be guided and implemented in coordination with CDFW to ensure methods are acceptable and effective. Refer to Final EIR/EIS, Section 3.7.7. for the full text of mitigation measures pertinent to bats.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9320**

The commenter asks how do bats get excluded (BIO-MM#27)? Please see the full text of BIO-MM#27 on page 3.7-217 for a description of bat exclusion measures. Bat exclusion involves attaching humane exclusionary netting or one-way flaps over the entrance to where bats enter the roosts. The bats can drop down and fly out, but are unable to crawl back in again.

### **4494-9321**

The commenter asked how construction would be changed to avoid ringtails (BIO-MM#28). Before ground-disturbing activity, the Project Biologist will conduct pre-construction surveys for ringtail and ringtail den sites within suitable habitat located within the work area. The Project Biologist will establish 100-foot no-work buffers around occupied maternity dens throughout the pup-rearing season (May 1 through June 15) and a 50-foot no-work buffer around occupied dens during other times of the year. No-work buffers would alter construction by requiring the contractor to stay outside these areas to avoid killing or injuring ringtail. In addition, BIO-MM#63 also allows the Project Biologist to implement work stoppages to prevent death or injury of any special-status species, which would include ringtails. Conducting surveys before ground disturbing activities, establishing no-work buffers around maternity dens and occupied dens at other times of the year, and use of the work stoppage would all result in modifications in construction activity to ensure that impacts to ringtail are avoided.

### **4494-9322**

The commenter asks if construction will cease when a badger den is spotted. Please see the full text of BIO-MM#29 in Section 3.7.7 for a description of pre-construction American badger den sites and implementation of minimization measures. If a badger den is found, the Project Biologist will establish a 100-foot no-work buffer around any occupied maternity dens and the buffer would remain in place throughout the pup-rearing season (February 15 through July 1). A 50-foot no-work buffer would be established around occupied dens during other times of the year. If non-maternity dens are found and cannot be avoided during construction activities, they will be monitored for badger activity. If the Project Biologist determines that dens may be occupied, passive den exclusion measures will be implemented for three to five days to discourage the use of these dens prior to project disturbance activities. These activities would occur ahead of ground disturbing activity and no-work buffers would be installed before construction starts. These measures will ensure that no badgers are killed during construction.

### **4494-9323**

The commenter asks how deep into the ground aprons or barriers will be installed. The Authority has set the depth of these features, described in BIO-MM#36, to be at least 12 inches below the ground surface.

### **4494-9324**

The commenter requests further detail regarding BIO-MM#47. As described in the full text of BIO-M#47 on page 3.7-220 of Section 3.7 of the Draft EIR/EIS, an example of aquatic resources compensatory mitigation would be the purchase of credits for stream restoration to replace the functions and values lost from unavoidable impacts to a stream within the project footprint. Additional potential options for compensatory mitigation, as described in BIO-MM#47, include preservation of aquatic resources through acquisition of property, the establishment, restoration and/or enhancement of aquatic resources, and the contribution of fees to an in-lieu fee program through consultation with the applicable regulatory agencies.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9325

The commenter requests further detail regarding BIO-MM#50. The Authority will oversee any off-site habitat restoration along with the regulatory agencies that require the mitigation or issue a permit for the mitigation action. Timing of off-site habitat restoration will be dependent on the specific restoration needs of the project, and any planning and permitting required for that project. However, the Authority anticipates off-site restoration will be implemented prior to the completion of project construction. As described in BIO-MM#47, mitigation plans specific to the restoration of offsite habitat will be developed in consultation with the applicable regulatory and/or resource agencies and will include a schedule for implementation that is specific to the type and location of the resource being restored. That plan will identify the required start of restoration activities, based on various milestones and factors, including but not limited to the issuance of the permit or authorization, start of project construction, and/or site specific factors such as seasonal constraints and the complexity of the restoration activities being implemented. The mitigation plans, including the schedule of implementation, will require agency review and/or approval prior to issuance of the project permits or authorizations.

### 4494-9326

The commenter requests further detail regarding BIO-MM#55. Weed control plans are specific to the weed species being treated. As described in BIO-MM#55, these may include chemical treatment, manual treatment, or a combination of both, depending on what has been identified to be the best method to control that specific weed species. Examples of these types of control may include mowing, grazing, plant removal, pre-emergent or post-emergent herbicide application.

### 4494-9327

The commenter requests further detail regarding BIO-MM#56. Specifically, it asks how many Project Biologists will be monitoring sensitive areas. The specific numbers are not reasonably foreseeable at this time. Nonetheless, a Project Biologist will be present to implement BIO-MM#56 at all initial ground disturbing activities. If multiple such initial ground disturbing activities occur at the same time, then a Project Biologist will be present in each area. The number of Project Biologists present will be determined by the need based on the work being initiated.

### 4494-9328

The commenter asks if different types of exclusionary barriers would be installed at the same locations to exclude different species, and how construction equipment would avoid crushing animal burrows. The Authority will typically install the most effective (or restrictive) barrier at any given location to address the different species that might be present. If necessary, however, the Authority will install different types of exclusionary materials in the same locations to exclude different species. The Authority has identified BIO-MM#20 and BIO-MM#21 to survey and map burrowing owl burrows and BIO-MM#29 to survey and map American Badger den sites to establish exclusionary buffers around active burrows to prevent the collapse of an occupied burrow.

### 4494-9329

The commenter asks if compliance reporting necessarily ensures that impacts to special status species will be reduced. The Authority will require compliance reporting to ensure all of the IAMFs and MMs are implemented correctly, and identify any non-compliances that may require additional mitigation to minimize the impacts to biological resources resulting from the non-compliance. In addition to reporting non-compliance events, further components of BIO-MM#61 require reporting on a daily, monthly, and annual basis that encompass details of day-to-day activities and the state of project sites. In short, compliance reporting helps ensure that impacts on special-status species are reduced by holding all parties involved with the project accountable for the actions occurring to minimize impacts on that on sensitive biological resources.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9330

The commenter asks how many times work stoppage under BIO-MM#63 is expected to minimize injury to mammals. BIO-MM#63 specifies that in the event any special-status wildlife species is found in a work area, the Project Biologist will have the authority to halt work to prevent death or injury of the species. The number of times work stoppage will be implemented cannot be determined at this time and will depend on specific site conditions. Any such work stoppage will be limited to the area necessary to protect the species. Work may be resumed once the Project Biologist determines that the individuals of the species have moved out of harm's way, or the Project Biologist has relocated them out of the work area (relocation not applicable to fully protected species). This is a standard mitigation measure utilized on many projects that involve work in within the range of special-status species. Stopping work in the area means that all construction activity will come to a halt including vehicle and equipment movement in the immediate area. This will allow the animal to leave the site before construction can begin again, and has been found to be a very effective method for preventing death or injury to species.

### 4494-9331

The commenter requests an example of a Wildlife Rescue Measure (BIO-MM#76). Wildlife rescue measures include relocating and releasing wildlife, or taking the wildlife species to the nearest CDFW permitted rehabilitation center. If injured or trapped wildlife occur on the project right-of-way during construction, maintenance, or operation, the Project Biologist shall be notified immediately and will determine whether it is appropriate to relocate and release the individual(s) within adjacent habitat or, if the individual is injured, taken to the nearest CDFW permitted rehabilitation center. Most common trapped or injured wildlife in this area includes passerine birds, small mammals, or reptiles trapped in ditches, exclusionary bird netting, or fencing.

### 4494-9332

The commenter asks if cameras will be used when surveying for mountain lion dens. The Authority anticipates the use of a range of detection techniques and tools to determine the presence/absence of mountain lions in potential and known dens, including cameras. As explained in BIO-MM#96, surveys will be conducted by a qualified biologist (i.e., a biologist with demonstrated experience in mountain lion biology, identification, and survey techniques) and may involve the establishment of camera stations, scent stations, pedestrian surveys (looking for tracks, caches, etc.), or other appropriate methods. Survey methods used will be designed to avoid the disturbance of known or potential dens to the extent feasible. Please see BIO-MM#96 in the Final EIR/EIS for more detail on survey requirements and methods.

### 4494-9333

The commenter is referencing BIO-MM#97 providing compensatory mitigation for impacts on mountain lion habitat, specifically den sites. The commenter asks what the follow-up procedures the Authority would take once a mountain lion den is located, which falls under BIO-MM#96. The Authority has identified and quantified impacts to suitable habitat for mountain lion from the implementation of all build alignment alternatives. If a mountain lion den is documented during pre-construction surveys, the Project Biologist will set a 1,970-foot exclusionary no-work buffer until it can be determined if the den is occupied or not. If occupied, the buffer will remain until the den becomes unoccupied and the exclusionary no-work buffer removed. Compensatory mitigation for impacts to suitable habitat using one of the methods described in BIO-MM#53 would also be implemented.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9334**

The commenter asks how implementing the lighting minimization measures during construction would have a different impact on resources accustomed to no nighttime lighting. The commenter also asks what type of lighting besides artificial lighting would be used (presumably at night since BIO-MM#99 references construction lighting during nighttime hours). BIO-MM#99 was developed to avoid or reduce illuminating habitat adjacent to the work area during nighttime construction activities. In addition, other related mitigation measures are provided, including BIO-MM#37 (Authority will avoid conducting ground disturbing activities in wildlife movement corridors during nighttime hours, to the extent feasible, and will shield nighttime lighting to avoid illuminating wildlife movement corridors in circumstances where avoidance of such activities is not feasible) and BIO-MM#100 (lighting minimization measures relating to operations). BIO-MM#99 was designed to reduce illuminating the habitat adjacent to the work area and not the work area itself. Artificial lighting is currently the only proposed lighting source for nighttime construction activities.

### **4494-9335**

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter requests additional information regarding how groundwater-dependent surface water would be monitored during tunneling in the Angeles National Forest (ANF). The commenter also asks where needed supplemental water would be sourced and whether CHSRA can guarantee that the mitigation measures would make the impacts “less than significant.”

Section 3 of Appendix 3.8-C describes the existing and pre-construction monitoring of groundwater-dependent surface features (springs, seeps, wells) and the metrics and data that would be measured and collected. The Authority would implement BIO-MM#93 (Adaptive Management Plan for Groundwater Effects on Species and Habitat) to provide supplemental water as necessary to support riparian vegetation, wildlife breeding cycles, aquatic wildlife, or protect tree health. Please also refer to Appendix 3.8-D provides a Supplemental Water Demand Analysis for Potential Impacts within the Angeles National Forest / San Gabriel Mountains National Monument.

The Supplemental Water Demand Analysis discusses the options, logistics, and feasibility of implementing the response actions that may be implemented in accordance with the Adaptive Management and Monitoring Plan (AMMP). Specifically, Appendix 3.8-D describes the methodology used to estimate potential remedial water needs and discusses various scenarios that would necessitate that supplemental water, the potential sources of that supplemental water, and the logistical considerations regarding the conveyance and delivery of that supplemental water. For additional information about water sources, please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The AMMP that will be implemented under BIO-MM#93 and HYD-MM#4 requires monitoring of groundwater-dependent surface water resources and associated habitat within the tunnel construction Resource Study Area (RSA), providing supplemental water where needed, and remediating or compensating for any adverse effects identified during monitoring. Thus, implementation of these measures would reduce the impact to a less-than-significant level. Please refer to Response to Comment #7962 for further discussion regarding monitoring of groundwater resources.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9336

The commenter is requesting information about BIO-MM#6 and how a plan reduces impacts. The Restoration and Revegetation Plan will address how temporary impacts to habitat for special-status species, wetlands, and other aquatic resources will be restored once construction is completed. Without active restoration of these areas, natural revegetation would occur but would take substantially longer than active restoration to return them to pre-construction conditions. In returning these areas to pre-construction conditions as described in BIO-MM#6 Prepare and Implement a Restoration and Revegetation Plan, the temporary impacts would be reduced in their duration. These actions, in addition to other substantive requirements outlined in BIO-MM#6, would ensure that impacts to plants and plant communities would be reduced.

### 4494-9337

The commenter asks how special status reptile and amphibian pre-construction surveys are conducted. The surveys would be conducted using USFWS, CDFW, or USFS protocol survey methods specific for each species. In the absence of prescribed protocol surveys, the method would include pedestrian surveys, during which a qualified biologist would visually examine the habitat suitable for reptiles and amphibians within the limits of disturbance. BIO-MM#7 was revised in Section 3.7.7, Mitigation Measures, of the Final EIR/EIS to include additional details about protocol level survey methodologies for sensitive species.

### 4494-9338

The commenter asks about the frequency of clearing of construction areas for sensitive amphibians. As described in BIO-MM#8 in the Draft EIR/EIS, clearance surveys will be conducted by the Project biologist prior to all ground disturbing activities within suitable amphibian habitat on a daily basis. If special status amphibians are observed, the Project biologist will first determine how best to avoid impacts on the species (such as establishing a temporary Environmentally Sensitive Area with a no-work buffer) and how to allow the individual(s) to leave the area of their own will. As required by BIO-MM#63, the Project Biologist will have "stop work authority" in the event that any special-status species is found in the work area. If the species does not leave the work area of its own volition, the Project biologist will relocate the individual(s) outside the work area and out of harm's way per the methodology of the most appropriate relocation plan and/or in accordance with regulatory authorizations issued under the Federal and/or California Endangered Species Act. The Project Biologist will be responsible for determining when work may resume. Please review BIO-MM#8 and BIO-MM#63 in the Final EIR/EIS.

### 4494-9339

The commenter asks about the most appropriate materials to be used as barriers to prevent special status reptiles from gaining access to the right-of-way. Typical materials include fine mesh fencing with holes less than 1/4 diameter extended at least 12 inches below ground to prevent burrowing and 12 inches above ground. A commonly used material for lizard barrier fencing is erosion or sediment cloth topped with a climbing barrier. These are standard requirements that are effective at excluding reptiles from work areas.

### 4494-9340

The commenter asks who will prepare the compensatory mitigation plan (CMP) for aquatic resource impacts and how the contractor would be involved. The Authority is responsible for preparing and implementing the CMP under BIO-MM#47 and will work with federal and state regulatory agencies to address temporary and permanent impacts to federal and state waters, as required under the Clean Water Act and/or the Porter-Cologne Act. The contractor(s) is not involved in the development of the CMP. The contractor will be responsible for compliance with any component of the CMP that involves on-site restoration or reporting activities associated with the construction site.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9341

The commenter asks about the differences between off-site mitigation and other mitigation measure as it relates to BIO-MM#50. This measure was developed to avoid adverse impacts to sensitive resources during off-site restoration and enhancement. Off-site mitigation is compensatory mitigation that is provided by the Authority to offset the impact of permanent habitat impacts that cannot be restored on site. Off-site compensatory mitigation is in the form of protecting existing habitat that is determined to be in good condition through establishment of conservation easements, or through restoring or enhancing lands that have been degraded such that those lands are returned to suitable conditions for species habitat. The Authority is sensitive to adverse impacts occurring with off-site restoration and enhancement activities and BIO-MM#50 includes measures to minimize those impacts. There is potential to restore or enhance disturbed areas on-site (i.e., BIO-MM#6) where impacts are temporary, but off-site mitigation may be required when on-site restoration or enhancement is not feasible, for permanent impacts for example. BIO-MM#50 will be implemented to reduce impacts to restoration or enhancement sites and act similarly to the mitigation requirements that will be implemented for impacts within the project site. Other measures related to on-site mitigation were developed to avoid, reduce or mitigate impacts within the limits of disturbance associated with construction and operation of the project.

### 4494-9342

The commenter is asking what specifically is done during lizard monitoring as it relates to BIO-MM#52. The Authority developed this measure to avoid impacts to special-status reptile species. BIO-MM#52 has been revised in the Final EIR/EIS to account for the correct known species occurring in the project area. San Joaquin coachwhip (*Coluber flagellum ruddocki*) is not present in the Resource Study Area, the Silvery legless lizard is a subspecies of the California legless lizard and has not been confirmed in genetic analysis as the subspecies present in the project area, and several special-status reptile species are not included in the Draft EIR/EIS. Therefore, the Authority has revised this measure to avoid impacts to California glossy snake, California legless lizard, coast patch-nosed snake, coastal rosy boa, coastal whiptail, Blainville's horned lizard, San Bernardino ringneck, San Bernardino mountain kingsnake, south coast garter snake, two-striped garter snake, and western pond turtle. Prior to ground disturbing activities, the Project Biologist inspects areas of suitable habitat and any inactive construction equipment for the presence of these species. The biologist may establish wildlife exclusion fencing to prevent species from entering the work area and/or if observed, the species will be avoided and allowed to exit the work area on their own or the individuals may be manually relocated out of the work area and into adjacent habitat. Relocation efforts would follow standard species-specific protocols, if applicable. Please refer to Section 3.7.7, Mitigation Measures, of the Final EIR/EIS, for the full text of BIO-MM#52, which was revised as indicated above.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9343

The commenter asks whether a mitigation plan always offsets impacts. The mitigation plan is designed to offset impacts, with criteria for success to ensure impacts are adequately mitigated/offset. The compensatory mitigation planning effort (e.g., refer to Final EIR/EIS, Section 3.7, Biological and Aquatic Resources, mitigation measures BIO-MM#47 and BIO-MM#53) specifically ensures mitigation measures are carried out to rectify, reduce, or compensate for impacts through outlining the conditions under which mitigation (e.g., restoration) is required, when it is required, how it will be conducted, and what success criteria must be met for the mitigation to be considered successful. The Compensatory Mitigation Plans (CMPs) overall strategy for mitigating effects on species will include the final ratios to be applied to determine mitigation levels and final compensatory mitigation acreage totals. The CMPs will compile required mitigation ratios established in other compensatory mitigation measures described in Section 3.7.7. In addition, the CMPs will include adaptive management approaches and a description of financial assurances that will be provided for successful implementation of the mitigation. In summary, the CMPs will ensure that impacts are successfully offset given the requirements of these plans and that they must be prepared in coordination with California Department of Fish and Wildlife, United States Fish and Wildlife Service, and other agencies with applicable regulatory oversight.

### 4494-9344

The commenter asks for an example of an invasive weed and an example of a WCP that would be implemented in reptile habitat. Yellow star thistle is an example of an invasive weed. Additional examples can be found on the California Invasive Plant Council website (<https://www.cal-ipc.org/>), as noted in BIO-MM#55 of the Draft EIR/EIS. The components of the WCP are included in BIO-MM#55. This plan may include physical or chemical treatment of weeds within reptile species habitat. If chemical treatments is used, treatments would consist of herbicides approved by the State of California and identified as safe for sensitive reptile species by the USFWS or CDFW.

### 4494-9345

The commenter asks what evidence there is that proposed mitigation measures will make biological and aquatic impacts identified in the Draft EIR/EIS less than significant. The mitigation measures described in the Draft EIR/EIS would avoid, minimize, or compensate for effects of the Palmdale to Burbank Project Section on biological and aquatic resources. Sections 3.7.6 and 3.7.8 of the Draft EIR/EIS provide detailed discussion of impacts to biological and aquatic resources, as well as the mitigation measures that would reduce the impacts below the significance thresholds identified in the EIR/EIS. The mitigation described includes a full range of proposed measures across multiple taxa and resources. For example, for those wildlife species that may be impacted by the Project, mitigation measures are provided that require the Authority to perform preconstruction surveys to detect the presence of wildlife (e.g., BIO-MM#3, #7, BIO-MM#14, BIO-MM#15, BIO-MM#20, BIO-MM#28) and construction monitoring (e.g., BIO-MM#5, BIO-MM#15, BIO-MM#34, BIO-MM#52, BIO-MM#56) to avoid or minimize impacts to wildlife if present. If wildlife species are present, avoidance and/or relocation would occur (e.g., BIO-MM#5, BIO-MM#8, BIO-MM#16, BIO-MM#18, BIO-MM#21, BIO-MM#26). By surveying prior to, and monitoring during construction to identify, if and when wildlife species are present, and subsequently implementing avoidance or minimization measures, potential impacts to wildlife, such as direct mortality, would be eliminated or greatly reduced. Additional mitigation such as restoration of impacted wildlife habitat to preconstruction conditions (e.g., BIO-MM#6, BIO-MM#32, BIO-MM#33, BIO-MM#50) would reduce the permanent loss of habitat to temporary habitat loss. Finally, mitigation to restore and revegetate aquatic resources, and to monitor construction adjacent to aquatic resources (e.g., BIO-MM#33, BIO-MM#34, BIO-MM#35) would reduce impacts to aquatic habitat and special-status plant species and communities that rely upon aquatic resources. As a result, the Authority has analyzed the impacts and potential measures to reduce those impacts, including consulting with CDFW, USFS, USFWS, and species-specific biologists, and these measures are appropriate to reduce potential impacts to less than significant. The Authority is currently implementing substantially the same mitigation measures during construction in the Merced to Fresno and Fresno to Bakersfield Project Sections and they have been effective at avoiding, minimizing and mitigating impacts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9346

The commenter requests additional detail regarding wells in Kagel Canyon, north of Lake View Terrace, and potential effects from the E2 Build Alternative. The commenter also asks how much time is required for restoration of aquatic resources.

It is noted that the E2 Build Alternative is not the Authority's preferred alternative; the Authority's preferred alternative (SR14A Build Alternative) would avoid construction in the Kagel Canyon area. The resource study area (RSA) for tunnel construction is the area within 1 mile of the centerline of each of the six Build Alternatives, which includes a portion of Kagel Canyon. Portions of Kagel Canyon within 1 mile of the alignment were therefore considered in the impact analysis in Section 3.8, Hydrology and Water Resources, of the Draft EIR/EIS. Pursuant to the Authority's 2019 Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest and 2019 Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest (referenced in Section 3.8 of the EIR/EIS), based on observed impacts on groundwater from past tunnel projects, no impacts to wells are expected to occur outside the tunnel construction RSA (more than 1 mile from the centerline of each Build Alternative). Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail how the Authority would address impacts to private water supply wells outside the ANF, including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. For wells within the ANF (including in Kagel Canyon) that are determined through modeling and monitoring to be adversely affected by groundwater reductions caused by the HSR, the Adaptive Management and Monitoring Plan (AMMP) included in Mitigation Measure HWR-MM#4 requires modifications to the affected wells or by providing supplemental water. Supplemental water would only be provided if monitoring indicates that the HSR construction caused groundwater impacts. However, the Authority has identified several IAMFs to avoid and minimize the potential for impacts to water supply wells and the need for supplemental

### 4494-9346

water. HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 require design features and construction methods to address potential groundwater intrusion, including the installation of a tunnel liner(s) capable of effectively controlling inflows into the tunnels. As such, groundwater inflow during construction would likely be minimal and temporary. Please refer to both Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest and Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest for additional information regarding impacts to wells and correlating mitigation measures and IAMFs.

In accordance with BIO-MM#32 and BIO-MM#33, restoration of aquatic resources temporarily impacted by the project will begin within 90 days of the completion of construction activities in a work area. As described in BIO-MM#6, the Restoration Revegetation Plan (RRP) will describe the maintenance, monitoring, and reporting schedules and those will be developed in accordance with the expected timeline for successful restoration of those areas based on the type and condition of the area. In addition, the RRP will establish success criteria which will be used to determine whether an area should be considered successfully restored. The timeline for an area being restored to meet the established success criteria varies, and can be from 1 year to multiple years, depending on the types of restoration and conditions. Additional requirements and conditions pertaining to success criteria, timelines for restoration, and approval of the restoration success may be included as conditions of authorizations issued by the aquatic resource regulatory agencies, such as the USACE, SWRCB, and/or CDFW.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9347**

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife.

The commenter references BIO-IAMF#11 and requests clarification on what is considered a “timely manner” for weed abatement that will reduce impacts on aquatic resources. The commenter asks what regulatory agencies would receive documentation, what data sources were used for previous monitoring of tunnel effects, and how these sources are pertinent to the ANF. BIO-IAMF#11 refers to maintaining construction sites and standard best management practices (BMPs) such as temporary soil stabilization, temporary sediment control, wind erosion control, non-storm water management, and waste management and materials control to avoid impacts to adjacent resources including aquatic resources. Weed abatement specifically is discussed in Section 3.7.6.3 (Operations Impacts), under Impact BIO#14, and is not specifically a component of BIO-IAMF#11. BIO-IAMF#5 and BIO-MM#55 address weed abatement and require the Authority to prepare and implement a Biological Resources Management Plan and Weed Control Plan. That plans outline requirements for a master schedule of events associated with the project phased (i.e., pre-construction, construction, etc.). Weed abatement would be required during pre-construction and construction phases to ensure weeds are not transported to or from the project site. Additionally, BIO-MM#54 requires the preparation of a vegetation control plan that will be implemented during the construction and operations and maintenance phases, and requires a vegetation control plan that will be updated each winter and completed in time to be implemented no later than April 1 of each year. Therefore, any required weed abatement would occur on project phase and yearly basis. Please refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife for more information.

Documentation will be submitted to a wide variety of regulatory agencies depending on the document. For example, the State Water Resources Control Board, California Department of Fish and Wildlife, and U.S. Army Corps of Engineers will receive documentation related to wetlands and waters, and the California Department of Fish and Wildlife and U.S. Fish and Wildlife Service will receive documentation related to special-status species. Various plans will be developed for the project and will be submitted to the California High-Speed Rail Authority for review and approval. Some

### **4494-9347**

plans, depending on the nature of the material (wetlands and waters or special-status species), will also be provided to regulatory agencies.

Numerous sources were referenced for an understanding of tunneling effects and are relevant to the HSR Palmdale to Burbank Project Section because of the tunneling activities required within the ANF. These sources utilize data for resources within the ANF to assess the risk of tunneling effects to change groundwater levels. References relevant to tunneling for the HSR Palmdale to Burbank Project Section can be found throughout the Draft EIR/EIS and are provided in Chapter 12, References/Sources Used in Document Preparation.

### **4494-9348**

The commenter asked for the name of the “agency-approved mitigation bank.” The commenter also asks how the Authority can justify destroying California and Federal wetlands and water, especially during an extreme drought. The Authority is considering a range of options and will work with the USACE and other relevant regulatory agencies to identify and confirm the appropriate agency-approved mitigation resource-specific bank(s), or other compensatory mitigation option, for the project. As part of the CWA Section 404 permitting process the Authority is preparing a preliminary compensatory mitigation plan (CMP), which is part of the Authority agreed-upon Checkpoint C process and includes considerations of agency-approved mitigation banks, such as the Petersen Ranch Mitigation Bank, as well as other possible compensatory mitigation options. As described in Impact BIO#8, implementation of the identified mitigation measures would result in impacts that are less than significant for all six Build Alternatives. As described in Impact BIO#8 on page 3.7-172, compensation to mitigate effects on aquatic resources would be coordinated with the USACE and SWRCB, and other relevant agencies, to ensure consistency with state and federal “no net loss” policies. BIO-MM#47 describes the requirements for development of a Compensatory Mitigation Plan that will address mitigation for permanent and temporary loss of aquatic resources and/or waters of the state. The CMP would discuss the compensatory mitigation options that would meet the no-net-loss standards, as well as financial assurances, success criteria, if warranted, and management actions.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9349

The commenter requests further detail regarding BIO-MM#4 and how the vernal pool restriction would be implemented and monitored. BIO-MM#4 would be implemented by scheduling work within 250 feet of mapped vernal pools or seasonal wetlands during the dry season (April 16-October 14) or when the pools are not inundated. The vernal pools or seasonal wetlands will be monitored by the Project Biologist.

### 4494-9350

The commenter requests further detail regarding BIO-MM#5. As stated in BIO-MM#5 in Section 3.7 of the Draft EIR/EIS, the Project Biologist will oversee or implement these measures. In addition, BIO-IAMF#1 in Appendix 2-E of the Draft EIR/EIS describes the various roles to be held by the Project Biologist, Designated Biologists, Species-Specific Biological Monitors and General Biological Monitors as they pertain to overseeing avoidance and minimization measures, construction activities and specific resource types, such as vernal pools and vernal pool species. The individuals to serve as Project Biologist and the other roles have not been identified at this time. As stated in BIO-IAMF#1, the names and qualifications for those roles will be submitted for written approval from USFWS, NMFS (where applicable) and CDFW prior to the start of ground disturbing activity. Additional approvals of staff qualifications may be required from additional agencies, such as the USACE; those approvals will be coordinated with the various regulatory and resource agencies during agency consultations and formal requests for agency authorizations. An example of one measure and how it protects aquatic resources would be BIO-IAMF#8 which would require clear identification of staging and access areas, including flagging and marking of access roads, to ensure that aquatic resources that are not authorized to be impacted are avoided by construction vehicles. The Project Biologist would be responsible for ensuring the flagging, marking, and delineation of staging and work areas is conducted and meeting the intent of the measure.

### 4494-9351

The commenter requests further detail regarding BIO-MM#32 and BIO-MM#33. It asks how the Authority will restore riparian and aquatic habitats, as described in BIO-MM#32 and BIO-MM#33 on page 3.7-172. The Project Biologist will direct the revegetation of any riparian areas that are temporarily disturbed as a result of the construction activities, using appropriate native plants and seed mixes. See Appendix 3.1-C-16 to -17. The Authority will also restore areas to their natural topography, will remove any gravel or geotextile fabrics added to protect substrate, and otherwise will restore the affected features.

### 4494-9352

The commenter asks if waters that are not considered jurisdictional will also be monitored during construction activities. The full text of BIO-MM#34 in Section 3.7 of the Draft EIR/EIS states that activities that occur within or adjacent to aquatic resources will be monitored by the Project Biologist. Jurisdictional waters consist of waters regulated under Sections 401 and 404 of the Clean Water Act, the Porter-Cologne Water Quality Control Act and Section 1600 of the California Fish and Game Code and include resources ranging from largely dry, intermittent or ephemeral washes to perennial streams, lakes and ponds. Waters not considered jurisdictional are largely limited to manmade structures such as cattle and stock ponds. Those resources may not be subject to construction monitoring unless those resources potentially support other resources, such as specific species habitat, that require construction monitoring. In those cases, the resources would be subject to monitoring in accordance with the applicable mitigation measures. In addition, measures HYD-IAMF#3 and HYD-IAMF#4, found in Appendix 2-E of the Draft EIR/EIS, would require the development of stormwater pollution prevention plans that would require monitoring of construction Best Management Practices and industrial facilities to ensure that water quality standards are being met across the project site, regardless of whether a water is identified as jurisdictional.

### 4494-9353

The commenter requests further detail regarding BIO-MM#39 and who will oversee the mitigation for impacts on habitat for vernal pool fairy shrimp and vernal pool tadpole shrimp. As stated in the full text of the mitigation measure on page 3.7-220, the Authority will oversee all mitigation required under FESA.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9354

The commenter requests further detail regarding BIO-MM#47. Please see the full text of BIO-MM#47 on Page 3.7-220 and 3.7-221 where the mitigation plan is described in detail. The compensatory mitigation plans will be reviewed and approved by the appropriate federal and/or state agencies, such as the USACE and CDFW, in accordance with their jurisdiction over the impacted resource addressed in the plan. Compensatory mitigation will be provided pursuant to regulatory authorizations issued under Sections 404 and 401 of the CWA and/or the Porter-Cologne Act. Compensatory mitigation for vernal pools (shrimp habitat) would be provided at a 2:1 ratio and would be identified in accordance with the appropriate resource or regulatory agency, depending on which agency(ies) has jurisdiction. As detailed in MM-BIO#47, if mitigation is required, compensatory mitigation options include purchase of credits from an agency-approved mitigation bank, preservation of aquatic resources through acquisition of property, establishment, restoration, or enhancement of aquatic resources, and/or in-lieu fee contribution determined through consultation with the applicable regulatory agencies.

### 4494-9355

The commenter asks how the avoidance and minimization measures listed in BIO-MM#50 would result in restoration of aquatic resources. Restoration, enhancement, or creation activities associated with implementation of mitigation measures has the potential to result in secondary impacts to biological and aquatic resources. BIO-MM#50 requires, prior to ground disturbing activities associated with habitat restoration, enhancement, and/or creation actions at a mitigation site, that the Authority conduct a site assessment of the work area to identify biological and aquatic resources, including vegetation communities, landcover types, and the distribution of special-status plants and wildlife. The IAMFs and BIO-MMs listed in BIO-MM#50 would ensure that actions to minimize and avoid impacts are applied to areas that are impacted by restoration, enhancement, or creation activities, as well as project construction and operation.

### 4494-9356

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter asks who will be in charge of implementing mitigation measures BIO-MM#56 and BIO-MM#58, the source of supplemental water, and whether/how the mitigation measures change the impacts under CEQA.

The Authority will be responsible for implementing the mitigation measures in coordination with the Project Biologist.

Regarding the source of supplemental water; as a matter of clarification, it is currently not known whether supplemental water would be needed. As explained in Impact BIO#1 in Section 3.7, Biological and Aquatic Resources of the Draft EIR/EIS, the Authority would implement IAMFs (HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7) that would reduce groundwater inflow from tunneling (see page 3.7-108 of the Draft EIR/EIS). Through these design features, the Authority would minimize the event that supplemental water would be needed by the Adaptive Management and Monitoring Plan (AMMP). In addition, the Authority has identified that their Preferred Alternative, the SR14A Build Alternative, poses the least risk of hydrologic impacts occurring among the Build Alternatives (see page 3.8-55 in Section 3.8, Hydrology and Water Resources of the Draft EIR/EIS). Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, for additional information regarding the sources of water for the HSR Palmdale to Burbank Section.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9357

The commenter asks who will design, monitor, and implement the mitigation measures to be applied to construction activities that could impact fish and wildlife species in aquatic features. As described in the Draft EIR/EIS, the Authority, as the lead agency under CEQA and NEPA and, in conjunction with the Project Biologist, will have ultimate responsibility for designing, monitoring, and implementing the project mitigation measures. The Authority has ultimate responsibility for ensuring the mitigation measures are followed as required and for ensuring that the Project Biologist is properly qualified and implementing their duties as required. Cooperating and responsible agencies, such as the USFWS, the USFS, the USACE, the CDFW, and the SWRCB will issue permits for the project that will have required measures in addition to the Final EIR/EIS. The Authority will likewise be responsible for ensuring the measures from regulatory permits are implemented as required.

This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### 4494-9358

The commenter asks if changes in groundwater levels caused by tunnel construction would be permanent. As discussed in the Impact HWR-MM#5 (pages 3.8-49 to 3.8-65) in Section 3.8, Hydrology and Water Resources of the Draft EIR/EIS, it is not anticipated that changes in groundwater due to tunneling would be permanent. Once the tunnel is constructed and the second lining installed, the tunnel will be watertight. Any groundwater intrusion between the first and second lining is expected to be minimal and any changes in groundwater levels are expected to return to pre-construction conditions. This conclusion is based on an assessment of information and data regarding the hydrogeological and hydrologic conditions of the western San Gabriel Mountains developed during preliminary geotechnical investigations, professional judgement of experts in the field of hydrogeology, hydrology and tunnel construction, and case studies of prior tunnel construction projects (Authority 2020c). Furthermore, as required by HWR-MM#4, groundwater monitoring activities would continue for a period of 10 years after completion of the Palmdale to Burbank Project Section to provide for timely detection of hydrological changes and, if necessary, appropriate remediation.

### 4494-9359

The commenter asks if tunneling is allowed in the SGMNM. The Authority has been consulting with the United States Forest Service (USFS) since 2017 on the project and the USFS is a cooperating agency in the preparation of this EIR/EIS document. The Authority believes that tunnel construction in the national monument would not be inconsistent with the management plan for the monument or the requirements of the Antiquities Act. Appendix 3.1-B, USFS Policy Consistency Analysis, provides an analysis of the consistency of the six Build Alternatives with these laws, regulations, policies, plans, and orders. Refer to Section 3.8.3, Consistency with Plans and Laws and Appendix 3.8-C for a discussion of specific standards that would apply to the tunneling activities associated with each of the six Build Alternatives in the ANF, including the national monument. To construct the Build Alternatives in the ANF, the Authority would need to obtain a Special Use Authorization from the USFS, which would require the Authority to, among other things, demonstrate that the proposed use would be consistent with USFS laws, regulations, plans, and policies.

### 4494-9360

The commenter asks how a revegetation plan will affect wildlife and fish dependent upon streams during project construction. The revegetation plan is intended to facilitate the restoration of temporarily impacted areas back to preconstruction conditions once construction is complete. These include areas that support special-status species, wetlands, or other aquatic resources. The restoration plan will include parameters for maintenance and monitoring of re-established habitats, including weed control measures, frequency of field checks, and specification of success criteria for re-established vegetation communities. Additional restoration measures such as BIO-MM#32 and BIO-MM#33 require the restoration of riparian and aquatic habitats as well. Through the successful restoration of upland, riparian and/or aquatic habitats, impacts from construction to both fish and wildlife will be mitigated. Impacts during construction will be mitigated through multiple measures such as BIO-MM#34 that require monitoring of construction activities within aquatic habitats, BIO-MM#85 that delineates environmentally sensitive areas that will be avoided during construction activity to limit inadvertent impacts to areas outside of construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9361

The commenter asks for an explanation of "long-term" as it relates to BIO-MM#32. The term "long-term" is not used in BIO-MM#32; however, a response to how this term is used in relation to restoration is provided as follows. The restoration of temporary impacts to riparian habitat is intended to facilitate the return of habitat function back to preconstruction conditions once construction has ended. Long-term refers to an extended period beyond the end of construction when the habitat is naturally self-sustaining with no further restoration intervention and returned to preconstruction conditions. Long-term does not necessarily equate to a specific amount of time and varies dependent on the type of restoration. Typical restoration monitoring is 3 -5 years for many habitats. In some cases, with slow growing habitats, this may extend to 10 years. The intent however is for the restored habitat to meet restoration criteria, whenever that is achieved (this could be as soon as 2-3 years in some cases). The duration of restoration monitoring would be determined by the Authority based on habitat type and in consultation with the appropriate resource agency(s) (e.g., USFWS, USFS, CDFW, ACOE).

### 4494-9362

The commenter asks how temporary is defined in terms of timing of the impact as it relates to BIO-MM#33. BIO-MM#33 requires the Authority to restore aquatic resources subject to temporary impacts from project construction. Temporary is defined by CDFW as an impact that occurs and is mitigated within one year of initial disturbance. Other agencies do not have specific definitions and generally refer to the time between initial ground disturbance and when the habitat is restored to preconstruction conditions. It would be reasonable to consider a temporary impact to be an impact that occurs for a short duration of time such that it does not disrupt the natural life cycle of a biological resource in a given reproductive cycle. A biological meaningful definition of "temporary" has not been universally agreed upon by regulatory agencies and would depend on the resource in question and the relative length of time of that resource's reproductive cycle. Due to the overall length of time construction is expected to take for the HSR Palmdale to Burbank Project Section, and specific success criteria (e.g., BIO-MM#6, BIO-MM#53, BIO-MM#93) that must be achieved for areas to be considered restored or revegetated, temporary may be longer than one year and could be as long as 3 to 5 years. Consequently, in terms of compensatory mitigation requirements, the Project's temporary effects are considered permanent due to the potential extended length of time of impact. In other words, temporary impacts occurring for an extended period of time are not mitigated at a lesser level than permanent impacts.

### 4494-9363

The commenter asks how construction monitoring is different in jurisdictional waters as opposed to non-jurisdictional waters. Jurisdictional waters, including those considered jurisdictional under the Clean Water Act and Porter-Cologne Act, have more regulatory restrictions on the type and amount of impacts. BIO-MM#34 requires monitoring of construction activities within or adjacent to aquatic resources, and documenting compliance with applicable avoidance and minimization measures. Monitoring of jurisdictional waters will include implementing and documenting compliance with additional measures set forth in regulatory authorizations issued under the CWA and/or Porter-Cologne Act. Activities in non-jurisdictional waters may be monitored depending on the specific resource or other resource values present, including habitat for sensitive species, but may not require monitoring of additional measures set forth in jurisdictional regulatory authorizations.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9364**

The commenter is asking how compensatory mitigation offsets permanent impacts relative to BIO-MM#46. The compensatory mitigation would provide either habitat restoration, acquisition of mitigation bank credits, or participation in an in-lieu fee program. The types of mitigation provide conservation of in-kind habitats at a greater acreage (2:1 or higher in this case) than the area impacted by the project. That habitat conservation is intended to exchange permanent impacts resulting from the project for long term habitat protection and management outside the project footprint but in the same general geography as the project.

### **4494-9365**

The commenter asks who prepares and oversees the CMP for aquatic resources relative to BIO-MM#47, BIO-MM#50, and BIO-MM#53 and how a CMP ensures mitigation. The Authority, with the assistance of the Project Biologist, will prepare and implement the CMP for aquatic resources as described in the Draft EIR/EIS under BIO-MM#47, BIO-MM#50, and BIO-MM#53. The CMP will identify mitigation required to address temporary and permanent loss, including ecosystem function and value, of aquatic resources defined as WOTUS under the CWA and/or waters of the state under the Porter-Cologne Act. If necessary, additional mitigation in the form of offsite habitat creation, enhancement, or restoration (BIO-MM#50) or compensatory mitigation (BIO-MM#53) will be implemented to ensure that impacts from construction are mitigated as required. The CMP specifically ensures mitigation through outlining the conditions under which mitigation (e.g., restoration) is required, when it is required, how it will be conducted, and what the success criteria are that must be met for the mitigation to be considered successful in qualifying as mitigation. In addition, the CMP will include adaptive management approaches and a description of financial assurances that will be provided for successful implementation of the mitigation. To provide further clarification regarding responsibility for implementing these measures, the title of Mitigation Measure BIO-MM#53 has been revised in Section 3.7, Biological and Aquatic Resources, of the Final EIR/EIS to "Prepare and Implement a CMP for Species and Species Habitat." The Authority will prepare and implement a CMP that sets out the compensatory mitigation.

### **4494-9366**

The commenter requests information about the type of weeds expected to occur with each build alignment alternative. These include, but are not limited to: Spanish broom, French broom, sweet clover, Mediterranean mustard, African mustard, perennial pepperweed, cape ivy, giant reed, Pampas grass, wild oat, red brome, riggut brome, tree spurge, salt cedar, fennel, poison hemlock, gum tree, tree of heaven, tree tobacco, smilo grass, and fountain grass.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9367

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-PUE-3: Water Demand and Usage.

The commenter asks about the time it would take to determine special-status species presence within suitable aquatic habitats. The commenter also asks about special-status species avoidance measures that would be applied to dewatering activities, and if these measures are known to be effective within other HSR project segments. Lastly, the commenter asks how supplemental water would be supplied, if required as part of mitigation measures.

As discussed in Section 3.7.6.3 of the Draft EIR/EIS, special-status species have the potential to occur in all six Build Alternative footprints due to the presence of suitable habitat. If avoidance of the waterbodies is infeasible or dewatering is required, the Authority would conduct pre-activity surveys of the suitable aquatic habitats (e.g., streams, ponds, vernal pools) prior to any ground disturbing or dewatering activities (BIO-MM#62: Prepare Plan for Dewatering and Water Diversions). The timing and duration of the pre-activity surveys would be based on the type of species with potential suitable habitat at that location, as well as the type of project activity. PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife provides an overview of the suite of general and species-specific Mitigation Measures (MMs) that when implemented would determine presence of a species and a set of MMs that outline specific avoidance and minimization steps for certain species and/or activities, if presence is confirmed.

The requirements for pre-construction surveys for vernal pool wildlife species and special-status reptile and amphibian species are detailed in BIO-MM#3: Conduct Pre-construction Surveys for Vernal Pool Wildlife Species and BIO-MM#7: Conduct Pre-construction Surveys for Special-Status Reptile and Amphibian Species, respectively. These measures detail the required survey areas, timing, and frequency of the required surveys, and any reporting requirements. If aquatic species (e.g., fish, amphibians, or turtles) are present, the dewatering would occur in conjunction with biological monitoring by a qualified biologist (BIO-IAMF#1: Designate Project Biologist, Designated Biologists, Species-Specific Biological Monitors, and General Biological Monitors) to observe the waterbody being dewatered and to identify and, if necessary, relocate any species that

### 4494-9367

might become stranded, as provided by regulatory authorizations. Rescued species would be relocated to the nearest suitable habitat outside of the construction footprint and where the species would be out of the way of further harm. If it is infeasible for dewatering activities to avoid vernal pools, species protection will be conducted in accordance with BIO-MM#5: Implement and Monitor Vernal Pool Avoidance and Minimization Measures within Temporary Impact Areas, which includes soil collection from the vernal pools and may include installation of measures to minimize damage to the soils and protect the pools' contours. If special-status reptile and amphibian species are observed during pre-activity or clearance surveys, the Project Biologist will identify actions, to the extent feasible, to avoid impacts on the species and to allow it to leave the area of its own volition, as described in BIO-MM#8: Implement Avoidance and Minimization Measures for Special-Status Reptile and Amphibian Species. This may include establishing a temporary Environmentally Sensitive Area and a buffer or relocation of the species, if necessary.

In addition, as summarized in PB-Response-BIO-2, there are a variety of MMs that are specific to work in aquatic resources and general construction areas that will minimize or avoid impacts to waterways and aquatic resources, further protecting species during dewatering activities. These include, but are not limited to, (BIO-MM#32 (Restore Temporary Riparian Habitat Impact), BIO-MM#33 (Restore Aquatic Resources Subject to Temporary Impacts), monitoring of construction restoration activities within waters that may include species habitat (BIO-MM#34 (Monitor Construction Activities within Jurisdictional Waters), installation of barriers within security fencing (BIO-MM#36 (Install Aprons or Barriers within Security Fencing), measures to minimizing secondary impacts form off-site restoration that could include waterbodies (BIO-MM#50 (Implement Measures to Minimize Impacts During Off-Site Habitat Restoration, or Enhancement, or Creation on Mitigation Sites), requirements for construction site vehicles (BIO-MM#60 (Limit Vehicle Traffic and Construction Site Speeds)), requirements in the event that special-status wildlife is found in the work area (BIO-MM#63 (Work Stoppage)), removal of carrion (BIO-MM#73 (Implement Removal of Carrion that may Attract Condors and Eagles)), height requirements for security fencing (BIO-MM#77 (Implement Wildlife Height Requirements for Enhanced Security Fencing)), wildlife rescue measures (BIO-MM#76 (Implement Wildlife Rescue Measures) and BIO-MM#78 (Install Wildlife Jump-outs)), spill prevention and containment measures (BIO-MM#87 (Prepare and

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9367

Implement Spill Prevention and Containment Measures)), and construction or maintenance activity debris prevention measures (BIO-MM#88 (Implement Construction or Maintenance Activity Debris Prevention Measures)).

Biological monitoring of dewatering and species relocation has been conducted during construction of other project sections of the California High-Speed Rail and on numerous other projects throughout California. The survival rate of individuals during capture and relocate is high; however, few studies and little data exist on the long-term survival of individuals after relocation (but see, Mosser et al. 2013). Generally, relocation efforts (i.e., moving an animal out of harm's way but keeping within its home range) are thought to be more successful than translocation efforts (i.e., moving an animal out of harm's way and to an entirely new location), and the Authority only proposes to relocate species.

Supplemental water would be provided, as needed, for changes in groundwater levels due to tunnel construction activities. Supplemental water is not anticipated for surface waters. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides additional information about water supplies for the project.

### 4494-9368

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife.

The commenter asks what evidence exists of BIO-IAMF#1 through BIO-IAMF #5 and BIO-IAMF#12's effectiveness until they have been executed.

The Authority has pledged to integrate programmatic impact avoidance and minimization features (IAMF) consistent with the 2005 Statewide Program EIR/EIS, the 2008 Bay Area to Central Valley Program EIR/EIS, and the 2012 Partially Revised Final Program EIR into the High Speed Rail (HSR) project. The Authority will implement these features, along with other IAMFs and resource/species-specific mitigation measures during project design, construction, and operation, as relevant to the Palmdale to Burbank Project Section, to avoid or minimize impacts. These same IAMFs are being successfully implemented for other California HSR System project sections, specifically the Merced to Fresno and the Fresno to Bakersfield Project Sections that are permitted and are in the construction phase. These measures will be effective. As an example, BIO-IAMF#1 (Designate Project Biologist, Designated Biologists, Species-Specific Biological Monitors and General Biological Monitors) will reduce potential biological resource impacts through designating Project Biologist(s), Designated Biologist(s), Species-Specific Biological Monitor(s), and General Biological Monitor(s) retained to conduct biological resource monitoring activities and implement avoidance and minimization features. These positions are approved by the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), and California Department of Fish and Wildlife (CDFW). The positions are responsible for overseeing timely implementation of biological resource mitigation features and permit conditions, overseeing regulatory compliance, and monitoring construction activities. The positions provide on-the-ground field inspection to verify that the project is implemented consistent with all biological resource terms and conditions. BIO-IAMF#2 (Facilitate Agency Access), (BIO-IAMF#3 (Prepare WEAP Training Materials and Conduct Construction Period WEAP Training), BIO-IAMF#4 (Conduct Operation and Maintenance Period WEAP Training) are standard measures for projects involving biological construction monitoring as well as permit conditions issued by regulatory agencies, which demonstrates they have been effective over time through repeated use and preference from regulatory agencies. As another example, BIO-IAMF#5 (Prepare

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9368

and Implement a Biological Resources Management Plan) requires the preparation of a Biological Resources Management Plan (BRMP), which would reduce potential impacts on biological resources by detailing an implementation strategy for biological resource conservation and mitigation features, and tying implementation of the features to discrete steps in the construction process. The BRMP would define responsibilities and timing to allow for the timely and appropriately implemented conservation and mitigation features. Please refer to Standard Response PB-Response-BIO-2, which provides additional information about the effectiveness of IAMFs.

### 4494-9369

The commenter asks who prepares, implements, and evaluates success metrics of the Restoration and Revegetation Plan. The Project Biologist will prepare the RRP with Authority oversight. The Authority will be responsible for implementing the RRP in coordination with the Project Biologist. The Authority will determine when success metrics have been met through coordination with the Project Biologist.

### 4494-9370

The commenter asks how implementation of BIO-MM#47 would provide additional benefits to critical habitat. The CMP developed under BIO-MM#47 would identify mitigation, including habitat restoration, establishment, and enhancement; preservation; or in-lieu fee for impacts to aquatic resources. This includes aquatic resources that are also critical habitat for ESA-listed species which would benefit through these additional conservation measures. Other measures such as BIO-MM#32, BIO-MM#33, BIO-MM#38, BIO-MM#39, BIO-MM#43, BIO-MM#44, BIO-MM#46, BIO-MM#53, and BIO-MM#70 have requirements to create/restore/enhance habitat for sensitive resources or habitat types (i.e., critical habitat) at various ratios. For example, impacts occurring to riparian forest within arroyo toad critical habitat would be compensated at a ratio of 2:1. In-lieu fees would be used for creation, restoration, or enhancement of the type of resource/habitat being impacted (i.e., critical habitat). Creation, restoration, or enhancement of aquatic resources within critical habitat will improve the habitat value for special-status species.

### 4494-9371

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter asks how implementation of BIO-MM#50 and off-site habitat mitigation can restore fish and ensure no adverse effects. The commenter also requests information regarding the source of supplemental water, who would administer the supplemental water, and if importing water to implement the mitigation justifies the no adverse effects determination.

Mitigation Measure BIO-MM#53 of the Draft EIR/EIS requires that the Authority prepare and implement a Compensatory Mitigation Plan for impacts to special-status species, including fish species, and their associated habitats. Through the efforts to implement off-site habitat restoration, enhancement, and/or creation, as well as restoration of temporary disturbance areas, while beneficial, this too can potentially result in impacts to species. As such, Mitigation Measure BIO-MM#50: Implement Measures to Minimize Impacts During Off-Site Habitat Restoration, or Enhancement, or Creation on Mitigation Sites will be implemented to address these types of impacts that can occur later during the mitigation efforts. BIO-MM#50 begins with conducting a site assessment of work areas in coordination with the Project Biologist to identify biological and aquatic resources, including vegetation communities, landcover types, and the distribution of special-status plants and wildlife. Based on the results of the site assessment, the Authority will obtain any necessary regulatory authorizations, specifically applicable to conducting habitat restoration, enhancement, and/or creation activities, and pursuant to the federal and state Endangered Species Acts, California Fish and Game Code Section 1600 et seq., Clean Water Act, and Porter-Cologne Act. BIO-MM#50 is intended to protect all species habitat and aquatic biological resources, including special-status fish species, in areas where off-site mitigation activities occur, as well as where temporary disturbance areas are subject to restoration. Implementation of BIO-MM#50 does not require supplemental water given that off-site habitat restoration, enhancement, or creation would involve establishing sufficient water needs to support the habitat being created in advance of implementation. Instead, the Draft EIR/EIS discusses the supplemental water in the context of groundwater levels changing as a result of tunneling, when adaptive management is triggered (as described in BIO-MM#93 and HWR-MM#4), and, when triggered, response actions to be implemented, as outlined in Appendix 3.8-C of the Draft EIR/EIS. One of these response actions includes adding

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9371

supplemental water to sustain habitat similar to baseline (i.e., pre-construction) conditions. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides additional information about water supplies for the project. The analysis of Impact BIO#4 in the Draft EIR/EIS Section 3.7, which also requires implementation of numerous applicable Impact Avoidance and Minimization Features, concludes that the impact to special-status fish and their habitats would be significant prior to the implementation of mitigation. Therefore, measures, such as BIO-MM#50, as well as BIO-MM#93, would be implemented not only to avoid/minimize impacts to the fish and their habitats, but also to restore, enhance, and/or create habitats for these species should the habitats that support them be impacted. Implementation of these measures ensures that any impacts to special-status fish species and their habitats are mitigated to less than significant levels.

### 4494-9372

The commenter asks how much acreage of the Hansen Spreading Grounds would be affected and how would any birds be affected by construction here. The HSR Build Alternative alignments would impact a total of 4.61 acres of the Hansen Dam Spreading grounds. The spreading grounds do not provide significant biological habitat as they are actively maintained and contain little to no vegetation. The primary habitat areas associated with the Hansen Dam area are located to the east of the Dam and would not be affected by construction of the Preferred Alternative (SR14A). Because the construction would not affect that primary habitat area, no impacts on the birds is expected. As described in Impact Bio#11 in Section 3.7.6.3, the area that would be filled is along the southernmost perimeter and is a fraction of the total spreading grounds, and would not affect connectivity with other portions of the Spreading Grounds.

### 4494-9373

The commenter asks if BIO-MM#6, BIO-MM#47, and BIO-MM#50 would be implemented during construction. The commenter also requests information about success metrics and how these would be determined. The commenter asks for examples of how the mitigation measures would be implemented within the Hansen Dam SEA. These mitigation measures will be implemented during construction, prior to ground disturbance. The mitigation measures contain success metrics including identifying the source and type of native seed, along with the degree of species richness, amount of basal coverage, the percentage of non-native species within each community and the required mix of herbaceous to woody species within each year of a multi-year restoration success evaluation process. As described in Impact BIO#11 in Section 3.7, Biological and Aquatic Resources, functionality of the Tujunga Valley/Hansen Dam SEA as habitat for protected fish species and sensitive vegetation would be degraded by surface impacts resulting from construction of the E2 and E2A Build Alternatives. Implementation of mitigation measures BIO-MM#6, BIO-MM#47, BIO-MM#50, and BIO-MM#53 would reduce direct and indirect impacts on SEAs during construction such that this impact would no longer result in a substantial adverse effect on SEAs. Also of note is that impacts to the Tujunga Valley/Hansen Dam SEA would not occur with the Authority's preferred alternative (SR14A) as it avoids the Big Tujunga Wash area.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9374

The commenter inquires what specific mitigation measures would protect native oaks. The commenter also notes its perspective that implementing mitigation plans to relocate oak trees is not viable as oak trees are not known to survive transplant well. In addition, the commenter asks what measures the Authority will take to mitigate for each kind of tree that will be permanently uprooted during construction, what methods of compensation are offered through BIO-MM#35, potential secondary environmental effects of implementation of BIO-MM#50, what are the measures proposed to prevent impacts from mold, and if the Authority is aware that many oak trees are over 100 years old. Lastly, the commenter asks if preserving native trees is important.

The Authority has developed a number of mitigation measures (BIO-MM#6, BIO-MM#35, BIO-MM#50, BIO-MM#55, BIO-MM#56, and BIO-MM#58) to avoid or mitigate potential impacts to native oak trees. BIO-MM#35 requires the Project Biologist to identify protected trees within the project work areas, establish exclusionary zones around those that do not require removal, and mitigate for those that are removed. The Authority will implement compensatory mitigation, and one of the forms of compensatory mitigation is through replacement or preservation of protected tree species at an offsite location or contributing to a fund to plant trees in near adjacent habitat at a ratios specified in the mitigation measure, unless higher ratios are required by local government agencies. Potential secondary impacts of implementing BIO-MM#50 are described in the Draft EIR/EIS at page 3.7-242. No adverse impacts from potential root mold are anticipated and any supplemental water would mimic the natural precipitation rate and seasonality. The Authority is aware of native oak tree longevity and the importance in preserving native trees as part of the project implementation and compensatory mitigation.

### 4494-9375

The commenter asks about BIO-MM#56 construction period monitoring and how close construction machinery will be allowed to trees, given that soil compaction is harmful. The commenter also asks what kinds of fencing will be used around portals and adits.

The Authority is aware of the harm that can occur to trees if soil is compacted because Impact BIO#19 (Project Operation Effects on Protected Trees) on page 3.7-211 of the Draft EIR/EIS describes the effects to trees and root structure that heavy equipment and heavy foot traffic can cause. BIO-MM#56 (Conduct Monitoring of Construction Activities) is not specific to trees. BIO-MM#35 (Implement Transplantation and Compensatory Mitigation Measures for Protected Trees) is specific to protected trees and specifies that ESAs will extend outward 5 feet from the drip lines of protected trees. Implementation of BIO-MM#35 and BIO-MM#56 includes the Project Biologist using flagging and temporary fencing to mark and preclude access to ESAs that support special-status species, including protected trees. Therefore, construction machinery will not be allowed within 5 feet of the drip line of protected trees. The establishment of ESAs would reduce impacts on protected trees and their roots during construction activities.

The commenter also asks how it can be concluded that unnamed mitigation measures will be successful. It is not clear what the commenter means by "unnamed mitigation measures". As described above, the Authority has identified specific mitigation measures in the Draft EIR/EIS that would minimize impacts. This response, which provides information already provided in the Draft EIR/EIS, explains how mitigation measures would minimize impacts to trees.

Because the comment is associated with BIO-MM#56, it is assumed the question about fencing around portals and adits corresponds to the type of wildlife exclusion fencing that would be installed. BIO-MM#36 (Install Aprons or Barriers within Security Fencing) on page 3.7-219 of the Draft EIR/EIS specifies that prior to final construction design, the Project Biologist will review the fencing plans along any portion of the permanent right-of-way that is adjacent to natural habitats and confirm that the permanent security fencing will be enhanced with a barrier (e.g., fine mesh fencing) that extends at least 12 inches below-ground and 12 inches aboveground to prevent special-status reptiles, amphibians, and mammals from moving through or underneath the fencing and gaining access to areas within the ROW. At the 12-inch depth of the below-grade portion of the

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9375**

apron, the barrier will extend or be bent at an approximately 90-degree angle and oriented outward from the ROW by a minimum of 12 inches to prevent fossorial mammals, reptiles, and amphibians from digging or tunneling below the security fence and gaining access to the right-of-way. The Project Biologist will ensure that the selected apron material and climber barrier do not cause harm, injury, or entanglement to, or entrapment of wildlife species. It also specifies that the specific design and method of installation of an apron or barrier may vary as required by regulatory authorizations issued under FESA and/or CESA. In addition, BIO-MM#77 (Implement Wildlife Height Requirements for Enhanced Security Fencing) on page 3.7-230 of the Draft EIR/EIS specifies that security fencing height will be increased to a minimum of 10 feet in mountain lion-suitable habitat and the final design will be approved by the Project Biologist. The kind of fencing was not specified in the measure, only the height. Installation of wildlife exclusion fencing to prevent special-status wildlife from entering the right-of-way (including adits and portals) would prevent injury or death that may occur during project construction and operation.

### **4494-9376**

The commenter requests additional details regarding construction activities, specifically how much soil will be displaced and allowed to cover areas around open-cut activities ( 3.7-188) . Appendix 2-I, Potential Disposal Plan for Spoils Generated during Construction Activities, includes a table with information on the quantities of material generated during construction for each Build Alternative. The amount of time spoils would stay in one spot before moving will be determined by the contractor. Taking into account the bulking factor for spoils, an estimated bulk volume of 39-47 million cubic yards of spoils are anticipated for each Build Alternative. The comment asks how wide the Authority would grade for a footprint. The width of the footprint when on the surface varies depending on location, topography, and construction approach. For example, when constructing a bridge or viaduct the construction footprint may be 60-100 feet wide. At grade footprints may vary depending on topography and can be several hundred feet wide in specific locations. Appendix 3.1-A Palmdale to Burbank: Footprint Mapbook includes the construction footprint for each Build Alternative.

### **4494-9377**

The commenter inquires how the Angeles Forest Highway is a constraint. One of the ways that movement corridor effects were analyzed was the assessment of effects to least-cost corridors and wildlife linkage design that were identified in a regional wildlife study for the San Gabriel-Castaic Connection of the South Coast Missing Linkages Project (Penrod et al. 2004). Least-cost corridor modeling is a GIS technique that analyzes the resistance or relative movement "cost" for a species to move between target areas. The width of the Los Angeles Forest Highway is not a barrier to wildlife; however, all roads and the associated vehicles create some level of deterrence to wildlife use, which is taken into account during the least-cost corridor analysis. The discussion on pg. 3.7-193 of the Draft EIR/EIS references the functionality of a wildlife crossing near the convergence of the SR 14 freeway, Los Angeles Forest Highway, and Sierra Highway.

### **4494-9378**

The commenter asks what would inundate the undercrossing as describe on page 3.7-198 of the Draft EIR/EIS. The E2A Build Alternative describes that the undercrossing could be inundated by water, but if it is likely to be inundated for longer than 24 hours at least once a year, a dry ledge would be incorporated into the undercrossing structure to facilitate safe passage of small wildlife.

### **4494-9379**

The commenter requests further detail regarding BIO-MM#36. BIO-MM#36 says the following "Although fencing would impede wildlife movement, it would prevent wildlife injury or death (i.e., vehicle and rail strikes) resulting from encroachment into the HSR operations zone. Fencing and berms would direct animals toward crossing structures where there would be no threat of injury or death from rail and vehicular strikes. As a result, impacts on wildlife that move through the area, such as mortality, injury, and harassment would be reduced." This fencing would be introduced during construction and operation of the project. This would be the same for wildlife crossings that are recommended for the project; wildlife crossings and fencing would be constructed as part of the project.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9380

The commenter asks how effects on wildlife movement corridors would be minimized during construction. The specific ways in which the effects on wildlife movement corridors would be minimized during construction are included in the text of BIO-MM#37. BIO-MM#37 specifies that the Authority will: (1) avoid placing fencing, either temporarily or permanently, within known wildlife movement corridors in those portions of the alignment where the tracks are elevated (e.g., viaducts or bridges), to the extent feasible; (2) keep wildlife crossing structures, land above tunnels, and other potential wildlife movement areas as free as practicable of equipment, storage materials, construction materials, and other potential impediments during ground disturbing activities; (3) require that before ground disturbing activities the contractor submit a construction avoidance and minimization plan for potential wildlife movement areas to the Project Biologist for concurrence; and (4) avoid conducting ground disturbing activities in wildlife movement corridors during nighttime hours, to the extent feasible, and will shield nighttime lighting to avoid illuminating wildlife movement corridors in circumstances where avoidance of such activities is not feasible.

### 4494-9381

The commenter requests further detail regarding BIO-MM#60 and asks what specific speeds are mandated for vehicle traffic at construction sites. Vehicle speed limits would be no more than 15 miles per hour for unimproved access roads and for temporary and permanent construction areas within the construction footprint. Please see the full text of BIO-MM#60 on page 3.7-225 where these details are provided.

### 4494-9382

The commenter asks for information about the appearance and function of the wildlife jump-out as described in BIO-MM#78. These are measures built into fencing plans that provide large wildlife an escape ramp built into the fencing, allowing them to exit out of the right of way but not re-enter. The jump-outs or ramps would allow wildlife to exit the right-of-way on their own.

### 4494-9383

In the context of BIO-MM#83, the commenter requests examples of specific measures for three kinds of special status wildlife as it relates to effects on wildlife movement. In addition, the commenter asks about the difference between construction and operational WEAP materials. The specific types of measures to avoid, minimize, or reduce adverse effects on wildlife movement include directional fencing to direct wildlife to wildlife movement corridors (large mammals), revegetating temporary disturbance areas beneath viaduct sections of the alignment to encourage wildlife movement (medium mammals, reptiles and amphibians), and vegetation of entrances to wildlife crossings using native vegetation (small mammals, reptiles and amphibians). Construction WEAP training focuses on avoidance, minimization and mitigation primarily resulting from ground disturbing (vegetation removal, earth moving, materials storage and assembly activities including a greater intensity of a large volume of equipment used in construction, a larger number of personnel moving within the footprint). The focus of a construction WEAP is identifying existing resources within the native habitats prior to and during construction activities. Operational WEAPs focus on less intensive activities with fewer people and less equipment moving within now existing permeant disturbance areas including vegetation management. With the exception of wildlife movement corridors, operational maintenance is not expected to occur within native habitats and therefore lack populations of sensitive species. The focus of the operational WEAP is avoidance of remaining habitats within wildlife movement corridors, staying within existing maintenance area, and preventing any additional disturbances to adjacent habitats.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9384**

The commenter is asking for examples of herbicides and pesticides that would be used for weed abatement for different species needing protection, why trash and chemicals would accumulate with the alignment after construction, and if hazardous materials would be an issue after mitigation. The specific types of herbicides to be used on the project have not been determined. As explained in BIO-MM#54, the Authority will generally follow the procedures established in Chapter C2 of the Caltrans Maintenance Manual to manage vegetation on Authority property (California Department of Transportation [Caltrans] 2010), including the use of Caltrans-approved herbicides. Pesticide application will be conducted in accordance with all requirements of the California Department of Pesticide Regulation and County Agricultural Commissioners by certified pesticide applicators. USFWS, CDFW, USFS, and USACE will provide feedback regarding the use of herbicides, especially in the vicinity of sensitive biological resources. The permitted herbicides will be restricted in their use within environmentally sensitive areas and environmentally restricted areas. Ongoing train operations and maintenance activities could directly or indirectly affect special-status species and habitat as activities may occur in areas where impacts on special-status species habitat had previously been restored.

The Draft EIR/EIS analyzes project impacts associated with the use and generation of hazardous materials and wastes, pollutants (including trash and chemicals), and herbicides in Section 3.7, Biological and Aquatic Resources; Section 3.8, Hydrology and Water Resources, and Section 3.10, Hazardous Materials and Wastes. Trash and chemicals associated with operational activities could accumulate within the project build alternative alignment footprint over time from several sources including pollutant generating surfaces like trains, stations and associated parking lots, access roads, and new overpasses or underpasses. HYD-IAMF#1 will require on-site stormwater management facilities to capture runoff from pollutant-generating surfaces, including station areas, access roads, new road overpasses and underpasses, reconstructed interchanges, and new or relocated roads and highways. HMW-IAMF#9 will minimize the hazardous materials selected for use throughout HSR operations and maintenance and HMW-IAMF#10 will implement hazardous materials plans to provide for the correct handling of hazardous materials throughout operations and maintenance activities. With implementation of these IAMFs, the project's operational impacts on water quality and habitat for special-status species, as well as the project's impacts associated with the

### **4494-9384**

use, transport, storage, and disposal of hazardous materials, would result in less-than-significant impacts under CEQA and no adverse effects under NEPA. No further mitigation would be required.

### **4494-9385**

The commenter is asking how lighting from the catenary system will affect birds flying at night. Also, the commenter is asking how light and noise at portals in the vicinity of the ANF and SGMNM will affect wildlife. During final design, the Project Biologist will verify that the catenary system is designed to be passerine and raptor safe in accordance with the BIO-IAMF#12 Design the Project to be Bird Safe and the applicable recommendations presented in Suggested Practices for Raptor Protection on Power Lines: The State of the Art in 2006 (APLIC 2006) and Reducing Avian Collisions with Power Lines: State of the Art in 2012 (APLIC 2012). BIO-IAMF#12 will be implemented requiring the design of the catenary system, masts, and other structures such as fencing, electric lines, communication towers, and facilities to be bird and raptor safe. The Project Biologist will check the final design drawings and submit a memorandum to the Authority to document compliance with this measure. While no portals are included within the ANF or SGMNM, lighting and noise at the portals are expected to cause wildlife to avoid these portals during construction based on duration, intensity, and ambient noise and light levels. BIO-IAMF#12 was also developed to avoid and minimize impacts from operational lighting sources by several methods, including using appropriate shielding to reduce horizontal or skyward illumination and avoiding the use of high intensity lights (e.g., sodium vapor, quartz, and halogen). Additionally, BIO-IAMF#12 specifies that no lighting will be installed under viaduct and bridge structures in riparian habitat areas.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9386

The commenter asks how prevailing wind patterns, including Santa Ana winds, affect seed settlement. The commenter also asks for an explanation about how short duration noise affects amphibians relative to existing effects from water contamination and the presence of invasive species. The commenter also asks what spacing of the electrical system is considered effective in preventing electrocutions, how marking electrical line protects birds at night, what types of flight diverters besides fences are proposed, and what distance from a moving train is required to protect bird habitat. The Authority considers plants within the project footprint to be acclimated to prevailing wind patterns including seed dispersal. No changes in seed dispersal are anticipated from reasonably foreseeable future wind patterns. While avoidance of the work area during construction due to noise and permanent exclusion of individuals during operations by a fenced right-of-way are expected to have direct effects on the population, additive impacts are not currently anticipated. The Authority will implement BIO-IAMF#12 utilizing the Suggested Practices for Raptor Protection on Power Lines: The State of the Art in 2006 and Reducing Avian Collisions with Power Lines: State of the Art in 2012 to prevent bird electrocutions. The Authority will use line markers to increase visibility, even in low light conditions, and avoid or reduce potential bird strikes. The type of flight diverters used for the project has not been determined. The Authority convened a working group of biologists and engineers in 2020 to investigate the electrical components of the HSR system to determine if they had the potential to result in electrocution hazards for birds. Among other findings, the Authority found that the preliminary Overhead Contact System (OCS), with a maximum separation of electrified or electrified and grounded elements of 20.7 inches, posed a risk of electrocution to some birds, in particular large species such as golden eagle and California condor. The working group recommended a number of design changes to the OCS configuration to increase the separation of elements to avoid and minimize electrocution risk. The Authority presented the draft findings to CDFW, which included two new OCS configurations for eagles (and all other raptors smaller than eagles) and for California condor, and solicited comments, which were received by the Authority on February 18, 2021 as noted by the commenter. The Authority carefully considered each of the comments provided by CDFW, made several additional design changes, and produced a final Bird Electrocution Avoidance Configuration memo which provides guidance and recommendations for the OCS to minimize the risk of large raptor and condor electrocutions (Authority 2021).

### 4494-9387

The commenter requests information about how implementing BIO-IAMF#12 will minimize the changes to melatonin metabolism caused by artificial light at night. Since melatonin is produced in the pineal gland of mammals in response to darkness and is inhibited by light, the presence of intermittent artificial light has been shown to cause changes in blood melatonin levels, blood glucose levels, metabolism, and circadian rhythms. These changes can induce stress-related metabolic impacts, changes in forage patterns, reduced reproductive abilities, and reduced life cycles. In addition to BIO-IAMF#12, the Authority developed BIO-MM#37, BIO-MM#99, and BIO-MM#100 to further minimize potential effects to wildlife from construction and operations night lighting, including melatonin production in mammals. The design features required under BIO-IAMF#12 include using motion or heat sensors and switches to reduce the time when lights are illuminated, shielding and avoidance of high-intensity lights, and prohibiting night lighting under viaducts and bridges.

### 4494-9388

The commenter asks which reptiles are the most sensitive to vibration and if those species are inactive during the day in all seasons. The Authority did not evaluate a ranking of reptiles' sensitivity to vibration. Most reptiles are sensitive to vibration but generally acclimate to the presence of changing vibrations within their habitat. Reptiles tend to be diurnal or nocturnal no matter the season and tend to increase activity during warm weather and summer months.

### 4494-9389

The commenter asks about the amount of noise reduction that would result from the installation of an apron and fence. The Authority considers the implementation of BIO-MM#36 as a measure that will restrict wildlife from accessing the right-of-way, including burrowing wildlife that might dig under the fencing. By restricting access to the right-of-way, potential wildlife death or injury from interactions with moving vehicles and trains are avoided. With implementation of N&V-MM#3, the Authority anticipates an exterior noise reduction of 5-15dB from the installation of noise barriers.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9390

The commenter requests further detail regarding BIO-MM#53. Please refer to BIO-MM#53 in 3.7.7 on page 3.7-222 for the detailed CMP requirements. As stated therein, the California High Speed Rail San Jose to Merced Preliminary Compensatory Mitigation Plan is an example of a plan that includes state-listed fish.

### 4494-9391

The commenter is asking about the effectiveness of weed control relative to injury and death of invertebrates, especially those invertebrates already killed by equipment maintenance. The commenter mentions BIO-MM#54 and BIO-MM#55 on page 3.7-207, which were developed by the Authority to address vegetation removal within the permanent and temporary disturbance areas to prevent the risk of wildland fire and subsequent wildlife habitat impacts, and the preparation and implementation of a weed control plan to minimize the spread of invasive plants during construction and operation. The intent of BIO-MM#55 is also to reduce construction and operational impacts to wildlife habitat from the spread of weeds. While BIO-MM#54 and BIO-MM#55 were not developed to prevent invertebrate mortality from interactions with maintenance equipment, they are effective in maintaining natural plant communities by providing host and nectar species for invertebrate populations and preventing catastrophic wildland fires that can remove all invertebrate habitat and reduce the local and regional populations for extend periods of time, both of which often take years to recover.

### 4494-9392

The commenter asks about the frequency of carrion removal described in BIO-MM#73 (Implement Removal of Carrion that may Attract Condors and Eagles). BIO-MM#73 is designed to reduce potential impacts to condors and eagles that may be attracted to dead or injured animals found within the right-of-way. Carrion detection will occur via automated security monitoring, manual track inspections, and observation reports from HSR operations and maintenance workers. BIO-IAMF#4 (Conduct Operation and Maintenance Period WEAP Training) will provide training to HSR operations and maintenance workers on regulatory agency terms and conditions contained in permits and approvals, federal and state environmental regulations, and project avoidance features and mitigation features. The automated security monitoring will occur on a continuous basis and the manual track inspections will occur monthly or more frequently based on automated security alerts and observation reports from train operators. BIO-MM#73 has been revised in the Final EIR/EIS to clarify this point.

### 4494-9393

The commenter asks for an example of a wildlife rescue measure for a specific endangered mammal, how would it be implemented, and who would oversee the work as part of BIO-MM#76. The Authority would implement wildlife rescue measures for any injured or trapped wildlife species. This typically includes the Project Biologist coordinating with the USFWS and CDFW specifically about the health of the injured animal and the approved wildlife rescue facilities available to rehabilitate it. The Project Biologist would coordinate with the wildlife rescue facility about either transportation to the facility or pickup by facility staff. The Project Biologist would ensure the injured animal is protected from construction activities and move the animal to a shaded area away from construction activities (if it doesn't further threaten the health of the animal), provide protection from heat and inclement weather, and typically deliver the injured animal to the designated rescue facility or turn it over to the facility technician that arrives to pick it up. Each species and circumstance of injured wildlife is treated separately and always in coordination with the USFWS and/or CDFW biologist.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9394

The commenter is asking for a specific example of weather-related work restriction that would be included in BIO-MM#86 for the Santa Clara River construction and maintenance weather and seasonal work restriction. One weather restriction example is only scheduling concrete pour for bridge or bank stabilization when there is less than a 40% chance of 0.10 inches or more of precipitation within a 48-hour period.

### 4494-9395

The commenter asks who will be responsible for overseeing the debris prevention measures in BIO-MM#88. The commenter also asks for an example of this measure.

The Authority will ultimately oversee the implementation of the measure. The Authority anticipates the Project Biologist will make field inspections of the barrier to ensure it is properly installed and working correctly. BIO-MM#88 involves the installation of an underslung tarp, debris platform, or equivalent barrier to prevent the inadvertent discharge of equipment, chemicals, or debris into the wetted channel. This would ensure that debris associated with construction activities would be caught by the tarp or platform, preventing any discharge to the wetted channel.

### 4494-9396

The commenter asks what measures the Authority proposes to implement to avoid impacts to the Santa Clara River during operation and maintenance.

The Authority is proposing the following measures that would apply during operation and maintenance: HYD-IAMF#1, BIO-IAMF#4, BIO-MM#88 (which applies to maintenance activities), and BIO-MM#92. The avoidance measures included as part of BIO-MM#92 relate to timing and work area restrictions for maintenance, including that no maintenance work will occur within 10 feet of the wetted channel, no maintenance activities will occur in the Santa Clara River wetted channel, and repair or replacement of bridge structures requiring access to the 25-year flood zone of the riverbed will be restricted to the period from June 1 to September 30, except in the case of an emergency. These measures are intended to avoid direct and indirect impacts to unarmored three-spine stickleback and stickleback habitat within the Santa Clara River during project operations and maintenance.

### 4494-9397

The commenter is asking about BIO-MM#89 and how impacts to aerial species wildlife movement from train strike and entrapment can be minimized. The Authority developed BIO-MM#89 to minimize intermittent impacts to aerial wildlife movement by installing features to discourage birds perching on overhead structures, placing flight barriers to prevent birds from flying into the train in selected locations, modifying some project infrastructure to reduce bird entrapment in hollow poles, and designing features for aerial structures and portals to discourage bats from roosting in expansion joints and tunnel crevices.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9398**

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter asks how the Authority measures conditions for noise reduction in areas with special-status bird habitat. Additionally, the commenter questions how successful proposed mitigation measures (BIO-MM#101) can be, since project construction and operation have not begun; when effectiveness monitoring would be implemented; and how the Authority manages mitigation measures that are determined to be ineffective.

The Authority has undertaken a detailed analysis of the impacts of noise on birds and bird habitat, which is disclosed in the Draft EIR/EIS in Section 3.7, Impact BIO#14. Noise measurements are based on the noise generated by the train traveling at top speed (approximately 220 miles per hour) at a specific point. Noise measurements are taken in the universal descriptor for environmental noise, the A-weighted sound pressure level expressed in A-weighted decibels (dBA). Federal and State wildlife resource agencies and academic literature generally agree that noise above 65 dBA is harmful to wildlife, including birds. As disclosed in the Draft EIR/EIS (page 3.7-204): “because all areas inside the fenced right-of-way would no longer be suitable habitat due to construction of facilities, this analysis focuses on noise impacts on special-status birds beyond the fence line. The effect of operational noise on birds depends on the interaction of existing noise conditions relative to the published thresholds for noise impacts. At the noise levels that would be generated outside the fence line, masking is the primary impact on birds. Masking occurs when new noise sources make bird calls inaudible due to the greater volume of the new sound. Dooling and Popper identify the conservative threshold of 60 A-weighted decibels for masking effects (Dooling and Popper 2007). This threshold must be considered relative to existing conditions, such as existing ambient noise sources. For example, on the Burbank to Los Angeles Project Section, the USFWS noted that for least Bell’s vireo that are habituated to existing conditions of 63-73 A-weighted decibels of ambient noise, an increase due to train operations, of 67-77 A-weighted decibels is not likely to adversely affect the species (USFWS 2021). Because the area of operational impact has some ambient noise but is generally not subject to high levels of ambient noise, the conservative threshold of 65 A-weighted decibels is used for this analysis.”

### **4494-9398**

Success of BIO-MM#101 is based on demonstrable reduction of noise generated by the train measured at adjacent bird habitat. BIO-MM#101 is based on the best professional technical judgment developed by experienced biologists and best available science for reduction of noise impacts to special-status bird species. While detailed studies have not been published regarding the efficacy of these measures, the measures are often used by CDFW and USFWS to avoid, minimize or mitigate species impacts. Noise barriers are known to successfully reduce noise trespass on areas adjacent to a source and are commonly used and approved by federal and State wildlife resource agencies. The location, length and height of the barriers will be determined based on detailed noise modeling for areas of suitable special-status bird habitat, and measurement of existing conditions so that the noise-attenuating effects of topography and other existing features can be accounted for during the final design phase. After mitigation, the area of bird habitat expected to be exposed to noise levels above 65 dBA after implementation of noise barriers is considered to be permanently impacted as disclosed in the impact assessment provided in the Draft EIR/EIS, Table 3.7-30 (page 3.7-204). Where permanent impacts to special-status bird habitat would occur, BIO-MM#53 would require the preparation of a compensatory mitigation plan. Please see standard responses PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife and PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife for additional details on impacts to wildlife related to noise.

### **4494-9399**

The commenter asks if noise will be measured during project operations further than 50 feet from the project’s above ground centerline, who would conduct the measurements, and how often they would be recorded. As noted in Section 3.4, Noise and Vibration, the Authority would typically measure noise levels during operation 50 feet from the noise barrier or right-of-way fence (BIO-MM#101). If noise levels higher than 65 dBA occur at 50 feet, noise measurements may be taken by the project Qualified Biologist farther away than 50 feet to determine the noise attenuation range and potential need for additional noise mitigation. Generally, noise measurements would be taken during routine maintenance by a project engineer.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9400**

The commenter asks for examples of herbicides and pesticides that would be applied and who would determine the compensation for impacts to trees. The Authority has not determined the specific types of herbicide that would be used in the implementation of the weed control program. The Authority would only use herbicides approved by the State of California and identified as safe for sensitive species habitats by the USFWS, CDFW, or USFS and safe for protected trees by the Los Angeles County or other local jurisdiction. BIO-MM#35 outlines transplantation and compensatory mitigation requirements for protected trees. Replacement of protected trees will be at a ratio not to exceed 3:1 for native trees or 2:1 for ornamental trees. While the Authority as a state agency is not subject to local requirements or ordinances, BIO-MM#35 does require the Authority to use higher ratios for native and ornamental tree replacement if required by local government ordinances or regulations. As such, final compensation for impacts on protected trees will be determined by the Authority in conjunction with the local jurisdictions.

### **4494-9401**

The commenter asks how a less than significant determination is made when a protected tree has to be removed and transplanting that tree is not possible. The commenter also asks if the contractor, who is responsible for the tree removal and mitigation, will be knowledgeable about tree conservation. Lastly, the commenter asks who within the Authority will be responsible for overseeing this contractor. Protected trees that would be permanently impacted and are not suitable for transplanting would be mitigated under BIO-MM#35 which requires replacement of protected trees at an off-site location, based on the number of protected trees impacted, at a ratio not to exceed 3:1 for native trees or 1:1 for ornamental trees. Replacing affected trees at the ratios cited in BIO-MM#35 would offset the impact and result in the same, if not higher number of trees and thus would result in mitigating the impact to less-than-significant. The Authority is responsible for overseeing and ensuring mitigation measures are implemented and effective. The Authority will hire qualified contractors with specific expertise to determine which trees can be translocated and which cannot.

### **4494-9402**

The commenter asks who will determine the appropriate planting areas for growth of new plants when plants cannot be salvaged, who will attend to that new plant growth, and who will approve the Salvage and Relocation of Special-Status Plant Species Plan prepared by the Project Biologist. BIO-MM#2 describes that special-status plant seed and plant materials will be collected and stockpiled and the top four inches of topsoil from locations will be segregated for use on off-site locations. Those offsite locations include Authority mitigation sites, refuges, reserves, federal or state lands, and public/private conservation and mitigation banks. The Authority will work with the appropriate regulatory agency, mitigation bank staff, and/or agency or party managing the offsite location, as well as the Project Biologist, to identify the appropriate replanting areas and to determine responsibility for attending to new plant growth prior to installation of any salvage or new planting materials. The replanting areas and responsibility for attending to new growth are expected to vary, depending on such factors as offsite location, plant species and which agency has jurisdiction or oversight for that species. The Salvage and Relocation of Special-Status Plant Species Plan will be subject to review and approval by the Authority but is also expected to be reviewed and subject to approval by resource agencies with jurisdiction or oversight over the plant species addressed in the plan, which may include but is not limited to USFWS, CDFW and USFS, as appropriate.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9403

The commenter asks what the word "work" is referring to in BIO-MM#3. The commenter also asks if ground disturbing activities would occur between October and April. BIO-MM#3 includes the word "work" in two separate sentences: "Prior to any ground disturbing activities, the Project Biologist will conduct an aquatic habitat assessment and survey for vernal pool wildlife species in seasonal wetlands and vernal pools that occur within both the work area and the area extending 250 feet from the outer boundary of the work area where access is available, consistent with USFWS vernal pool survey protocols." and "The Project Biologist will submit a report to the Authority within 30 days of completing the work." Work in the first excerpt refers to the construction work area. Work in the second excerpt refers to the completion of the Project Biologist conducting seasonal wetland and vernal pool surveys in pools that have been determined to be inundated; a report on the findings would be submitted to the Authority within 30 days of completing that survey work. Ground disturbing construction activities would occur between October and April unless preconstruction surveys determine the presence of regulated species which require exclusionary buffers and seasonal closures of certain areas of the project work areas.

### 4494-9404

The commenter notes that the requirements in BIO-MM#6 are very general since a specific Build Alternative has not been chosen. The commenter asks where the Project Biologist would procure the procedures for a variety of vegetation communities. BIO-MM#6 describes the purpose of the Restoration and Revegetation Plan (RRP), examples of restoration activities that may be required (e.g. grading), and the minimum requirements of topics that must be included in the RRP. Detailed planning for restoration and revegetation will begin after the preferred alternative alignment is chosen. Details for the RRP will be developed based on findings from preconstruction surveys within temporary impact project areas. The RRP will identify the types of vegetation communities and resources being subject to impacts and subsequent restoration and revegetation, how the pre-construction conditions of those temporary impact areas are being documented, the specific restoration and revegetation activities that will be implemented and the monitoring, maintenance, reporting, success criteria and adaptive management process that will be implemented to facilitate successful restoration and revegetation. These items will be prepared to be specific to the resource being restored and/or revegetated (e.g. different vegetation communities or types of aquatic resources), as appropriate and the RRP, and all procedures in the RRP, will be developed in coordination with, and approved by, the relevant regulatory agencies such as the USFWS, USACE and CDFW, as appropriate. Each of the agencies that will review and/or approve the RRP will provide input, suggestions and guidance on the procedures and all other content within the RRP that are specific to their jurisdiction or agency responsibilities.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9405**

The commenter is asking about the process of conducting preconstruction surveys as required under BIO-MM#7. The surveys are conducted to determine the presence/absence survey of special status reptiles and amphibians, including the time spent at each survey location. The Authority utilizes USFWS or CDFW sensitive species protocols (if they have been developed by the agencies) to develop, conduct, and report the results of these surveys. The agencies have detailed requirements, including seasonality, duration, time spent at each location, and reporting requirements. The Authority will continue to utilize the survey protocols to conduct presence/absence preconstruction surveys. If the USFWS or CDFW do not have published survey protocols, the Authority will utilize a focused survey approach that includes wildlife biologist walking meandering transects through suitable habitat looking for both visual and auditory cues of the species presence. If the biologist has a visual or auditory detection of the species presence, they will document the locations and suitable habitat boundaries. In some cases this may require both daylight and night-time surveys to adequately complete the preconstruction surveys.

### **4494-9406**

The commenter is asking how relocation of special status reptile and amphibians is conducted under BIO-MM#8: Implement Avoidance and Minimization Measures for Special-Status Reptile and Amphibian Species. Each species of special status amphibians has their own protocol for relocating individuals out of the work area and into adjacent suitable habitat. These protocols are coordinated between the Project Biologist, the Authority, and the resource agencies. In some cases the individuals are placed in 5-gallon buckets, carried outside the work area and into suitable habitat before being released. For federal or state-listed species, relocations will be undertaken in accordance with regulatory authorizations issued under the project biological opinion and/or the incidental take authorization. While non-federally or state listed species may not require specific approvals for relocation, they would be relocated using the same or similar methodology as the listed reptile and amphibian species.

### **4494-9407**

The commenter requests further detail regarding BIO-MM#14 and asks if birds will remain in nests within 75 feet of construction and if construction will occur between February and September. All exclusionary or no-work buffers will be set at a distance of 75 feet unless a larger buffer is required pursuant to species tolerances and regulatory authorizations by CDFW and USFWS. Construction will take place between February and September, but the no-work buffer and monitoring by the Project Biologist is expected to prevent the loss of active bird nests. Please see Impact BIO#3 Project Construction Effects on Special-Status Bird Habitat for more details.

### **4494-9408**

The commenter asks how effective buffers are for raptor nests. Exclusionary buffers for raptors are effective with considerations of species, the life history of the individual birds, the size of the buffers, and the type of activities being conducted. An example of exclusionary buffers for raptors being effectively used is the Southern California Edison Tehachapi Renewable Transmission Project in Los Angeles County, California. Regulatory agencies that protect raptors and raptor nests, such as CDFW and USFWS, routinely use buffers as an effective method to reduce impacts on raptors and their nests.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9409**

The commenter asks if construction activities will occur before sunrise or after sunset in areas of California Condor roosting, if there be more than one Project Biologist overseeing multiple work areas being constructed simultaneously, if the Project Biologist will have experience identifying Swainson's Hawks and their nests, and what kinds of trees Swainson's Hawks typically nest in. While the commenter refers to BIO-MM#16, both BIO-MM#16 and BIO-MM#17 include this information. As explained in BIO-MM#16, if USFWS informs the Authority or if the Authority is otherwise made aware that California condors are roosting within 0.5 mile of a work area, no construction activity will occur during the period between one hour before sunset and one hour after sunrise. It is not anticipated that there would be more than one Project Biologist per segment even if multiple spreads with active construction are working at the same time. As explained in BIO-IAMF#1, the Project Biologist is responsible for ensuring the timely implementation of the biological avoidance and minimization features as outlined in the Biological Resources Management Plan, and for guiding and directing the work of the Designated Biologists and Biological Monitors. Accordingly, in addition to the Project Biologist, each segment will include (as appropriate) designated species biologists, species-specific biological monitors, and general biological monitors reporting to the Project Biologist. This includes USFWS approved California condor species biologist on site during work within 0.5 mile of habitat. Utilizing the range of monitors during construction allows the Project Biologist to oversee a large area of work consisting of multiple construction crews.

The Project Biologist will be experienced with Swainson's Hawk identification including breeding and nesting. Swainson's Hawk nest in a variety of trees, including Joshua Tree, depending on the available habitat where they are breeding. They breed in isolated western cottonwood, and mesquite trees in areas adjacent to irrigated agricultural fields.

### **4494-9410**

The commenter is asking how often burrowing owls return to relocated burrows. Since not all burrowing owls migrate annually, individual birds or dispersing chicks can utilize area burrows repeatedly during the course of a year. Burrowing owl passive relocations and associated burrows are frequently used if they are no more than 50-100 meters from the original burrows and consist of the required nest properties (CDFW 2012).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9411

The commenter asks what factors are used to determine the feasibility of relocating a bat roost, to provide an example of an exclusionary technique, whether construction activities continue to occur during the week after implementing exclusionary activities, and what kind of exclusionary plans exist for bats.

Bats may relocate on their own after passive eviction (using exclusion/deterrence methods) or be actively relocated as a last and less preferred option. Addressing bats and potential impacts to them involves a series of steps, and these steps need to be explained and implemented first before determining the feasibility of removal/relocation options.

Well in advance of construction, with at least one maternity season remaining prior to construction, the Project Biologist will assess existing bridges, structures (typically abandoned), and trees with large cavities or dense foliage identified as suitable bat habitat and where accessible, at a minimum, within the project's disturbance limits and 500-foot buffer. If bats or bat signs are observed, the next step would be to conduct an evening visual and acoustic emergence survey per Mitigation Measure BIO-MM#25 (Conduct Surveys for Bat Species), amended for clarity in the Final EIR/EIS (refer to Section 3.7.7).

The purpose of these emergence surveys is to confirm presence/absence at each location; determine the species of bats, including whether the bats are non special-status species or special-status species and estimate population size. The biologists will analyze the bat call data using appropriate software and will prepare a report that will be submitted to the Authority, including an assessment of the significance of the roost for local bat populations.

Because bats are highly cryptic, the visual and acoustic emergence surveys will be conducted only during the appropriate time of year when bats are actively emerging from and returning to their roosts, generally March 1 –October 15, but may be extended outside of this timeframe depending on temperature and other weather-related factors. Emergence surveys will not be conducted when bats are in torpor (i.e., in hibernacula; semi-hibernating during months with colder temperatures) when detection is unlikely.

### 4494-9411

If it is determined that bats are within the project disturbance limits or 500-foot buffer of the boundary of upcoming construction activities, avoidance will be the first option considered. If avoidance is not possible, bats will be passively evicted using exclusion and deterrence methods, only when outside of hibernation and maternity roosting periods as described in BIO-MM#27 (Implement Bat Exclusion and Deterrence Methods), amended for clarity in the Final EIR/EIS (refer to Section 3.7.7). Should hibernacula or maternity roosts be detected during pre-construction surveys (generally 30 days prior to ground disturbance) within project disturbance limits or 500-foot buffer of the boundary of construction work areas, and avoidance and/or eviction (exclusion/deterrence methods) are not possible, the Authority shall coordinate with California Department of Fish and Wildlife (CDFW) regarding available options, including preparation and implementation of a removal/relocation plan, as described in BIO-MM#26 (Bat Pre-construction, Avoidance, and Removal/Relocation), with removal/relocation as a last and least preferred option, particularly if the bats in a hibernaculum or maternity roost are special-status. BIO-MM#26 has been amended for clarity in the Final EIR/EIS (refer to Section 3.7.7).

To address the commenter's question regarding exclusion/deterrence methods, examples include opening the roosting area to change the lighting and airflow conditions or installing one-way doors (refer to BIO-MM#27). To the extent feasible, the Authority would leave the roost undisturbed by project activities for a minimum of one week after implementing passive exclusion/deterrence methods to ensure that all bats have left the roost. Because it's anticipated that any exclusion features, installed well in advance of construction to evict bats and deter them from returning to work areas and the 500-foot buffer, exclusion features would remain in place from the time they are installed through construction to ensure that bats are not present and thus not harmed by construction activities.

To address the commenter's question regarding determining the feasibility of relocation, factors considered include but are not limited to: population size; time of year when bats are active versus in hibernacula or maternity roosts; project schedule; effectiveness of using passive eviction techniques only (e.g., exclusion/deterrence techniques); available suitable habitat for relocated bats; level of anticipated success of active relocation (i.e., to ensure minimal mortality); and results of coordination with CDFW. Southern California

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9411

Edison, San Diego Gas & Electric, and Caltrans frequently develop removal/relocation plans to address bat roosts and implement these plans prior to and during construction.

### 4494-9412

The commenter is asking how to determine if an American badger den is active and what are examples of passive badger den exclusion measures. A determination of a successful badger pregnancy is not required to designate an active den as a maternity den. All active badger dens are considered maternity dens from early February until early July. Badgers mate in summer and early fall. Gestation period varies from 183-265 days, including delayed implantation. Offspring are born mostly in March and April. Passive den exclusion often includes placing one-way doors on dens outside the maternity season. The one-way door allows any badgers using the den to leave but not return. Once the den is empty, verified through multiple observations, the den is excavated to ensure no badgers are inside and then the den is collapsed.

### 4494-9413

The commenter asks how the Project Biologist will align restoration reseeding with the growing season. As described in BIO-MM#32, revegetation of temporarily impacted restoration areas will begin within 90 days of completing construction in a work area. To the extent feasible, these revegetation activities, including planting and seeding, will be aligned with the local precipitation seasons in Los Angeles County to take advantage of natural rainfall and minimize the need for irrigation. In cases where the conclusion of construction activities does not align well with the local precipitation seasons, installation of plants and/or seeding may be postponed accordingly with approval by the relevant resources agencies and/or as specified in the Restoration and Revegetation Plan, which is described in BIO-MM#6. The RRP will be prepared to address restoration of temporary impact areas, will be submitted to the appropriate regulatory agencies for review and approval, and will describe timelines for restoration activities such as native plant and seed installation.

### 4494-9414

The commenter asks for an example of maintenance monitoring, as described in BIO-MM#33, for a specific aquatic plant. While a collection of individual plants make up a restored habitat, maintenance monitoring for aquatic resources will typically focus on the status of the larger plant assemblage and not individual plants. Maintenance monitoring will be conducted at temporary impact areas that are being restored to evaluate progress towards the approved success criteria, which will be detailed in the Restoration and Revegetation Plan (RRP), described in BIO-MM#6 and will be submitted to the appropriate regulatory agencies for review and approval. The RRP will also describe the parameters for monitoring, including methods, requirements, and frequency, and may involve a combination of qualitative and/or quantitative data gathering. Examples of data gathering include, but are not limited to, point intercept line transects, 1-meter square vegetation plots, qualitative observations and the use of permanent photo monitoring stations to compare past and current conditions. The monitoring will assess conditions such as plant growth and mortality, presence, extent and type of non-native and invasive species, and overall condition of the site, including presence of trash and debris. The data will be used to inform ongoing maintenance and restoration activities and assess progress towards the approved success criteria. Impacts to individual plants that are special-status plant species will be addressed in accordance with BIO-MM#2, which requires preparation of a plant species salvage plan, as appropriate. The plant species salvage plan would include specific requirements for monitoring of the restoration of special status plant species, as well as maintenance, implementation, and reporting requirements.

### 4494-9415

The commenter asks if protective barriers described in BIO-MM#34 will be permanent. No, the Authority anticipates removal of all protective barriers described in BIO-MM#34 once construction is complete and opportunities for soil erosion have been reduced through revegetation and restoration.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9416

The commenter noted that examples of BIO-MM#35 would be useful. The Authority through coordination with local jurisdictions will determine which protected trees will remain within the work area with staked ESA buffers and which trees will need to be transplanted outside the work area. Individual species that do not typically survive transplanting will require either a replacement off-site with the same species or a contribution to a tree planting fund approved by the Authority through coordination with the local jurisdictions.

### 4494-9417

The commenter is asking about the permanence and aesthetics of the right-of-way security fencing. The Authority has not completed fencing design for the project, but the design will meet the requirements of applicable local, state, and federal laws and regulations. The primary purpose of the fence is the security of the facility and the safety of the public.

### 4494-9418

The commenter asks for examples of compensatory mitigation discussed in BIO-MM#38, BIO-MM#39, BIO-MM#44, BIO-MM#46. Examples of compensatory mitigation identified by the Authority for the resources addressed in these mitigation measures include, but are not limited to: payment to an in-lieu fee program, purchase of credits from an approved conservation or mitigation bank, and protection of habitat through acquisition of private properties that possesses or can support sensitive species habitat or nest resources and funding long-term management of the site, as described in BIO-MM#53. BIO-MM#53 requires that a Compensatory Mitigation Plan be prepared to describe compensatory mitigation options to offset permanent and temporary impacts on federal and state-listed species and their habitat, fish and wildlife resources regulated under Section 1600 et seq. of the Fish and Game Code, and certain other special-status species. This Plan will be used to facilitate discussions with the relevant regulatory resource agency to gain concurrence on the appropriate compensatory mitigation for specific species and habitats.

### 4494-9419

The commenter asks the Authority to identify two agency approved mitigation banks that could be used for compensatory mitigation. The commenter also asks for the location of property that could be acquired and if the property would meet the criteria for aquatic resources set forward in BIO-MM#47. The Authority will identify in consultation with the USACE and other applicable agencies potential mitigation banks that could be used as compensatory mitigation for impacts to aquatic resources. The Peterson Ranch Mitigation Bank in Los Angeles County is an example of a mitigation bank that is primarily used for stream and wetland resource mitigation. The Authority is also evaluating other avenues of compensatory mitigation including through property acquisition; this process would take place and be finalized as part of procuring Section 404 authorization from the USACE and approval from other aquatic resource agencies such as the California Department of Fish and Game or State Water Resources Control Board. Any property acquired for purposes of aquatic resource compensatory mitigation would be evaluated first to ensure that it provided the appropriate conditions for compensatory mitigation for impacts to aquatic resources and that it would meet state and federal policies on no net loss of functions and values of wetlands.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9420

The commenter asks who will be responsible for ensuring the implementation of the IAMFs. The Authority will be responsible for implementing and overseeing the IAMFs for the project and the Authority, its contractor, or agency will implement the biological IAMFs under the supervision of the biologists and biological monitors, as appropriate, as described in BIO-IAMF#1. Project Biologists, Designated Biologists, Species-Specific Biological Monitors, and General Biological Monitors will be retained to implement avoidance and minimization measures and resumes for these staff will be approved in writing, as applicable, by the U.S. Fish and Wildlife Service, National Marine Fisheries Service and California Department of Fish and Wildlife. The Project Biologist for the project is responsible for ensuring the timely implementation of the biological avoidance and minimization measures and for guiding and directing the work of the Designated Biologists and Biological Monitors. Designated Biologists will be responsible for directly overseeing and reporting the implementation of general and species-specific conservation measures. In some instances, Designated Biologists will only be approved for specific species, in which case they will only be authorized to conduct surveys and implement measures for the species for which they have been approved. Species-Specific Biological Monitors will be responsible for implementation of species-specific measures for the species for which they have been approved and will report directly to a Designated Biologist. General Biological Monitors will report directly to a Designated Biologist or to the Project Biologist. General Biological Monitors will be responsible for conducting Worker Environmental Awareness Program (WEAP) training, implementing general conservation measures, conducting general compliance monitoring, and reporting on compliance monitoring activities.

### 4494-9421

The commenter requests further detail regarding BIO-MM#53 and asks if it applies to all federal and state-listed species and their habitat, what role the Project Biologist has in the process of CMP preparation, who decides the type of credits to be given, and if easements will be permanent.

BIO-MM#53 (Prepare and Implement a CMP for Species and Species Habitat) requires the preparation of a CMP to offset permanent and temporary significant impacts on federal and state-listed species and their habitat, fish and wildlife resources regulated under the Fish and Game Code, and certain other special-status species and special-status plant communities (Draft EIR/EIS page 3.7-222). Thus, BIO-MM#53 applies to all federal and state-listed species and their habitat.

The role of the Project Biologist will be to oversee qualified biologists familiar with the species' biology, population dynamics, and the particular species' likely response to project impacts. The Project Biologist will prepare the CMP.

The type of credits and other mitigation will be developed in consultation with the appropriate resource agencies (CDFW, USFWS, USFS, etc.) and will be purchased "from an agency-approved mitigation bank" (Draft EIR/EIS page 3.7-222). Any easements obtained for mitigation purposes would be permanent. All legally recognized conservation easements in the state of California must be perpetual in duration (see California Code of Regulations section 815.2(b)). Preparation of the CMP will take place during the detailed design phase of the project and prior to the start of construction. The process described in BIO-MM#53 is expected to take approximately 24 months.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9422

The commenter is asking for description of cultural weed controls and if chemicals would be used to control vegetation.

Cultural weed control includes making existing ground cover more competitive against weeds. While typically used in agricultural practices, the technique may include applying mulch as a protective ground cover to prevent weed growth, solarization, and using weed-free erosional control features. The Authority has not determined which approach to weed control and management will be implemented and anticipates using a variety of approved methods, including chemical, to meet the requirements of BIO-MM#54. BIO-MM#54 requires the Authority to develop and implement a plan prior to operation and maintenance, and it is therefore too early in the process to identify specific chemicals that may be used. As explained in BIO-MM#54, the Authority will generally follow the procedures established in Chapter C2 of the Caltrans Maintenance Manual to manage vegetation on Authority property (California Department of Transportation [Caltrans] 2010), including the use of Caltrans-approved herbicides. Pesticide application will be conducted in accordance with all requirements of the California Department of Pesticide Regulation and County Agricultural Commissioners by certified pesticide applicators. The Authority will cooperate in area-wide efforts to control noxious/invasive weeds if such programs have been established by local agencies.

### 4494-9423

The commenter requests further detail regarding BIO-MM#55, asking specifically who would be in charge of carrying out the weed control plan and what paperwork is involved. Per BIO-MM#55 on page 3.7-224, the Project Biologist will develop a Weed Control Plan (WCP). The WCP will be subject to review and approval by the Authority. Compliance Reporting (BIO-MM#61) will include a summary of progress made regarding the implementation of the WCP.

### 4494-9424

The commenter asks if new roads will be created for the project, if these roads are likely to be constructed within habitat occupied by endangered plants, and if these plants would require relocation or compensatory mitigation. The Authority will utilize existing roads to the greatest extent possible but some new construction of access roads may be required. New roads will be sited to avoid sensitive resources but may be placed within endangered plant habitat. Refer to Impact BIO#1 in Section 3.7, Biological and Aquatic Resources, for further discussion regarding construction impacts to special-status plants and plant communities resulting from all six Build Alternatives. Mitigation measure BIO-MM#1 on page 3.7-23 will require presence/absence botanical field surveys for special-status plant species prior to any ground disturbing activities, including new roads. The Authority anticipates the preconstruction surveys will identify exact locations and acres of or numbers of endangered plants allowing for refinement of access road location during final engineering design. Mitigation measure BIO-MM#2 on page 3.7-223 will require preparation and implementation of a Plant Species Salvage Plan for special-status plant species. The Plan will include provisions that address the techniques, locations, and procedures required for the collection, storage, and relocation of seed or plant material, and collection, stockpiling, and redistribution of topsoil and associated seed. This mitigation measure is anticipated to be effective because it salvages unavoidable special-status species within the project footprint; relocates salvaged species to suitable habitat acquired within the region, and monitors relocated species per the Special Plant Species Management Plan to provide for suitable survival of special-status plant species, reducing and offsetting impacts from potential disturbance during construction.

### 4494-9425

The commenter is asking for the type of feedback that the Project Biologist will be provided after submittal and review of daily and annual monitoring and compliance reports. Coordination between the Authority, the regulatory agencies, and the Project Biologist will be ongoing throughout the project construction life-cycle. The Authority intends to provide regular feedback to the Project Biologist regarding development and implementation of the IAMFs, MMs, and all commitments and conditions set forth by regulatory agency authorizations. This may include feedback to the Project Biologist on refined implementation of these measures and conditions based on changing resource conditions or revised construction methodologies as the project is constructed.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9426**

The commenter is asking how long the Authority expects it to take for the Dewatering Plan identified in BIO-MM#62 to be completed. An exact timeframe to develop the plan cannot be estimated because of the large number of variables that determine the complexity and function of the plan. The Authority will prepare the plan based on final engineering design, the presence of open or flowing water which may be affected by seasonal precipitation, coordination with and approvals by regulatory agencies, and the results of a preconstruction survey to determine presence/absence of special status species. If required, the plan would be completed and approved prior to initiating construction activity in open or flowing water.

### **4494-9427**

The commenter requests further detail regarding BIO-MM#64, specifically asking for an example of a feature that would accommodate wildlife movement when designing bridges and culverts. BIO-MM#64 on page 3.7-228 provides several features and design considerations for wildlife crossings. Examples of features that accommodate wildlife movement include designing culverts with openness and clear line of sight from end to end, having native earthen bottoms, or ledges or tunnels incorporated into the design to facilitate safe passage of small mammals.

### **4494-9428**

The commenter requests further detail regarding BIO-MM#65, specifically asking how the "pre-construction sweep" for golden eagle is carried out. BIO-MM#65 on page 3.7-228 of the Draft EIR/EIS identifies that the protocols for carrying out the pre-construction Golden Eagle surveys (or pre-construction sweep as referred to by the commenter) are based on the USFWS Interim Golden Eagle Inventory and Monitoring Protocols (2010) and CDFW's Bald Eagle Breeding Survey Instructions (CDFW 2010), or current guidance. Per BIO-MM#65, at least one year prior to the start of any ground disturbing activities and construction, the Project Biologists will conduct nesting season surveys for eagles within four miles of any construction areas that support suitable nesting habitat. All breeding and foraging eagles will be documented with GPS and nest locations identified. Only after completing at least two full surveys in a single breeding season and finding a nesting territory or inventoried habitat vacant will it be "considered unoccupied by golden eagles." These preconstruction surveys include all accessible areas within the survey buffer including important eagle roost sites and foraging areas.

### **4494-9429**

The commenter requests a description of the types of project activities likely to disturb active eagle nests and asks if a no-work buffer would halt all work. Activities that are likely to disturb active eagle nests include, but are not limited to: loud construction noise such as sharp banging and clanking noise, grinding and sawing noise, and equipment back-up beepers. To prevent potential impacts to active eagle nests, no construction activities will be allowed within the no-work buffer. The no-work buffer of 1 mile and 0.5 mile, for line of sight and no line of sight buffers, respectively, during the breeding season are adequate to prevent construction-related eagle nest failure. As permitted by BIO-MM#66, the no-work buffer around active nests may be reduced if the Project biologist determines that smaller buffers would suffice.

In response to this comment, BIO-MM#66 has been revised in the Final EIR/EIS to clarify that no construction activities will be permitted within the no-work buffer. Please refer to Section 3.7.7, Mitigation Measures, of the Final EIR/EIS, for the full text of the BIO-MM#66.

### **4494-9430**

The commenter asks if active eagle nests can be relocated. Active bald eagle and golden eagle nests can be relocated through the use of a federal eagle nest take permit issued by the USFWS under the authority of the Bald and Golden Eagle Protection Act. However, pursuant to California Fish & Game Code 3511 golden eagle are fully protected and active nests cannot be relocated. Please see response to comment 10391 for further discussion regarding nest relocation.

### **4494-9431**

The commenter asks if the Project Biologist will be able to identify loss of Tricolor Blackbird habitat (BIO-MM#70). The Project Biologist will be experienced with Tricolored Blackbird habitat and project activities that may result in loss of habitat. Suitable habitat includes wetlands with cattails, bulrushes, and willows. Suitable habitats also include wetlands converted to agricultural fields, livestock impoundments, and irrigated pastures. These habitats are used for nesting and foraging. Foraging habitats also include cultivated fields and feedlots associated with dairy farms.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9432**

The commenter asks if the Project Biologist will be on site both day and night pertaining to BIO-MM#72. BIO-MM#72 on page 3.7-230 requires the Project Biologist will be on site during nighttime light use to determine whether the lighting poses a risk or otherwise disturbs or harms condors.

### **4494-9433**

The commenter requests further detail regarding BIO-MM#74. BIO-MM#74 on page 3.7-230 states the vertical buffers will be measured from the location of the nest. If a nest is located on a tower or a tree, the vertical buffer begins from the nest location. Wildlife jump-outs are described in MM#78 and would be determined and designed during the detailed design phase of the project. Jump outs could take the form of escape ramps for wildlife.

### **4494-9434**

The commenter requests further detail regarding BIO-MM#79, #80, #81, and #82 and how surveys for coastal California gnatcatcher, least Bell's vireo, southwestern willow flycatcher, western flycatcher, and western yellow-billed cuckoo would be conducted. BIO-MM#79, #80, #81, and #82 on pages 3.7-231 and 3.7-232 states the surveys will be conducted according to the published survey guidelines or protocols established for the particular species.

### **4494-9435**

The commenter asks how much fencing is planned for at-grade sections and how tall it will be. At-grade segments would be fenced along the track for safety and to preclude wildlife from train strikes. Fencing will consist of 6–12-foot-high chain-link fencing. As described in BIO-MM#77, the Project Biologist shall review the fencing plans prior to construction to ensure they are appropriate in height. The amount of fencing would vary by Build Alternative as each alternative has different lengths of at-grade track segments. For example, the SR14A alternative has 6.5 miles of at-grade track that would be fenced.

### **4494-9436**

The commenter asks whether the crossing structures and fences would be inspected in perpetuity and if biologists who specialize in different species would be involved in the monitoring. Fencing and wildlife crossings installed as part of the project would be inspected and repaired on a regular basis during construction and throughout operation of the project. The Authority will utilize wildlife biologists with appropriate expertise based on the habitat and species biology to conduct the inspections and repairs. If more than minor fence repairs that can be implemented by the wildlife biologist, the Authority will utilize a fencing specialist overseen by the wildlife biologist to implement and complete the repairs.

### **4494-9437**

The commenter asks if the k-rail construction barrier described in BIO-MM#85 would be eventually removed. The K-rail construction barrier to separate the bridge construction work zone from the environmentally sensitive area of the wetted channel of the Santa Clara River, described in MM#85, is for the construction period and would be removed once construction is complete.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9438**

The commenter asks if hazardous materials will be used at night. Construction is not anticipated to occur at night given the sensitive resources within the project RSA. Therefore, use of hazardous materials at night is not anticipated during construction. If emergency night construction activities are required, the Spill Prevention and Containment Measures listed in BIO-MM#87 would be implemented and required during all construction activities, including those that occur at night.

Operation of the six Build Alternatives would require the use of hazardous materials and would generate hazardous wastes associated with routine maintenance. The hazardous materials would include wastes such as herbicides, lubricants, and janitorial supplies, which would be used at the station areas, ancillary facilities, and along the trackway. It is unlikely that these activities would occur at night. Regardless, with adherence to applicable federal and state regulations, combined with HMW IAMF#9, HMW-IAMF#10, and HYD-IAMF#1, operation of each of the six Build Alternatives would not create a significant hazard to the public or the environment resulting from the routine transport, use, or disposal of hazardous materials, or reasonably foreseeable upset and conditions that involve the release of hazardous materials.

### **4494-9439**

The commenter asks what materials the underslung tarp or other barrier would consist of, as required by BIO-MM#88. Prior to initiation of construction or maintenance activities, an underslung tarp, debris platform or equivalent barrier extending at least 10 feet beyond the width of the wetted channel will be deployed beneath the bridge deck to prevent the inadvertent discharge of equipment, chemicals, or debris into the Santa Clara River. The specific material has not been identified at this time. The purpose of the measure is to keep construction debris from entering the river.

### **4494-9440**

The commenter asks what the purpose of dewatering is, how much water is expected to be dewatered, and how will it be used, pertaining to BIO-MM#90. Dewatering may be necessary to remove water from the work area where the footings and supports for the bridge structure across the river would be constructed. Dewatering would involve removing water that is encountered during excavation activities. The amount of water encountered is not known at this time. Water encountered would be treated and then discharged back into the river or into upland areas to percolate back into the soil. Dewatering will be implemented in a manner that: (1) does not create temporary wetted channel habitat suitable for unarmored three-spine stickleback; (2) does not diminish existing river flow, and therefore does not result in stranding of unarmored three-spine stickleback or other fish; and (3) does not introduce pollutants to surface waters.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9441

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter asks if, under BIO-MM#93, the AMMPs will vary by site, how supplemental water would be provided and where it would come from, how much water is expected to be needed over 3 seasons, how the water would be transported, and how often the groundwater levels would be monitored for the first 5 years after construction.

As described in BIO MM#93, the Authority will implement an adaptive management and monitoring plan to monitor groundwater-dependent biological resources within the tunnel construction RSA to detect and remediate adverse effects on habitat function in a timely manner. The plan actions will vary by site and type of resource. The AMMP will include contingency plans to provide supplemental water as necessary to support riparian/aquatic vegetation, wildlife breeding cycles, aquatic wildlife, or protected tree health within the area of predicted effects determined through modeling or monitoring to be potentially affected by groundwater lowering. Seasonal variation as documented during the preconstruction baseline monitoring will be considered in establishing the amount of supplemental water. For all features, supplemental water will provide minimum flows and periods of inundation to match baseline conditions. The periods of supplemental water, in general, will likely be in periods of baseflow, which occurs in late spring, summer, and early fall outside of rain periods. For breeding habitats, the Authority will, at a minimum, supplement breeding habitat where necessary to maintain adequate depths for completion of the reproduction cycle. Section 2 of Appendix 3.8-D provides estimated water demand for AMMP purposes using several Risk Areas as examples (Please see Table 3 in Appendix 3.8-D for this example). Section 3 of Appendix 3.8-D provides information on the sources of water to be used which is anticipated to primarily be the same water source as used for construction. Also see standard response PB-Response-PUE-3: Water Demand and Usage which provides additional information as to the sources and supply of water during construction. Section 4 of Appendix 3.8-D provides information on the conveyance and transport of this supplemental water noting that delivery of water could occur through different methods, depending on quantity, location of water source, and location of the affected area. As a result, the method of conveyance or transport would be specific to each affected area. However, the Authority did evaluate the feasibility of utilizing trucks to convey water as well as piping water from the construction site to an affected location. The frequency of

### 4494-9441

groundwater monitoring post construction has not been determined at this time. Current groundwater monitoring occurs on a quarterly basis.

### 4494-9442

The commenter asks why a project intended to help the environment is purchasing mitigation credits to compensate for impacts on endangered species' habitats. The purchase of mitigation credits to compensate for a project's impact on habitat is a standard practice allowable under CEQA and NEPA and recommended by various agencies. The USFWS recommends purchasing mitigation credits for mitigating impacts to protected species and habitat, and the Army Corps of Engineers recommends them for mitigating impacts to wetlands.

### 4494-9443

The commenter requests further detail regarding BIO-MM#96 and asks specifically if construction work would continue if a mountain lion den is determined to be occupied. In addition, the commenter asks how CHSRA will keep track of mountain lion dens given that mountain lions are apt to claim large areas. BIO-MM#96 on page 3.7-238 specifies what to do if a mountain lion den is determined to be occupied and what evidence will be used to determine their occupancy. A non-disturbance buffer of at least 1,970 feet will be established around the known or potential den to protect it from project construction disturbances. Known and potential dens will be tracked using Geographic Information Systems (GIS) database.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9444**

The commenter appears to be asking about how much light will spill above the light, after a shield is installed. BIO-MM#100 identifies the following requirement about shields: "Nighttime lighting will have shields or cowls (or other device to limit lighting) installed to direct the light downward to reduce the standard luminous intensity distribution curve to contain the light to the boundaries of the project site to the extent practicable." Shields or cowls used to direct operational light downward would be small in size, covering just the light source. The size of the shield or cowl would depend on the size of the luminaires (i.e., fixed lighting device). Wherever possible, fully shielded luminaires, with additional side shielding will be used. Fully shielded luminaires emit no uplight (i.e., no light is emitted above 90° from the direction pointing below a particular location) (BLM 2023; CEC 2019; IES 2020).

These shields or cowls would not create significant shading during daylight hours and would not prevent light from above from permeating the area. Every effort would be made to minimize the light spill, and any minimal light spill would be limited to within the boundaries of the project site. Light spill above lights would be very minimal, and lighting would be limited to the boundaries of the project site to the extent practicable.

### **4494-9445**

The commenter asks for an example of a special-status bird that could withstand noise as a result of sound barriers (BIO-MM#101). As an example, through experience and professional expertise, project biologists have found that coastal California gnatcatchers are able to withstand elevated noise levels with the installation of noise barriers. Many special status bird species in Los Angeles County are more acclimated to higher levels of noise than individuals living in less developed areas, as evidenced by their tolerance of these noise levels during successful breeding and nesting.

### **4494-9446**

The commenter asks how long mitigation measures need to be in operation for them to be successful. The commenter also asks if measures would be temporary enough for wildlife to return to the restored habitat once construction is complete. The Authority has developed a range of measures to avoid, reduce, or compensate for project impacts. Some of these would be implemented as preconstruction measures (e.g., preconstruction surveys such as BIO-MM#1, BIO-MM#3, BIO-MM#7, BIO-MM#14) early in the construction phase and would be completed prior to any ground disturbing activity. Other measures are designed to be implemented during construction (e.g., BIO-MM#8, BIO-MM#16, BIO-MM#26, BIO-MM#27) and generally are completed during or shortly after construction is completed. Other measures are implemented during post-construction (e.g., BIO-MM#32, BIO-MM#33, BIO-MM#50) and during the operational phase (BIO-MM#54, BIO-MM#55, BIO-MM#73) of the project's lifecycle and may stay in place for the duration of the project's operational phase. All measures—preconstruction, construction, post-construction, or operation—would remain in effect as long as needed to achieve the stated goals and objectives of resource protection or compensatory mitigation. For example, BIO-MM#93 has post-construction requirements to monitor its goals of completing riparian/wetland restoration within 1 year of construction and will provide compensatory mitigation if this is not achieved. The Authority expects wildlife to use the temporarily impacted habitat once it is successfully revegetated or restored. Some mitigation measures have the potential to result in secondary environmental effects. An analysis of impacts from implementing mitigation measures for biological and aquatic resources is provided on page 3.7-240 of the Draft EIR/EIS. Mitigation measures associated with pre-construction surveys, construction site management, and construction and operation within wildlife movement corridors, are not anticipated to result in secondary environmental effects. Several mitigation measures associated with resource protection and restoration (BIO-MM#4, BIO-MM#5, BIO-MM#6, BIO-MM#32, BIO-MM#33, and BIO-MM#34) would result in secondary environmental effects, namely due to maintenance and removal activities. Maintenance activities would be ongoing during operation. BIO-MM#2, BIO-MM#8, BIO-MM#21, BIO-MM#26, and BIO-MM#67 will entail relocation for special-status plant species, special-status reptile and amphibian species, burrowing owls, bats, and eagle nests. However, relocation of special-status species would affect resident individuals in the relocation area through increased predation and competition of resources with relocated individuals. Therefore, wildlife relocation activities associated with the mitigation measures listed above could result in

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9446**

secondary environmental effects. However, such secondary impacts are common to most infrastructure construction projects, are temporary in nature, and are typically minimal and not significant. These impacts would be effectively reduced with adherence to applicable regulations, compliance with regulatory permits, incorporation of BMPs, and application of standard mitigation measures. Actions associated with compensatory mitigation will directly or indirectly require conservation management to ensure the long-term viability of target species.

### **4494-9447**

The commenter asserts stating that secondary impacts common in construction projects should not apply to this particular project given it is a first of its kind. The commenter also asks how impacts from the project differ from other projects, especially in the San Gabriel Mountains. The Authority has identified potential impacts to resources during the implementation of biological mitigation measures (Section 3.7.7.1) and identifies secondary environmental effects described in Section 3.7.7.1. For relocation of wildlife species (page 3.7-241), the Draft EIR/EIS notes that "such secondary impacts are common to most infrastructure construction projects and are typically minimal and not significant." While the HSR Palmdale to Burbank Project Section is a first of its kind project in that it is the first high speed train constructed in the United States of America, it is nonetheless similar to other projects in many ways, especially to other rail construction projects. It is a linear construction project. It requires a project footprint consisting of access roads, construction material laydown and staging yards, security fencing, stream crossings, and many other features and activities no different than many other construction projects. The aspect of the project that is unique is the scale of tunnel construction to be undertaken. Tunnel construction will have a minimal direct effect on the surface of the land under which it passes and those surface effects would be on a scale and type consistent with typical large construction projects (e.g., transmission, transportation, rail construction, and renewable energy projects). The HSR Palmdale to Burbank Project Section will be entirely underground through the San Gabriel Mountains and the Authority has undertaken extensive analysis of the impacts to groundwater and surface water features as a result of tunneling activities. The suite of mitigation measures identified in the EIR/EIS include strategies to ensure that, as design advances, any impacts anticipated to result from the Build Alternatives would be minimized or avoided, consistent with the findings of the EIR/EIS.

### **4494-9448**

The commenter asks how permanent security fencing can be made agreeable to the eye, if management activities would be on-going, and if they are budgeted. Fencing installed as part of the project will meet city and county codes for aesthetics. See Table 3.16-1 in Section 3.16, Aesthetics and Visual Quality, which lists the applicable regional and local plans, policies, and regulations relevant to the aesthetics and visual quality of the project. Fencing would be monitored and inspected on a regular basis. The project budget includes costs for fencing as well as ongoing inspection.

### **4494-9449**

The commenter asks how the Authority knows that the implementation of mitigation measures would leave no adverse effect when the measures have yet to be implemented. The measures are based on the best professional technical judgment developed by experienced biologists and best available science for these particular species. While detailed studies have not been published regarding the efficacy of these measures, the measures are often used by CDFW and USFWS to avoid, minimize or mitigate species impacts. This comment does not address the sufficiency of specific mitigation measures in the draft EIR/EIS nor does it suggest edits to the measures. As a result, no change has been made to the document in response to this comment.

### **4494-9450**

The commenter questions the conclusion that there would be no adverse effects due to the implementation of mitigations when no work has begun. The determination of no adverse effects is based on Section 3.7.4.5, Methods for Evaluating Impacts Under NEPA, and Section 3.7.4.6, Determining Significance under CEQA. Refer to Response to Comment #9449 from this same letter for more information regarding efficacy of mitigation measures.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9451

The commenter asks how mitigation measures have been successful in reference to Table 3.7-34 on pages 3.7-271 through 273. Table 3.7-31 through Table 3.7-34 present the NEPA conclusions for adverse effects after implementation of each relevant mitigation measure. The conclusions presented in these tables are a standard and required component of a NEPA analysis for findings of expected success of mitigation for a project under 40 CFR Part 1502. The Authority has pledged to integrate programmatic impact avoidance and minimization features (IAMF) consistent with the 2005 Statewide Program EIR/EIS, the 2008 Bay Area to Central Valley Program EIR/EIS, and the 2012 Partially Revised Final Program EIR into the HSR project. The Authority will implement these features during project design and construction, as relevant to the Palmdale to Burbank Project Section (Project section, or project) to avoid or minimize impacts. Built into these measures are adaptive management strategies meant to navigate the complexities of the project. These same IAMFs have already been implemented for other sections of the California HSR System sections, including the Merced to Fresno Project Section that is currently being constructed. The mitigation measures are only as successful as the thoroughness of the planning and development, application of past project lessons learned, and close coordination with the resource agencies that have complex histories managing these resources within the parameters of the regulatory requirements. The Authority engages experienced resource experts with agency specialists to develop detailed approaches to implementation and effective use of adaptive management, allowing for greater levels of overall success.

### 4494-9452

The commenter is asking what difficulties might be encountered during the determination of no adverse effects to biological resources, and if reducing impacts to the Significant Ecological Areas equates to no impacts to these resources. The difficulties the Authority has in evaluating and making a no adverse effect determination include ensuring all the biological variables have been included, understanding the responses by biological resources to construction and operation, and what effective mitigation measures can be used to avoid, reduce, or mitigate those effects to an extent that the impacts are reduced to a less than significant level. Reducing impacts to Significant Ecological Areas would not necessarily equate to a no effect determination. In some cases eliminating the impact to a no effect level is not achievable and therefore the goal is to reduce or minimize the impact to the lowest level possible.

### 4494-9453

The commenter asks the question what existing constraints make wildlife movement impossible. Existing constraints to wildlife connectivity are described on page 3.7-188 through 3.7-197 and in the Palmdale to Burbank Project Section: Wildlife Corridor Assessment Report (Authority 2019C). These existing constraints to wildlife connectivity and natural wildlife movement in the project vicinity occur from a combination of habitat loss, fragmentation, and degradation of existing habitat resulting from urban and agricultural development and linear transportation barriers (Clevenger and Huijser 2009; Beier and Loe 1992). The primary constraint to wildlife movement along the project alignment is the urban development associated with the city of Palmdale to the north and the San Fernando Valley to the south. Urban development in the San Fernando Valley is especially dense with residential, commercial, and industrial development crossed by a number of high traffic freeways. Linear transportation features primarily consist of SR14, which is a 65-mile-per hour six-to-eight-lane freeway, divided by a concrete k-rail. Portions of the SR14 freeway are secured by four-foot barbwire fencing with woven wire along the southern freeway sections. Although the fencing likely only provides a limited barrier to wildlife, the width, medians, speed, and amounts of traffic associated with these facilities could act as a barrier to some wildlife moving through the area. The terrain and habitat disruption, coupled with the lack of concealing vegetative cover, could also deter wildlife movement across these corridors. Portions of the SR14 freeway include large concrete sound walls or retaining walls that would create a physical barrier for wildlife movement. The Sierra Highway, including a number of frontage roads and conventional railroad tracks, parallels the SR14 freeway. The Southern Pacific Railroad tracks extend south from Palmdale along Sierra Highway and then along Soledad Canyon Road beginning in Acton. The Southern Pacific Railroad tracks are not fenced and are also used by Metrolink. This combination of transportation corridors through the San Gabriel Mountains and foothills interrupts the natural mix of ridges and canyon terrain with a series of alternating cut-and-fill slopes. The California Aqueduct generally runs west to east at the southern end of Palmdale. The California Aqueduct is over 125 feet wide and is bordered on each side by a paved road and a dirt road secured with a chain-link fence topped with barbwire, which is generally considered a complete barrier to wildlife, except where the canal goes underground or is crossed by bridges. There are also a number of drainage culverts that cross under the aqueduct that may be used by some species to cross under the aqueduct. The Antelope Valley-East Kern Water Agency's Acton Water Treatment Plant along Sierra Highway and the

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9453

Waste Management Antelope Valley Landfill are both fenced facilities. Existing developments are concentrated in Palmdale, Acton, and the San Fernando Valley, but also include the transportation network that connects these urban centers. Other peripheral developments often associated with the urban centers include landfills, airports, mines, energy development (oil and gas and wind), and suburban and rural residential development. Roads, highways, canals, and railroads that connect these developments restrict free movement by acting as semi-permeable barriers. Road traffic creates a risk of wildlife and vehicle collisions and can deter wildlife movement activity. In addition, roads and highways frequently include fencing that restricts wildlife movement. Near the Town of Acton, the surrounding area is a mix of rural and suburban development surrounded with scattered single-family ranchettes and industrial development. The Southern California Edison substation near Acton is a fenced barrier to wildlife. There are several mines in Soledad Canyon, which would also limit wildlife movement due to the lack of vegetative cover and the amount of mining activity. At the southern end of the proposed HSR Alignment Build Alternatives, the primary barrier to wildlife is the urbanized development associated with the San Fernando Valley, including a mix of suburban and urban residential, commercial, and industrial development with associated roads and freeways. The combination of these features, as described above and further identified on page 3.7-188 through 3.7-197 and in the Palmdale to Burbank Project Section: Wildlife Corridor Assessment Report (Authority 2019C), restrict wildlife movement.

### 4494-9454

The commenter asks if compensation as a form of mitigation results in a different (or lower) level of significance than other forms of mitigation. Compensatory mitigation is often used a part of a suite of approaches to mitigate impacts to biological resources. Restoration is often the preferred method for mitigating temporary impacts to habitat where the habitat affected can be restored to pre-construction conditions and values. When a project results in the permanent removal of habitat, restoration is not possible and compensatory mitigation is the most common form of mitigation. Compensatory mitigation is a common and accepted method of offsetting a project's impacts to a less than significant level.

### 4494-9455

The commenter is concerned about the ability of the TBM to withstand water pressures above 30 bar and provides information about a TBM used in New York City.

The NYC tunnel was completed successfully in 2019. The Robbins TBM was provided with dewatering, drilling and grouting systems in place. Another feature was a bulkhead to seal off the machine if water inflows were encountered. Probe drilling and pre-excavation grouting were systematically used: "The project specification required a mandatory probe drilling program for the entire tunnel alignment, which included water inflow measurements at the probe hole locations. The TBM crew was thus required to drill four probe holes every 115 m (380 ft) to measure water inflows. When water inflows exceeded contract-allowable values, grouting would be required to reduce water inflows to acceptable levels. The TBM could then advance inside the grouted area of the alignment" (Tunneling Online 2023).

"To accomplish this feat, the TBM was equipped with two types of grouting systems. The pre-excavation grouting system was a mono-component grout system used to grout ahead of the TBM. The two-component (A+B) grout system was used to backfill the annular gap between the segmental lining and the bored tunnel. The machine was equipped with two drills in the shields for drilling through the head in 16 different positions and a third drill on the erector to drill through the shields in an additional 14 positions. To add to that, water-powered, high pressure down-the-hole (DTH) hammers allowed for drilling 120 m (400 ft) ahead of the machine at pressures up to 20 bar if necessary" (Tunneling Online 2019). Regarding the EEPB project and groundwater pressures, TBMs are capable of operating in areas with pressures above 30 bar when other boring techniques, such as pre-excavation grouting, are applied. These techniques provide for a reduction of pressures on the TBM. Where groundwater is present, HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 will be implemented to dissipate the pressure on the TBM and to control the volume of groundwater inflow into the tunnel. Pre-excavation grouting creates a permanent strengthened very low permeability circular crown around the TBM that takes on the water pressure. The potential high water pressure is therefore borne by the improved ground, and not by the TBM. Pre-excavation grouting can be performed from a TBM with built-in grouting capability, which generally includes grout ports in the cutter-head and the shield. Grouting will also allow for tunnel boring through problematic geological formations and unexpected faults.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9455

Other than the mentioned NYC tunnel, there are numerous additional examples of tunnel projects constructed under high groundwater pressure conditions using TBMs such as: St. Gotthard (200 bar measured), Lotschberg (110 bar measured locally), and Lyon-Turin (under construction). On the St. Gotthard Tunnel, approximately 28 miles of the tunnel were excavated with TBM. The groundwater pressure expected required a suitable pre-investigation campaign and probe drillings through the TBM cutterhead. A waterproofing system with sheet membrane and concrete lining was installed along the whole tunnel length. On the Lotschberg Tunnel, approximately 6 miles of the tunnel was excavated with TBM. A leak proofing ring with sealing injections around the tunnel was constructed. Two different drilling and injection rings, each with about 20 boreholes, were planned around the tunnel. The second ring was only to be implemented in its entirety if the desired results were not achieved after injecting the previous ring. The possibility of arranging a third ring was also available.

### 4494-9456

The commenter presents a case study that faced difficulties related to high groundwater pressures and questions the capability of the TBMs to perform with groundwater pressures above 25 bar. Reading the paper mentioned by the commenter, it appears that the original TBM used in the Parbatii Hydroelectric project did not have the capability of grouting for ground improvement ahead of the tunnel excavation. This capability was added after the TBM was retrieved. Work resumed 3 years later. The requirements for the TBMs in the Palmdale to Burbank project section include the TBM to be fitted, such that it is capable not only of systematic probe drilling for ground exploration, but also of pre-grouting ahead of the excavation, and post-grouting. Pre-excavation grouting from the TBM can be performed to reduce groundwater seepage into the tunnels during construction. Where groundwater is present, HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 will be implemented to work under high groundwater pressures and control the volume of groundwater inflow into the tunnel. There are many other success examples of base tunnels with high groundwater pressures and tunneling through fault zones. Please refer to Response to Comment #9457 regarding examples of successful use of TBMs in similar conditions to the Palmdale to Burbank Project Section.

### 4494-9457

The commenter brings a case study for a tunnel built under high groundwater pressures and expresses concern about excavation under high water pressures and the risk of the TBM getting stuck. The main causes of the difficulties faced during the excavation of the Gerede tunnel, as described by the commenter, do not occur in the tunnels designed under the ANF. In the Gerede tunnel, the TBM encountered karstic aquifer conditions, which are not expected in the ANF. In addition, the tunnels for the Project do not cross under rivers flowing overhead. There are many other success examples of base tunnels with high groundwater pressures and tunneling through fault zones. All of them yield lessons learned and many have similarities to the projected tunnel through San Gabriel mountains. For example, all Alpine base tunnels are constructed with theoretical groundwater pressures of this magnitude and higher. Because during construction the pressure around the TBM is dissipated, TBM shields are not expected to withstand the full mountain groundwater pressure during excavation. Groundwater pressure on the excavation front is dissipated due to controlled groundwater seepage and pre-excavation grouting treatments, and this allowed the successful completion of the excavation of these tunnels.

Pre-excavation grouting from the TBM can be performed to reduce groundwater seepage into the tunnels during construction. Pre-excavation grouting can be performed from a TBM with built-in capability including grout ports through the TBM cutter-head and through the shield. Where groundwater is present, HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 will be implemented to control the volume of groundwater inflow into the tunnel. It is in the long term, though, when the groundwater levels are restored, that this pressure can build on the tunnel lining, if this lining is designed as a fully tanked solution. In the segments where ground water pressures are expected to exceed 25 bar, a monolithic concrete second lining will be put in place to minimize water leakage into the tunnel for the complete lifespan of the infrastructure. After completion of the second lining, the tunnel will be considered to be dry during the lifespan of the infrastructure. "Dry tunnel condition" is defined as the situation where a finished tunnel has such a low water inflow rate that it does not impact in any form the ground water resources, neither in the short nor in the long term.

The Lotschberg Base tunnel (Switzerland) crossed several fault zones and encountered water pressures over 100 bar. Through the pre-treatment of a sedimentary slice with a

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9457

measured water pressure of 110 bar, the inflow reduced from 8 l/s to 3.5 l/s (127 gpm to 55 gpm). This tunnel was successfully completed in 2007.

In the Gotthard rail base tunnel in Switzerland, groundwater pressures of up to 200 bar have been measured, and to bear the expected high groundwater pressures, a reinforced concrete second lining has been constructed. Other examples where a concrete second lining has been implemented to withstand high water pressures on the long term are the Wienerwald, Pershlingtal and Koralm in Austria, and Murgenthal double track rail tunnel in Switzerland. Anticipated loss and eventual retrieval plans of TBMs are not included in the PEPD provisions. This is a risk to be assessed and mitigated once the TBM features and geotechnical information is completed in the final design phase. TBMs are equipped with extra power and torque to overcome situations where the TBM could eventually get trapped. In extreme cases, there are several strategies that could be implemented to retrieve a stuck TBM, depending on its location within the tunnel, depth, and ground conditions. A common approach is to continue the excavation from the other end of the tunnel to reach the location of the stuck TBM. Also, the TBM could be dismantled, and continue the excavation through other conventional methods. Also, an auxiliary tunnel or shaft could be built to reach the TBM and release it. More specific procedures will be analyzed once the specifications for the TBM machine are known and additional information is gathered regarding the conditions to be encountered.

### 4494-9458

The commenter asks what the anticipated cost of the TBM. Construction Costs, including tunneling with TBM, are included in Appendix 6-B PEPD Record Set Capital Cost Estimate Report. This report includes costs per route mile of excavation with TBM. The cost of a specific TBM depends on the diameter and technical features that will be defined based on expected ground. Please refer to Appendix 6-B for further details about the TBM cost. The commenter also asks about the costs from loss of TBMs. Anticipated loss and eventual retrieval plans of TBMs are not included in the PEPD provisions. This is a risk to be assessed and mitigated once the TBM features and geotechnical information are completed in the final design phase. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### 4494-9459

The commenter asks about the procedure proposed to remove or retrieve a tunnel boring machine (TBM) in the event it gets stuck during tunneling. Anticipated loss and eventual retrieval plans of TBMs are not included in the Preliminary Engineering for Project Definition (PEPD) provisions. This is a risk to be assessed and mitigated once the TBM features and geotechnical information is completed in the final design phase. TBMs are equipped with extra power and torque to overcome situations where the TBM could get trapped. In extreme cases, there are several strategies that could be implemented to retrieve a stuck TBM, depending on its location within the tunnel, depth, and ground conditions. A common approach is to continue the excavation from the other end of the tunnel to reach the location of the stuck TBM. In addition, the TBM could be dismantled, and the excavation continued through other conventional methods. Also, an auxiliary tunnel or shaft could be built to reach the TBM and release it. More specific procedures will be analyzed once the specifications for the TBM machine are known and additional information is gathered regarding the conditions to be encountered.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9460

The commenter is concerned about the use of certain chemicals associated with grouting agents used for tunnel construction.

The selection of grouts and grout components will occur during the design phase and during construction. Grouting composition has substantially evolved in recent years. For instance, cementitious materials are now widely used for grouting and chemical grouts are used far less frequently for engineering and tunneling purposes. The environmental requirements for the selected grout material, in particular its effects on groundwater, will be taken into consideration during the planning and design phase of tunnel construction.

Regarding the selection of grout materials, please refer to a more recent publication "Hard Rock Tunnel Grouting Practice in Finland, Sweden, and Norway - Literature Study 2003". That document describes the types of grouting agents currently used, and how cementitious materials have come to replace chemical grouts in rock grouting in tunnels because of environmental accidents and the improved performance of cementitious grouts, achieving the high level of tightness required. Currently, very fine-grained cements are used more often, since the use of chemical grouts has been limited or even prohibited. Under HMW-IMAF#9 the Authority will use an Environmental Management System to describe the process that will be used to evaluate the full inventory of hazardous materials as defined by federal and state law employed on an annual basis and will replace hazardous substances with nonhazardous materials. The Authority is committed to identifying, avoiding, and minimizing hazardous substances in the material selection process for construction, operation, and maintenance of the HSR System including those uses for grouting.

To the extent feasible, cementitious materials in grouting would be used over chemical grouts for tunnel construction for the project.

### 4494-9461

The commenter is concerned about the effects of grouting on groundwater. The composition of grout has developed substantially in recent years. The environmental requirements for the selected grout material, in particular its effects on groundwater, will be taken into consideration. Cementitious materials are being widely used in recent years for grouting, as chemical grouts are becoming the minority for engineering and tunneling purposes. Regarding the selection of grout materials, please refer to a more recent publication "Hard Rock Tunnel Grouting Practice in Finland, Sweden, and Norway - Literature Study 2003". That document describes the types of grouting agents currently used, and how cementitious materials have come to replace chemical grouts in rock grouting in tunnels because of environmental accidents and the improved performance of cementitious grouts, achieving the high level of tightness required. Currently, very fine-grained cements are used more often, since the use of chemical grouts has been limited or even forbidden. Section 3.6, Public Utilities and Energy (page 3.6-78), Impact PUE#4 Effects from Wastewater Generated during Construction of Draft EIR/EIS indicates that any water generated from the tunnel construction would be treated and reused on-site or hauled off-site for proper disposal. On-site water treatment before discharging water to rivers or aquifers is currently achieved via temporary water treatment plants for construction installed at tunnel portals. Water will be treated to remove oils and greases from the TBM and concentration limits of harmful substances (e.g., concentration limits on pH, total suspended solids, dissolved metals, and other) will be adhered to in accordance with federal and state regulations to ensure that water quality standards are maintained.

### 4494-9462

The commenter asks about the grouting compounds that would be used during tunnel excavation. The selection of grouts and grout components will occur during the design phase and during construction. Grouting has developed greatly in recent years, with improvements made to the material itself as well as from an environmental standpoint. The environmental requirements for grout, in particular as it may affect groundwater, will be taken into consideration in the selection of grouting materials, being the cementitious materials preferred at present in rock grouting in tunnels to achieve the level of the tightness required.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9463

The commenter asks about the destination of the water inflow into the tunnel. The composition of grout has developed substantially in recent years. The environmental requirements for the selected grout material, in particular its effects on groundwater, will be taken into consideration. Cementitious materials are being widely used in recent years for grouting, as chemical grouts are becoming the minority for engineering and tunneling purposes. Regarding the selection of grout materials, please refer to a more recent publication "Hard Rock Tunnel Grouting Practice in Finland, Sweden, and Norway - Literature Study 2003", that describes the types of grouting agents currently used, and how cementitious materials have come to replace chemical grouts in rock grouting in tunnels, because of environmental accidents and the improved performance of cementitious grouts, achieving the high level of tightness required. Currently, very fine-grained cements are used more often, since the use of chemical grouts has been limited or even forbidden. Section 3.6, Public Utilities and Energy (page 3.6-78), Impact PUE#4 Effects from Wastewater Generated during Construction of Draft EIR/EIS indicates that any water generated from the tunnel construction would be treated and reused on-site or hauled off-site for proper disposal. On-site water treatment before discharging water to rivers or aquifers is currently achieved via temporary water treatment plants for construction installed at tunnel portals. Water will be treated to remove oils and greases from the tunnel boring machines and concentration limits of harmful substances (e.g., concentration limits on pH, total suspended solids, dissolved metals, and other) will be adhered to in accordance with federal and state regulations to ensure that water quality standards are maintained. Where groundwater is present, HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 will be implemented to control the volume of groundwater inflow into the tunnel, as discussed in Section 3.8, Hydrology and Water Resources. Management of any water generated from tunnel construction would be in accordance with federal and state regulations and would prevent any discharge from impacting water quality standards.

### 4494-9464

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter raises concerns about tunnel construction impacting water chemistry and its potential effect on surface flora and fauna. Please refer to standard response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, which includes discussion of the AMMP that would be implemented throughout the tunnel construction RSA. HWR-MM#4 requires that the AMMP include monitoring protocols to establish baseline conditions of surface water resources and to detect changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial measures. This would include evaluation of changes in water chemistry that could affect surface resources.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9465

The commenter is concerned about the effects on groundwater from the chemicals that could be used for grouting. The type and estimated volume of grouting will depend on final design features and contractor's means and methods of construction, which will depend upon the ground conditions encountered during construction. The selection of grouts and grout components will occur during the design phase and during construction. The composition of grout has developed substantially in recent years. The environmental requirements for the selected grout material, in particular its effects on groundwater, will be taken into consideration based on the state-of-practice.

Cementitious materials are being widely used in recent years for grouting, as chemical grouts are becoming the minority for engineering and tunneling purposes. Regarding the selection of grout materials, please refer to a more recent publication "Hard Rock Tunnel Grouting Practice in Finland, Sweden, and Norway - Literature Study 2003". That document describes the types of grouting agents currently used, and how cementitious materials have come to replace chemical grouts in rock grouting in tunnels because of environmental accidents and the improved performance of cementitious grouts, achieving the high level of tightness required. Currently, very fine-grained cements are used more often, since the use of chemical grouts has been limited or even forbidden.

Under HMW-IMAF#9 the Authority will use an Environmental Management System to describe the process that will be used to evaluate the full inventory of hazardous materials as defined by federal and state law employed on an annual basis and will replace hazardous substances with nonhazardous materials. The Authority is committed to identifying, avoiding, and minimizing hazardous substances in the material selection process for construction, operation, and maintenance of the HSR System including those uses for grouting. To the extent feasible, the Authority will use cementitious materials for grouting during tunnel construction. Section 3.6, page 3.6-78, Impact PUE#4 Effects from Wastewater Generated during Construction of Draft EIR/EIS indicates that any water generated from the tunnel construction would be treated and reused on-site or hauled off-site for proper disposal. On-site water treatment before discharging water to rivers or aquifers is currently achieved via temporary water treatment plants for construction installed at tunnel portals. Water will be treated to remove oils and greases from the TBM and concentration limits of harmful substances (e.g., concentration limits on pH, total suspended solids, dissolved metals, and other)

### 4494-9465

will be adhered to in accordance with federal and state regulations to ensure that water quality standards are maintained.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9466

The commenter asks about the estimated volume of grouting material required for tunnel construction (as required by HYD- IAMF#5, HYD-IAMF#6, and HYD-IAMF#7) and how it correlates to the risk of contamination of the water supply and potential impacts on biological resources.

The estimated volume of grouting material is not known at this phase of preliminary design. The need, frequency, and volume of grouting depends on the geology and geotechnical and hydrologic conditions of the ground encountered during the excavation of the tunnels. The volume of grouting material will be estimated during final design and after additional geotechnical investigations are conducted, which will inform the means and methods of tunnel construction.

HYD-IAMF#7 defines backfill grouting in terms of the more up-to-date technique, specifically the use of quick-setting bi-component grout, which provides resistance to water flow immediately upon hardening. The accelerated two-component grout is superior to conventional cement grouts because it provides a more reliable backfilling of the annular gap. Design features such as the mining methods to be employed, the specific type of TBM to be used when construction by TBM is selected, the type of grouting approaches to be implemented to control water flows, and the appropriate lining systems to be installed would be further refined during the pre-construction phase of the selected Preferred Alternative (Build Alternative SR1A) after detailed field investigations are completed and would be implemented during construction.

Regardless of the volume of grouting material required for tunnel construction, the Authority will implement a variety of measures to minimize any water quality impacts, including implementation of HWR-MM#1, which requires the Authority to comply with applicable Regional Water Quality Control Board permits and treat potential groundwater contamination (including through constructed wetland systems, biofiltration and bioretention systems, wet ponds, organic mulch layers, planting soil beds, and vegetated systems (biofilters), such as vegetated swales and grass filter strips) so as to prevent degradation of groundwater quality. Implementation of these measures will minimize the project's impact on surface water and groundwater quality and associated impacts on biological resources and habitat.

### 4494-9467

The commenter asks what case studies the Authority has to demonstrate TBM success under the conditions of greater than 60 bar pressure. Please refer to Response to Comment #9455, which provides examples of TBM with high groundwater pressure and also explains how the IAMFs in the Draft EIR/EIS would address concerns related to using TBM in areas with high groundwater pressure.

### 4494-9468

The commenter is concerned about the capability of the single pass lining to withstand high water pressures until the second pass lining is cast in place. The two-pass lining is conceived for tunnel stretches with expected long-term high groundwater pressures over 25 bar. In the short-term, pre-excavation grouting measures would be put in place during construction to reduce both the pressure on the TBM and water inflows into the tunnel. Pre-excavation grouting creates a permanent strengthened very low permeability circular crown around the TBM that takes on the water pressure. The potential high-water pressure is therefore borne by the improved ground, and not by the TBM. Also, as discussed in HYD-IAMF#6 in sections where groundwater pressures are above 25 bar, and after the first lining has been installed, no significant water leakage is expected to occur during the period prior to the installation of the second pass lining. Current gaskets available in the market are nominally rated up to 50 bar; however these gaskets are assumed to withstand only 25 bars in the design (using a safety factor of 2) to account for construction quality defects and the 100-year lifespan of the infrastructure. The inner, waterproof lining is monolithic and will be designed to withstand the long-term groundwater pressures that may build up gradually over time.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9469**

The commenter provides their calculations, based on assumptions that they generated, for how many days they expect the tunnel would not have a single layer lining to protect it from groundwater pressure. Based on those calculations, the commenter asks about the vulnerability of the tunnel to seepage before the installation of the single layer lining, where water pressure exceeds 25 and 50 bars. The commenter also asks about the risks associated with the time period in which the tunnel has a single layer, where water pressure exceeds 25 and 50 bars.

First, as a matter of clarification, the commenter's assumptions regarding waiting times between excavation and installation of the lining are inaccurate. The TBM will install the precast segmental lining immediately as excavation progresses. These segments are typically 5.25 feet long (see PEPD Tunnel Plans Drawing TN-C0202 in Volume 3 of the Draft EIR/EIS) and are erected right after the shielded area. As such, in response to the commenter's initial questions about a situation where the tunnel would not have a single layer lining, this scenario would not occur.

Excessive groundwater pressures might generate some seepage into the tunnel during construction, but additional measures implemented during construction, such as pre-grouting, would help to reduce the flow to manageable values. In the Palmdale to Burbank Build Alternatives, the TBMs are not expected to withstand the full mountain groundwater pressure during excavation. Groundwater pressure on the excavation front will be dissipated due to controlled groundwater seepage and pre-excavation ground treatments. Pre-excavation grouting from the TBM can be performed to reduce groundwater seepage into the tunnels during construction. Pre-excavation grouting can be performed from a TBM with built-in capability including grout ports through the TBM cutterhead and through the shield. Where groundwater is present, HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 will be implemented to control the volume of groundwater inflow into the tunnel.

Regarding the comment about risks associated with the time period in which the tunnel has a single layer, in the two-pass lining concept, the outer segmental lining can bear up to 50 bar; however, the gaskets for design purposes are assumed to withstand only 25 bars (using a safety factor of 2) to account for potential construction quality defects and the 100-year lifespan of the infrastructure. For the waiting time until the inner (tanked)

### **4494-9469**

lining is built, some water seepage may occur, but significant water breakthroughs are not expected. If any water flow is detected during the construction period after the installation of the first lining and before the second lining deployment, additional check grouting will be implemented as needed.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9470

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process.

The commenter expresses concern regarding the HSR alignment routes studied in the Draft EIR/EIS and asserts that they are inconsistent with US Executive Order 11990, which aims to avoid direct or indirect impacts on wetlands from federal projects when a practicable alternative is available. The commenter asserts that other routes, such as those along I-5 and SR14, were eliminated from further study even though they were practicable alternatives that would avoid wetlands.

Please refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, which explains the Authority's evaluation and selection of the alternatives studied in the Draft EIR/EIS, as well as why corridors and route such as those mentioned in the comment were considered but rejected from further consideration. As described in the Draft EIR/EIS Chapter 2, Alternatives, and in Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, the Authority has conducted a thorough consideration of project-level alternatives for the Palmdale to Burbank Project Section since 2005.

These analyses are documented in numerous alternatives analyses reports for the Palmdale to Los Angeles and Palmdale to Burbank Project Sections cited in the Draft EIR/EIS Chapter 2. Through those evaluations, the Authority considered consistency with the project purpose and needs, HSR system performance, constructability, cost, input of federal and state resource agencies and communities along the route, and community and environmental impacts, including impacts on waters and wetlands. In coordination with USACE and USEPA on the range of alternatives, the Authority explored additional options to avoid or minimize impacts to Una Lake, which is a water of the State and the U.S. and includes wetland habitat. As a result of this process, the Authority developed the SR14A, E1A, and E2A Build Alternatives, which are shown in Figure 2-2 in Chapter 2 of this Final EIR/EIS and proposed these Build Alternatives for study in this the Draft EIR/EIS along with the Refined SR14, E1, and E2 Build Alternatives. USACE and USEPA concurred on December 17, 2020, and December 16, 2020, respectively, with the range of alternatives recommended in the Checkpoint B Summary Report for inclusion consideration in the EIR/EIS. As described in Section

### 4494-9470

8.4.2, in Chapter 8, Preferred Alternative, of this Final EIR/EIS, out of each of the six Build Alternatives, the preferred alternative (SR14A Build Alternative) would have the least direct and indirect impact on wetland waters of the U.S.

The Draft EIR/EIS Section 3.7, Biological and Aquatic Resources, adequately discloses the impacts of project construction and operations on waters and wetlands, consistent with CEQA and NEPA requirements. Furthermore, consistent with USEO 11990, which states that all practicable measures to minimize harm may be included if wetland impacts cannot be avoided, the Authority has proposed numerous mitigation measures to further reduce, avoid, or compensate for these impacts (e.g., BIO-MM#4, BIO-MM#5, BIO-MM#6, BIO-MM#32, BIO-MM#33, BIO-MM#34, BIO-MM#39, BIO-MM#47, BIO-MM#50, BIO-MM#50, BIO-MM#55, BIO-MM#56, BIO-MM#62, BIO-MM#93, HYD-MM#4). The analysis concludes that with implementation of these mitigation measures, the Build Alternatives would not result in a substantial adverse effect to state and federal wetlands. Accordingly, the Authority disagrees with the commenter's assertion that the project alternatives are inconsistent with USEO 11990.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9471

Refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF.

The commenter provides an overview of the Sole Source Aquifer Protection Program; emphasizes the importance of naturally occurring sources of water in the San Gabriel Mountains given drought conditions and the reliance of individuals within the ANF on groundwater; and asks how the Authority plans not to violate the Safe Drinking Water Act, given potential impacts from tunneling on naturally occurring water sources. The USEPA defines a sole source aquifer as one that supplies at least 50 percent of the drinking water for its service area and where there are no reasonably available alternative drinking water sources. Data on the percentage of residential water usage that relies on groundwater within the ANF is not publicly available. However, the Authority understands that groundwater within the San Gabriel Mountains is an important resource for the region, including for residents who reside within the ANF. The Draft EIR/EIS identifies potential impacts to groundwater quality and quantity due to tunnel construction. Groundwater in the vicinity of the Project may be used by existing residents for drinking water and the Safe Drinking Water Act protects drinking water supplies from human-produced contamination. Because tunnel construction activities have the potential to impact groundwater, the methods and materials used during construction will be selected to avoid contamination of groundwater. The TBM excavation process includes a capture and disposal system for harmful substances such as lubricants, grouts, water, or chemicals utilized as part of the TBM drilling operations and untreated water will not be discharged into groundwater aquifers. In addition, through implementation of the Impact Avoidance and Minimization Features and Mitigation Measures described in Section 3.8, Hydrology and Water Resources of the EIR/EIS, impacts to drinking water will be less than significant. The following response includes additional information regarding the engineering practices that would ensure that contamination of water is avoided. TBM operations can roughly be divided into two different, mutually exclusive phases: 1) Excavation, when the TBM advances and 2) Pre-excavation grouting or grouting for ground improvement ahead of excavation. During excavation operations in rock, a substantial amount of water is injected to the TBM cutterhead, and also added to foams when the TBM works in EPB mode (Earth Pressure Balance). This water mixes with the excavated soil (spoil), which is taken out of the tunnel to be treated or left for the water to evaporate so it will not filter or disperse

### 4494-9471

into the groundwater aquifers. Therefore, excavation operations are not expected to have a risk of contamination of groundwater aquifers. The products employed for TBM excavation are mostly biodegradable foaming agents and biopolymers. Biodegradation happens when these additives are broken down by micro-organisms into natural elements such as water and carbon dioxide. During grouting for ground improvement, the requirements for the grout are determined by the hydrological and geological conditions and the ability of the grout to penetrate the fractures and ground cavities. The grout material must comply with the environmental requirements. Please see response to comment #9465 for a discussion of the use of cement-based grouting in tunnel construction.

In addition, for all tunnels, all water used for construction and extracted at tunnel portals will be treated to the required quality limits before discharging into the environment. This applies also to the mountain water that could leak into the tunnels. During the excavation works, water used in tunnel execution, groundwater filtered into the tunnel that may have naturally occurring chemicals, and water used in cleaning and industrial processes will undergo treatment in facilities located at the tunnel portal construction staging area before being discharged to natural water courses or hauled off. Treatments will be designed and adapted to the quantity and quality of water originating from each construction activity and process. The objective is to ensure the protection of aquatic resources and water quality. Water coming from the tunnel excavation will undergo the following processes: preliminary screening to separate the very coarse material (gravel or stones), sedimentation, acidity correction and, if needed, removal of lubricants and greases. Water coming from tunnel excavation is typically loaded with a high concentration of suspended solids. The elimination of these solids is achieved through settlement basins or compact treatment plants. Another particularity of water coming from tunnel excavation is that it is highly alkaline, caused by the contact with concrete used for primary and final tunnel linings. Water will be treated for acidity correction before being discharged to watercourses. The acidity levels are checked with a probe that also rations the amount of corrector, which is usually hydrochloric acid or carbon dioxide. During operation any water coming from the tunnel will be conveyed to a detention pond located at the tunnel portal (a permanent feature) and treated as described above before discharging to the environment or hauled off. In addition, please refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells, which addresses how the Authority would minimize impacts on wells, including private wells.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9472

The commenter inquired if the Authority's proposed alignments are in violation of USFS Standard 45.

Consistency of the HSR Build Alternatives with USFS Standard 45 is discussed in Appendix 3.1-B. The Authority concluded that the HSR Build Alternatives would be consistent with Standard 45 for the following reasons: (1) construction, operation, and maintenance for the Build Alternatives would implement impact avoidance and minimization features that minimize adverse effects to groundwater aquifers and surface expressions to the maximum extent practicable; (2) utilization of hydrologic monitoring, modeling, subsurface mapping, and geotechnical investigation would allow for avoidance of aquifer surface expressions for construction staging areas and access roads, establish baseline conditions for groundwater aquifers, and provide supplemental water to restore aquifers to offset changes to groundwater levels. Refer to Section 2, Project Alternatives, and Section 3.8, Hydrology and Water Resources, for further discussion of minimization of impacts to groundwater resources during construction activities.

Tunnel construction under the ANF has the potential to alter hydrogeological conditions, resulting in inflows of groundwater into the tunnel and the subsequent impacts to groundwater aquifers. Loss of groundwater could affect surface aquatic resources. The Authority has incorporated HYD-IAMF#5, Tunnel Boring Machine Design, HYD-IAMF#6, Tunnel Lining Systems, and HYD-IAMF#7, Grouting into the design and construction methods for tunnels under the ANF to avoid and minimize groundwater inflows into and around tunnels during and after construction. Although HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 would reduce the amount of potential groundwater loss due to tunnel construction, based on the available information and based on prior tunnel construction experience elsewhere, some groundwater inflow into the tunnels could still occur in during construction. This groundwater flow could result in localized declines in groundwater levels that could also affect surface aquatic resources.

To address this impact, the Authority would prepare and implement a long-term AMMP, described in HWR-MM#4. The AMMP includes monitoring protocols to establish baseline conditions of surface water resources and to detect changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial

### 4494-9472

measures.

### 4494-9473

The commenter requests further information on the United States Forest Service (USFS) water resource screening process for the project. The commenter asks what comments or concerns the USFS has brought to the Authority, related to impacts on riparian areas within the ANF. To construct the Build Alternatives in the ANF, the Authority would be required to obtain a Special Use Authorization from the USFS, which would require the Authority to, among other things, demonstrate that the proposed use would be consistent with USFS laws, regulations, plans, and policies pertaining to the protection of existing hydrologic conditions and water resources, including USFS Soil, Water, Riparian and Heritage Standard 47. The USFS is a NEPA Cooperating agency under 40 CFR 1501.8, Cooperating Agencies. The USFS has provided comments on the Draft EIR/EIS and are included in Volume 4 of the Final EIR/EIS in Comment Letter PB-4525. Please refer to that comment letter, which includes all comments from the USFS, including comments related to riparian areas. In addition, please refer to Section 9.4.9, in Chapter 9, Public and Agency Involvement of the Draft EIR/EIS, for further discussion of Authority coordination with the USFS.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9474

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter is concerned about impacts to special-status species from tunnel construction in the ANF. Please refer to standard response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, which discusses the project's potential effects of tunneling on groundwater and surface water resources and measures that would be taken to minimize and avoid this impact. This standard response also discusses potential impacts on special-status plant and animal species that are groundwater dependent. The Draft EIR/EIS identifies indirect effects from tunnel construction associated with the Build Alternatives that could have substantial adverse effects on special-status species, through conversion or degradation of habitat. The Refined SR14 and SR14A Build Alternative alignments would cross the fewest identified Risk Areas compared to the other two alignments (E1/E1A and E2/E2A). Within those Risk Areas, no known seeps, springs, intermittent or perennial streams are present. As such, the Refined SR14 and SR14A Build Alternatives pose the least risk of hydrologic impacts occurring among the Build Alternatives. To address this impact, the Authority would implement an AMMP. BIO-MM#93 will involve implementation of the bioresource portions of the AMMP prepared under HYD-MM#4, which will require monitoring of groundwater-dependent surface water resources and associated habitat within the tunnel construction RSA, providing supplemental water where needed, and remediating or compensating for any adverse effects identified during monitoring in a timely manner.

### 4494-9475

The commenter notes that the Authority will need to provide notification to CDFW pursuant to Fish and Game Code Section 1600 et seq. concerning certain project impacts to rivers, streams, and lakes. Commenter further requests information on any such notification to CDFW regarding potential impacts on applicable bodies of water.

The Authority will comply with Section 1600 et seq. regarding the project it ultimately approves. Until such time, the Authority will continue to engage with CDFW through the CEQA process (please refer to Chapter 9, Public and Agency Involvement, further information). CDFW is a designated Responsible Agency under CEQA. A Responsible Agency under CEQA is a public agency with some discretionary authority over a project or a portion of it, but which has not been designated the Lead Agency. (State CEQA Guidelines Section 15381.) Because Responsible Agencies will take discretionary actions regarding a project, they are also required to comply with CEQA. For efficiency, CEQA allows Responsible Agencies to rely on a CEQA document prepared by the Lead Agency to meet their CEQA compliance requirements.

The Authority has been in close coordination with CDFW throughout the development of the Draft EIR/EIS and will continue to do so through finalization of the Final EIR/EIS and the decision on the project. In its role as a Responsible Agency, CDFW has provided comments on the Authority's Draft EIR/EIS.

For further information regarding potential impacts of the alternatives on resources covered under Section 1600 et seq., see Impact BIO#9 and Impact BIO#16, which include analyses and descriptions of the effects of project construction and operation on resources under CDFW jurisdiction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9476

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter asks for an explanation of how the project's water demands for construction are not in violation of the Los Angeles Flood Control Act, which requires water conservation within the district boundaries. The commenter has not identified any particular provision of the Los Angeles Flood Control Act (a California Legislature statute) that could apply here.

PUE-MM#1 (described in Section 3.6.7) will require the Authority to prepare an updated water supply analysis for the selected Build Alternative that details and describes the minimum adequate water supply for the RSA during normal, dry, and multiple dry years based on a more detailed project design. Based on the results of the water supply analysis, the Authority will coordinate with the water agencies to determine if allocations for additional water supply are needed and would pay the water agencies its fair share of the State Water Project fees, provided water from the State Water Project is procured. Additionally, PUE-MM#1 will require the Authority to utilize non-potable water from regional water utility service providers for construction activities where feasible, as well as recycling/reusing water used for tunnel construction, further minimizing demand for water supplies. Please refer to PB-Response-PUE-3: Water Demand and Usage for additional information.

### 4494-9477

The commenter asks whether the Authority studied the Metro Red Line and the effects on Runyon Canyon, what the Authority learned from that case study, and how those lessons can be applied to tunneling through the ANF. The Authority is aware of the tunnel example the reviewer cites. The Red Line Runyon Canyon was not used as a case history. However, more relevant case histories for tunnels in Southern California with similar issues were reviewed and included in the evaluation of potential hydrologic impacts. These include the San Jacinto Tunnel through the San Jacinto Mountains National Forest and State Park, the Tecolote Tunnel beneath the Santa Ynez Mountains Los Padres National Forest, Arrowhead Tunnels in the San Bernardino National Forest, and the Central Pool Augmentation Tunnel and the Irvine-Corona Expressway Tunnels in the Cleveland National Forest. The details of these case histories, such as tunnel construction occurring under similar conditions, including documented effects on surface water and other water resources associated with those tunnels, are included in the following report, "Palmdale to Burbank Project Section PEPD Record Set Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest," dated January 2019. The lessons learned from the issues encountered during the construction of the Metro Red Line tunnel, as well as from more analogous tunneling projects located elsewhere (both inside and outside of the U.S.) will be reflected in the Authority's approach to tunnel construction and have helped inform the development of mitigation measures and the AMMPs associated with tunneling.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9478

The commenter provided an overview on project alignment intersections with surface water resources/features. Each of the six Build Alternatives includes construction of twin side-by-side tunnels. Tunnels could provide a conduit for groundwater to seep into excavated areas as the advancing tunnel construction intersects subsurface fractures and faults in bedrock that contain water. Where groundwater is present, it may under certain circumstances leak from the rock mass into the tunnels. In such cases, groundwater inflows may temporarily affect the hydrology of streams, springs, water supply wells, and other waterbodies. The amount and duration of groundwater loss would depend on the geotechnical and hydrogeological conditions along the tunnel alignment, the tunnel construction methods used, and design features adopted to avoid and minimize inflows. Under certain conditions, temporary inflows into the tunnel during construction would likely be unavoidable. Thus, there could be temporary effects on surface and groundwater conditions even with incorporation of design features and construction methods to avoid and minimize the effects.

The Authority will use state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, including through the use of tunnel boring machines (TBMs) with features to reduce or prevent inflows and grouting and tunnel-lining approaches that have proven effective at controlling water seepage. These measures are identified in HYD-IAMF#5 (TBM Design Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting). HYD-IAMF#5 (TBM Design Features) would use closed-mode operations to effectively prevent water seepage from occurring at the TBM cutterhead area, with ports for drilling horizontal probe holes through the TBM cutterhead, and angled probe holes through the TBM shields. These holes will allow for water pressures and flow rates to be measured ahead of the TBM, and further allow for pre-excavation grouting ahead of the TBM to cut-off groundwater inflows into the tunnel. HYD-IAMF#6 (Tunnel Lining Systems) will consist of segmental, precast, concrete lining with bolted and gasketed joints, creating a tunnel lining capable of resisting the groundwater pressure with minimal leakage in circumstances where groundwater pressures are 25 bar or less. In sections where groundwater pressures are above 25 bar, and after the first lining has been installed, no significant water leakage is expected until a second lining has been put in place. Furthermore, a monolithic second lining will be put in place after the TBM has finalized its operations and all its facilities have been dismantled (approx. 16 months). HYD-IAMF#7 (Grouting) involves pouring

### 4494-9478

coarse mortar into various narrow cavities along the tunnel lining. Several grouting methods will be used during the construction of the tunnels to avoid and minimize groundwater flows into the tunnels, including pre-excavation grouting, backfill grouting with two-component grout, and check grouting (refer to Appendix 2.0-E of the Palmdale to Burbank Project Section EIR/EIS for further descriptions of IAMFs that will be implemented as part of the project, including HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7).

In most cases, TBMs would be used to mine the tunnels. Mining the tunnels may also include conventional mining methods, which would involve the installation of a preliminary lining concurrent with the excavation process in combination with grouting, thus providing a barrier from groundwater infiltration into the proposed tunnel alignment. Under the conventional approach, and as set out in HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7, various measures will be implemented to avoid and minimize tunnel inflows.

The tunnel lining system would also help control water flows both during and after construction and would consist of either a single-pass or two-pass lining system, depending on groundwater pressures. For proper implementation of this approach, a detailed site-specific geotechnical and hydrogeological characterization would be carried out for the selected Preferred Alternative (SR14A).

Notwithstanding these measures, in High-Risk Areas, which are zones associated with tunnels intersecting areas with faults and high hydrostatic pressure, groundwater inflow into the tunnels would likely occur during construction. Groundwater seepage into tunnel structures during construction and operation could affect water levels of streams, springs and wells reliant on groundwater aquifers. The extent to which groundwater drains into tunnel structures depends on the tunnel lining system's ability to resist hydrostatic pressures. Specialized tunnel design (e.g., one-pass gasketed segmental lining and two-pass tunnel linings) could withstand higher hydrostatic pressure at greater depths. To address this, the Authority will implement an Adaptive Management and Monitoring Plan (AMMP) (See HWR-MM#4). The AMMP would be implemented throughout the tunnel construction RSA. HWR-MM#4 requires that the AMMP include monitoring protocols to establish baseline conditions of surface water resources and to

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9478

detect changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial measures. The purpose of the AMMP is to ensure that adverse effects on subsurface and surface water resources and associated habitat within the ANF caused by tunnel construction activities are identified and that appropriate responses to address those effects are expeditiously implemented. This AMMP involves a multi-step iterative process to comply with U.S. Forest Service (USFS) standards, which includes remedial measures. The remedial measures include actions such as establishing adaptive management triggers for each water resource being monitored, implementation of compensatory mitigation for each affected water resource, and the minimization of effects on water resources associated species as a result of tunnel construction. For a full list of USFS standards for remedial measures, see Appendix 3.8-C, Adaptive Management and Monitoring Plan for Potential Hydrologic Effects within the Angeles National Forest.

The hydrogeological changes that may occur during tunnel construction would be primarily influenced by a combination of risk factors identified above. Based on the comparative assessment of tunnel-related hydrologic impacts between the six Build Alternatives, the Refined SR14 and SR14A Build Alternatives pose the least risk of hydrologic impacts occurring among the Build Alternatives. The Refined SR14 and SR14A Build Alternative alignments would cross the fewest identified risk areas compared to the other two alignments (E1/E1A and E2/E2A). Within those risk areas, no known seeps, springs, intermittent or perennial streams are present. As such, the Refined SR14 and SR14A Alternatives pose the least risk of hydrologic impacts occurring among the Build Alternatives. Moreover, to the extent such impacts associated with the Refined SR14 and SR14A Build Alternatives may occur, they would likely be of less severity than the other Build Alternatives. The E2 and E2A Build Alternative alignments traverse the greatest number of Moderate- and High-Risk areas and have the greatest length of tunnel in water pressure zones above 25 bar. As such the E2 and E2A alternatives would pose the highest risk of hydrologic impacts occurring when compared to the other Build Alternatives. If through further investigation additional seeps, spring, intermittent or perennial streams are discovered within the tunnel construction RSA, the risk of hydrologic impacts may increase accordingly. As noted above, implementation of HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 would minimize the severity and duration of groundwater inflow during tunnel construction, but

### 4494-9478

groundwater inflow into the tunnel excavations may still occur. Implementation of the Water Resources AMMP set forth in HYD-MM#4 would minimize impacts that occur and, if necessary, provide compensatory mitigation for unavoidable impacts to surface aquatic resources, including water supply wells.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9479

The commenter is concerned about groundwater and surface water resources in the Angeles National Forest (ANF) being adversely affected by tunnel construction, as well as potential impacts on wells in the area of Kagel Canyon. The Authority understands that tunnel construction through the ANF may affect surface and subsurface aquatic resources. The project tunnel alignments would be constructed in compliance with CASHRA Technical memoranda requirements (TM 2.4.2 Basic High-Speed Train Tunnel Configuration, TM 2.4.5 High-Speed Train Tunnel Structures, and TM 2.4.6 High-Speed Train Tunnel Portal Facilities) for application of engineering design features to avoid and minimize such impacts.

Potential impacts associated with tunnel construction are analyzed in detail in Section 3.8, Hydrology and Water Resources, specifically in Impact HWR#4 (Changes in Groundwater Recharge Associated with Temporary Construction Activities and Permanent Structures Required for the Build Alternatives) and HWR#5 (Changes in Hydrogeologic Conditions Associated with Tunnel Construction Beneath the ANF which May Affect Surface and Subsurface Water Resources). These potential impacts will be addressed through the Authority's use of state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, including through the use of tunnel boring machines (TBMs) with features to reduce or prevent inflows and grouting and tunnel-lining approaches that have proven effective at controlling water seepage. These measures are identified in HYD-IAMF#5 (TBM Design Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting). HYD-IAMF#5 would use closed-mode operations to effectively prevent water seepage from occurring at the TBM cutterhead area, with ports for drilling horizontal probe holes through the TBM cutterhead, and angled probe holes through the TBM shields. These holes will allow for water pressures and flow rates to be measured ahead of the TBM, and further allow for pre-excavation grouting ahead of the TBM to cut-off groundwater inflows into the tunnel. HYD-IAMF#6 will consist of segmental, precast, concrete lining with bolted and gasketed joints, creating a tunnel lining capable of resisting the groundwater pressure with minimal, if any, leakage in circumstances where groundwater pressures are 25 bar or less. In sections where groundwater pressures are above 25 bar, a second tunnel lining will be put in place to ensure that the tunnels are watertight over time.

### 4494-9479

In the event that groundwater and/or water wells in the ANF are adversely impacted by project construction, the Authority will implement an Adaptive Management and Monitoring Plan (AMMP) as required by mitigation measure HWR-MM#4. The AMMP includes provisions for augmenting water supplies for wells and actions and any affected aquatic resources in the ANF, if necessary. The AMMP will require the implementation of a comprehensive monitoring program to establish baseline conditions for surface water resources and to allow for the detection of changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial measures. The monitoring program would continue for up to 10 years after the completion of construction. The AMMP will establish performance standards that the remedial actions must achieve to approximately match baseline conditions. As a result, HWR-MM#4 would effectively mitigate impacts on affected water resources.

Regarding specific concerns about the potential impacts to streams within the ANF, the Authority will prepare contingency plans to provide supplemental water as necessary to support springs and streams determined through modeling and monitoring to be adversely affected by groundwater reductions due to project construction. Seasonal variation, as documented during the preconstruction baseline monitoring, would be considered in establishing the amount of supplemental water sufficient to offset the impact. For all features, supplemental water would provide minimum flows and periods of inundation to match baseline conditions. The periods in which supplemental water would be provided, in general, would likely reflect the period in which baseflows occur, which is late spring, summer, and early fall outside of rain periods, but could vary between different types of springs and streams. The measures to address impacts on riparian/aquatic vegetation, wildlife breeding cycles, aquatic wildlife, or protected tree health are provided in Mitigation Measure BIO-MM#93 in Section 3.7, Mitigation Measures, of the Final EIR/EIS.

The Authority considered the project's consistency with USFS policies in Appendix 3.1-B of the Draft EIR/EIS. Please refer to that appendix, which includes a consistency analysis on pertinent policies, including policies related to maintaining ecosystems, including ephemeral streams. As part of the application process for a Special Use Authorization from the U.S. Forest Service, the Authority will need to demonstrate that it meets the regulatory requirements for such authorization, including the project's

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9479

consistency with USFS policies and management plans. As discussed in Response to Comment #9481, the 1-mile distance from the tunnel alignment that delineates the tunnel construction RSA was selected based on the general limit of observed impacts on groundwater from past tunnel projects (Authority 2019b). Based on a review of relevant case histories of tunnel projects (as cited in the referenced report) and implementation of IAMFs in the Draft EIR/EIS, significant impacts to wells outside the tunnel RSA are not anticipated during construction of the tunnel.

For additional information on the potential impacts on wells in Kagel Canyon, please refer to Response to Comment #9481.

### 4494-9480

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF.

The commenter inquired if the water supply wells in Kagel Canyon would be impacted, and what would happen to homeowners in Kagel Canyon if they experience depletion of their water supply.

The resource study area (RSA) for tunnel construction is the area within 1 mile of the centerline of each of the six Build Alternatives, which includes a portion of Kagel Canyon. Portions of Kagel Canyon within 1 mile of the alignment were therefore considered in the impact analysis in Section 3.8, Hydrology and Water Resources, of the Draft EIR/EIS. Pursuant to the Authority's 2019 Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest and 2019 Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest (referenced in Section 3.8 of the EIR/EIS), based on observed impacts on groundwater from past tunnel projects, no impacts to wells are expected to occur outside the tunnel construction RSA (more than 1 mile from the centerline of each Build Alternative). Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail how the Authority would address impacts to private water supply wells outside the Angeles National Forest (ANF), including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. For wells within the ANF (including in Kagel Canyon) that are determined through modeling and monitoring to be adversely affected by groundwater reductions caused by the HSR, the Adaptive Management and Monitoring Plan (AMMP) included in Mitigation Measure HWR-MM#4 requires modifications to the affected wells or by providing supplemental water. Supplemental water would only be provided if monitoring indicates that the HSR construction caused groundwater impacts. However,

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9480**

the Authority has identified several IAMFs to avoid and minimize the potential for impacts to water supply wells and the need for supplemental water. HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 require design features and construction methods to address potential groundwater intrusion, including the installation of a tunnel liner(s) capable of effectively controlling inflows into the tunnels. As such, groundwater inflow during construction would likely be minimal and temporary. Please refer to both Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest and Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest for additional information regarding impacts to wells and correlating mitigation measures and IAMFs.

### **4494-9481**

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF, PB-Response-SOCIO-2: Property Values.

The commenter states that “one of the proposed mitigation measures is to truck in water to homeowners whose wells were depleted as a result of tunneling.” The commenter also asks about the resale value for properties that no longer have a water supply and whether the Authority will compensate homeowners who suffer an economic loss in resale value due to impacts on wells. The commenter asks whether the proposed mitigation applies to homeowners in Kagel Canyon who fall outside the 1-mile resource study area (RSA).

The Authority has not proposed a mitigation measure to truck in water to homeowners whose wells are depleted as a result of tunneling during project construction. The commenter appears to be referring to Mitigation Measure HWR-MM#4, which sets out an Adaptive Management and Monitoring Plan (AMMP). The AMMP indicates that supplemental water may be used in the Angeles National Forest (ANF) in the event that springs, streams, and wells are determined through modeling and monitoring to be adversely affected by groundwater reductions caused by the HSR.

The RSA for tunnel construction is the area within 1 mile of the centerline of each of the six Build Alternatives, which includes a portion of Kagel Canyon. Portions of Kagel Canyon within 1 mile of the alignment were therefore considered in the impact analysis in Section 3.8, Hydrology and Water Resources, of the Draft EIR/EIS. Pursuant to the Authority’s 2019 Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest and 2019 Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest (referenced in Section 3.8 of the EIR/EIS), based on observed impacts on groundwater from past tunnel projects, no impacts to wells are expected to occur outside the tunnel construction RSA (more than 1 mile from the centerline of each Build Alternative). Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9481

potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail how the Authority would address impacts to private water supply wells outside the ANF, including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. For wells within the ANF (including in Kagel Canyon) that are determined through modeling and monitoring to be adversely affected by groundwater reductions caused by the HSR, the AMMP included in Mitigation Measure HWR-MM#4 requires modifications to the affected wells or by providing supplemental water. Supplemental water would only be provided if monitoring indicates that the HSR construction caused groundwater impacts. However, the Authority has identified several IAMFs to avoid and minimize the potential for impacts to water supply wells and the need for supplemental water. HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 require design features and construction methods to address potential groundwater intrusion, including the installation of a tunnel liner(s) capable of effectively controlling inflows into the tunnels. As such, groundwater inflow during construction would likely be minimal and temporary. Please refer to both Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest and Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest for additional information regarding impacts to wells and correlating mitigation measures and IAMFs.

Regarding potential loss of property values, please refer to Standard Response PB-Response-SOCIO-2: Property Values.

### 4494-9482

The commenter asks why seeps were mapped at a center line distance twice that of wells, and states that if wells were to be mapped at the same distance of impacts, then all 50+ wells in Kagel Canyon would be included in the mapping. The commenter further inquires about the criteria the Authority utilized for determining the distance of potential impacts on various sources of water. The Authority understands that there are risks affecting groundwater with undergoing tunnel construction in the ANF. Therefore, the wells within the resource study area (RSA) for tunnel construction, or one mile from the alignments' centerline, are included in the analysis. Several active wells are located within 1 mile of the alignment centerline of each of the six Build Alternatives (see Figure 3.8-A-21 and Figure 3.8-A-22). The active wells depicted in the figures are the wells used in this analysis and are from publicly available databases. As explained in Section 3.8.4.5 of the Draft EIR/EIS in its discussion of hydrology and water resources methodology, the only spring/seeps chosen for monitoring are those that appear on the USGS National Hydrography maps. In 2015, the Authority initially identified the springs/seeps within the RSA, i.e., one mile of the alignments (identified at that time) in the ANF, similar to what was performed for the well location identification. After the spring/seep monitoring program had started, the Authority refined some of the alternative alignments. The refined alignments resulted in the already-started analysis of some springs/seeps to be located beyond the one-mile centerline location. However, the Authority decided to keep all the original springs/seeps in the monitoring program, even though some exceeded the one-mile distance from the revised alignments centerline.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9483

Refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

The commenter calculates that if the San Gabriel Mountains continue to rise approximately 2 inches per year, in the 10+ years that it will take CHSRA to construct this alignment, the concrete "ground" on which the track is laid within then may have risen nearly 2 feet. The commenter also asks how the rising of the San Gabriel Mountains will impact the Authority's tunneling plans and the flow of naturally-occurring water sources.

The Authority understands that there are risks associated with undergoing construction in a seismically active (i.e., mountain uplift) location as well as the potential impacts on groundwater resources associated with tunnel construction. The project tunnel alignments would be constructed in compliance with CASHRA Technical memoranda requirements (TM 2.4.2 Basic High-Speed Train Tunnel Configuration, TM 2.4.5 High-Speed Train Tunnel Structures and TM 2.4.6 High-Speed Train Tunnel Portal Facilities) for application of engineering design features to avoid and minimize these risks. The project design incorporates IAMFs such as the preparation of a Construction Management Plan that requires a topographic survey and an assessment of geotechnical conditions prior to construction. See Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events which provides additional information explaining the engineering approach, methods, and feasibility of tunneling through this seismically active area.

The Authority will use state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, including through the use of tunnel boring machines (TBMs) with features to reduce or prevent inflows and grouting and tunnel-lining approaches that have proven effective at controlling water seepage. These measures are identified in HYD-IAMF#5 (TBM Design Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting). HYD-IAMF#5 (TBM Design Features). The TBM would use closed-mode operations to effectively prevent water seepage from occurring at the TBM cutterhead area, with ports for drilling horizontal probe holes through the TBM cutterhead, and angled probe holes through the TBM shields. These holes will allow for water pressures and flow rates to be measured ahead of the TBM,

### 4494-9483

and further allow for pre-excitation grouting ahead of the TBM to cut-off groundwater inflows into the tunnel. HYD-IAMF#6 (Tunnel Lining Systems) will consist of segmental, precast, concrete lining with bolted and gasketed joints, creating a tunnel lining capable of resisting the groundwater pressure with minimal, leakage in circumstances where groundwater pressures are 25 bar or less. In sections where groundwater pressures are above 25 bar, a second lining will be put in place to ensure that the tunnels are watertight over time. Several grouting methods will be used during the construction of the tunnels to avoid and minimize groundwater flows into the tunnels, including pre-excitation grouting, backfill grouting with two-component grout, and check grouting (refer to Appendix 2.0-E of the Palmdale to Burbank Project Section EIR/EIS for further descriptions of IAMFs that will be implemented as part of the project, including HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7).

Please also see the response to comment 9567 and its explanation of fault chambers.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9484

The commenter is concerned about the 30-ft diameter concrete tunnels creating impermeable surfaces that will act as barriers preventing natural groundwater flow. The tunnels will occupy a 30-foot diameter space within the 1,000-foot plus thick groundwater aquifer. The relatively small footprint of the tunnels compared to the thick aquifer will have a very negligible effect on groundwater and groundwater movement. Where each of the six Build Alternative alignments would pass through the San Gabriel Mountains and the ANF, the tunnels would likely be constructed in areas where groundwater is present. Tunnel construction in the ANF will occur under conditions characterized by faults, hard rock formations, and groundwater. The groundwater in the bedrock is stored and transmitted through fracture systems in the hard rock. Therefore, if the tunnels pass through areas where groundwater is present it would likely flow into the tunnels, particularly where the groundwater pressure is high and during the period between the tunnel boring machine (TBM) cutterhead encounter with groundwater and the installation of the first-pass lining system. As set out in HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7, various measures will be implemented to avoid and minimize tunnel inflows during construction. Conditions are expected to return to normal once construction is complete. After construction is completed, while groundwater would not be able to flow into the tunnel, groundwater would be able to move around the tunnel as the tunnel would be a relatively small obstruction within the much larger groundwater aquifer.

### 4494-9485

The commenter is concerned about tunneling through faults would cause a fault to transition from a conduit to a barrier. Many of the faults in the Angeles National Forest (ANF) extend several miles below the ground surface. However, within the project area the portion of the faults that extend across all the Build Alternatives are about 7 miles long and extend approximately 1,500 feet deep, to about the base of the San Gabriel Mountains. The cross-sectional area of the 30-foot diameter tunnel (about 710 square feet) is insignificant when compared to the cross-sectional area of the faults (about 55 million square feet) crossing the Build Alternatives. A completed tunnel intersecting an onsite fault will not cause a fault to transition from a conduit to a barrier.

In most cases, tunnel boring machines (TBMs) would be used to mine the tunnels. Mining the tunnels may also include conventional mining methods, which would involve the installation of a preliminary lining concurrent with the excavation process in combination with grouting, thus providing a barrier from groundwater infiltration into the proposed tunnel alignment. Under the conventional approach, and as set out in Section 3.8, Hydrology and Water Resources (HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7), various measures will be implemented to avoid and minimize tunnel inflows. The tunnel lining system would also help control water flows both during and after construction and would consist of either a single-pass or two-pass lining system, depending on groundwater pressures. For proper implementation of this approach, a detailed site-specific geotechnical and hydrogeological characterization would be carried out for the selected Preferred Alternative. Notwithstanding these measures, in High-Risk Areas, which are zones associated with tunnels intersecting areas with faults and high hydrostatic pressure, groundwater inflow into the tunnels would likely occur during construction. Groundwater seepage into tunnel structures during construction could affect water levels of streams, springs and wells reliant on groundwater aquifers. The extent to which groundwater drains into tunnel structures depends on the tunnel lining system's ability to resist hydrostatic pressures. Specialized tunnel design (e.g., one-pass gasketed segmental lining and two-pass tunnel linings) could withstand higher hydrostatic pressure at greater depths. The Authority will implement an Adaptive Management and Monitoring Plan (AMMP) (See HWR-MM#4). The AMMP would be implemented throughout the tunnel construction RSA. HWR-MM#4 requires that the AMMP include monitoring protocols to establish baseline conditions of surface water resources and to detect changes in groundwater conditions related to tunnel

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9485

construction to ensure timely implementation of remedial measures. The purpose of the AMMP is to ensure that adverse effects on subsurface and surface water resources and associated habitat within the ANF caused by tunnel construction activities are identified and that appropriate responses to address those effects are expeditiously implemented. This AMMP involves a multi-step iterative process to comply with U.S. Forest Service (USFS) standards, which includes remedial measures. The remedial measures include actions such as establishing adaptive management triggers for each water resource being monitored, implementation of compensatory mitigation for each affected water resource, and the minimization of effects on water resources associated species as a result of tunnel construction. For a full list of USFS standards for remedial measures, see Appendix 3.8-C, Adaptive Management and Monitoring Plan for Potential Hydrologic Effects within the Angeles National Forest.

With respect to the question raised in the comment regarding the sufficiency of data to support tunnel construction in the ANF, in 2016 the Authority conducted a preliminary geotechnical investigation of evaluating the area's geology and geologic hazards and drilling six deep bore holes to collect subsurface data for evaluating tunnel feasibility and subsurface conditions. The investigation was not conducted for any specific tunnel alignment, but rather to identify and evaluate field conditions (such as groundwater, situ rock stresses, adverse geology including faults, gouge zones, and squeezing ground) within the ANF that could present feasibility constraints for tunnel design and construction. This preliminary investigation demonstrated that all of the Build Alternative alignments are feasible (practicable). Additional and extensive geotechnical investigations and explorations are to be performed during the design phase of the approved project and prior to start of any construction. Several hundred borings, CPTs, fault trenches and geophysical surveys are planned for the approved project.

### 4494-9486

The commenter questioned whether the Authority has discussed with the U.S. Forest Service the need to conduct additional test drilling within the Angeles National Forest and identified the number of test bores it intends to drill. The commenter also requests information regarding any response that the USFS may have provided the Authority regarding this issue. In 2016, the Authority conducted a preliminary geotechnical investigation of drilling six bore holes to collect data for evaluating tunnel feasibility and subsurface conditions within the ANF. The investigation was not conducted for any specific tunnel alignment, but rather to identify and evaluate field conditions (such as, groundwater, situ rock stresses, adverse geology including faults, gouge zones, and squeezing ground) within the ANF that could present feasibility constraints for tunnel design and construction. This preliminary investigation showed that the alignment alternatives are feasible. The Authority understands that tunnel construction could potentially affect groundwater conditions. The project tunnel alignments would be designed and constructed in compliance with CAHSRA Technical memoranda (TM) requirements (TM 2.4.2 Basic High-Speed Train Tunnel Configuration, TM 2.4.5 High-Speed Train Tunnel Structures, and TM 2.4.6 High-Speed Train Tunnel Portal Facilities, and other relevant TMs) which directs the incorporation of engineering design features to avoid and minimize these risks. The USFS is a Cooperating Agency under NEPA, and the Authority has consulted with the USFS about the need to conduct additional test drilling within the ANF. Section 3.8, Hydrology and Water Resources, discusses that the Authority will conduct additional test borings. Once a preferred alignment is approved, the additional geological and geotechnical investigations (test borings) would occur during the final design stage prior to construction. A Special Use Authorization (SUA) from the USFS will be required prior to conducting these additional geotechnical investigations within the ANF. The estimated number, type and depth of explorations will depend on the design features and will be determined as the design progresses, in consultation with the USFS. Geotechnical borings would be converted to piezometers or fitted with vibrating pressure transducers for measuring water pressure changes along the alignment to establish seasonal baseline conditions for deep groundwater and near surface water. Such instrumentation would also be used as the early warning system for pressure changes occurring in the subsurface along the alignment during tunnel construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9487

The commenter asks why the Authority did not include the impacts related to additional geotechnical borings in the Draft EIR/EIS. The Draft EIR/EIS, Section 2.9.4.1, discloses that additional geotechnical borings will be required prior to construction to inform final design and construction methods, and describes the anticipated scope, duration, and broadly explains the anticipated environmental effects of the investigations. The Draft EIR/EIS, Section 2.9.4.1 notes that “These geotechnical investigations may result in additional environmental effects such as emissions and fugitive dust from construction equipment, noise, temporary road closures or traffic delays, mobilization of extant hazardous materials or wastes, and impacts on biological and cultural resources.” The Draft EIR/EIS also describes that the Authority has committed to integrate programmatic geotechnical investigation specific IAMF’s to minimize the risk of affecting sensitive environmental resources such as habitat or aquatic resources, to the extent feasible. The detailed plan for additional geotechnical borings will be developed during the project design phase. Programmatic IAMFs protecting biological resources would include 1) selection of geotechnical investigation sites that would avoid placing access roads or staging areas in or in proximity (within 50 feet) of streams, 2) selection of sites that would avoid placing access roads or staging areas in sensitive habitat areas, 3) avoidance of vegetation removal in sensitive habitat areas to the extent feasible, and 4) for investigation sites that would be in the ANF, including the SGMNM, additional coordination with the USFWS to obtain modified or additional permits or approvals. Implementation of BIO-IAMF#1, BIO-IAMF#2, BIO-IAMF#3, and BIO-IAMF#5 through BIOIAMF# 11 (described in Section 3.7.4.2) will also ensure that measures are applied in a timely manner, that the Palmdale to Burbank Project Section site and construction activities comply with all regulatory procedures intended to avoid and minimize impacts on applicable resources, and that biological resources are appropriately identified and preserved, to the extent feasible.

### 4494-9488

The commenter presumes that test bores would also be required for Routes E1, E1A, E2, and E2A. The commenter also asks whether USFS policies regarding permission to drill test bores in the SGMNM for E1, E1A, E2, and E2A Build Alternatives would differ than those for the areas of the ANF that are not within the SGMNM boundaries. In 2016 the Authority conducted a preliminary geotechnical investigation evaluating geology and geologic hazards, and drilling six bore holes to collect subsurface data for evaluating tunnel feasibility and subsurface conditions, within the ANF, including areas within the SGMNM. The investigation was not conducted for any specific tunnel alignment, but rather to identify and evaluate field conditions (such as, groundwater, situ rock stresses, adverse geology including faults, gouge zones, and squeezing ground) within the ANF that could present feasibility constraints for tunnel design and construction. This preliminary investigation demonstrated that all of the Build Alternative alignments are feasible (practicable). The USFS is a Cooperating Agency under NEPA, and the Authority has consulted with the USFS about the need to conduct additional test drilling within the ANF. Section 3.8, Hydrology and Water Resources, and HWR-MM#1 state that the Authority will conduct additional test borings. Once a preferred alignment is approved, the extent of additional borings and explorations will be determined by the Authority and proposed to the USFS. Additional geological investigation would occur during final design prior to construction. Further testing for the E1, E1A, E2, and E2A Build Alternatives would only occur if one of these alternatives was the selected alternatives alignment. Geotechnical borings would be converted to piezometers or fitted with vibrating pressure transducers for measuring water pressure changes along the alignment to establish seasonal baseline conditions for deep groundwater and near surface water. Such instrumentation would also be used as the early warning system for pressure changes occurring in the subsurface along the alignment during tunnel construction. The San Gabriel Mountains National Monument Management Plan does not explicitly provide direction regarding the drilling bore holes, however, the Authority will continue to coordinate with USFS on additional testing and will comply with applicable policies, regulations, and laws associated with the ANF and the national monument designation.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9489**

The commenter inquires about what results from the future test bores that could render the chosen alignment to be impracticable and if such results are yielded, what happens next? Based on available information and the results of preliminary geotechnical investigations conducted during development of EIR/EIS, it is not anticipated that future borings (geotechnical investigations) would render the Build Alternative alignments as impracticable. However, it is possible that future investigations could result in additional data requiring application of specific design features and/or construction techniques or modification of portions of Project alignment or features to reduce impacts or improve cost efficiencies. The Authority will perform comprehensive geotechnical investigations for the Preferred Alignment during the design phase to further evaluate field conditions (such as, groundwater pressures, in situ rock stresses and adverse geology). These risks and impacts were analyzed in Section 3.9, Geology, Soils, Seismicity and Paleontological Resources, specifically listed in Draft EIR/EIS Section 3.9.6.1 (see Impacts GSSP#1 through GSSP#16). These risks and impacts are addressed by GEO-IAMF#1 and GEO-IAMF#10 that would require prior to construction that the Contractor prepare a Construction Management Plan (CMP) addressing how the Contractor will address geologic constraints and minimize or avoid impacts to geologic hazards during construction, as identified in Impacts GSSP#1 through GSSP#16. The CMP will be submitted to the Authority for review and approval. The Project would be constructed consistent with engineering design features to address and minimize the impacts. These risks and impacts are addressed by the Authority's use of state-of-the-art design features and construction methods to avoid and minimize impacts. If the results of additional, future geotechnical investigations indicate the necessity for any significant changes to the Project, the Authority would address these concerns by assessing whether modifications to the Project would resolve the concerns and conducting any required further environmental review under CEQA and NEPA.

### **4494-9490**

The commenter questions the accuracy of the cost estimates due to the limited number of test borings. A geotechnical profile has been prepared based on existing and available geological and geotechnical information, as well as the specific test borings conducted along the alternatives. Tunnel design and construction methods of the Build Alternatives have been proposed consistently with the geotechnical profile. Bill of quantities and cost estimations are based on these design and construction methods.

### **4494-9491**

The commenter is concerned about the ability of the TBM to withstand water pressures above 30 bar. TBMs are capable of operating in areas with pressures above 30 bar when other boring techniques, such as pre-excitation grouting, are applied. These techniques provide for a reduction of pressures on the TBM. Pre-excitation grouting can be performed from a TBM with built-in capability including grout ports through the TBM cutter-head and through the shield. Where groundwater is present, HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 will be implemented to control the volume of groundwater inflow into the tunnel. There are many other success examples of base tunnels with high groundwater pressures and tunneling through fault zones. Please refer to Response to Comment #9457 regarding examples of successful use of TBMs in similar conditions to the Palmdale to Burbank Project Section.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9492

The commenter summarizes project impacts on hydrological and aquatic resources and inquired about the reasoning behind the CEQA conclusion reached.

The commenter is correct that the project could result in a permanent alteration of drainage patterns from aboveground temporary construction activities and permanent structures required for the Build Alternatives. As explained in Impact HYD#1 in Section 3.8, Hydrology and Water Resources, of the Draft EIR/EIS, the placement of fill or removal of material in surface water channels during construction would permanently modify channel capacity and water flow height and increase erosion and sedimentation potential by redirecting water flow. Grading and earthmoving would alter upland topography, which could directly influence the direction and timing of stormwater flow toward receiving waters. Construction activities within the surface water channel could result in water diversion, or dewatering could be required to install these facilities, representing a direct temporary impact on surface water hydrology during the construction period. Trackway, viaduct abutments, traction power substations, roadway/railway modifications, access roads, station areas, construction staging areas, utility lines, power lines, and drainage facilities would require grading adjacent to surface waters, which would temporarily increase erosion impacts and permanently modify stormwater drainage. Impacts related to construction staging areas would be temporary because these areas would be restored to preconstruction topography following construction activities. Drainage facilities would be specifically designed to convey stormwater runoff, which would result in minimal direct drainage impacts related to these facilities. The project will incorporate several impact avoidance and minimization features (IAMFs) that would minimize these impacts. The construction-period Storm Water Pollution Prevention Plan (HYD-IAMF#3) will incorporate best management practices to reduce short-term increases in construction-site runoff, and the stormwater management and treatment plan (HYD-IAMF#1) will address stormwater runoff and system capacity. HYD-IAMF#2 will require water crossings to maintain preconstruction hydraulic capacity. Refer to the full text of these IAMFs in Appendix 2-E, Impact Avoidance and Minimization Features, for a list of the potential best management practices that would be employed to minimize potential short-term increases in sediment transport caused by construction, including erosion control requirements, stormwater management, and channel dewatering for affected stream crossings. With implementation of these IAMFs as part of the project, construction of the Build

### 4494-9492

Alternatives would not substantially alter the existing drainage pattern of the site or area, including the alteration of the course of a stream or river, or through the addition of impervious surface, in a manner that would: result in substantial erosion or siltation on- or off-site, substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site, or create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems. As a result, this project would result in a less than significant impact under CEQA and would not warrant mitigation.

### 4494-9493

The commenter asks about coordination with the Antelope Valley Watermaster. The Authority has consulted during preparation of its EIR/EIS with AVEK as to both the water needs of the project as well as effects on AVEK infrastructure. In addition AVEK has reviewed and provided comment on the Draft EIR/EIS, and the Authority will continue to coordinate with AVEK during the detail design phase.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9494**

The commenter asserts that the project will impact between 78 and 93 surface water crossings and asks if the Authority has coordinated with the Upper Los Angeles River Area Watermaster. As described in Section 3.8.2.3, the ULARA Watermaster is responsible for managing the watershed and tributaries of the Los Angeles River and four groundwater basins including the San Fernando, Sylmar, Verdugo, and Eagle Rock Groundwater Basins above a point in the river designated by Los Angeles County Public Works. The ULARA Watermaster is also responsible for managing the groundwater quality of these groundwater basins including managing the groundwater contamination within the San Fernando Superfund Site. With respect to the project's impacts on surface water, the Build Alternatives would only cross two waterbodies -- the Tujunga Wash (includes Hansen Spreading Grounds) and Big Tujunga Wash within the ULARA jurisdictional boundaries. As described in Section 3.08 Hydrology and Water Quality, the Authority has outlined several Impact Avoidance and Minimization Features (IAMFs) that focus on protection of groundwater resources and stormwater run-off during construction. These IAMFs include HYD-IAMF#1: Stormwater Management, which details the preparation and implementation of a stormwater management and treatment plan and provides examples of the LID techniques that will be used to detain stormwater runoff on site, and HYD-IAMF#3: Prepare and Implement a Construction Stormwater Pollution Prevention Plan (SWPPP) which details preparation and implementation of a SWPPP which will include BMPs to minimize potential short-term increases in sediment transport caused by construction, including erosion control requirements, stormwater management, and channel dewatering for affected stream crossings. Additionally, Section 3.8.7 of the Final EIR/EIS requires Mitigation Measure HWR-MM#1 (Minimize Construction-period Water Quality Impacts Associated with Tunnel Construction) to be implemented. HWR-MM#1 provides additional measures pertaining to groundwater monitoring during tunnel construction and, if necessary, isolation of groundwater to prevent contamination. HWR-MM#1 would also include treatment of the water in the event of contamination. Furthermore, HMW-IAMF#11: Stakeholder Consultation for the San Fernando Valley Groundwater Basin Superfund Site, has been added to the Final EIR/EIS in Section 3.10, Hazardous Materials and Wastes as well as in Appendix 2-E. This IAMF includes the provision that groundwater extractions from ULARA are reported to the ULARA Watermaster, and to the City of Los Angeles (via the Los Angeles Department of Water and Power). This provision is included because the ULARA Watermaster is responsible for managing groundwater quality in the San Fernando

### **4494-9494**

Superfund site and would require coordination if groundwater exactions in the San Fernando Groundwater Basin Superfund site were to occur. However, groundwater from the San Fernando Groundwater Basin Superfund Site will not be used as a source of water for the construction and operation of the HSR. If groundwater within the ULARA managed basins is encountered during construction, then notification in accordance with ULARA requirements would be conducted. Additionally, the Authority will utilize construction techniques to reduce the potential for groundwater to enter the tunnels and underground alignment and facilities during construction. These construction techniques are detailed in HYD-IAMF#5: Tunnel Boring Machine Design and Features, HYD-IAMF#6: Tunnel Lining Systems and HYD-IAMF#7: Grouting. Pursuant to the requirements of CEQA and NEPA, the Authority has conducted an extensive public and agency involvement program as part of the environmental review process, which is documented in the Draft EIR/EIS Chapter 9, Public and Agency Involvement. Although no meetings have been documented with the Upper Los Angeles River Area Watermaster to date, the Authority has conducted several meetings with the Los Angeles River Cooperation Committee, which include representatives from the City of Los Angeles, Los Angeles County Flood Control District, Los Angeles Department of Water and Power, and USACE.

### **4494-9495**

The commenter is concerned about the risks of the Build Alternatives. As noted by the commenter, the EIR/EIS discloses various potential impacts to water resources that could occur with implementation of the project and that with implementation of mitigation measures included in the EIR/EIS, these impacts would be reduced to a less-than-significant level. The commenter then goes on to present a risk/reward argument for selection of the No Project alternative. Chapter 8 of the Draft EIR/EIS presents the Authority's identification of the Preferred Alternative the agency believes would fulfill its statutory mission and responsibilities by giving consideration to economic, environmental, technical, and other factors. The Authority will ultimately make a final decision among alternatives based on the project's benefits and the environmental impacts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9496**

The commenter provides an excerpt from the Draft EIR/EIS (page 3.8-46) related to impermeable surfaces from the Build Alternatives impeding surface water infiltration and affecting groundwater recharge. The commenter also notes that in the Draft EIR/EIS, the Authority explains that groundwater may be depleted by tunneling and could impact groundwater basins. Finally, the commenter indicates that the Authority minimizes the importance of groundwater basins by explaining that they are not listed as medium or high priority groundwater basins and that no applicable groundwater sustainability plans have been adopted for the basins. As required by CEQA, one of the thresholds to determine whether there could be a significant impact is to consider whether a project could "conflict with or obstruct the implementation of a water quality control plan or a sustainable groundwater management plan" as identified in Section 3.8.4.4 in Section 3.8, Hydrology and Water Resources. As explained on page 3.8-6 of the Draft EIR/EIS, the Sustainable Groundwater Management Act (SGMA) has resulted in each groundwater basin having a priority classification. SGMA requires that local agencies form Groundwater Sustainability Agencies tasked with establishing sustainable groundwater management plans for medium- and high-priority groundwater basins. The purpose of the Draft EIR/EIS indicating the priority status of the groundwater basins in the project area is to provide the appropriate regulatory and environmental setting and to comply with CEQA requirements. The purpose is not to minimize the importance of the groundwater basins but rather to relate the facts, as required by CEQA. The Authority recognizes the importance of all groundwater basins (i.e., Antelope Valley basin, Santa Clara River Valley East Sub-basin, Acton Valley basin, and San Fernando Valley basin) regardless of priority classification. The Draft EIR/EIS includes a robust analysis of the potential impacts on these groundwater basins. The excerpt provided by the commenter is just the very beginning of the Authority's analysis. What follows that excerpt on page 4.8-46 is an analysis of the potential impacts to the groundwater basins in question. Impacts are analyzed in detail in Section 3.8, Hydrology and Water Resources, specifically in Impact HWR#4 (Changes in Groundwater Recharge Associated with Temporary Construction Activities and Permanent Structures Required for the Build Alternatives). Risks and impacts are addressed by the Authority's use of state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources. These include the use of permeable ballast and sub-ballast trackway materials for aboveground and at grade alignment profiles that would allow stormwater to percolate through the trackway into the groundwater basin. New impervious surfaces

### **4494-9496**

would include drainage infrastructure designed to redirect upstream runoff and capture stormwater for local discharge, thus minimizing permanent impacts on groundwater recharge. The Authority has also identified mitigation measure HWR-MM#3 to prevent the net loss of groundwater recharge from impacts on the Hansen Spreading Grounds. As explained in Impact HWR#4, the impacts on groundwater recharge would be less than significant with mitigation.

### **4494-9497**

The commenter provides an overview of the important role that the Hansen Dam Spreading Grounds play in capturing and storing water for the region. The commenter is concerned that new impervious surfaces that the project will add to the spreading grounds, which could reduce groundwater recharge capacity.

The Refined SR14, SR14A, E1, and E1A Build Alternatives alignments would cross the Hansen Dam Spreading Grounds. The Hansen Dam Spreading Grounds consist of a groundwater recharge facility where water percolates into the groundwater basin below. Creation of new impervious surfaces within the Hansen Spreading Grounds could interfere with groundwater recharge in the San Fernando Groundwater Basin because the HSR guideway would be placed on embankment that would displace surface area. This would create an associated loss of groundwater recharge capacity. Impacts on groundwater recharge could lead to the reduction of ground water resources over time if they reduce the amount of water that can infiltrate into the groundwater basin below. As discussed in Section 3.8.7, Mitigation Measures in Section 3.8, Hydrology and Water Resources of this Final EIR/EIS, HWR-MM#3 requires the Authority to provide replacement groundwater recharge areas to ensure there is no net loss in recharge area capacity. With implementation of HWR-MM#3, the groundwater recharge function and capacity of the Spreading Grounds would not substantially change.

### **4494-9498**

The commenter provided information from the article "Groundwater Recharge, Retention & Pollution," Comment has been noted.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9499

The commenter provided links to various articles. Comment has been noted.

### 4494-9500

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF, PB-Response-PUE-3: Water Demand and Usage.

The commenter provides a quote from the Sierra Club indicating the importance of protecting open space in the urban fringe above Hansen Dam to protect groundwater resources. The commenter indicates the importance of groundwater resources and states that the Authority proposes to pollute, reduce, and reduce the potential for recharge for groundwater resources. Regarding the commenter's first comment about the importance of protecting open space in the urban fringe above the Hansen Dam, the Refined SR14, SR14A, E1, and E1A Build Alternatives would cross the Hansen Dam Spreading Grounds. The Hansen Dam Spreading Grounds consist of a groundwater recharge facility where the Los Angeles County Flood Control District applies water within basins, which then percolates into the groundwater basin below. Creation of new impervious surfaces within the Spreading Grounds could interfere with groundwater recharge in the San Fernando Groundwater Basin because the HSR guideway would be placed on embankment that would displace surface area. This would create an associated loss of groundwater recharge capacity. Impacts on groundwater recharge could lead to the reduction of ground water resources over time if they reduce the amount of water that can infiltrate into the groundwater basin below. As discussed in Section 3.8.7, Mitigation Measures, in this Final EIR/EIS, HWR-MM#3 requires the Authority to provide replacement groundwater recharge areas. The preliminary engineering project design drawings include culverts that would be placed under the HSR berms located at the Hansen Spreading Grounds which would convey water between the spreading grounds ponds and allow water to reach the existing outfall. With implementation of HWR-MM#3, the groundwater recharge function, operation and capacity of the Spreading Grounds would not change substantially.

With respect to the assertion that the Authority proposes to pollute, reduce, and reduce the recharge of groundwater resources, the Authority does not propose these things. The Authority is proposing the construction of the HSR Palmdale to Burbank Project Section and has identified potential impacts on groundwater that would be avoided and minimized with the implementation of IAMFs and any remaining impact would be less

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9500

than significant with the implementation mitigation measures.

Regarding the potential for pollution of groundwater, the Draft EIR/EIS considered the potential impacts on groundwater quality from both construction and operation of the HSR Palmdale to Burbank Section. Impact HWR#2 in Section 3.8, Hydrology and Water Resources of the Draft EIR/EIS identified the potential impacts from construction on groundwater quality and identified that HWR-MM#1 will require the Authority to treat potential groundwater contamination pursuant to RWQCB permit requirements; that through treatment of groundwater and installation of groundwater barriers (where necessary), application of this mitigation measure would prevent degradation of groundwater quality; and that with implementation of HWR-MM#1, the Build Alternatives would not violate standards for groundwater quality or otherwise substantially degrade groundwater quality, and this impact would be less than significant for the Refined SR14, SR14A, E1, E1A, E2, and E2A Build Alternatives.

Impact HWR#6 in Section 3.8, Hydrology and Water Resources of the Draft EIR/EIS identified the potential impacts from operation on groundwater quality and identified that per HMW-IAMF#9 and HMW-IAMF#10, the Authority will prepare hazardous materials monitoring plans and would, to the extent feasible, limit the use of hazardous substances utilized during operations; that HYD-IAMF#1 and HYD-IAMF#4 will provide the control and treatment of stormwater runoff throughout operations of the Palmdale to Burbank Project Section, prior to discharge; and that with implementation of these IAMFs, operations of each of the six Build Alternatives would not violate water quality standards or WDRs or otherwise substantially degrade surface or groundwater quality. Regarding the potential to reduce groundwater resources and reduce the recharge of groundwater resources, please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which identifies the sources of water for the project and that the Project would not directly use groundwater and that any indirect use of groundwater (from AVEK, which includes groundwater as one of its sources) would not affect sustainable groundwater management or the ability of residents that receive water from AVEK. Please also refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, which identifies the potential impacts on groundwater resources within the ANF and how those impacts would be avoided and minimized and mitigated to a less than

### 4494-9500

significant level. Please also refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF, which identifies the IAMFs that would minimize groundwater seepage.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9501

The commenter reiterates that the Draft EIR/EIS states that there is insufficient groundwater information available at this time to identify where tunnels would be located in relationship to the water table. The commenter also questions whether the Authority has sufficient information regarding groundwater resources to determine whether tunnel construction would be feasible.

Potential impacts on groundwater during construction in the Antelope Valley Groundwater Basin are discussed under Impact HWR#4 (Changes in Groundwater Recharge Associated with Temporary Construction Activities and Permanent Structures Required for the Build Alternatives), under the sub-header for Groundwater Recharge Impacts from Tunnel Construction (see page 3.8-47). As described in the impact discussion, the tunnels would be constructed at depths in the Antelope Valley Groundwater Basin substantially shallower than they would be to the south in the Angeles National Forest (ANF) and would therefore not be subject to high water pressures. The primary issues associated with tunneling in the Antelope Valley Groundwater Basin is the tunnel depth relative to the groundwater table and tunneling through alluvial soils. When tunnel depth is above the known groundwater table, effects on groundwater and groundwater dependent resources would be minimal to none. Within the Antelope Valley Groundwater Basin, tunneling activities required for each of the six Build Alternatives could encounter shallow groundwater as reported in Table 3.8-5 in Section 3.8.5.5 of the Draft EIR/EIS. However, the potential for local water inflows associated with shallow groundwater would be largely avoided through the implementation of the IAMFs described below, and groundwater inflow impacts from tunnel construction would be minimal, temporary, and less than significant.

Under the conditions that would be encountered in the Antelope Valley Groundwater Basin, existing tunnel technology would ensure that construction of the tunnels would be feasible. Implementation of HYD-IAMF#5 (Tunnel Boring Machine Design and Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting) would ensure the Authority's commitment to tunnel construction methods avoid and minimize groundwater seepage into tunnels, including Tunnel Boring Machine (TBM) specifications tailored to avoid and minimize the potential for seepage into tunnel cavities to occur. HYD-IAMF#6 (Tunnel Lining Systems) would employ different types of tunnel system lining that would be used under varying circumstances, including

### 4494-9501

circumstances where risk of seepage into tunnel cavities is moderate or high. Additionally, HYD-IAMF#7 (Grouting) would employ various methods and approaches to grouting that would be used to avoid and minimize seepage into tunnel cavities. Where groundwater is present, the above-mentioned IAMFs (HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7) will be implemented to minimize or avoid groundwater inflow into the tunnel. The tunnel lining system is also important in controlling water flows during construction and would consist of a single-pass lining system in areas such as the Antelope Valley Groundwater Basin where water pressures are expected to be relatively low. Studies and investigations completed to date provide sufficient information to support the conclusion that groundwater pressures within the Antelope Valley Groundwater Basin would be relatively low and that tunneling with implementation of the IAMFs noted above would be feasible.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9502

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter questions whether the Authority has conducted sufficient tests and studies to determine whether tunnel construction necessary for the Project would be feasible, particularly if such tests and studies indicated that water pressures exceed 60 bar. Please refer to Standard Response-PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, for additional discussion of high-risk areas that may be encountered including areas with water pressure above 25 bar. The general geologic, geotechnical, and surface water resources of the Angeles National Forest (ANF) were also investigated by the Authority for a feasibility study of tunneling (Authority 2019a). Tunneling in the ANF was subject to more focused analysis in part because the conditions in the ANF are substantially different than those outside the ANF. The local geology of the tunnel construction RSA is complex due to multiple stages of metamorphism, igneous intrusion, tectonic rotation, and subsequent uplift and faulting of the area over the past 1.7 billion years. The geology of the San Gabriel Mountains has been mapped by the California Geological Survey (Campbell et al. 2014) and the U.S. Geological Survey (Yerkes and Campbell 2005). Data collected during the geotechnical investigations (Authority 2019a) provide supporting evidence of the trends believed to characterize the groundwater system(s) where the tunnel alignments are located. In High-Risk Areas, which are zones associated with tunnels intersecting areas with faults and high hydrostatic pressure, groundwater inflow into the tunnels would likely occur during construction. Groundwater seepage into tunnel structures during construction could affect water levels of streams, springs, and wells reliant on the affected groundwater aquifers. The extent to which groundwater drains into tunnel structures depends on the tunnel lining system's ability to resist hydrostatic pressures. Certain approaches to tunnel construction (e.g., two-pass tunnel linings) are designed to withstand higher hydrostatic pressure at greater depths. Tunnels can be constructed at the 60-bar level of pressure. Tunnel boring machines (TBMs) are capable of operating in areas with high water pressures, even above 60 bar, when other boring techniques, such as pre-excavation grouting, are applied. These techniques provide for a reduction of pressures on the TBM. Where groundwater is present, HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 will be implemented to dissipate the pressure on the TBM and to control the volume of groundwater inflow into

### 4494-9502

the tunnel. Pre-excavation grouting creates a permanent strengthened very low permeability circular crown around the TBM that takes on the water pressure. The potential high water pressure is therefore borne by the improved ground, and not by the TBM. Pre-excavation grouting can be performed from a TBM with built-in grouting capability, which generally includes grout ports in the cutter-head and the shield. Grouting will also allow for tunnel boring through problematic geological formations and unexpected faults. Examples of tunnel projects constructed under high groundwater pressure conditions using TBMs include: St. Gotthard (200 bar measured), and Lötschberg (110 bar measured locally). On the St. Gotthard Tunnel, approximately 28 miles of the tunnel were excavated with TBM. The groundwater pressure expected required a suitable pre-investigation campaign and probe drillings through the TBM cutterhead. A waterproofing system with sheet membrane and concrete lining was installed along the entire tunnel length. On the Lötschberg Tunnel, approximately 6 miles of the tunnel was excavated with TBM. A leakproofing ring with sealing injections around the tunnel was constructed. Two different drilling and injection rings, each with about 20 boreholes, were planned around the tunnel. The second ring was implemented in its entirety only if the desired results were not achieved after injecting the previous ring. The possibility of arranging a third ring was also available. For these examples, exploration and pre-excavation grouting ahead of the excavation face have been a constant in all alpine tunnels dating back to 1994 (Lötschberg base tunnel). While the expected maximum groundwater pressures in the PB tunnels are lower than in the provided international examples, these examples are relevant to show even larger pressures can be managed successfully for a tunnel of this size, applying measures such as exploration and grouting ahead of the excavation phase. The Authority will commit to using similar construction methods where applicable. HYD-IAMF#6 requires the installation of a single segmental, precast, concrete lining with bolted and gasketed joints in circumstances where groundwater pressures are 25 bar or less, which will create a tunnel lining capable of resisting the groundwater pressure with minimal leakage, if any. In sections where groundwater pressures are above 25 bar, a second lining will be put in place to ensure that the tunnels are watertight over time. However, seepage may occur temporarily under high pressure conditions between the time of boring and the installation of the first pass lining. Several grouting methods will be used during the construction of the tunnels to avoid and minimize groundwater flows into the tunnels, including pre-excavation grouting, backfill grouting with two-component grout,

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9502**

and check grouting. In the event that the groundwater or surface aquatic resources are adversely impacted, the Authority will implement an Adaptive Management and Monitoring Plan (AMMP) as required by mitigation measure HWR-MM#4. The AMMP would be implemented throughout the tunnel construction RSA. HWR-MM#4 requires that the AMMP include monitoring protocols to establish baseline conditions of surface water resources and to detect changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial measures. The purpose of the AMMP is to ensure that adverse effects on subsurface and surface water resources and associated habitat within the ANF caused by tunnel construction activities are identified and that appropriate responses to address those effects are expeditiously implemented. This AMMP involves a multi-step iterative process to comply with U.S. Forest Service (USFS) standards, which include remedial measures. The remedial measures include actions such as establishing adaptive management triggers for each water resource being monitored, implementation of compensatory mitigation for each affected water resource, and the minimization of effects on water resources-associated species as a result of tunnel construction. For a full list of USFS standards for remedial measures, see Appendix 3.8-C, Adaptive Management and Monitoring Plan for Potential Hydrologic Effects within the Angeles National Forest.

### **4494-9503**

The commenter requests clarification on who will be conducting the additional site-specific geotechnical and hydrogeological studies discussed in the Draft EIR/EIS Section 3.8, Hydrology and Water Resources. The Authority would procure a qualified contractor to conduct site-specific geotechnical and hydrogeological studies during the final design process for the Selected Alternative. These studies would be performed under the oversight of Authority staff.

### **4494-9504**

Please refer to the response to submission 4494-9504, which addresses the feasibility of the Build Alternatives.

### **4494-9505**

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding. The commenter asks how the Authority can provide a cost estimate, given that additional studies will need to be conducted. Please see standard response PB-Response-GEN-2: Project Costs and Funding Overruns that discusses how the cost estimates were developed and why the Authority believes they are reasonably accurate. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### **4494-9506**

The commenter accurately summarizes part of the monitoring and recovery plans included in the EIR/EIS (an Adaptive Management and Monitoring Plan (AMMP) as required by mitigation measure HWR-MM#4). The commenter goes on to say that it would prefer that the project not cause to damage naturally-occurring water sources in the first place. The Authority, by proposing to tunnel under the ANF and well as through much of the project area, is doing so as a way to avoid surface impacts to resources such as naturally-occurring water sources. The Authority expects that surface impacts, if they were to occur, could be isolated to specific areas as noted in its analysis. If such impacts were to occur, the Authority believes the AMMP includes feasible and reasonable measures to address the impacts. Chapter 8 of the Draft EIR/EIS describes how the Authority identified the Preferred Alternative the agency believes would fulfill its statutory mission and responsibilities by giving consideration to economic, environmental, technical, and other factors. The Authority will ultimately make a final decision among alternatives based on the project's benefits and the environmental impacts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9507

The commenter accurately quotes a passage of Section 3.8, Hydrology and Water Resources, in the Draft EIR/EIS and then asserts that the Authority's approval of projects with preliminary design has been "an abject failure." The Authority rejects the commenter's assertion. Neither CEQA nor NEPA requires a final design or even near-final design as a prerequisite for environmental analysis. The use of a preliminary level of engineering design is common in large transportation infrastructure projects, particularly design-build projects, where the environmental analysis process occurs before completion of final engineering design, and indeed helps decisionmakers finalize a design. The Draft EIR/EIS includes a thorough description of the project alternatives, including information regarding all of the project components at a level of detail needed to identify and disclose environmental impacts, consistent with CEQA and NEPA requirements. The commenter asserts that the preliminary level of design in the Central Valley resulted in cost overruns, unnecessary acquisition of private property through eminent domain, and design modifications. While the Authority disagrees with this characterization of the construction in the Central Valley, the Authority is committed to applying lessons learned from construction in the Central Valley to deliver the project while managing risk. Please refer to the Authority's 2023 Project Update Report (available: <https://hsr.ca.gov/about/project-update-reports/2023-project-update-report/>) and the Authority's 2022 Business Plan (<https://hsr.ca.gov/about/high-speed-rail-business-plans/2022-business-plan/#>) for additional information regarding the construction progress in the Central Valley and the lessons learned that will be applied to future construction packages.

### 4494-9508

The commenter asks whether it would be preferable to research the necessary factors ahead of time in order to conclude whether or not the preferred alignment is feasible. The Authority in conducting its preliminary engineering, environmental studies under CEQA and NEPA, and cost estimating, believes the project as currently proposed is feasible. Please refer to the documentation in the Draft EIR/EIS, which includes the information that the Authority has gathered for the project's feasibility.

### 4494-9509

The commenter is concerned about the gaps in available data surrounding issues with geological, hydrogeological, and hydrological conditions for the Build Alternatives. In 2016 the Authority conducted a preliminary geotechnical investigation of evaluating the area's geology and geologic hazards, including drilling six bore holes to collect subsurface data for evaluating tunnel feasibility and subsurface conditions within the ANF. The investigation was conducted to identify and evaluate field conditions (such as, groundwater, situ rock stresses, adverse geology including faults, gouge zones, and squeezing ground) within the ANF that could present feasibility constraints for tunnel design and construction. This preliminary investigation is sufficient for the purpose of environmental review and to demonstrate that the construction and operation of all of the Build Alternative alignments would be feasible. The analysis of hydrogeologic effects is not limited to solely the geotechnical cores that were drilled. The analysis relies on extensive existing data that is available on the faults, geology and groundwater within the San Gabriel Mountain range and throughout the project area. This existing data, along with data from the core samples and ongoing monitoring within the ANF informed the analysis. Project feasibility based on the geotechnical investigation's findings is also addressed in Section 3.8.8.6 (Hydrology and Hydrogeology in the ANF), page 3.8-78, and Section 3.9.4.3 (Methods for NEPA and CEQA Analysis), page 3.9-10.

The data presented in the Draft EIR/EIS is sufficient for the purpose of environmental review under CEQA and NEPA. Additional, more detailed geological investigation will occur before final design and construction. For instance, several hundred borings, CPTs, fault trenches and geophysical surveys are planned for the Preferred Alternative.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9510

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding. The commenter expressed concern that the Authority does not have enough geologic, hydrogeologic, and hydrologic information to make a decision about the feasibility of completing the Build Alternative tunnels, and that for this reason the cost estimates for the Palmdale to Burbank Project Section reported in the 2022 Business Plan may be unrealistic. With respect to the feasibility the Build Alternatives, as explained in Section 3.8, Hydrology and Water Resources, the Authority conducted a preliminary geotechnical investigation in 2016 of drilling six bore holes to collect data for evaluating tunnel feasibility and subsurface conditions within the ANF. The investigation was not conducted for any specific tunnel alignment, but rather to identify and evaluate field conditions (such as, groundwater, situ rock stresses, adverse geology including faults, gouge zones, and squeezing ground) within the ANF that could present feasibility constraints for tunnel design and construction. This preliminary investigation indicated that the alignment alternatives are technically feasible. Additional geotechnical investigations and studies during the design and pre-construction phases of the project will supplement this existing information and will further inform the final design of the Selected Alternative. With respect to the project costs, please refer to Standard Response PB-Response-GEN-2: Project Costs and Funding. As explained in the standard response, at this stage of preliminary design, the capital cost estimates include contingencies to account for changes in material costs and changes during project design.

### 4494-9511

The commenter requested further information regarding the Adaptive Management and Monitoring Plan (HWR-MM#4), and the efficacy of addressing unforeseeable hydrological effects resulting from changes in hydrogeological conditions. The AMMP is designed to provide the basis for adaptive responses to be developed to respond to changing circumstances. The flexibility inherent in the AMMP allows for foreseeable impacts and, in many cases, unforeseeable impacts to be effectively addressed. Among its provisions, the AMMP establishes ongoing reporting and monitoring requirements to enable detection and timely remediation of effects on hydrological resources that may occur, including impacts that are considered unforeseeable at the time of this analysis.

### 4494-9512

The commenter is concerned with groundwater resources in the basins and mountains being adversely affected by tunnel construction. The Authority understands that tunnel construction in the ANF may result in impacts to groundwater and surface aquatic resources. The project tunnel alignments would be constructed consistent with engineering design features to avoid and minimize these risks. These potential impacts are analyzed in detail in Section 3.8.6.3 of the Draft EIR/EIS, specifically in Impact HWR#4 (Changes in Groundwater Recharge Associated with Temporary Construction Activities and Permanent Structures Required for the Build Alternatives) and HWR#5 (Changes in Hydrogeologic Conditions Associated with Tunnel Construction Beneath the ANF which May Affect Surface and Subsurface Water Resources). These potential impacts are addressed by the Authority's use of state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, including through the use of tunnel boring machines (TBMs) with features to reduce or prevent inflows and grouting and tunnel-lining approaches that have proven effective at controlling water seepage. These measures are identified in HYD-IAMF#5 (TBM Design Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting). HYD-IAMF#5 would use closed-mode operations to effectively prevent water seepage from occurring at the TBM cutterhead area, with ports for drilling horizontal probe holes through the TBM cutterhead, and angled probe holes through the TBM shields. These holes will allow for water pressures and flow rates to be measured ahead of the TBM, and further allow for pre-excavation grouting ahead of the TBM to cut-off groundwater inflows into the tunnel. HYD-IAMF#6 will consist of segmental, precast, concrete lining with bolted and gasketed joints, creating a tunnel lining capable of resisting the groundwater pressure with minimal leakage in circumstances where groundwater pressures are 25 bar or less. In sections where groundwater pressures are above 25 bar, a second lining has been put in place to ensure that the tunnels are effectively watertight over time. Several grouting methods will be used during the construction of the tunnels to avoid and minimize groundwater flows into the tunnels, including pre-excavation grouting, backfill grouting with two-component grout, and check grouting (refer to Appendix 2.0-E of the Palmdale to Burbank Project Section Draft EIR/EIS for further descriptions of IAMFs that will be implemented as part of the project, including HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7). In the event that groundwater and/or water wells are adversely impacted, the Authority will implement an Adaptive Management and Monitoring Plan (AMMP) as required by mitigation measure HWR-

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9512

MM#4. The AMMP includes provisions for augmenting water supplies for wells and actions to restore affected resources, if necessary. The AMMP will require the implementation of a comprehensive monitoring program to establish baseline conditions for surface water resources and to allow for the detection of changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial measures. The monitoring program would continue for up to 10 years after the completion of construction. The AMMP also will include provisions for augmenting water supplies for surface water resources and wells and will establish performance standards that the remedial actions must achieve to approximately match baseline conditions. As a result, HWR-MM#4 would effectively mitigate impacts on affected water resources, including wells from tunneling. Also, as required by mitigation measure HWR-MM#3, replacement groundwater recharge areas will be identified in coordination with Los Angeles Flood Control District for the Hansen Spreading Grounds, if necessary. Floodplains and groundwater basins are discussed and identified in Section 3.8.5.3 and Section 3.8.5.5, respectively, of the Draft EIR/EIS.

The commenter also expressed concern that the Authority does not have enough geologic, hydrogeologic, and hydrologic information to make a decision about the feasibility of completing the Build Alternative tunnels. However, in 2016 the Authority conducted a preliminary geotechnical investigation of drilling six bore holes to collect data for evaluating tunnel feasibility and subsurface conditions within the ANF. The investigation was not conducted for any specific tunnel alignment, but rather to identify and evaluate field conditions (such as, groundwater, situ rock stresses, adverse geology including faults, gouge zones, and squeezing ground) within the ANF that could present feasibility constraints for tunnel design and construction. This preliminary investigation showed that the alignment alternatives are feasible. Additional and extensive geotechnical investigations and explorations are to be performed during the design phase of the project and prior to start of any construction. Several hundred borings, CPTs, fault trenches and geophysical surveys are planned for the Preferred Alternative. The analysis of hydrogeologic effects is not limited to solely the geotechnical cores that were drilled. The analysis relies on extensive existing data that is available on the faults, geology and groundwater within the San Gabriel Mountain range and throughout the project area. This existing data, along with data from the core samples and ongoing monitoring within the ANF informed the analysis. The Authority understands that there

### 4494-9512

are risks associated with undergoing construction in southern California. These risks are discussed in detail in Section 3.9, Geology, Soils, Seismicity and Paleontological Resources, specifically in all of the impacts listed in Draft EIR/EIS Section 3.9.6.1 (see Impacts GSSP#1 through GSSP#16). Impacts associated with these risks will be addressed by GEO-IAMF#1 and GEO-IAMF#10 that would require prior to construction that the Contractor prepare a Construction Management Plan (CMP) addressing how the Contractor will address geologic constraints and minimize or avoid impacts to geologic hazards during construction, as identified in Impacts GSSP#1 through GSSP#16. The CMP will be submitted to the Authority for review and approval.

### 4494-9513

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-PUE-3: Water Demand and Usage.

The commenter expressed concern regarding the amount of water needed for construction as well as the potential impact from tunneling under the Angeles National Forest (ANF) on surface habitats. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage which discusses the amount and sources of water needed for project construction. Also see Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, which discusses the potential effects of tunneling under the ANF, as well as potential impacts to habitat within the ANF, and measures identified in the EIR/EIS to reduce and mitigate these impacts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9514

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding. The commenter raises concerns about a specific HSR contractor and its costs. Although this is not a comment raising a significant environmental issue requiring response under CEQA or NEPA, nor is it a comment addressing the sufficiency of the Draft EIR/EIS, some information is provided in this response. The contract with a design-build contractor would require compliance with standard engineering design and environmental practices and regulations, as well as implementation of Palmdale to Burbank Project Section avoidance and minimization features and applicable mitigation measures included in the Draft EIR/EIS. For information about cost estimates, refer to Chapter 6 of the Draft EIR/EIS and to the Authority's 2022 Business Plans, which can be found at the Authority's website, [www.hsr.ca.gov](http://www.hsr.ca.gov). Please also refer to Standard Response PB-Response-GEN-2: Project Costs and Funding.

### 4494-9515

The commenter provides an overview of how the U.S. Forest Service (USFS) requires that activities on USFS lands must minimize adverse impacts to groundwater. The commenter reiterates that the USFS also requires that any activities on USFS lands cannot result in damage to ecological systems and that construction should not be allowed if it will have such an impact. Each of the six Build Alternatives includes construction of twin side-by-side tunnels. Tunnels could provide a conduit for groundwater to seep into excavated areas as the advancing tunnel construction intersects subsurface fractures and faults in bedrock that contain water. Where groundwater is present, it may under certain circumstances leak from the rock mass into the tunnels. In such cases, groundwater inflows may temporarily affect the hydrology of streams, springs, water supply wells, and other waterbodies.

The Authority will use state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, including through the use of tunnel boring machines (TBMs) with features to reduce or prevent inflows and grouting and tunnel-lining approaches that have proven effective at controlling water seepage.

These measures are identified in HYD-IAMF#5 (TBM Design Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting). HYD-IAMF#5 (TBM Design Features). The TBM would use closed-mode operations to effectively prevent water seepage from occurring at the TBM cutterhead area, with ports for drilling horizontal probe holes through the TBM cutterhead, and angled probe holes through the TBM shields. These holes will allow for water pressures and flow rates to be measured ahead of the TBM, and further allow for pre-excavation grouting ahead of the TBM to cut-off groundwater inflows into the tunnel. HYD-IAMF#6 (Tunnel Lining Systems) will consist of segmental, precast, concrete lining with bolted and gasketed joints, creating a tunnel lining capable of resisting the groundwater pressure with minimal leakage in circumstances where groundwater pressures are 25 bar or less. In sections where groundwater pressures are above 25 bar, a second lining will be put in place to ensure watertight tunnels over time. HYD-IAMF#7 (Grouting) involves pouring coarse mortar into various narrow cavities along the tunnel lining. Several grouting methods will be used during the construction of the tunnels to avoid and minimize groundwater flows into the tunnels, including pre-excavation grouting, backfill grouting with two-component grout, and check grouting (refer to Appendix 2.0-E of the Palmdale to Burbank Project

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9515

Section EIR/EIS for further descriptions of IAMFs that will be implemented as part of the project, including HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7). For proper implementation of this approach, a detailed site-specific geotechnical and hydrogeological characterization would be carried out for the selected Alternative. Notwithstanding these measures, in High-Risk Areas, which are zones associated with tunnels intersecting areas with faults and high hydrostatic pressure, some groundwater inflow into the tunnels would likely occur during construction.

Groundwater seepage into tunnel structures during construction and operation could affect water levels of streams, springs, and wells reliant on groundwater aquifers. The extent to which groundwater drains into tunnel structures depends on the tunnel lining system's ability to resist hydrostatic pressures. To address any such impacts, the Authority will implement an Adaptive Management and Monitoring Plan (AMMP) (See HWR-MM#4). The AMMP would be implemented throughout the tunnel construction RSA. HWR-MM#4 requires that the AMMP include monitoring protocols to establish baseline conditions of surface water resources and to detect changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial measures. The purpose of the AMMP is to ensure that adverse effects on subsurface and surface water resources and associated habitat within the ANF caused by tunnel construction activities are identified and that appropriate responses to address those effects are expeditiously implemented. This AMMP involves a multi-step iterative process to comply with U.S. Forest Service (USFS) standards, which includes remedial measures. The remedial measures include actions such as establishing adaptive management triggers for each water resource being monitored, implementation of compensatory mitigation for each affected water resource, and the minimization of effects on water resource associated species as a result of tunnel construction. For a full list of USFS standards for remedial measures, see Appendix 3.8-C, Adaptive Management and Monitoring Plan for Potential Hydrologic Effects within the Angeles National Forest. Currently the monitoring of the springs/seeps is conducted on a quarterly basis within the ANF. The AMMPs and MMs contained in the Final EIR/EIS address potential impacts and mitigation measures associated with the Build Alternatives. See Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, for additional information regarding concerns about tunneling in the ANF.

### 4494-9516

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter expressed concerns regarding the impacts that tunneling could cause, including groundwater impacts and subsequent impacts to surface water affecting flora and fauna, and the effectiveness of remedial steps to address changes in groundwater conditions. Please refer to standard response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest (ANF), which addresses the concerns raised by the commenter.

As described under Impact HWR#5 in Section 3.08, Hydrology and Water Resources, tunnel construction under the ANF could temporarily affect groundwater conditions through the inflow of groundwater into tunnels during construction in areas that have been determined to be risk areas (zones associated with tunnels intersecting areas with faults and/or high hydrostatic pressure). Inflow of groundwater into tunnels during construction could lower groundwater levels which could affect water dependent resources such as springs, streams, and wells. However, this inflow is not expected to significantly reduce groundwater levels. It is expected that any such groundwater losses would be recovered over time through recharge processes.

As described in HYD-IAMF #6: Tunnel Lining, the first tunnel lining system will consist of a single segmental, precast, concrete lining with bolted and gasketed joints, creating a tunnel lining capable of resisting the groundwater pressure with minimal leakage. In segments where groundwater pressure is expected to exceed 25 bar, a second lining would be installed to ensure that the tunnels are water-tight for the lifespan of the infrastructure. Furthermore, HYD-IAMF#7, Grouting, will also be implemented to reduce or prevent potential groundwater flows into the tunnels. As described in HYD-IAMF#7, pre-excitation grouting would create a permanent strengthened circular crown with very low permeability around the TBM, that in conjunction with the first-pass tunnel lining, will be able to withstand the water pressure until the second lining is installed (i.e., greater than 25 bar) and avoid and minimize potential groundwater leakages during tunnel construction. After completion of construction and during operation of the project, leakage of groundwater into the tunnels is not anticipated.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9516

The Authority also will implement HWR-MM#4: Water Resources Adaptive Management and Monitoring Plan (AMMP) Including Compensatory Mitigation Measures, which will require the Authority to monitor and detect changes in surface and subsurface conditions within the ANF both during and after construction of the HSR tunnels. This would allow for the Authority to detect any hydrological changes in a timely manner and if necessary, provide appropriate remediation. These monitoring activities would continue for 10 years after completion of the Palmdale to Burbank Project Section and would continue if impacts persisted after this period. The Authority has researched tunneling projects that have encountered similar excavation and groundwater conditions, including cases located in both Southern California and Europe. As a result, the Authority has incorporated lessons learned from those cases for this project.

The Southern California case studies focused on groundwater impacts, mitigation measures, and duration of recovery of the water resources because of tunneling during and after construction. Southern California examples included the Inland Feeder Arrowhead Tunnels located in the San Bernardino Mountains. The Arrowhead Tunnels data indicated that the water losses were significantly less in the tunnels mined and lined with water-proofing technology than the tunnel mined with an open face TBM. The Arrowhead tunnels demonstrate that with improved technologies even from 20+ years ago, water losses can be reduced through new TBM designs and more advanced tunnel lining designs. Water inflows into the tunnels during construction were managed for the Arrowhead East Strawberry Creek Portal tunnel drive and the Arrowhead West tunnel through a properly adapted and designed TBM accompanied by lining systems that could prevent water inflows into the tunnel behind the TBM. As a result of tunneling operations, some impacts to the surface waters were detected through a comprehensive monitoring program that included baseline conditions, and carefully documented and analyzed data collected during construction to identify impacts as they occurred. Once impacts were identified, then decisions were made regarding sensitivity of the associated habitats to water losses and temporary mitigations such as water supplementation or irrigation were implemented. Irrigation was applied to each surface water resource as mitigation for documented losses of water that supports the biology of springs or streams. Recovery from surface water impacts were evaluated during and after construction to plan the post construction recovery and monitoring period. Based on the recoveries of monitoring wells (installed during the construction of Arrowhead

### 4494-9516

tunnels) as indicators of recovery to normal groundwater conditions, the springs and stream flows mirrored the groundwater recovery.

European tunnel projects included Lötschberg, St. Gotthard, Koralm, Guadarrama, and Pajares. Tunnel characteristics, construction method, geology encountered, groundwater pressures/flows and water loss for each of these European tunnels are provided in Table 2. The analysis of these European case studies shows that mountain tunnels under high groundwater pressures required one or more of the following: 1) a closed-face TBM technology to resist water pressures at the tunnel face; 2) excessive pressure can be released by draining water from the tunnel face in order to advance the TBM, 3) a solution consisting of a grouting zone around the tunnel designed to reduce the leakage to the tunnel, and 4) a drainage system behind the lining to reduce the water pressure on the lining. The main implication for tunnel construction methods is that some amount of leakage may be unavoidable, and that construction methods and drainage measures should be chosen with the lowest possible environmental impact. TBM methods were selected over Drill & Blast in ratios in the order of 70/30 for the main tunnels, although this ratio decreased when considering the whole underground complex. For example, for the Gotthard tunnel, the ratio for the main tubes was 75/25, but 56/44 for the overall construction. Exploration and pre-excavation grouting ahead of the excavation face have been a constant in all alpine tunnels dating back to 1994 (Lötschberg base tunnel).

The commenter raises the examples of Runyon Canyon and the Central Valley. For Runyon Canyon, the Authority believes the commenter is referring to MTA's Red Line subway tunnels in the 1990s, which was associated with effects on surface water resources (Clifford and Simon 1997). Groundwater could seep into tunnels resulting in impacts to surface water features which are dependent on groundwater. However, there are significant differences between the tunnels built in the 1990's through Hollywood Hills and the proposed tunnels for this Project. Tunnel design and construction methods have advanced significantly in the last 30 years when Red Line tunnels were constructed. The Authority will use state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, through the use of tunnel boring machines (TBMs) with features to reduce or prevent seepage and grouting and tunnel-lining approaches that have proven effective at controlling groundwater

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9516**

inflows. These measures are identified in HYD-IAMF#5 (TBM Design Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting). Additional details regarding these measures are provided in the above paragraphs.

For the Central Valley, it is unclear whether the commenter is referring to a specific example or the cumulative effects of subsidence due to over pumping of groundwater in the larger Central Valley region. There is no area-wide subsidence associated with groundwater pumping in this section. The U.S. Geological Survey (USGS) has been tracking subsidence in California since the early 20th century and has developed maps that illustrate areas of recorded subsidence across California. Most of the subsidence has resulted from excessive groundwater pumping for municipal, industrial, and agricultural uses, although oil extraction is also a documented cause. Subsidence within the Central Valley is due to groundwater pumping for agriculture.

The USGS subsidence maps are presented on the agency's website ([https://ca.water.usgs.gov/land\\_subsidence/california-subsidence-areas.html](https://ca.water.usgs.gov/land_subsidence/california-subsidence-areas.html)) and show that there is no documented, or measured, subsidence within the RSA of any of the six Build Alternatives. The nearest area of subsidence is located north of the Palmdale Regional Airport approximately 6.5 miles from Palmdale to Burbank Project Section. Any dewatering required during construction of the project and measures to avoid and minimize impacts to surface and ground water resources including existing wells are addressed in the following: Hydrology and Water Resources Technical Report (Authority 2017); Appendix 2-E, Impact Avoidance and Minimization Features (IAMF); Appendix 3.8-C, Adaptive Management and Monitoring Plan for Potential Hydrologic Effects in the Angeles National Forest (ANF); and Appendix 3.8-D, Supplemental Water Demand Analysis for Impacts on the ANF, including the San Gabriel Mountains National Monument (SGMNM), which evaluates the feasibility of proposed remedial activities set out in the AMMP.

### **4494-9517**

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter criticizes elements of the adaptive management and monitoring plan (AMMP) described in Draft EIR/EIS Appendix 3.8-D, Supplemental Water Demand Analysis for Potential Impacts within the Angeles National Forest/San Gabriel Mountains National Monument. The commenter contends that these measures are infeasible, untenable and absurd.

The Draft EIR/EIS, however, incorporates into the alternatives several IAMFs (HYD-IAMF#5, Tunnel Boring Machine Design, HYD-IAMF#6, Tunnel Lining Systems, and HYD-IAMF#7, Grouting) intended to avoid or reduce water seepage during tunneling. The Authority expects these measures will be effective at keeping water loss within an acceptable range that would not result in significant losses of groundwater or surface waters. The Authority will conduct real-time monitoring and establish numeric triggers that require the implementation of adaptive management measures. See HWR-MM#4, Draft EIR/EIS (pages 3.8-67 to 3.8-69). The AMMP includes provisions for augmenting water supplies for surface water resources and wells and establishes performance standards that the remedial actions must achieve to approximately match baseline conditions.

As discussed in Appendix 3.8-D, water for construction would be delivered by domestic and wholesale providers to construction sites (primarily portal and adit locations) via pipelines that would be constructed as part of the project. These pipelines have been incorporated into the project footprint and have been evaluated in the impact analysis. Many of the portal and adit locations where domestic and wholesale water supplies would be piped in for construction are either within or near the Angeles National Forest. These pipelines would be relatively close to Risk Areas that may require supplemental water. The AMMP also includes actions to restore affected resources and, if necessary, to provide compensatory mitigation for affected water resource if effects cannot be arrested or substantially reduced through other response actions. As a result, the AMMP would effectively mitigate impacts to affected water resources. In the event that impacts to surface resources and/or wells does occur resulting from tunneling activities, the Authority has included measures to address these impacts which are reasonable and feasible. Please refer to Standard Response PB-Response-PUE#3: Water Demand and

### 4494-9517

Usage for additional information about the water supply for the project, including the water supply for supplemental water.

### 4494-9518

The commenter is concerned about the feasibility of obtaining water for project construction and the feasibility of obtaining supplemental water as a mitigation measure based on recent, ongoing drought conditions in California. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides additional information about water supplies for the project, including in the scenario of dry and multiple dry years.

### 4494-9519

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter expressed concern regarding the amount of water needed for construction. Please refer to standard response PB-Response-PUE-3: Water Demand and Usage, which discusses the amount and sources of water needed for project construction.

### 4494-9520

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter expressed concern regarding the amount of water needed for construction. Please refer to standard response PB-Response-PUE-3: Water Demand and Usage, which discusses the amount and sources of water needed for project construction as well as measures that would be implemented to reduce water demands from local water providers such as the use of non-potable water from regional water utility service providers for construction activities where feasible, as well as to use recycled/reused water for tunnel construction to minimize demand for water supplies.

### 4494-9521

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter expresses concern for the amount of water required for construction even when accounting for recycled water. Please refer to standard response PB-Response-PUE-3: Water Demand and Usage, which discusses the amount and sources of water needed for project construction as well as measures that would be implemented to reduce water demands from local water providers such as the use of non-potable water from regional water utility service providers for construction activities where feasible, as well as to use recycled/reused water for tunnel construction to minimize demand for water supplies.

### 4494-9522

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter expressed concern regarding the amount of water needed for construction. Please refer to standard response PB-Response-PUE-3: Water Demand and Usage, which discussed the amount and sources of water needed for project construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9523

The commenter raises concerns about the water infrastructure that would be necessary as part of the project and its encroachment into the ANF. As acknowledged by the commenter, the project footprint for each Build Alternative includes all necessary utilities such as water lines. As such, these facilities have been accounted for in the Authority's environmental analysis. Most water lines would be constructed along existing roads or utility corridors. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### 4494-9524

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter questions the use of wells for supplemental water for habitat restoration. As noted in Appendix 3.8-D of the Draft EIR/EIS, it is expected that the source of water for supplemental water for maintaining baseline habitat conditions if effects from tunneling occurs is the same sources of water that will be used for construction. Please refer to Standard Response PB-Response-PUE#3: Water Demand and Usage, which provides additional information about water supplies for the project.

Appendix 3.8-D also notes that if other sources of water are not available, a dedicated well is another potential source of water. As noted by the commenter, a well within the Angeles National Forest (ANF) would likely not yield sufficient water for maintaining baseline habitat conditions if effects from tunneling occur, and such a well would likely need to be located within the groundwater basin associated with the watershed of the affected Risk Area. For example, the watersheds containing the High-Risk Areas identified in the EIR/EIS ultimately drain into two alluvial groundwater basins, the Santa Clara River Valley Groundwater Basin and the San Fernando Valley Groundwater Basins, as noted by the commenter. For maintaining water quality and natural recharge into each of the basins, if dedicated water supply wells were to be used, they should be constructed in one or both of the two basins, depending on the location of the affected area in the upstream watershed.

Finally, as a matter of clarification, the Authority has incorporated HYD-IAMF#5, Tunnel Boring Machine Design, HYD-IAMF#6, Tunnel Lining Systems, and HYD-IAMF#7, Grouting, into the design and construction methods for tunnels under the ANF to avoid or minimize groundwater inflows into and around tunnels during construction. Supplemental water would only be needed in the event there is groundwater inflow. For the preferred alternative, the potential for impacts is identified as minimal to none. As such, supplemental water may not even be necessary. Nonetheless, please refer to Standard Response PB-Response-PUE#3: Water Demand and Usage for additional information about the water supply for the project, including the water supply for supplemental water.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9525

The commenter asks if the water infrastructure required for construction would be permanent.

These facilities would be needed for construction and as such, would be temporary facilities. However, some may become permanent facilities if determined to be necessary. For example, water lines constructed to admit locations may be deemed appropriate to remain as permanent as they may provide long-term benefit for wildfire protection.

### 4494-9526

The commenter inquired who pays for the 10-years of post-construction monitoring. After construction, the Authority will conduct, and pay for, additional monitoring activities to evaluate the recovery of water resources, in accordance with mitigation measure HWR-MM#4 (Implement a Water Resources Adaptive Management and Monitoring Plan Including Compensatory Mitigation Measures as Necessary). The post-construction monitoring program would be modified to focus on areas where construction monitoring documented water resource effects caused by tunnel construction. The post-construction monitoring would continue for 10 years, or longer if required, until such time that conditions are comparable to the range of baseline conditions that existed before construction.

### 4494-9527

The commenter inquired who pays for the water during and after construction, and who pays for the replacement water delivery systems. The Authority will be responsible for paying for any water used for the project during and after construction, including for any supplemental water required as part of implementing the Water Resources Adaptive Management and Monitoring Plan described in HWR-MM#4, as well as any water delivery systems required for the project. Water used during construction activities would be obtained from existing permitted commercial sources in the cities of Palmdale, Santa Clarita, Burbank, and Los Angeles, as well as in unincorporated Los Angeles County. Additionally, PUE-MM#1 (Water Supply Analysis for Construction) presented on page 3.6-90 of Section 3.6.7 of the Draft EIR/EIS, requires the Authority to prepare an updated water supply analysis for the selected Build Alternative that details and describes the minimum adequate water supply for the RSA during normal, dry, and multiple dry years based on a more detailed project design. Based on the results of the water supply analysis, the Authority will coordinate with the water agencies to determine if allocations for additional water supply are needed and would pay the water agencies its fair share of the State Water Project fees. The commenter also asked about the payment of water after construction. The Authority would be responsible for water use after construction, as necessary, and for replacement of water infrastructure affected by the project. As discussed in Section 3.8.7 of the Draft EIR/EIS, the Authority will implement an Adaptive Management and Monitoring Plan (AMMP) (see HWR-MM#4), which will include actions to restore affected resources and, if necessary, to provide compensatory mitigation for affected water resources if effects cannot be arrested or substantially reduced through other response actions.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9528

The commenter inquired if the water agencies are aware of plans for replacement water. Pursuant to the requirements of NEPA and CEQA guidelines (Sections 15086 and 15087), the Authority provided widespread notice of the availability of the Draft EIR/EIS to ensure that members of the public; local, state, and federal agencies; and tribes had the opportunity to review and provide comments. The Authority has also conducted an extensive public and agency engagement program as part of the environmental review process. Agency involvement included agency scoping meetings, Interagency Working Group meetings with agency representatives, and other agency consultation. Tables 9-2 to 9-5 of the Final EIR/EIS list the key stakeholder outreach meetings held as part of the Authority's outreach efforts associated with the Palmdale to Burbank Project Section development process. The Authority conducted meetings with Sun Valley Watershed, the Metropolitan Water District of Southern California, Palmdale Water District, and Antelope Valley-East Kern Water Agency during preparation of the Draft EIR/EIS. The Authority intends to continue coordination with these water districts and agencies through preparation of the Final EIR/EIS and during final design. This commitment is reflected in PUE-MM#1, which requires the Authority to prepare an updated water supply analysis for the selected Build Alternative based on a more detailed project design and coordinate with the water agencies to determine if allocations for additional water supply are needed.

### 4494-9529

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter asks why the Authority is going to pump water if they plan on getting water from local water agencies. The commenter also noted that local water agencies rely on groundwater for their inventory.

The commenter is mistaken that the Authority would rely on groundwater as a source of water supply. The Authority will not use groundwater for Project construction or operation. Please refer to Standard Response PB-Response-PUE#3: Water Demand and Usage, which describes the water sources for the Project.

### 4494-9530

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter inquires why the project is given priority with respect to water allocation. The Authority disagrees with this comment's assumption, which is not supported by evidence. Consistent with CEQA and NEPA requirements, the Draft EIR/EIS evaluates and discloses the environmental impacts of the project, including those related to the project's construction and operational water use. As the impact from construction water demand was determined to be a significant impact in the Draft EIR/EIS, the Authority identified mitigation (PUE-MM#1, Water Supply Analysis for Construction) to address the impact. The comment does not raise any specific concern regarding the conclusions or adequacy of the Draft EIR/EIS, nor did it result in any revisions to the Draft EIR/EIS.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9531

Refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

Refer to PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

The commenter expressed concern with the “insufficient number of bore holes” that were drilled for the Build Alternatives during the development of the Draft EIR/EIS. The commenter stated that the Authority does not have enough information to make a rational decision about which Build Alternative should be selected. The commenter stated the failure to perform more subsurface testing to support the Draft EIR/EIS violates the CEQA Guidelines (14 Cal. Code Regs. Sec. 15126.4). In 2016, the Authority conducted a preliminary geotechnical investigation of drilling six bore holes to collect data for evaluating tunnel feasibility and subsurface conditions within the ANF including SGMNM. As stated on page 3.9-11 of Section 3.9 of the Draft EIR/EIS, the investigation was not conducted for any specific tunnel alignment, but rather to identify and evaluate field conditions (such as groundwater, in-situ rock stresses, adverse geology including faults, gouge zones, and squeezing ground) within the ANF and SGMNM that could present feasibility constraints for tunnel design and construction. Based on those results, the Authority concluded that it did not need additional bore holes to conclude that the alignment alternatives are feasible.

The commenter contends that a reasonably prudent contractor would require more information to enter into a design-build contract. If the Authority approves a Build Alternative, it will then advance design to develop the information sufficient to obtain a contractor. Please refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, which addresses concerns related to seismicity. Additionally, the subsurface investigations performed along with gathering existing information (see Section 3.9.4.3 of the Draft EIR/EIS) was sufficient to characterize the environmental setting, evaluate impacts of each of the Build Alternatives, and identify mitigation measures where needed.

### 4494-9532

The commenter inquired how many bore holes are required along each proposed route to have sufficient information to make an accurate and finite project description. An Environmental Impact Report (EIR) and Environmental Impact Statement (EIS) are documents required under California and federal law that inform the public and public agency decision-makers of environmental effects of a proposed project, identify possible ways to mitigate those effects, and describe reasonable alternatives to those projects. The documents examine the impacts of a proposed project on the physical, cultural, and human environments within the project area. Section 3.9 of the Draft EIR/EIS describes potential geology, soils, seismicity, mineral resource, and paleontological resource effects of the Palmdale to Burbank Project Section. The analyses of the core holes drilled in the ANF and the evaluation of area’s geology and geologic hazards demonstrate the project Build Alternatives described in the Draft EIR/EIS to be feasible. Additional and extensive geotechnical investigations and explorations are to be performed during the design phase of the project and prior to start of any construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9533

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process.

The commenter asks how the Authority can select a Build Alternative if it has not conducted the tests (i.e., bore holes) needed to derive the requisite information. The Authority possesses the requisite information to decide among alternatives. In 2016, the Authority conducted a preliminary geotechnical investigation of drilling six bore holes to collect data for evaluating tunnel feasibility and subsurface conditions within the ANF, including SGMNM. The investigation was not conducted for any specific tunnel alignment, but rather to identify and evaluate field conditions (such as groundwater, in-situ rock stresses, adverse geology including faults, gouge zones, and squeezing ground) within the ANF and SGMNM that could present feasibility constraints for tunnel design and construction. This preliminary investigation showed that the alignment alternatives are all feasible from a geotechnical standpoint. The preliminary investigation along with review of existing data sources provided sufficient information to characterize the existing environmental setting, describe impacts, and identify mitigation measures to address impacts where needed. Therefore, the Authority has sufficient information regarding the Build Alternatives' feasibility and impacts to make a decision on which alternative to select. Please refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, which provides additional information about the alternative selection process.

### 4494-9534

The commenter inquired if the Authority has approached any contractors about what information will be necessary to enter the design-build phase of the project, in regards to tunneling through the Angeles National Forest (ANF). To the extent the question is asking about specific Authority discussions with contractors, that information does not inform the public on the environmental consequences of the project. Consequently, neither NEPA nor CEQA requires a specific response. The selected contractor for the design and/or construction of the project will, at a minimum, have technical qualifications that would be required of any contractor, and have an understanding of the risks associated with Southern California tunnel construction in mountainous and seismically active terrain.

The alignment alternative would be constructed in compliance with building code requirements for application of engineering design features to address and minimize these risks. These risks and impacts are analyzed in detail in Section 3.9, Geology, Soils, Seismicity and Paleontological Resources, specifically in the impacts listed in Draft EIR/EIS Section 3.9.6.1 (see Impacts GSSP#1 through GSSP#16). These risks and impacts are addressed by GEO-IAMF#1 and GEO-IAMF#10 that would require that the Contractor prior to construction prepare a Construction Management Plan (CMP) addressing how the Contractor will address geologic constraints and minimize or avoid impacts to geologic hazards during construction, as identified in Impacts GSSP#1 through GSSP#16. The CMP will be submitted to the Authority for review and approval. Adherence to GEO-IAMF#1 will require an investigation to address the potential geologic hazards (earthquake ground rupture, liquefaction, ground shaking, landslides) and geotechnical constraints of groundwater withdrawal, unstable soils and slope instability, subsidence, water and wind erosion, shrink-swell potential in soils, and soil corrosive potential. GEO-IAMF#10 will require the Contractor to issue a technical memorandum describing how the guidelines and standards have been incorporated into the facility design and construction. These guidelines/standards are provided by the American Association of State Highway and Transportation Officials, Federal Highway Administration, American Railway Engineering and Maintenance-of-Way Association, California Build Code, International Building Code, American Society of Civil Engineers, Caltrans Design Standards, and the American Society for Testing and Materials.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9535**

The commenter asks whether costs for tunneling under the ANF have been developed as part of the Draft EIR/EIS analysis. Please see Chapter 6.0, Project Costs & Operations, which includes a detailed assessment of project costs, and supporting Appendix 6-B; however, consistent with the Authority's cost methodology, cost categories are reported based on functional categories (e.g., Category 10 for Track Structures and Track, vs Category 40 for Sitework, Right-of-Way, Land and Existing Improvements) and not necessarily broken out by geographic subsections of the Palmdale to Burbank Project Section. Please also see the description of the anticipated procurement process in Chapter 2, Section 2.3.9, of the Draft EIR/EIS.

### **4494-9536**

The commenter inquired what would occur if the bore holes drilled along the SR14A Build Alternative confirm the SR14A Build Alternative is infeasible. The analyses of the core holes drilled in the ANF and the evaluation of area's geology and geologic hazards, described in Section 3.9, Geology, Soils, Seismicity, and Paleontological Resources, of the Draft EIR/EIS, have demonstrated that the Preferred SR14A Build Alternative is feasible. A comprehensive geotechnical investigation along the Preferred SR14A Build Alternative will be conducted during the design phases of the project, prior to start of any construction.

### **4494-9537**

The commenter inquired what would occur if the drilled bore holes confirm the Build Alternatives are infeasible. The analyses of the core holes drilled in the ANF and the evaluation of the area's geology and geologic hazards, described in Section 3.9, Geology, Soils, Seismicity, and Paleontological Resources, of the Draft EIR/EIS, have demonstrated that all the Build Alternatives are feasible. A comprehensive geotechnical investigation, along the alternative that the Authority selects, will be conducted during the design phases of the project, prior to the start of any construction.

### **4494-9538**

Refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

The commenter expressed concerns on seismic risks and effects on the project. Please refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, which addresses concerns related to seismicity.

### **4494-9539**

The commenter inquires as to how long it would take an HSR train traveling at 200 miles per hour to stop. A train traveling at 200 miles per hour and then decelerating at 1 m/s<sup>2</sup> [3.3 ft/s<sup>2</sup>] would require a breaking distance of approximately 13,000 feet (2.5 miles) and 90 seconds to stop.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9540

The commenter refers to Section 3.9, Geology, Soils, Seismicity, and Paleontological Resources. The commenter inquired if restricting the train's speed to no more than 100 mph while traveling through a tunnel would be a reasonable mitigation measure to decrease stopping distance and time in the event of an earthquake. Potential effects of geologic hazards during operations with respect to fault rupture and ground shaking are addressed in Section 3.9.6, Environmental Consequences, specifically Impact GSSP#16 Effects of Geologic Hazards During Operations, Effects of Fault Rupture and Ground Shaking starting on p. 3.9-89 of the Draft EIR/EIS. The Authority acknowledges that all six Build Alternatives would cross hazardous and potentially hazardous faults that would be susceptible to rupture during a seismic event (discussed in Draft EIR/EIS Section 3.9.5.6 and Table 3.9-4). To address this potential effect, the Authority has designed the Palmdale to Burbank Project Section to include Impact Avoidance and Minimization Features (IAMFs) GEO-IAMF#6: Ground Rupture Early Warning Systems, GEO-IAMF#7: Evaluate and Design for Large Seismic Ground Shaking, GEO-IAMF#8: Suspension of Operations During an Earthquake, and GEO-IAMF#10: Geology and Soils.

One key feature of earthquakes is that although they start at a point, the rupture takes time to spread out over the fault. Large magnitude 8-9 earthquakes can rupture hundreds of kilometers along a major fault, and this takes tens of seconds to minutes to occur. Thus, for the largest earthquakes, there is a higher potential for long warning times than there is for smaller earthquakes. Once the Early Earthquake Warning System (EEWS) sends the signal to stop the train after the detection of seismic P-waves, it would take approximately one minute for the train to come to a full stop. The passengers will experience an emergency braking deceleration of approximately 5 feet per second which is lower than the braking deceleration of a car emergency braking. While the EEWS would provide ground motion data and a control system to shut down HSR operations temporarily during or after a potentially damaging earthquake, the monitoring equipment will then be inspected for damage due to ground motion and/or ground deformation, and then returned to service when appropriate.

Importantly, the EEWS main goal is to avoid the derailment of the train at high speeds, so the strategy will always be to stop the trains when an established acceleration threshold is surpassed. This has been proven to be the safest course of action in similar

### 4494-9540

systems in other parts of the world, such as Japan. Most countries with early warning systems built them after a devastating earthquake. Japan invested \$600 million in such a system after the 1995 Kobe earthquake killed 6,400 people. Today, Japan's system allows every citizen to receive advance alert of earthquake ground shaking from the Japan Meteorological Agency. Due to its EEWS, no trains derailed in the magnitude 9.1 Tohoku earthquake on March 11, 2011. A seismometer at Kinkazan Island on the northeast coast of Japan detected seismic P-waves and sent an automatic stop signal via the UrEDAS to the Shinkansen's electric power transmission system, triggering the emergency brakes on 27 bullet trains, 19 of which were traveling through the affected area. Ten seconds after the warning signal was issued, a 9.1 magnitude earthquake hit mainland Japan (USGS, 2011). Although the Tohoku Earthquake and the following tsunami caused immense destruction and loss of life in eastern Japan, none of the 19 trains running through the affected area were derailed and no casualties were sustained on the trains. The magnitude 9.1 Tohoku earthquake occurred on a thrust fault within the subduction zone where the Pacific and North America tectonic plates pass over each other, whereas in California, the same tectonic plates move pass each other laterally along the strike-slip San Andreas fault. The USGS reports that an earthquake larger than a magnitude 8.3 occurring on the San Andreas fault is extremely unlikely. The magnitude 9.1 Tohoku earthquake is 8 times larger than the largest expected earthquake occurring on the San Andreas fault of magnitude 8.3. Japan HSR lines also cross active faults and seismic hazards and are not limited to large distant events. The EEWS also stopped trains after sensing the magnitude 7.6 2024 Noto earthquake, and no injuries were reported. Most service resumed soon after the initial earthquake.

In the event of an earthquake epicenter located in the vicinity of the alignment, to the extent that the EEWS is not able to provide enough lead time to completely stop the trains, the infrastructure is still designed to achieve a performance level that safeguards against loss of life or collapse in case of the MCE taking place. In addition, and as explained on page 3.11-59 in Section 3.11 of the Draft EIR/EIS, strategies will be implemented to ensure containment of the trainsets within the right-of-way. Specific to train derailment, in addition to other design features to address impacts due to seismic shaping more generally, physical elements such as containment parapets, check rails, guard rails, and derailment walls would be used in specific areas with a high risk of or high impact from derailment.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9540

The Authority's analysis concludes that incorporation of these IAMFs would keep fault rupture and ground shaking hazards within established safety thresholds, which would prevent the direct and indirect endangerment of people and structures to increased seismic hazards. This impact would be less than significant for all six Build Alternatives and CEQA; therefore, it does not require mitigation.

Please note, the CEQA Conclusion for Impact GSSP#16 Effects of Geologic Hazards During Operations, Effects of Fault Rupture and Ground Shaking in the Draft EIR/EIS included a typographical error that has been corrected in the Final EIR/EIS. The Draft EIR/EIS erroneously stated that CEQA requires mitigation, but the Final EIR/EIS has been corrected to conclude that CEQA does not require mitigation. The Authority appreciates the commenter's inquiry related to mitigation, but notes that CEQA does not require mitigation of less than significant impacts.

### 4494-9541

The commenter inquired as to, hypothetically, whether the No Project Alternative would be easier and less expensive compared to constructing a tunnel under the ANF if the train were limited to 100 mph. However, the train will not be limited to 100 mph in the tunnel underneath the ANF. There, maximum train speeds will be about 220 miles per hour (350 km/h). In the dedicated segments (used by HSR only), maximum train speeds will be about 220 miles per hour (350 km/h), and in the blended segments (used by HSR and other train operators), maximum speeds will be about 110 miles per hour (180 km/h).

### 4494-9542

The commenter asks about the Japanese and European rail models that HSR is modeled after. As discussed in Section 2.3.2 of the Draft EIR/EIS, the California HSR System is modeled after the Train à Grande Vitesse in France, the Shinkansen in Japan and Taiwan, and the InterCity Express in Germany. For additional information, please refer to Section 2.3.2 of the Draft EIR/EIS.

### 4494-9543

The commenter notes the possibility of the TBM becoming stuck and asks about the length of time and cost to extract the TBM from the Angeles National Forest location in the event it becomes stuck.

Anticipated loss and eventual retrieval plans of TBMs are not included in the Preliminary Engineering for Project Definition (PEPD) provisions. This is a risk to be assessed and mitigated once the TBM features and geotechnical information is completed in the final design phase. TBMs are equipped with extra power and torque to overcome situations where the TBM could eventually get trapped. In extreme cases, there are several strategies that could be implemented to retrieve a stuck TBM, depending on its location within the tunnel, depth, and ground conditions. A common approach is to continue the excavation from the other end of the tunnel to reach the location of the stuck TBM. The TBM could be dismantled, and excavation would continue through other conventional methods. An auxiliary tunnel or shaft could be built to reach the TBM and release it. More specific procedures will be analyzed once the specifications for the TBM are known, and additional information is gathered regarding the conditions to be encountered.

The time and cost associated with removal of a TBM are not related to an environmental effect of the project.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9544**

The commenter asks how tunnels would be constructed, given high water pressure; where water will be sent during construction; how high water pressure would affect the use of the second tunnel for evacuation in the event of an earthquake or derailment; at what pressure would water seep into tunnels; and what the effect is of water seeping into tunnels.

Regarding the comment about high water pressure and construction, as well as the comment about water seepage: for all excavation methods, excessive groundwater pressures might generate some seepage into the tunnel during construction, but measures implemented during construction, such as pre-grouting, would help to reduce the flow to manageable values. The Authority considered these impacts in Section 3.8, Hydrology and Water Resources, in the Draft EIR/EIS (Impact HWR#5). For the Build Alternatives, the tunnel boring machines (TBMs) are not expected to withstand the full groundwater pressure during excavation. Groundwater pressure on the excavation front will be dissipated due to controlled groundwater seepage and pre-excavation ground treatments. Pre-excavation grouting from the TBM can be performed to reduce groundwater seepage into the tunnels during construction. Pre-excavation grouting can be carried out through a TBM with built-in capability, including grout ports through the TBM cutter-head and through the shield. Where groundwater is present, HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 will be implemented to control the volume of groundwater inflow into the tunnel (see Section 3.8). Water is not expected to seep into the tunnels during rail operation. For groundwater pressures below 25-bar, the fully gasketed one-pass lining is a tanked solution (for precast segmental lining, the segments are equipped with gaskets to seal the joints between segments and thus provide a watertight tunnel) that is expected to withstand pressures encountered. In the segments where ground water pressures are expected to exceed 25 bar, a monolithic concrete second lining will be put in place to avoid water leakage into the tunnel for the complete lifespan of the infrastructure.

After completion of the second lining, the tunnel will be considered to be dry during the lifespan of the infrastructure. "Dry tunnel condition" is defined as the situation where a finished tunnel has such a low water inflow rate that it does not impact in any form the ground water resources, neither in the short nor in the long term. Regarding the comment about where water will be sent during construction, Section 3.6, Public Utilities

### **4494-9544**

and Energy, of Draft EIR/EIS indicates that any water generated from the tunnel construction would be treated on-site and reused or hauled off-site (see Impact PUE#4). Management of any water generated from tunnel construction would be in accordance with federal and state regulations and would prevent any discharge from impacting water quality standards. Regarding the comment about emergency evacuation, in the most probable causes for a train evacuation (emergency train stop), no water inflow would occur since the tunnel lining would not be compromised, and therefore water inflow would not be a factor affecting evacuation procedures. The Tunnel Lining System would be implemented by HYD-IAMF#6, as described in Section 3.8.

### **4494-9545**

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter is concerned about impacts to flora and fauna from tunnel construction in the ANF. Please refer to standard response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, which discusses the project's potential effects of tunneling on groundwater and surface water resources and measures that would be taken to minimize and avoid this impact. This standard response also discusses potential impacts on special-status plant and animal species that are groundwater dependent.

### **4494-9546**

The comment asks about a future action by another federal agency, which is outside the scope of this EIR/EIS.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9547

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter asks about the source and quantity of the water that would be needed to address any effects on surface hydrologic conditions caused by tunneling within the Angeles National Forest and the cost for the replacement water. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage. Specifically, please refer to the Supplemental Water for Groundwater-Related Impacts subsection, which describes the state-of-the-art design features and construction methods (i.e., IAMFs) that would be implemented and would make the need for supplemental water for habitat restoration unlikely. This Standard Response also explains why an Adaptive Management and Monitoring Plan (AMMP), as required by HYD-MM#4 would be required. It explains that in the unlikely event that supplemental water is needed, the source of this water would be the same as the sources identified for construction water. These sources are summarized in Standard Response PB-Response-PUE-3: Water Demand and Usage. As described in Standard Response PB-Response-PUE-3, the amount of water needed due to groundwater-related impacts is speculative at this time. The costs associated with this water will depend on the quantity need, timing of that need, and source, which cannot be determined at this time. Similarly, the costs of conveyance would depend on method (piping, trucking, hand carrying), which also depend on the location and amount of habitat affected, which cannot be determined at this time.

### 4494-9548

The commenter expressed concern that adding or removing water from formations could cause seismic events. The construction of the HSR Palmdale to Burbank Project Section and tunnels will not add or remove amounts of water or liquids in quantities sufficient to cause an earthquake. The process used in fracking is very different from the construction techniques that would be used in building the rail tunnels.

### 4494-9549

Refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption.

The comment asks about the source of electrical power for operation; who will be responsible for the power grid upgrade costs; and what the costs are. Please refer to Section 2.3.7 of the Draft EIR/EIS, which explains the various studies that the Authority has conducted to verify how HSR would be powered by 100 percent clean, renewable energy sources through a variety of mechanisms. This same section includes a discussion of the infrastructure that would be needed. The Authority would construct and pay for the necessary utility infrastructure needed to support project operations. As indicated in Chapter 6 (Section 6.2.2) of the Draft EIR/EIS the capital cost estimates include the total labor effort and materials to build the Palmdale to Burbank Project Section, including track structures, stations, support facilities, communications and signaling, electric traction and any necessary utility relocations, upgrades, and road modifications.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9550

Refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption.

The commenter asks about priority of electric use compared between the California HSR System and residential/commercial uses, as well as what would happen if electricity is not available for the California HSR System. Please refer to Section 2.3.7 of the Draft EIR/EIS, which explains the various studies that the Authority has conducted to verify how HSR would be powered by 100 percent clean, renewable energy sources through a variety of mechanisms. Please also refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption. Based on the way that the Authority plans to obtain electricity to power the California HSR System, as detailed in Section 2.3.7 of the Draft EIR/EIS and PB-Response-PUE-1: Energy Use and Consumption, the Authority does not expect that there would be a need to make decisions regarding priority use of electricity. For Backup and Emergency Power Supply Sources for Stations and Facilities, please refer to Draft EIR/EIS Appendix 2-D Design Baseline Report (page 2-35). During normal system operations, power would be provided by the local utility or a TPSS. Should the flow of power be interrupted, the system would automatically switch to a backup power source: an emergency standby generator, an uninterruptible power supply, or a direct current (DC) battery system. For the Palmdale to Burbank Project Section, permanent emergency standby generators are anticipated to be located at passenger stations and terminal layup/storage and the Maintenance Facility. Standby generators are required to be tested (typically once a month for a short duration) in accordance with National Fire Protection Association (NFPA) 110/111 to verify readiness for backup and emergency use. If needed, portable generators could also be transported to other trackside facilities to reduce the impact of power interruptions on system operations.

### 4494-9551

Refer to Standard Response PB-Response-PUE-4: Coordination with Local Government Entities and Utility Owners.

The commenter asks about agreements or memoranda of understanding with utilities to provide electrical power for operation and construction of the Palmdale to Burbank Project Section. As indicated in Section 3.6, Public Utilities and Energy, of the Draft EIR/EIS page 3.6-4, the base standards for design, construction, installation, operation, and maintenance established by General Order 176 require coordination and cooperation of the Authority (the entity that owns the HSR system) and other facility owners (e.g., LADWP) so that the facilities of both parties are not prevented from performing as required or intended. Utility maintenance access would be permitted by the Authority to local service providers for utilities within the HSR right-of-way. As discussed in Standard Response PB-Response-PUE-4: Coordination with Local Government Entities and Utility Owners, the Authority will continue coordination through the final design and engineering phases. The Authority will continue coordination with local government entities and utility owners by utilizing memoranda of understanding (MOUs) and cooperative agreements to establish its working relationships with local government entities along the HSR alignment in each project section as it moves forward with project implementation.

In addition, coordination with utility providers would be required by PUE-IAMF#4 (see page 3.6-15 of the Draft EIR/EIS), which requires the Authority to prepare a technical memorandum, prior to construction, documenting how construction activities would be coordinated with service providers to minimize or avoid interruptions. Please refer to Standard Response PB-Response-PUE-4: Coordination with Local Government Entities and Utility Owners for further information regarding compliance with locally adopted requirements when the Authority addresses construction impacts on local government facilities.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9552

The commenter asks if the Authority has discussed issues related to project electrical usage and service with LADWP. As a matter of clarification, the commenter is referring to issues that were brought up as part of Comments #9549 through #9551. For responses to those specific comments, please refer to Response to Comments #9549 through #9551.

Regarding coordination with LADWP, please refer to Chapter 9: Public and Agency Involvement. A variety of meeting types and outreach activities were conducted. Federal, state, regional, and local agencies, tribes, elected officials, neighborhood councils, organizations, businesses, and the general public participated in these meetings to obtain project information and provide feedback. Additional public and agency meetings have occurred between 2017 and 2021. On November 7, 2018, Authority staff and LADWP staff met and discussed various topics, including coordination regarding electrical infrastructure and sources of electricity. The Authority will continue to coordinate with LADWP during subsequent stages of the project.

### 4494-9553

The commenter expresses concern about the Authority's "design-build" approach, including whether it is permissible under California law, and states commenter's perspective that there is no substantial evidence to sustain the approval of an EIR.

Currently, the HSR Palmdale to Burbank Project Section is at a preliminary design phase, which is an appropriate level of design to support environmental review. The HSR Palmdale to Burbank Project Section is expected to be constructed using a design-build approach. The design-build approach offers flexibility to adapt the project to changing conditions. The Draft EIR/EIS relied on substantial evidence in determining its impact conclusions and mitigation requirements for this level of design. The use of a design build standard does not preclude a lead agency from considering the potential environmental impacts from a project and in the Draft EIR/EIS, and as shown in the Draft EIR/EIS, the Authority has relied on substantial evidence to determine potential impacts. In this comment, the commenter does not identify any specifics where the Draft EIR/EIS was lacking in substantial evidence.

Regarding the comment made on mitigation, CEQA Guidelines Section 15126.4 (B) states: "...formulation of mitigation measures shall not be deferred until some future time. The specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project's environmental review provided that the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be considered, analyzed, and potentially incorporated in the mitigation measure." In other words, the CEQA Guidelines identify that specific details of mitigation may be developed after project approval, as long as the lead agency commits to mitigation, identifies performance standards, and identifies potential actions of the mitigation. The Authority will commit to its mitigation through adoption of a Mitigation Monitoring and Reporting Program (MMRP) and as described in the Draft EIR/EIS, identifies performance standards and actions as part of its mitigation.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9554

The commenter inquired why testing was not completed before the approval of the preferred alternative. The commenter additionally inquired about what assurances can the Authority provide to successfully complete the project. An Environmental Impact Report (EIR) and Environmental Impact Statement (EIS) are documents required under California and federal law that inform the public and public agency decision-makers of environmental effects of a proposed project, identify possible ways to mitigate those effects, and describe reasonable alternatives to those projects, so that the decision-maker can decide among alternatives. The documents examine the impacts of a proposed project on the physical, cultural, and human environments within the project area. Section 3.9 of the Draft EIR/EIS describes potential effects on geology, soils, seismicity, mineral resource, and paleontological resources associated with the Palmdale to Burbank Project Section. The analyses of the core holes drilled in the ANF and the evaluation of area's geology and geologic hazards demonstrate the project Build Alternatives described in the Draft EIR/EIS to be feasible. The Authority has concluded that it has completed sufficient testing and analysis to disclose environmental impacts and for the decision-maker to decide among alternatives. Moreover, "CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors." (CEQA Guidelines, section 15204(a).) Because the Authority can choose only one alternative, it would waste taxpayer dollars to complete unnecessary, voluminous, detailed analysis and modeling of every alternative. The Authority will complete additional and extensive geotechnical investigations and explorations during the design phase of the project and prior to the start of any construction.

### 4494-9555

The commenter asks why the Authority has not already conducted the additional test bores necessary to evaluate the feasibility of the tunneled routes and suggests that testing should have occurred and the results been made available prior to the release of this Draft EIR/EIS. The Authority has completed the necessary analysis and compiled sufficient information to evaluate the feasibility of all alternatives. Chapter 3.9 of the Draft EIR/EIS describes potential geology, soils, seismicity, mineral resource, and paleontological resource effects of the Palmdale to Burbank Project Section. Section 3.9.4.3 Methods for NEPA and CEQA Impact Analysis, describes the geotechnical investigations that have been completed.

In 2016, the Authority conducted a preliminary geotechnical investigation of drilling six bore holes to collect data for evaluating tunnel feasibility and subsurface conditions within the ANF, including SGMNM. The investigation was not conducted for any specific tunnel alignment, but rather to identify and evaluate field conditions (such as groundwater, in-situ rock stresses, adverse geology including faults, gouge zones, and squeezing ground) within the ANF and SGMNM that could present feasibility constraints for tunnel design and construction. This preliminary investigation showed that the alignment alternatives are all feasible from a geotechnical standpoint. The preliminary investigation along with review of existing data sources provided sufficient information to characterize the existing environmental setting, describe impacts, and identify mitigation measures to address impacts where needed. Therefore, the Authority has sufficient information regarding the Build Alternatives' feasibility and impacts to make a decision on which alternative to select.

Refer to the Palmdale to Burbank Project Section Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest (Authority 2017a) and the Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest (Authority 2017b) for the results of this preliminary geotechnical investigation, as noted in footnote 4 on page 3.9-21 of the Draft EIR/EIS. Additional and extensive geotechnical investigations and explorations would be performed during the design phase of the project and prior to start of any construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9556

The commenter requested further information on the graphs presented in Section 3.9 Geology, Soils, Seismicity, and Paleontological Resources. There are no graphs in the section but if the commenter is referring to the figures and tables in this section, there is a reference and date at the bottom left of all tables and figures. For the figures, the date at the bottom right refers to the date the figure was placed in the Draft EIR/EIS. The references and sources used for document preparation can be found in Chapter 12 of the EIR/EIS.

### 4494-9557

The commenter requested further information on public safety effects during project construction, and the ways in which the Authority has prepared for catastrophes that may occur as a result of tunneling through the San Gabriel Mountains. Exposure to construction site hazards is described and evaluated in Impact S&S#6, in Section 3.11, Safety and Security, of this Final EIR/EIS. Worksite safety in California, including construction worksite safety, is regulated by provisions of Title 8 of the California Code of Regulations and is overseen by Cal-OSHA. Title 8 requires compliance with standard procedures to prevent construction worksite accidents and requires a written workplace injury and illness prevention program to be in place. Construction activities will also be subject to standards included in California HSR Standard Safety Procedures. In addition to legal requirements, the contractor will manage potential exposure to workplace hazards through implementation of Construction Safety and Health Plans for each phase of project construction (SS-IAMF#2). Each of these plans will establish the minimum safety and health standards for contractors of, and visitors to, project construction sites. Each of these plans will require the contractor to develop and implement site-specific measures that address regulatory requirements protective of human health and property at each construction site. Standard implementation of a Construction Safety and Health Plan during construction in compliance with legal requirements would reduce risks to human health during construction by establishing protocols for safe construction operations, including daily safety awareness meetings and training to establish a safety culture among the construction workforce.

### 4494-9558

Refer to Standard Response PB-Response-AQ-1: Construction-Period Emissions, PB-Response-AQ-2: Health Risks and Impacts, PB-Response-AQ-3: Construction Air Quality/Truck Impacts, PB-Response-N&V-5: Impacts of Spoils Hauling (Noise), PB-Response-TRA-1: Temporary Traffic Associated with Construction.

The commenter asks if CHSRA intends to reimburse residents in the Foothills and San Fernando Valley for effects they may suffer as a result of the project, specifically related to water depletion, landslides, deforestation, and construction impacts. CEQA requires that feasible mitigation measures be implemented to reduce significant environmental impacts but neither CEQA nor NEPA requires citizens to be compensated in relation to any such impacts.

With respect to potential water depletion, Chapter 3.8 Hydrology and Water Resources includes analysis of Impact HWR#5: Changes in Hydrogeologic Conditions Associated with Tunnel Construction Beneath the Angeles National Forest (ANF) which May Affect Surface and Subsurface Water Resources. The project design includes implementation of impact avoidance and minimization features (IAMFs) HYD-IAMF#5: Tunnel Boring Machine Design Features, HYD-IAMF#6: Tunnel Lining Systems, and HYD-IAMF#7: Grouting. Even with implementation of these features, the Authority has concluded that Impact HWR#5 will result in a significant impact under CEQA and mitigation is required.

With implementation of HWR-MM#4: Implement a Water Resources Adaptive Management and Monitoring Plan Including Compensatory Mitigation Measures as Necessary, the impact of each of the six Build Alternatives on surface water resources would be reduced to a less than significant level. Please refer to Section 3.8.7 for more information regarding mitigation measures.

The potential for landslides is analyzed in Chapter 3.9 Geology, Soils, Seismicity, and Paleontological Resources, specifically Impact GSSP#3: Landslides Could Endanger People or Structures During Construction. The project design incorporates GEO-IAMF#1 Geologic Hazards which provides for identification of slope hazards and implementation of engineering controls to minimize landslide vulnerability during construction. With adherence to GEO-IAMF#1, construction of each of the 6 Build Alternatives would not directly or indirectly cause substantial adverse effects involving landslides on- or off-site.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9558

This impact would be less than significant for the Refined SR14, E1, and E2 Build Alternatives and CEQA, therefore, does not require mitigation.

The Authority does not anticipate that the project will result in deforestation. The project is proposed to tunnel underneath the ANF which will avoid surface impacts, such as the need to remove trees for construction of the project. Surface features within the ANF (e.g., adits and utility corridors) would be located on private property within the forest and follow existing transportation and utility corridors, to reduce impacts and minimize the need to remove trees.

Disruption from construction period truck traffic, air quality, and noise impacts is addressed in Draft EIR/EIS Chapters 3.2 Transportation, 3.3 Air Quality and Global Climate Change, and 3.4 Noise and Vibration, respectively. Please see Section 3.4.7 Mitigation Measures for more information regarding mitigation measures. In addition and for reference, please see PB-Response-N&V-5: Impacts of Spoils Hauling (Noise) for additional information regarding noise impacts related to spoils hauling.

### 4494-9559

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

The commenter expresses concern related to seismicity due to the HSR Palmdale to Burbank Project Section crossing fault lines. Please refer to Standard Responses PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, and PB-Response-ALT-1, which addresses concerns related to seismicity, and describes the Authority's efforts to focus on selecting alignment alternatives that would cross major faults at grade.

### 4494-9560

The commenter requested further information on project plans and design features to prevent project railroad train derailment. A description of analyses regarding the potential for railroad accidents/derailment can be found under Impact S&S#12, in Section 3.11, Safety and Security, of this Final EIR/EIS. The design of the Build Alternatives would include safety elements to prevent train-to-train collisions, as well as collisions between trains and objects, vehicles, pedestrians, or bicyclists. These safety elements would include grade separations, physical separations including separation distances and vertical separations, physical protection barrier structures, PTC features, and derailment containment. In addition, the design of the California HSR System includes an operations and maintenance plan that includes schedules and procedures for the periodic maintenance of the track, right-of-way, power systems, train control systems, signaling, communications, and safety systems required for operations of the system. Scheduled maintenance of operations and safety systems would minimize the potential for failure of systems that could lead to derailment.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9561

The commenter requested further information on existing emergency response plans that would be implemented in the case of a train derailment.

SS-IAMF#2 in Section 3.11 of the Draft EIR/EIS will require the Authority to coordinate with local emergency service providers in developing and implementing the System Safety Program Plan (SSPP), Security and Emergency Preparedness Plan (SEPP), and Safety and Security Management Plan (SSMP) to establish an efficient and coordinated response protocol, systems, and procedures across the multiple agencies that may be involved in responding to an emergency incident, including establishing coordinated procedures for emergency responder access to the HSR access-controlled right-of-way, aerial track, trenches, and tunnels, including during cases of train derailment. Furthermore, implementation of S&S-MM#1 (described in Section 3.11.7 of this Draft EIR/EIS) will require the Authority to monitor the response of local fire, rescue, and other emergency service providers to incidents. The Authority will enter a cost-sharing agreement with these providers to fund the Authority's fair share of emergency service needs created by the Palmdale to Burbank Project Section ensuring that services are made available. Further information on the development and implementation of the project SSPP, SEPP, and SSMP can be found under the California High-Speed Rail Program subheading in Section 3.11.2.2 of this Final EIR/EIS.

Physical elements, such as containment parapets, check rails, guard rails, and derailment walls, would be used in specific areas with a high risk of or high impact from derailment. These areas include elevated guideways and approaches to conventional rail and roadway crossings. Concrete derailment walls are like tall curbs that run close to the train wheels. In the event of a derailment, these walls keep the train within the right-of-way and upright. Furthermore, scheduled maintenance of operations and safety systems would minimize the potential for failure of systems that could lead to derailment.

### 4494-9562

Refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, PB-Response-HAZ-1: Materials Hauling and Transportation of Hazardous Materials, PB-Response-S&S-2: Accidents and Explosions.

The commenter asks how the Authority can claim to be consistent with local safety policies when each of the six Build Alternatives are inconsistent with one policy from the Los Angeles County General Plan related to human-made disasters, such as hazardous waste, seismic events, fires, and floods. The commenter notes that this inconsistency is due to the HSR Palmdale to Burbank Project Section introducing hazardous waste and materials to the project area. Page 3.11-7 in Section 3.11, Safety and Security of the Draft EIR/EIS acknowledges the inconsistency of the HSR Palmdale to Burbank Project Section with the Los Angeles County General Plan 2035 Safety Element. Page 3.11-8 of the Draft EIR/EIS goes on to state that despite that inconsistency, "the project is consistent with the majority of regional and local policies and plans" and that "although it may not be possible to meet all safety and security standards... IAMFs and mitigation measures will generally minimize safety and security impacts and would ultimately meet the overall objectives of the local policies." Therefore, the Authority is not claiming to be consistent with local safety policies and has indicated the inconsistency with local policies related to safety and security. The Authority is, however, also stating that in general, the project would be consistent with the majority of regional and local policies and plans, and that IAMFs and mitigation measures will minimize impacts to safety and security.

Appendix 2-H in the Draft EIR/EIS provides a Regional and Local Policy Consistency Table, which lists the safety and security goals and policies applicable to the Palmdale to Burbank Project Section and notes the Build Alternatives' consistency or inconsistency with each. The consistency analysis in Appendix 2-H has been revised in the Final EIR/EIS to reflect the inconsistency with the Safety Element, related to the introduction of hazardous materials to the project area. Appendix 2-H examines 30 regional and local plans and policies. After the revision, the project will still be consistent with the majority of the plans and policies. Please refer to Standard Response PB-Response-HAZ-1: Materials Hauling and Transportation of Hazardous Materials, for hazardous waste and materials handling. Please refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, for seismic

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9562

concerns. Please refer to Standard Response PB-Response-S&S-2: Accidents and Explosions, for safety concerns. In addition, Section 3.11.5.1, Emergency Services, of the Draft EIR/EIS addresses fire protection and HYD-IAMF#2: Flood Protection in Section 3.8, Hydrology and Water Resources of the Draft EIR/EIS requires a flood protection plan before construction.

### 4494-9563

The commenter outlined each of the safety and security resource study areas presented in Section 3.11, Safety and Security, of the Draft EIR/EIS, and requested further information on the distance buffer used for identifying the study area to evaluate effects on oil and natural gas wells/fields. The commenter uses the term "must be" a certain number of miles from the project footprint. The EIS does not prohibit the project from operating within those distances. It explains, instead, that when construction and operations of the California HSR System comes within those distances of the respective facilities, it could potentially directly or indirectly affect those facilities. It also states that, "All sections above must be ½mile away from the airport." That is inaccurate. When construction or operations is within two miles of an airport, the analysis considers that within the resource study area. The commenter further asks why the Authority believes a 150-foot clearance from a gas line is safe.

The 150 feet project footprint buffer for the evaluation of hazards and hazardous materials, including oil and natural gas wells, is based on the distance in which the listed hazard could pose risks to each of the six Build Alternatives, either through migration of hazardous materials into the Build Alternative footprint or other means. Appendix 3.10-A, Hazardous Materials and Wastes Figures of the Draft EIR/EIS, includes figures depicting hazards and hazardous materials within the study area, including oil and gas wells. The 150-foot buffer area is established by the Authority as part of the Authority's Environmental Methodology Guidelines (Environmental Methodology Guidelines, Version 5.10, revised June 2020), which establishes the resource study area as the footprint for tracks, stations, and maintenance facilities, plus a 150-foot buffer of the project footprint to account for hazardous materials and waste issues on adjacent properties. The buffer area and the Authority's evaluation methodology is based on the California Department of Transportation (Caltrans) Standard Environmental Reference, Chapter 10, Initial Site Assessment guidance document and the American Society for Testing and Materials (ASTM) International Standard E 1528-06 (ASTM 2006), and ASTM International Standard E 1527-05 (ASTM 2005).

Implementation of SS-IAMF#4 will require the Contractor to identify and inspect all active and abandoned oil and gas wells within 200 feet of the proposed HSR tracks. Any active wells will be abandoned and relocated by the Contractor in accordance with the standards maintained by the California Geologic Energy Management Division

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9563**

(CalGEM) of the California Department of Conservation, formerly known as Division of Oil, and Gas and Geothermal Resources (DOGGR), in coordination with the well owners. All abandoned wells within 200 feet of the HSR tracks will be inspected and re-abandoned, as necessary, in accordance with CalGEM standards and in coordination with the well owner. The Contractor will provide the Authority with documentation that the identification and inspection of the wells has occurred prior to construction.

### **4494-9564**

The commenter requested further information on construction safety monitoring. CEQA Guidelines section 15126.4(a)(2) requires mitigation measures to be fully enforceable through permit conditions, agreements, or other legally binding instruments. As the lead agency, the Authority would adopt a mitigation monitoring and enforcement plan (MMEP) if it approves the project.

The MMEP would serve as the binding instrument to require the enforceability of mitigation measures and IAMFs identified to reduce project impacts in compliance with CEQA Guidelines section 15126.4(a)(2). The Authority will therefore regularly monitor the construction contractor to ensure the construction standards in management plans will be met, which would be outlined in the MMEP that is adopted if the project is approved (see, e.g., the Mitigation Monitoring and Enforcement Plan for the Burbank to Los Angeles Project Section, which includes IAMFs and mitigation measures and a reporting schedule: [https://hsr.ca.gov/wp-content/uploads/2022/04/Attachment\\_E-Exhibit\\_C-MMEP\\_A11Y.pdf](https://hsr.ca.gov/wp-content/uploads/2022/04/Attachment_E-Exhibit_C-MMEP_A11Y.pdf)).

As such, the development and implementation of management plans prepared by the construction contractor will be reviewed and monitored by the Authority. For example, implementation of SS-IAMF#1 will require the Contractor to prepare for submittal to the Authority a construction safety transportation management plan prior to project construction. As an example, the Burbank to Los Angeles Project Section MMEP specified that the implementation mechanism for this same IAMF was a condition of the design-build contract (see id.). The IAMF itself also requires that the contractor prepare and submit monthly reports to the Authority documenting construction transportation plan implementation activities for compliance monitoring.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9565

The commenter requested further information on emergency response times in the study area. The commenter asks how the Authority can maintain emergency response times considering the HSR Palmdale to Burbank Section would run through the ANF and at-grade railroad crossings can hinder emergency response times.

Information on safety and security related to the project, including emergency response for fire, police, and other emergency service facilities are available in Appendix 3.11-A of the Draft EIR/EIS. This includes emergency response times for police and fire departments gathered from respective online databases when preparation of the Draft EIR/EIS was initiated in 2016. As described in Chapter 2, Alternatives, of the Draft EIR/EIS, each of the Build Alternative alignments would be underground in bored tunnels through the ANF. Being underground, train operations would not have the potential to cause fire on the surface within the ANF. The limited above ground facilities in the ANF are limited to ancillary facilities such as small adit/access areas that would have little potential for creating wildland fires; above ground ancillary facilities would be located along existing roads in the ANF including Little Tujunga Canyon Road. Potential impacts on emergency response, related to emergencies within tunnels, including the tunnel within the ANF is discussed in Impact S&S#3 in Section 3.11, Safety and Security of the Draft EIR/EIS. Impact S&S#3 identifies that the Build Alternatives each include provisions for emergency service access to the access-controlled right-of-way including, but not limited to, the following: permanent access roads would be built to provide at least one access portal for each tunnel to support tunnel operations and maintenance activities; for tracks in trenches and tunnels, passenger walkways would be incorporated to allow emergency access and evacuation routes; and tunnel design would include a central, fire-rated dividing wall that would separate the two tracks of each single tunnel into two independently ventilated railways to allow access in the event of an emergency. Furthermore, the project would minimize interference with emergency response by including design provisions and procedures for emergency service access to the HSR right-of-way and the Burbank Airport Station through preparation and implementation of a System Safety Program Plan (SSPP) and a Safety and Security Management Plan (SSMP) prior to project operations (SS-IAMF#2). Additionally, the Construction Transportation Plan (required to be completed under TR-IAMF#2) will minimize traffic impacts caused by temporary road closures by providing traffic control on several elements, including provisions for 24-hour access by emergency vehicles.

### 4494-9565

Regarding the potential for the project to result in at-grade crossings that would hinder emergency response times, as discussed under Impact S&S#7 in Section 3.11, Safety and Security of the Draft EIR/EIS, where the Build Alternatives would cross existing roads, project construction would create grade separations so that roads would cross either over or under the HSR tracks. In total, between 9 and 13 existing roads would be modified to create grade separations, depending on the Build Alternative. Some of these grade separations implemented as part of the Palmdale to Burbank Project Section would replace existing at-grade rail crossings, while others would be new rail crossings; overall, reducing at-grade rail crossings and enhancing safety and improving emergency response times. As discussed in page 2-87 in Chapter 2, Alternatives of the Draft EIR/EIS, the Authority would also convert an existing at-grade railroad crossing at Sheldon Street with a new grade-separated railroad bridge over Sheldon Street. As such, when it comes to effects on emergency response times due to conflicts with at-grade railroad crossings, the HSR Palmdale to Burbank Section would improve emergency response compared to existing conditions, given that it would overall reduce the number of at-grade crossings.

Emergency response could still be disrupted by changes in local circulation patterns associated with project implementation. As described above, the Authority identified IAMFs that would minimize impacts. In addition, the Authority identified a mitigation measure that would further reduce impacts. S&S-MM#1 (described in Section 3.11.7) will require the Authority to monitor the response of local fire, rescue, and other emergency service providers to incidents. The Authority will enter a cost-sharing agreement with these emergency service providers to fund the Authority's fair share of emergency service needs created by the Palmdale to Burbank Project Section ensuring that services are made available. Calculations regarding emergency response times from construction and operation of the project are not included in the Draft EIR/EIS, since calculations would be speculative in nature. Nonetheless, the Authority has conducted a qualitative analysis and identified a mitigation measure that would ensure that emergency service providers maintain acceptable emergency response times, service ratios, and acceptable performance objectives and no new emergency service facilities will be required.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9566

The commenter requested further information on mitigation and minimization of Valley Fever exposure and spread during construction of the project. The project will include measures to prevent the spread of Valley fever during construction by managing fugitive emissions through a fugitive dust control plan through implementation of AQ-IAMF#1. The construction contractor will prepare and implement the fugitive dust control plan for each distinct construction segment to describe how each measure as part of the plan will be employed and who will be responsible for implementation of the measures. As part of the fugitive dust control plan measures during construction, vehicles transporting construction fill material on public roads would be covered. In addition, trucks and equipment transporting construction fill material will be washed prior to leaving construction work areas and traveling on public roads. Exposed surfaces and unpaved roads in construction areas will be watered as needed to control fugitive dust, in accordance with the fugitive dust control plan developed and implemented by the contractor for each construction work area. Further, the plan will include information on causes, preventive measures, symptoms, and treatments for Valley fever; outreach and coordination with the California Department of Public Health and county departments to make information on Valley fever readily available to residents, schools, and businesses; and dedication of a qualified person who will oversee implementation of the Valley fever prevention measures including fugitive dust control measures and construction worker protection measures. A Valley Fever Health and Safety designee will coordinate with the County Public Health Officer to determine what measures will be required by the Authority as part of the Safety and Security Management Plan that will be developed and implemented by the Authority under SS-IAMF#2, to minimize Valley fever exposure. The Valley Fever Health and Safety designee will manage implementation of the Valley fever control measures, which will include, but would not be limited to, training workers and supervisors on how to recognize symptoms of illness and ways to minimize exposure; providing washing facilities; providing vehicles with enclosed air-conditioned cabs; equipping heavy equipment cabs with high-efficiency particulate air filters; and making National Institute for Occupational Safety and Health-approved respiratory protection with particulate filters available to workers who request them.

### 4494-9567

Under the comment letter's heading for Section 3.11: Safety and Security, the commenter lists various statements about seismic risks, emergency response, flooding, methane gas, fire hazards, road closure, and permanent interference with emergency response times. Following these statements, the commenter asks how the project will be designed to account for, and how the Authority will respond to, an earthquake when trains are in a tunnel.

Regarding the commenter's reference to the history of earthquakes, the region's seismicity is addressed in EIR/EIS Section 3.9.5.5. The commenter's reference to an emergency response plan that acknowledges that a large earthquake could exceed response capabilities of individual cities is contained on Draft EIR/EIS page 3.11-39. The description refers to the content of the County of Los Angeles Operation Area Emergency Response Plan. The commenter's statement about a 1 percent annual flood risk is contained on Draft EIR/EIS page 3.11-39. The commenter's statement about methane gas from landfills is also found on Draft EIR/EIS page 3.11-39. Methane occurs in the soil in the Palmdale to Burbank project area. Methane is a particular concern in the vicinity of landfill sites where methane may build up in the landfill material in addition to naturally occurring methane in the ground. On June 24, 1971, a methane explosion occurred at a tunnel construction site in Sylmar. The Authority is aware of the potential presence of, and danger of methane buildup during construction of the tunnels included as part of the preferred alternative alignment. The Palmdale to Burbank Project Section EIR/EIS specifically identifies HMW-IAMF#2 to address methane during construction and operation. GEO-IAMF#3 and HMW-IAMF#2 will establish measures to protect against methane-related hazards associated with construction activities near landfill sites. HMW-IAMF#2 will require the contractor to prepare a technical memorandum outlining methane protection measures for ground-disturbing work within 1,000 feet of a landfill, including gas detection systems and personnel training. This will be undertaken pursuant to State of California Title 27, Environmental Protection –Division 2, Solid Waste. The statement about wildfire hazards appears to have been derived from material in EIR/EIS Section 3.11.5.3. This topic is further discussed in Standard Responses PB-Response-S&S-1: Wildfire. The commenter's statement about temporary road closures is derived from Table 3.11-2 of the EIR/EIS, while the statement about permanent road closures is derived from Table 3.11-3. The commenter raises no specific concerns related to these statements derived from EIR/EIS material; therefore,

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9567

no substantive response is required. However, note that to the extent these impacts could occur, these issues are addressed in the EIR/EIS. As defined on page 3.8-14 of the Draft EIR/EIS, a 1-percent risk flood is called a 100-year flood or base flood. This corresponds to FEMA Zone A, Zone AE, or Zone AO as defined on page 3.8-23 of the Draft EIR/EIS. The Draft EIR/EIS discusses floodplain designations along the project in Section 3.8.5.3. The EIR/EIS addresses wildfire risk and discloses which parts of the alignment are located within FHSZs in Section 3.11.5.3 and Impact S&S#16. The temporary road closures are addressed in the Draft EIR/EIS under Impact S&S#1, and the permanent road closures are addressed under Impact S&S#2. Regarding landfill gas refer to EIR/EIS Impact HMW#4 for a discussion of potential impacts during construction and operation.

Regarding design and impacts about tunnels, seismic risks and impacts are analyzed in detail in Section 3.9, Geology, Soils, Seismicity and Paleontological Resources of the EIR/EIS. Refer to Impact GSSP#7 (Fault Rupture and Seismic Ground Shaking Could Endanger People or Structures During Construction), Impact GSSP#8 (Liquefaction, Lateral Spreading, and Ground Lurching Could Endanger People or Structures During Construction) and Impact GSSP#16 (Effects of Geologic Hazards During Operations). Extensive measures would be implemented to address seismic risks in the design of the project. GEO-IAMF#10 requires incorporation of design guidelines to limit vulnerability to fault ruptures, including for tunnels. As required by GEO-IAMF#10, the alignment, including tunnels, would be constructed in compliance with applicable codes and design standards to address and minimize these risks. These applicable codes and design standards and recommendations include 2015 American Association of State Highway and Transportation Officials (AASHTO) Federal Highway Administration Circulars and Reference Manuals; American Railway Engineering and Maintenance-of-Way Association Manual; California Building Code; International Building Code (IBC); American Society of Civil Engineers (ASCE)-7; Caltrans Design Standards; American Society for Testing and Materials (ASTM); and the Authority's Technical Memoranda (TM).

In addition, the Authority's Technical Memoranda provides guidance and procedures to advance the preliminary engineering. Preliminary design of the tunnel structures has been completed in accordance with the following TMs: TM 2.4.5 Train Tunnel

### 4494-9567

Structures, TM 2.4.2 Basic Tunnel Configuration, TM 1.1.21 Typical Cross Sections for 15% Design, TM 2.4.6 Tunnel Portal Facilities, and TM 2.4.8 Tunnel Service and Maintenance Considerations. Please also refer to Response to Comment #10527, which discusses design of tunnels where they cross a Hazardous Fault zone. The HSR system project design also includes several components that minimize the effects from seismic events and the potential safety risks from seismic events (GEO-IAMF#6). These include a train control system with Early Earthquake Detection System (EEDS), which is a system integrated with train control, communications and signal systems capable of detecting early P-wave ground motions, calculating the expected magnitude of shaking, and triggering braking response for at-risk trains. This would help identify situations where fault rupture and/or liquefaction have the potential to damage facilities and enable control of trains in a manner that would reduce the potential for accidents. Response to Comment #10528 also discusses the EEDS required under GEO-IAMF#6 and how it would function.

Regarding tunnel seismic design, refer to TM 2.10.5 Seismic Design Criteria, which establishes design criteria for tunnels and other primary structures. For 15% seismic design, all tunnels shall be considered "complex". The objective of the Technical Memoranda Guidelines is to ensure that complex structures under consideration are feasible and will meet the "No Collapse" performance level under the Maximum Considered Earthquake (MCE) event at the 15% Design level of project development. The project will also be designed in accordance with TM 2.10.6 Fault Hazard Analysis and Mitigation Guidelines, which provides guidelines for identifying Hazardous Fault Zones (HFZs) in terms of their fault displacements, recurrence rates, orientation, sense of slip, and other characteristics. The methodology for assessing fault hazard displacement includes both deterministic and probabilistic approaches to quantify the best estimates of fault displacement to be used in design. According to the Authority's TM 2.10.6 R1 Fault Rupture Analysis and Mitigation, where the tunnels cross a Hazardous Fault zone, a larger cross-section has been considered to allow clear passage and realignment of the tracks after a seismic event below grade. Also, the length of the track realignment zone has been extended beyond the fault zone. The fault chamber is designed to accommodate fault displacement by the failure of the initial lining while preserving the integrity of the interior lining. Please refer to Draft EIR/EIS Volume 3 Tunnel Plans Drawings TN-C0300 through TN-C0302 for a description of the

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9567

fault chamber design. Before and after the fault chamber, the tunnel will have a widened cross section to allow the alignment recovery. The Authority has developed an emergency access plan for operation of the California HSR System, pursuant to NFPA Standard 130: Standard for Fixed Guideway Transit and Passenger Rail Systems, the principal guidance document. The plan includes emergency access provisions with regard to fire and safety for stations, tunnels, ventilation systems, procedures, control systems, communication, and vehicles. The twin tunnels will be connected by cross passages every 800 feet for emergency egress between the tunnels. Response to Comment #10529 also addresses the EEDS function when trains are in a tunnel, as well as passenger evacuation. In addition, the project design includes fire warning systems and ventilation, as well as emergency exits and notification systems, consistent with the requirements of the NFPA Safety Code and Standard for Fixed Guideway Transit and Passenger Rail Systems, the California Building Code, and the International Building Code. Therefore, the tunnel design will have sufficient components to facilitate safe harbor and/or egress of passengers from tunnel areas following a seismic event.

The project's design also incorporates IAMFs such as the preparation of a Construction Management Plan (GEO-IAMF#1) that requires an assessment of geotechnical conditions prior to construction, which includes seismicity. In accordance with GEO-IAMF#7, prior to final design, the contractor shall conduct additional seismic studies to establish site-specific ground motions to be used in developing the seismic design parameters for the design of project elements in accordance with Authority's Technical Memoranda. Final design would be further supported by additional seismic studies and compliance with Caltrans seismic design criteria. These design procedures and features reduce to the greatest practical potential movements, shear forces, and displacements that result from inertial response of the structure. In critical locations, pendulum base isolators may be used to reduce the levels of inertial forces.

Because of the effectiveness of the above-mentioned design features and IAMFs, the Authority concluded that impacts related to fault rupture and seismic ground shaking endangering people or structures during construction (Impact GSSP#7); liquefaction, lateral spreading, and ground lurching endangering people or structures during construction (Impact GSSP#8); and the effects of geologic hazards during operations (Impact GSSP#16) would be less than significant under CEQA for all six Build

### 4494-9567

Alternatives.

The Authority has developed an emergency access plan for operation of the California HSR System, pursuant to NFPA Standard 130: Standard for Fixed Guideway Transit and Passenger Rail Systems, the principal guidance document. The plan includes emergency access provisions with regard to fire and safety for stations, tunnels, ventilation systems, procedures, control systems, communication, and vehicles. The twin tunnels will be connected by cross passages every 800 feet for emergency egress between the tunnels. In addition, the project design includes fire warning systems and ventilation, as well as emergency exits and notification systems, consistent with the requirements of the NFPA Safety Code and Standard for Fixed Guideway Transit and Passenger Rail Systems, the California Building Code, and the International Building Code. The tunnel design will have sufficient components to facilitate safe harbor and/or egress of passengers from tunnel areas following a seismic event. Emergency egress for long, twin-bore tunnels is expected to be done by the passengers and crew from one tunnel to the other one, through the cross passages, which will be located every 800 feet. The typical procedure will be to wait inside these cross passages until a rescue train is able to reach the incident section, or at least until the traffic on the other tunnel has been confirmed to have stopped by the control center, to perform a self-rescue walking along the tunnel to the nearest portal.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9568**

The commenter expressed concerns about the proposed heights of structures within the vicinity of the Hollywood Burbank Airport and potential impacts on airport operations. Permanent interference with airport safety, including the Hollywood Burbank Airport, is evaluated in Impact S&S#9, in Section 3.11, Safety and Security, of the Draft EIR/EIS. To address the potential for disruption of airfield and airspace operations at Hollywood Burbank Airport as a result of operation of the project, each of the HSR Build Alternatives incorporates SS-IAMF#5, which requires the Authority to submit designs and/or information to the Federal Aviation Administration (FAA) as required by the Code of Federal Regulations (C.F.R.), Title 14, Part 77, which may include the location of planned HSR construction and construction staging areas within and adjacent to the boundary of the Hollywood Burbank Airport, the types and height of proposed equipment, and planned time/duration of construction, to ensure that permanent HSR features within and adjacent to the boundary of Hollywood Burbank Airport do not intrude into imaginary surfaces as defined in 14 C.F.R. Section 77.9(b). SS-IAMF#5 also requires the implementation of measures required by the FAA to ensure continued safety of air navigation during HSR Build Alternative operation, pursuant to 14 C.F.R. Section 77.5(c). If necessary, coordination with Hollywood Burbank Airport to amend the current Airport Layout Plan (Burbank-Glendale-Pasadena Airport Authority 2017) for any permanent construction-related facilities required for the HSR project will be submitted to the FAA for approval. The Airport Layout Plan amendment would be developed consistent with FAA's Standard Operating Procedures, including Standard Operating Procedure No. 2. In addition to the Airport Layout Plan amendment, as stated in SS-IAMF#5, the Authority will submit engineering design and/or information to the Burbank-Glendale-Pasadena Airport Authority for ultimate submittal to the FAA as required by 14 C.F.R. Part 77, to ensure temporary construction, and permanent HSR features within and adjacent to the boundary of the Hollywood Burbank Airport do not intrude into imaginary surfaces as defined in 14 C.F.R. Section 77.9(b). Each of the HSR Build Alternatives also incorporates SS-IAMF#6, which requires continued coordination with the FAA and the Burbank-Glendale-Pasadena Airport Authority to avoid conflicts due to overlapping construction schedules and future operations at the Hollywood Burbank Airport as design of the Build Alternatives progresses. SS-IAMF#6 will require coordination to support full operations of the runway and taxiway systems during construction (please refer to Appendix 2-E, Impact Avoidance and Minimization Features, for further descriptions of IAMFs that will be incorporated into project design).

### **4494-9568**

Furthermore, as discussed in Section 9.6, Table 9-5 of the Draft EIR/EIS, the Authority has been in coordination with the Burbank-Glendale-Pasadena Airport Authority (BGPAA) and the Federal Aviation Administration (FAA) since 2014 and continues to work closely with those entities to avoid impacts to airfield operations. Additionally, the FAA is a Cooperating Agency under NEPA for the Palmdale to Burbank Project Section.

### **4494-9569**

The commenter requested further information on wildfire avoidance and minimization measures during project construction. Project construction could increase fire risks in designated Fire Hazard Severity Zones (FHSZs) due to the storage and use of flammable or combustible materials, operation of vehicles and heavy machinery, or other factors resulting from increased human activity. However, all HSR right-of-way and facility vegetation control programs would conform to California Department of Forestry and Fire protection (CAL FIRE) guidelines for defensible space to reduce fire hazards. Additionally, ancillary features would be co-located with existing infrastructure of a similar nature and located in disturbed areas where possible, in order to reduce wildfire risks. Furthermore, the Authority will develop and incorporate fire and life safety programs into the project design and construction (SS-IAMF#1 and SS-IAMF#2) as part of the California HSR System. Fire risks would also be reduced by the Authority's formation of a statewide Fire and Life Safety and Security Committee (FLSSC) through implementation of SS-IAMF#2, which will be composed of representatives from fire, police, and local building code agencies. The FLSSC will ensure the incorporation of local building codes and other fire safety features into the project design. Through co-location of infrastructure with existing structures and disturbed areas, implementation of the FLSSC, implementation of SS-IAMF#1 and SS-IAMF#2, and limitation of the use of flammable building materials, the Build Alternatives will not require the installation of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts on the environment.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9570

The commenter expresses concern over the year of Council on Environmental Quality (CEQ) regulations, the year of Census data, and the peak construction year used for the purposes of the Draft EIR/EIS. The commenter also asks more broadly why “outdated data” is used “throughout” the EIR/EIS.

As explained in Section 3.1, Introduction, (Section 3.1.4.5) of the Final EIR/EIS, “The existing conditions baseline year for this Draft EIR/EIS is generally 2015, the year when the environmental analysis for the Palmdale to Burbank Project Section began following issuance of the federal Notice of Intent and the State Notice of Preparation for this project section.”

Regarding specific data referenced by the commenter:

- Census data: The Community Impact Assessment and the Relocation Impact Report to support the Draft EIR/EIS, from which the environmental analyses in Section 3.12, Socioeconomics and Communities, Section 3.18, Regional Growth, and Chapter 5, Environmental Justice, are based on, were initiated in 2016. The Draft EIR/EIS therefore relied upon the latest census data available in 2016 (2015 data) for its analyses in these sections as an adequate representation of existing conditions at the time the NOP was issued. Based upon its review of more recent census data (U.S. Census 2021), the Authority concluded that the population characteristics in the resource study area (RSA) have not changed and the socioeconomics, communities, and environmental justice impact conclusions would not be affected. For example, the Authority also refreshed its economic impact analysis based on the Regional Input-Output Multipliers System (RIMS) using more recent data. This updated analysis did not change the impact conclusions. The Authority’s review of existing conditions is further discussed in Section 3.1.4.5 of the Final EIR/EIS.

- Housing prices: As noted above, the Community Impact Assessment and the Relocation Impact Report to support the Draft EIR/EIS was initiated in 2016. The Draft EIR/EIS therefore relied upon the latest housing stock and housing characteristics data (2015 data) and the latest housing price data (2016 data) available in 2016 for its analysis in Section 3.12 as an adequate representation of existing conditions at the time the NOP was issued. While the commenter claims that “Housing prices are dated from 2008 and 2017”, this is incorrect; Table 3.12-9 in Section 3.12, Socioeconomics and

### 4494-9570

Communities, of the Draft EIR/EIS, only presents 2016 average housing prices for jurisdictions in the RSA. The Authority is unaware of any reason that 2016 data on housing prices would be substantially different than 2015 data and therefore used it as baseline data and therefore believes it is an adequate representation of baseline for the analysis in the EIR/EIS. For more information on housing price data over time, see Standard Response PB-Response-SOCIO-2: Property Values.

- Employment and unemployment rates: As noted above, the Community Impact Assessment and the Relocation Impact Report to support the Draft EIR/EIS was initiated in 2016. The Draft EIR/EIS therefore relied upon the latest employment and unemployment rates (2016 data) available in 2016 for its analysis in Section 3.12 as an adequate representation of existing conditions at the time the NOP was issued. The Authority is unaware of any reason that 2016 data on employment would be substantially different than 2015 data and therefore used it as baseline data and therefore believes it is an adequate representation of baseline for the analysis in the EIR/EIS. Section 3.1.4.6 of the Final EIR/EIS explains how the Authority has continued updating its employment forecasts.

- General Plans: The Authority updated the list of general plans used for the analysis of project consistency, which is reflected in the revised Appendix 2.0-H, Regional and Local Policy Consistency Analysis in the Final EIR/EIS. Therefore, in the Final EIR/EIS, the most recent general plans are used. No land use analysis or conclusions changed as a result of updating any general plans in the Final EIR/EIS.

Regarding NEPA regulations, they are not considered data or environmental conditions for the purpose of the impact analysis. Commencement of the Palmdale to Burbank Project Section EIR/EIS began in 2016, prior to the release of the new 2020 Council on Environmental Quality (CEQ) regulations. As explained in footnote 2 in Section 3.12 of this Final EIR/EIS:

“The CEQ issued new regulations, effective September 14, 2020, updating the NEPA implementing procedures at 40 C.F.R. 1500. However, this project initiated NEPA before the effective date and is not subject to the new regulations, relying on the 1978 regulations [amended in 1986, 51 Federal Register 15618 (April 25, 1986)] as they

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9570

existed prior to September 14, 2020. All subsequent citations to CEQ regulations in this environmental document refer to the 1978 regulations, pursuant to 40 C.F.R. 1506.13 (2020) and the preamble at 85 Federal Register 43340."

The commenter asks how accurate projections can be made if the Authority is relying on older data. In response, the "peak year" of construction was assumed to be 2023 at the onset of environmental analysis, as presented in the Draft EIR/EIS. As explained in footnote 4, under the Employment subheading in Section 3.12.4.3 of the Draft EIR/EIS: "For each Build Alternative, 2023 is assumed to be the peak year of construction. For the purposes of this analysis, delays are not expected to change the magnitude of impacts. Operations would commence upon completion of construction." The 2040 projections presented in Section 3.12, Socioeconomics and Communities, are based on a separate report that were obtained from the Southern California Association of Governments' (SCAG) 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The purpose of including population and demographic projections for 2040 is to provide context for the affected environment during which it is anticipated the project would be operating.

### 4494-9571

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter refers to Chapter 3.12 Socioeconomics and Communities and associated Appendices 3.12-A, 3.12-B, and 3.12-C and requests information on the methodology that will be used to calculate fair compensation for displaced businesses unable to find suitable relocation sites. This topic is further discussed under Impact SOCIO#6: Permanent Displacement of Commercial and Industrial Businesses from Construction.

Although the displacement of local businesses is not considered an environmental impact under CEQA, the Authority has incorporated IAMFs that would apply to any of the six Build Alternatives and that will assist displaced businesses. As described in Section 3.12.4.2 of the Draft EIR/EIS, relevant IAMFs include SOCIO-IAMF#2: Compliance with Relocation Assistance and Real Property Acquisition Policies Act, which describes the Authority's commitment to compliance with the Act, which guarantees the right to appeal and states that any person may file an appeal with the head of the responsible agency if that person believes that the agency has failed to determine properly the person's eligibility or the amount of a payment authorized by the Act. The Authority would also implement SOCIO-IAMF#3: Relocation Mitigation Plan, which requires the Authority to develop a relocation plan that includes a program to minimize economic disruption and includes the creation of an ombudsman's position to act as a single point-of-contact for questions about the relocation process.

Also, please refer to Appendix 2-E of the Draft EIR/EIS for more information regarding these IAMFs. Detailed information regarding the Authority's relocation assistance policies is available in Appendix 3.12-A Residential, Business, and Mobile Home Relocation and Assistance Brochures of the Draft EIR/EIS. Additionally, PB-Response-SOCIO-1: Parcel Acquisitions and Relocations provides more information on the topics of methodology and calculation of benefits for displaced businesses, including the process and methodology in the event eminent domain is used.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9572**

The commenter requests further information on mitigation regarding community cohesion and division effects from the project.

Impact SOCIO#1 and Impact SOCIO#2, in Section 3.12 of this Final EIR/EIS, describe effects on community cohesion/division effects from the project, and includes discussions of IAMFs/mitigation measures to ameliorate these effects. Construction of the Build Alternatives would present some new physical and visual barriers with the potential to divide existing communities. New physical and visual barriers from the at-grade or above-grade Build Alternative footprint would occur at the unincorporated community of Harold (Refined SR14, E1, and E2 Build Alternatives), the Boulders at the Lake Mobile Home Park (SR14A, E1A, and E2A Build Alternatives), the residential area near Vasquez High School in Acton (Refined SR14 Build Alternative only), the residential area near Big Springs Road in Agua Dulce (Refined SR14 Alternative), the residential area west of the SCE Vincent Substation in Acton (E1, E1A, E2, and E2A Build Alternatives), and the Lake View Terrace Neighborhood (E2 and E2A Build Alternatives).

Where new physical and visual barriers would occur within existing communities, access between properties and the local road networks would be maintained. The project would provide adequate roadway overcrossings and undercrossings to facilitate pedestrian, bicycle, and vehicular circulation. Impact SOCIO#1 (temporary disruption to community cohesion or division of existing communities from construction) would be less than significant for all Build Alternatives. Impact SOCIO#2 (permanent disruption to community cohesion or division of established communities from construction) would be potentially significant and require mitigation. SO-MM#2 (discussed in Section 3.12.7, of this Final EIR/EIS) will be implemented to minimize these effects, and will require the Authority to conduct special outreach to affected residential neighborhood and community residents, community organizations, and local officials, as well as require the Authority's evaluation of the community's modified access, in order to enable the Authority to maintain community cohesion and avoid physical deterioration.

Upon gathering feedback from the community, the Authority would utilize the input and define solutions. The Authority will report the decisions at a public workshop and in a written report made available to the public. The Authority would be responsible for

### **4494-9572**

implementing the measures to reduce impacts through project design and through the long-term management of the measures, which would involve documenting the desired design concepts, incorporating them into the final design, and facilitating ongoing maintenance. The commenter is correct that CEQA does not require consideration of effects that are solely economic or social; however NEPA does require some consideration of these and other related effects, which is why they are analyzed in the EIR/EIS.

### **4494-9573**

The commenter requested further information on the type of data used to project anticipated local and regional growth. Growth projections for local and regional population, employment, and housing growth for the purposes of this analysis are based on the Southern California Association of Government's (SCAG) projections in its 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (please refer to Section 3.12.5 of this Draft EIR/EIS for further information).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9574

The commenter expressed concern on the year of Census data used for the purposes of the Draft EIR/EIS. The baseline year for the analysis of project impacts was established after the Notice of Preparation was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis (see Draft EIR/EIS, pp. S-7, 3.3-23 to 3.3-24). CEQA Guidelines section 15125(a)(1) explicitly supports establishing baseline physical conditions in this manner, therefore, the use of a 2015 baseline is appropriate.

Preparation of the technical reports and appendices for the Palmdale to Burbank Project Section EIR/EIS was initiated in 2016, and thus the analysis is based on 2016 data. In reviewing more recent census data, the population and population characteristics of the study area have not changed substantially, as to where it would affect the analysis and significance conclusion presented. The Authority reviewed existing conditions data during preparation of the Final EIR/EIS and concluded that the 2015 baseline continues to be appropriate (see Section 3.1.4.5). The Authority also updated the list of general plans used for the analysis of project consistency which is reflected in a revised Appendix 2.0-H, Regional and Local Policy Consistency Analysis.

### 4494-9575

The commenter expressed concern about the year of CEQ regulations used for the purposes of the Draft EIR/EIS. As a matter of clarification, the regulations are not considered data for the purpose of the analysis. Commencement of the Palmdale to Burbank Project Section EIR/EIS began in 2016, prior to the release of the new 2020 CEQ regulations. As explained in footnote 2 in Section 3.12 of this Final EIR/EIS, the project initiated NEPA before the effective date and is not subject to the new regulations, relying on the 1978 regulations as they existed prior to September 14, 2020.

### 4494-9576

The commenter requested further information on access to the Draft EIR/EIS for residents with Limited English Proficiency. In March 2012 the High-Speed Rail Authority Board adopted a Title VI Program, in May 2012 the Board adopted a Limited English Proficiency (LEP) Policy, and in August 2012 the Board adopted EJ guidance. The adoption of these policies formalized the Authority's long-standing efforts to ensure that no person in the state of California is excluded from participation in, nor denied the benefits of, its programs, activities, and services on the basis of race, color, national origin, age, sex, or disability as afforded by Title VI of the Civil Rights Act of 1964 and related statutes. As described in Section 5.2.2, California High-Speed Rail Limited English Proficiency Policy and Plan, in Chapter 5 of this Final EIR/EIS, the LEP Policy articulates the Authority's policy to communicate effectively, with respect, and to provide meaningful access to limited English proficient (LEP) individuals to all the Authority's programs, services, and activities. Consistent with the Authority's LEP policy, the Authority has provided free language assistance services to LEP individuals encountered during public outreach or whenever requested by LEP individuals.

Language assistance may be provided through a variety of methods, including but not limited to Interpretation (verbal) and/or translation (written) of vital text (or a summary of that vital text). This has been accomplished through the translation of noticing materials and the Executive Summary distributed with the Draft EIR/EIS. It is the policy of the California High-Speed Rail Authority (Authority) to communicate effectively and to provide meaningful access to Limited English Proficient (LEP) individuals to the Authority's programs, services, and activities.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9577**

The commenter requests further information on how project inconsistencies with Community Plans would be mitigated. The Authority, as the lead state and federal agency proposing to construct and operate the HSR System, is required to comply with all federal and state laws and regulations and to secure all applicable federal and state permits prior to initiating construction on the selected Build Alternative. Therefore, there would be no inconsistencies between the six Build Alternatives and these federal and state laws and regulations. The Authority is a state agency and therefore is not required to comply with local land use and zoning regulations; however, it has endeavored to design and construct the California HSR System so that it is consistent with land use and zoning regulations. For example, the proposed Build Alternatives will incorporate IAMFs that require the contractor to prepare a plan to demonstrate how construction socioeconomic and community impacts will be managed such that they comply with applicable standards. This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### **4494-9578**

The commenter asked whether the General Plans used for the purposes of the Draft EIR/EIS are the most recent versions. Please refer to response to comment 9570 regarding the references to General Plans.

### **4494-9579**

The commenter requests further information on the type of data used to project anticipated local and regional growth. Growth projections for local and regional population, employment, and housing growth for the purposes of this analysis are based on the Southern California Association of Government's (SCAG) projections in their 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (please refer to Section 3.12.5 of this Final EIR/EIS for further information). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### **4494-9580**

The commenter refers to Chapter 3.12 Socioeconomics and Communities, Section 3.12.5.1 Social Setting, and asks whether the 2015 information presented in Tables 3.12-3 Regional Population Density, 3.12-4 Regional Race and Ethnicity, 3.12-5 Regional Household Income, and 3.12-6 Sensitive Populations in Areas of Residential Displacements remains relevant and appropriate to future construction of the Palmdale to Burbank Project Section. Specifically, the commenter refers to tables that rely on census data available in 2015. CEQA Guidelines section 15125(a)(1) specifies that the environmental baseline generally consists of the physical environmental conditions as they exist at the time the notice of preparation was published.

In response, the baseline year for the analysis of project impacts was established after the Notice of Preparation (NOP) was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis. Therefore, the use of a 2015 (or later, depending) baseline is appropriate. The Authority reviewed existing conditions data during preparation of the Final EIR/EIS and concluded that the 2015 baseline continues to be appropriate. Please see Section 3.1.4.5 of the Final EIR/EIS for further explanation, including citations for the U.S. Census data used in the analysis (the 2010-2014 American Community Survey 5-year estimates) presented in the Final EIR/EIS, and the most recent U.S. Census data available (the 2017-2021 American Community Survey 5-year estimates available at <https://data.census.gov/table>) that the Authority reviewed. In addition, the 2040 projections presented in Section 3.12, Socioeconomics and Communities, comes from the Southern California Association of Governments' (SCAG) 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The 2016-2040 RTP/SCS anticipates annual population growth in the SCAG region to be approximately 0.7 percent per year.

The purpose of including population and demographic projections for 2040 is to provide context for the affected environment for the horizon year for analysis of California HSR System operations. Although these 2040 projections are based upon data available in 2015, the Authority's review of more recent data did not identify substantial changes, and concluded that the projections remain valid. Section 3.1, Introduction, specifically Section 3.1.4.5 Affected Environment and Section 3.12, Socioeconomics and Communities, specifically Section 3.12.1 Introduction have been updated to explain the

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9580

Authority's review of existing conditions data since publication of the Draft EIR/EIS.

### 4494-9581

The commenter refers to Figure 3.12-8 Population and Community Resource Study Area (Map 7 of 11), and requests specific information as to the location where the E1 Build Alternative emerges from tunnel near Little Tujunga Canyon. The Refined SR14, SR14A, E1, and E1A Build Alternative tunnel opening depicted on Figure 3.12-8 is located at Montague Street, northeast of Ralston Avenue. The E2 and E2A Build Alternative tunnel openings depicted on Figure 3.12-8 are located south of Wentworth Street and along Oliver Road between Oliver and Cassie Canyons, east of Little Tujunga Canyon.

### 4494-9582

The commenter expresses confusion over the E2 and E2A Build Alternatives being "inconsistent" due to lack of available replacement units, but "consistent with the majority of local and regional policies and plans."

The reference to inconsistency is specific to two policies: the City of Los Angeles Plan for a Healthy Los Angeles (Policy 1.7), which calls for mitigating the potential displacement caused by large-scale investment and development; and the Sunland-Tujunga-Lake View Terrace-Shadow Hills-East La Tuna Canyon Community Plan (Policy 1.1.4), which promotes neighborhood preservation in existing residential neighborhoods. Certain project alternatives are inconsistent with Policy 1.7 because Sun Valley and Lake View Terrace would have insufficient replacement units available to accommodate all displaced residents in these communities from the E2 and E2A Build Alternatives. These same project alternatives are inconsistent with Policy 1.1.4 because they would displace existing residential land within neighborhoods (Lake View Terrace and Shadow Hills) and convert residential uses to transportation use to accommodate construction staging, rail alignment, utility easement, and access.

At the end of Section 3.12.3, Consistency with Plans and Laws, the EIR/EIS states "Despite the inconsistencies, the project is consistent with the *majority* of regional and local policies and plans." This is not double-speak nor contradictory, as suggested by the commenter. While the E2 and E2A Build Alternatives would be inconsistent with two distinct policies, the project generally would be consistent with hundreds of policies analyzed across 12 regional and local plans. The full analysis of the project's consistency with local and regional plans is provided in Appendix 2.0-H, Regional and Local Policy Consistency Analysis. Because the E2 and E2A Build Alternatives would be consistent with the vast majority of the policies analyzed, the statement in Section 3.12.3 is accurate.

### 4494-9583

The commenter questions why certain jurisdictions are not included in the study area. As described in Section 3.12.4 and Section 3.12.5 of this Final EIR/EIS, both the City of San Fernando and the Sylmar neighborhood are included in the study area.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9584**

The commenter asks when the project's mitigation plans will be available. The detailed mitigation plans specified in the EIR/EIS will be prepared during the detailed design and before construction begins. Currently, the Authority does not have funding for detailed design or construction of this project section. Therefore, the timing for preparation of these plans is not known. Future funding is being sought for continued progress. As funds become available, the Authority will proceed with advanced design and prepare for other pre-construction work, including work on finalization and distribution of the project mitigation plan.

### **4494-9585**

The commenter inquired about the anticipated construction years used for the purposes of the Draft EIR/EIS.

The baseline year for the analysis of project impacts was established after the Notice of Preparation was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis (see Draft EIR/EIS, pp. S-7, 3.3-23 to 3.3-24). CEQA Guidelines section 15125(a)(1) explicitly supports establishing baseline physical conditions in this manner, therefore, the use of a 2015 baseline (or later, as applicable) is appropriate.

Preparation of the Palmdale to Burbank Project Section EIR/EIS, including technical reports and appendices, began in 2016, and thus the analysis, including construction assumptions, is based on 2016. At that time, peak construction was anticipated to occur in 2023. Currently, the Authority does not have funding for construction of this project section. Therefore, planning efforts have not begun for this specific stage of the project. Future funding is being sought for continued progress.

The Authority reviewed existing conditions data during preparation of the Final EIR/EIS and concluded that the 2015 baseline continues to be appropriate (see discussion in the Final EIR/EIS, Section 3.1.4.5). Because the analysis in the EIR/EIS applies the project's effects in light of existing or baseline conditions, and those conditions have not changed substantially since 2015, the impact analysis and results continue to be accurate notwithstanding the peak year of construction not being 2023.

### **4494-9586**

The commenter requests further information on the basis of describing the Courtship Ranch equestrian facility as an element of community cohesion in the Lake View Terrace area. The statement on the consideration of Courtship Ranch as an element of community cohesion, in the Affected Environment discussion (Section 3.12.5.1), has been deleted from the Final EIR/EIS. This facility would not be displaced and is not further evaluated in the document.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9587

The commenter requests further information on the verification of use of recreational areas, considering the recent pandemic.

Based on the latest Centers for Disease Control and Prevention (CDC) guidelines on Covid-19, published in May 2023, the federal COVID-19 Public Health Emergency declaration ended on May 11, 2023 (please refer to: <https://www.cdc.gov/coronavirus/2019-ncov/your-health/end-of-phe.html>). In addition, the California COVID-19 State of Emergency was terminated as of February 28, 2023.

The Governor has also phased out the executive actions put in place since March 2020 as part of the pandemic response (please refer to: <https://covid19.ca.gov/safely-reopening/#:~:text=California%20has%20moved%20Beyond%20the,part%20of%20the%20pandemic%20response>).

Since the lifting of COVID restrictions, prior uses of recreational areas and facilities are reasonably expected to have resumed. Sun Valley parks and the Sun Valley Recreation Center are open (see <https://www.laparks.org/reccenter/sun-valley>).

### 4494-9588

The commenter refers to Chapter 3.12, Socioeconomics and Communities, Section 3.12.5.2 Housing Setting which provides data from 2015 and 2016, and observes that housing figures have changed and homeless populations have increased in the Lake View Terrace and Hansen Dam areas. The commenter asks about the current homeless populations for those areas. CEQA Guidelines section 15125(a)(1) specifies that the environmental baseline generally consists of the physical environmental conditions as they exist at the time the notice of preparation was published.

The baseline year for the analysis of project impacts was established after the Notice of Preparation (NOP) was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis. Therefore, the use of a 2015 (or later, depending) baseline is appropriate. The Authority reviewed existing conditions data during preparation of the Final EIR/EIS and concluded that the 2015 baseline continues to be appropriate. Please see Section 3.1.4.5 of the Final EIR/EIS for further explanation. Specifically, Table 3.12-7, Regional Housing Characteristics, and Table 3.12-8, Regional Housing Stock, within Section 3.12.5.2, Housing Setting, of the Draft EIR/EIS to which the commenter refers, rely on census data available in 2015. Based upon its review of more recent census data (U.S. Census 2021), the Authority concluded that the population (including homeless population) and housing characteristics in the resource study area (RSA) have not changed and the socioeconomics, communities, and environmental justice impact conclusions would not be affected. As a result, Section 3.1, Introduction (specifically Section 3.1.4.5, Affected Environment), and Section 3.12, Socioeconomics and Communities (specifically Section 3.12.1, Introduction) have been updated in the Final EIR/EIS to explain the Authority's review of existing conditions data since publication of the Draft EIR/EIS.

### 4494-9589

The commenter requests further information on the quantity of workers in certain employment sectors commuting from Palmdale/Lancaster to Burbank/LA. Further information on this topic is available in the Greater Antelope Valley Economic Alliance's (GAVEA) Economic Roundtable Reports (<https://avedgeca.org/wp-content/uploads/2021/01/2020-GAVEA-Econ-Round-Table.pdf>).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9590

The commenter inquires as to the purpose of including 2015 and 2040 State and Los Angeles County employment and projected growth data. Growth projections for local and regional population, employment, and housing growth for the purposes of this analysis are based on the Southern California Association of Government's (SCAG) projections in their 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (please refer to Section 3.12.5 of this Final EIR/EIS for further information). The Authority's goals are to support HSR ridership by promoting, in partnership with local agencies, transit-oriented development (TOD) around HSR stations.

The analyses presented in this Final EIR/EIS, including Section 3.12, Socioeconomics and Communities, and Section 3.13, Station Planning, Land Use, and Development, evaluates the impacts of the project alternatives based on projected 2040 future conditions, which is the horizon year for analysis of California HSR System operations. These projections allow for the evaluation of how the HSR system and its project sections would operate in the context of anticipated growth.

The scope of this analysis includes population growth within Los Angeles County, rather than the state in its entirety. Recent statewide exodus figures which have occurred since 2016 were not accounted for in this analysis. However, it is not anticipated these figures would substantially affect that data presented for LA County in this Final EIR/EIS, such that it would affect the conclusions presented. Population projections are always snapshots, reflecting the historical data available, and the analysis of trends, growth capacities, and growth constraints apparent at the times the projections are prepared. More important than the specific population projection is the recognition and examination of how the HSR system and its project sections would operate in the context of anticipated growth. Updating the document with 2020 data or with more recent population projections for 2040 would not change the project's impact or the impact determinations presented in Section 3.12 and Section 3.13 as the Palmdale to Burbank Project Section which is the project is not anticipated to induce substantial unplanned population growth beyond what is planned for the project study area.

### 4494-9591

The commenter requested further information on how property taxes in the area have changed since 2015. The year 2015 was used as the baseline year for assessing impacts because the Notice of Preparation was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis (see Draft EIR/EIS, pp. S-7, 3.3-23 to 3.3-24), and CEQA Guidelines section 15125(a)(1) explicitly supports establishing baseline physical conditions in this manner. Therefore, the use of a 2015 baseline is appropriate. Impact SOCIO#12, in Section 3.12 of this Final EIR/EIS, provides further discussion of anticipated property tax effects from the project. Property tax impacts were estimated using Los Angeles County Assessor parcel data reflecting the assessed value of full- and partial-acquisition parcels along the alternatives. A detailed discussion of this methodology can be found in Appendix C, Economic Analysis, of the Community Impact Assessment of this Final EIR/EIS. Electronic versions of Technical Reports prepared for this Final EIR/EIS are available through submitting a request on the Public Records Act portal (available at: <https://hsr-ca.nextrequest.com/>). Property is assessed, and the corresponding property tax is collected at the county level in California. Property owners pay one percent of assessed property value in general property tax, along with any special or direct assessments levied by local taxing entities that must be voter-approved. Property tax distribution varies from jurisdiction to jurisdiction, even within jurisdictions, and from year to year. The property tax revenues and ensuing loss in property tax revenues for each Build Alternative are calculated at a collective local level, reflecting the full one percent tax rate that is distributed between cities, Los Angeles County, local school districts, and other special districts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9592

The commenter refers to Chapter 3.12 Socioeconomics and Communities (Section 3.12.5.3) in the Draft EIR/EIS and asks whether the information presented in Table 3.12-15 regarding School District Funding for 2015 remains useful, given changes due to attrition, gaps in attendance after COVID-19, and decreases in population.

CEQA Guidelines section 15125(a)(1) specifies that the environmental baseline generally consists of the physical environmental conditions as they exist at the time the notice of preparation was published. The baseline year for the analysis of project impacts was established after the Notice of Preparation (NOP) was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis. Therefore, the use of a 2015 (or later, depending) baseline is appropriate. The Authority reviewed existing conditions data during preparation of the Final EIR/EIS and concluded that the 2015 baseline continues to be appropriate. Please see Section 3.1.4.5 of the Final EIR/EIS for further explanation. With respect to the school district funding, the Authority reviewed more recent data from the 2021-2022 fiscal year (available from the California Department of Education at <http://www.ed-data.org/>) to determine whether the analysis presented in the Draft EIR/EIS remains valid. Upon reviewing the 2021-2022 data, each of the eight school districts in the project study area listed in Table 3.12-15 have seen an increase in property tax revenue, and in total revenue, which includes property tax revenue and ADA-based revenue.

As discussed in Section 3.12.6.6, Impact SOCIO#13, each of the Build Alternatives could result in a loss of total affected school district funding. However, property tax revenues contribute a small amount to the district funding, and it is unlikely that a reduction in only property tax revenues would trigger school closures within the district. Additionally, the total revenue of school funding increased in the fiscal year 2021-2022 for all school districts, meaning that the loss of revenue from property taxes represents an even smaller percentage with the updated data. For the reasons above, the analysis presented in the Draft EIR/EIS remains valid. As described above, Section 3.1.4.5 of the Final EIR/EIS, has been updated to explain the Authority's review of existing conditions data since the publication of the Draft EIR/EIS.

### 4494-9593

The commenter cites page 3.12-49 of the Draft EIR/EIS, which states that the No Project Alternative could have similar effects as the HSR Palmdale to Burbank Project Section due to other later projects, and accuses the Authority of ignoring the possibility of land remaining in its "natural, undisturbed form."

The commenter appears to be commenting on the following statement on page 3.12-49 of the Draft EIR/EIS: "Anticipated growth under the No Project Alternative includes other projects that could result in potential economic benefits and losses."

Pursuant to CEQA Guidelines, the No Project Alternative represents conditions in the study area in the absence of approval of the proposed project (CEQA Guidelines Section 15126.6(e)(1)). The No Project Alternative must discuss current conditions as well as reasonably foreseeable future conditions expected to occur if the project were not approved (CEQA Guidelines Section 15126.6(e)(2)). Pursuant to the aforementioned CEQA Guidelines, the No Project Alternative for this EIR/EIS includes all currently known, programmed, and funded improvements to the intercity transportation system (highway, rail, and transit) and reasonably foreseeable local development projects (with funding sources already identified) expected to be developed as planned by 2040, the planning horizon used in the EIR/EIS.

Furthermore, the analysis of the No Project Alternative included the assumption made by the commenter (i.e., that under the No Project Alternative, land would remain in its natural, undisturbed form). Page 3.12-49 of the Draft EIR/EIS includes the following statement: "Development under No Project Alternative conditions would primarily occur within existing urban/suburban communities within the project area, including Palmdale and the San Fernando Valley, and would generally avoid portions of the San Gabriel Mountains that preclude development because of topographical constraints or protected land designations (such as within the ANF including SGMNM)."

The Draft EIR/EIS, thus, does not ignore that some land, specifically land in mountainous regions, would remain in its existing form under the No Project Alternative. The Draft EIR/EIS specifically states that under the No Project Alternative, development would generally avoid portions of the San Gabriel Mountains.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9594**

Refer to Standard Response PB-Response-TRA-1: Temporary Traffic Associated with Construction.

The commenter points out a minor error in Section 3.12, inadvertently referring to "SR-188" as "SR-118". This minor error has been corrected in the Final EIR/EIS. The commenter also inquires about freeway traffic effects from project construction staging areas that would be located near where the I-210 and SR-118 freeways connect. This topic is addressed in Standard Response PB-Response-TRA-1, which explains that trips for construction workers would generally occur outside of the peak hours for freeway and street traffic (TR-IAMF#6). The movement of heavy construction equipment such as cranes, bulldozers, and dump trucks to and from the site would generally occur during off-peak hours on designated truck routes (TR-IAMF#6 and TR-IAMF#7). The contractor will be responsible for identifying adequate off-street parking for construction-related vehicles and, if necessary, designating remote parking areas for these workers, with shuttles to bring them to and from the construction area if the remote parking areas are distant from the project site (TR-IAMF#3). At this specific location, there is proposed to be an intermediate window area for the SR14/SR14A and E1/E1A Build Alternatives. Access to the construction site is planned to be from Foothill Boulevard and I-210 and SR 118 freeways (depending on the spoils deposit sites), thereby minimizing the amount of construction spoils truck traffic on neighborhood streets. As documented in Section 3.2.4.3, five intersections and two roadway segments were assessed in this area, including along Foothill Boulevard and Paxton Street. Construction activities were found to result in a significant impact to two intersections (I-280 Ramps at Paxton Street and Foothill Boulevard at the Spoils Area 15 Access Road). To address these issues, mitigation measures have been identified, including TR-MM#12, which would address the impacts of construction by preparing a Transportation Construction Management Plan to manage circulation and connections for modes of travel during the construction duration.

### **4494-9595**

The commenter requests further information on the project Construction Management Plan, including development of the CMP and anticipated water use used for dust control measures. Please refer to Appendix 2-E of this Final EIR/EIS for the full text on project IAMFs, including the proposed CMP (SOCIO-IAMF#1). Management plans, including the CMP, are to be prepared by the construction contractor, the preparation of which is outside of the scope of an EIR/EIS. As described under Impact PUE#4, in Section 3.6, Public Utilities and Energy, of this Final EIR/EIS, the average annual water use over the construction period for the Build Alternatives would be approximately 907 acre-feet/year; this figure includes water used for dust suppression during construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9596

The commenter refers to Impact SOCIO#1: Temporary Disruption to Community Cohesion or Division of Existing Communities from Construction, in Section 3.12, Socioeconomics and Communities, of the Draft EIR/EIS. The commenter asks how residents can address temporary impacts resulting from light and glare during nighttime construction should efforts to minimize them prove insufficient.

Effects from construction light and glare are discussed under Impact AVQ#2: Temporary Construction Impacts from Light and Glare, in Section 3.16, Aesthetics and Visual Quality, of the Draft EIR/EIS. Construction light and glare would be an annoyance to viewers along the alignment where construction activities would occur, reducing the visual quality rating by one or more levels depending upon the setting. Construction would occur only intermittently at night throughout the construction period. Construction at any given location would typically last 1 to 2 years. Combined with an overall viewer sensitivity rating of moderate, the effect of construction light and glare would be significant under CEQA. To mitigate this impact, AVQ-MM#2 Minimize Light Disturbance During Construction requires the contractor to prepare a technical memorandum verifying how they will shield nighttime construction lighting and direct it downward in such a manner to minimize light that falls outside the construction site boundaries. The technical memorandum will be submitted to the Authority for review and approval.

Following implementation of AVQ-MM#2 and if light and glare from nighttime construction activities continues to be objectionable, residents or others will be able to contact the Authority through a toll-free hotline for construction-related activities to make their concerns known. A designated representative of the Authority will respond to hotline messages within 24 hours (excluding weekends and holidays). The Authority will make a reasonable, good-faith effort to address all concerns and answer all questions and shall include in a log its responses to all callers. The Authority shall make the log of the incoming messages including the Authority's responsive actions publicly available on its website.

### 4494-9597

The commenter requests further information on mitigation measures specific to the area along the E2 and E2A Build Alternatives where it emerges from tunnel in the Lake View Terrace area. The E2 and E2A Build Alternatives would result in both permanent and temporary impacts in this area. The EIR/EIS identifies these impacts by topic and specific to the E2 and E2A Build Alternatives. In this area the E2 and E2A alternatives would result in displacement of residential and commercial land uses to construct the project. As described in the EIR/EIS, construction impacts related to noise, traffic, and air quality that may disrupt residents and motorists would be minimized through NV-IAMF#1 (minimization of noise near sensitive receptors), AQ-IAMF#1 (implementation of a fugitive dust control plan), AQ-IAMF#2 (selection of coatings), AQ-IAMF#6 (reduce the potential impact of concrete batch plants), and TR-IAMF#2 (implementation of best management practices through a CTP), and impacts from temporary construction activities would be minimized such that existing land-use patterns and community cohesion would be preserved. The Authority's preferred alternative is SR14A would avoid the Lake View Terrace area.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9598**

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter inquires about how the Authority engages and coordinates with agents from the Uniform Act. The Uniform Act is a federal law that establishes minimum standards for federally funded programs and projects that require the acquisition of real property (real estate) or displace persons from their homes, businesses, or farms. The Authority employs various specialists who will assist with compliance with the Uniform Act, including relocation specialists (individuals who perform early studies of the general needs of persons who may be relocated and the types of replacement properties which may be required), property surveyors (perform field surveys, delineate property lines, and map the Authority's right-of-way needs), and right-of-way agents or appraisers (assess the value of private property). Some of these specialists may be directly employed by the Authority, while others would be contractors working on behalf of and under the oversight of Authority staff. As explained in the Authority's booklet, "Your Property, Your High-Speed Rail Project," (available on the Authority's website: [https://hsr.ca.gov/wp-content/uploads/docs/programs/private\\_property/Your-Property-Your-HSR-Project-Factsheet.pdf](https://hsr.ca.gov/wp-content/uploads/docs/programs/private_property/Your-Property-Your-HSR-Project-Factsheet.pdf)), property owners will be given the opportunity to accompany the appraiser on the inspection of their property. The appraiser will analyze the property and examine all features that contribute to its market value. Property owners can provide information about improvements that have been made and any other special features that may affect the market value of their property to the appraiser to ensure that he/she has all the relevant information. The owner will receive a copy of the appraisal or a summary of the valuation upon which the Authority's offer is based. However, at the time an offer is made to purchase the property, an owner may also choose to obtain their own independent appraisal by a state-licensed appraiser. Please refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations, which includes additional information about how the Authority complies with the Uniform Act.

### **4494-9599**

The commenter inquires about the validity of the analysis for the No Project Alternative. As described in Section 2.5.1 of this Final EIR/EIS, the No Project Alternative assumes that the Palmdale to Burbank Project Section would not be constructed. In assessing future conditions, it was assumed that all currently known, programmed, and funded improvements to the intercity transportation system (highway, rail, and transit) and reasonably foreseeable local development projects (with funding sources already identified) would be developed as planned by 2040. The No Project Alternative is based on a review of all city and county general plans, regional transportation plans for all modes of travel, and agency-provided lists of pending and approved projects within Los Angeles County. For the environmental analysis, the No Project Alternative considers the effects of growth planned for the region, as well as existing and planned improvements to the highway, aviation, conventional passenger rail, and freight rail systems in the Palmdale to Burbank Project Section area through 2040. The scenario is based on future development projects and improvements to the intercity transportation system that are programmed and funded for construction. Therefore, the analysis of the No Project Alternative is not based on speculation but on existing and approved land uses and development.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9600**

Refer to Standard Response PB-Response-SOCIO-3: Health and Safety of Children.

The commenter refers to Section 3.12.6.3, Impact SOCIO#1: Temporary Disruption to Community Cohesion or Division of Existing Communities from Construction, and requests further information related to the impacts that adjacent construction staging may have on students at Hillery T. Broadous Elementary School related to the Refined SR14 Build Alternative.

The proposed construction staging area for Refined SR14-W2 would be located directly south of the I-210/SR 118 intersection, within 250 feet of Hillery T. Broadous Elementary School. The proposed staging site is currently used as industrial warehousing facilities, which would be removed. The site would be fenced and screened from the school and other surrounding uses for aesthetic purposes. To minimize interference with school-related circulation and traffic impacts, construction equipment/trucks would enter the proposed staging site through specified entrance and exit location via Foothill Boulevard, which is a major arterial and truck route. As such, the school and circulation immediately around the school will not be affected. No truck traffic is proposed to pass by the school. Nor will children be exposed to construction activities as the site will be securely fenced and screened from view from the school and surrounding neighborhood. Please refer to Standard Response PB-Response-SOCIO-3: Health and Safety of Children for a discussion of construction impacts to schools.

### **4494-9601**

The commenter requests further information on the length of time construction effects would be experienced at a given location. Construction at any given location would typically last 1 to 2 years, although construction activities at concrete batch plants and some construction laydown areas would last for up to 5 years. For further information on construction timeline estimates, please refer to Section 2.9.2 in Chapter 2, Alternatives, of this Final EIR/EIS.

### **4494-9602**

The commenter requests further information on the verification of recreational areas, accounting for the recent pandemic. Per the latest Centers for Disease Control and Prevention (CDC) guidelines on Covid-19, as of June 2021, prior health orders regarding social distancing and capacity limits have been lifted, with exceptions related to masking and mega-events, as well as settings serving children and youth (please refer to: <https://covid19.ca.gov/safely-reopening/#what-to-do-now>).

### **4494-9603**

The commenter requests further information about mitigation regarding community cohesion and division effects from the project on the communities of Acton and Agua Dulce. Impact SOCIO#1 and Impact SOCIO#2, in Section 3.12 of this Final EIR/EIS, describe effects on community cohesion/division effects from the project, and includes discussions of IAMFs/mitigation measures to ameliorate these effects. Construction of the Build Alternatives would present new physical and visual barriers with the potential to divide existing communities. New physical and visual barriers from the at-grade or above-grade Build Alternative footprint would occur at the residential area near Vasquez High School in Acton (Refined SR14 Build Alternative only), the residential area near Big Springs Road in Agua Dulce (Refined SR14 Alternative), and the residential area west of the SCE Vincent Substation in Acton (E1, E1A, E2, and E2A Build Alternatives). Where new physical and visual barriers would occur within existing communities, access between properties and the local road networks would be maintained. The project would provide adequate roadway overcrossings and undercrossings to facilitate pedestrian, bicycle, and vehicular circulation. SO-MM#2 (discussed in Section 3.12.7, of this Final EIR/EIS) will be implemented to minimize these effects, and will require special outreach to affected residential neighborhood and community residents, community organizations, and local officials, as well as require the Authority's evaluation of the community's modified access, in order to enable the Authority to maintain community cohesion and avoid physical deterioration. Upon gathering feedback from the community, the Authority would use the input and develop enhancements to ameliorate effects associated with community cohesion and community division. The Authority would be responsible for implementing the measures to reduce impacts through project design and through the long-term management of the measures, which would involve documenting the desired design concepts, incorporating them into the final design, and facilitating ongoing maintenance.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9604

The commenter refers to the Draft EIR/EIS discussion in Section 3.12, Socioeconomics and Communities, related to Impact SOCIO#2: Permanent Disruption to Community Cohesion or Division of Established Communities from Construction of the E2 Build Alternative, asks for more information regarding reduction of views and paths in the Lake View Terrace neighborhood, and expresses concern about social isolation.

Entering the San Fernando Valley from the north, the E2 Build Alternative would transition from tunnel to at-grade for approximately 1,000 feet before rising onto an elevated viaduct structure at Lake View Terrace. Due to its at-grade and on-viaduct construction, the E2 Build Alternative would divide the Lake View Terrace neighborhood between Jimenez Street and Wheatland Avenue. Connectivity between the divided neighborhood would be maintained via Arnwood Road and Foothill Boulevard, both of which would pass underneath the elevated HSR right-of-way. Foothill Boulevard would continue to provide the neighborhood with access to the regional road network. Nevertheless, the Draft EIS/EIS identifies that construction of the E2 Build Alternative would present new physical and visual barriers with the potential to divide the Lake View Terrace neighborhood, which is a significant impact requiring mitigation.

The Authority has incorporated an Impact Avoidance and Minimization Feature (IAMF) SOCIO-IAMF#1: Construction Management Plan, that will address the potential of the E2 Build Alternative to temporarily disrupt the Lake View Terrace neighborhood during construction. SOCIO-IAMF#1 will provide measures that minimize impacts on low-income households and minority populations such as directing all street users around the construction to allow them to access their destinations. These detours will be within urban areas, making them shorter as multiple nearby streets traffic could be rerouted to. Access between existing communities and the local road networks would be maintained through the project providing adequate roadway overcrossings and undercrossing to facilitate pedestrian, bicycle, and vehicular circulation. Please refer to Section 3.12.4.2 and Volume 2, Appendix 2-E, for more information regarding this IAMF.

Notwithstanding the implementation of a Construction Management Plan, the significant impact of the E2 Build Alternative must still be mitigated. Mitigation Measure SO-MM#2, discussed in Section 3.12.7 of this Final EIR/EIS, provides for implementation of measures to reduce impacts associated with the division of residential neighborhoods. It

### 4494-9604

requires special outreach to affected residential neighborhood and community residents, community organizations, and local officials, as well as require the Authority's evaluation of the community's modified access, in order to enable the Authority to maintain community cohesion and avoid physical deterioration.

Upon gathering feedback from the community, the Authority would use the input and develop enhancements to ameliorate effects associated with community cohesion and community division. For example, if safety considerations prohibit such uses as bike paths or community gardens, alternatives, such as sculpture gardens or managed landscaping, could be considered. The Authority would be responsible for implementing the measures to reduce impacts through project design and through the long-term management of the measures, which would involve documenting the desired design concepts, incorporating them into the final design, and facilitating ongoing maintenance. With implementation of Mitigation Measure SO-MM#2, the impact of physically dividing the Lake View Terrace neighborhood by the E2 Build Alternative would be less than significant.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9605

The commenter asks how Burbank can be considered as a replacement property for the Los Angeles County Department of Social Services.

It is not uncommon for County buildings or facilities to be located within the jurisdictional limits of a City. For example, the Los Angeles County Department of Regional Planning is located in downtown Los Angeles, and the Los Angeles County Public Works Department is located in the City of Alhambra. Notably, the Los Angeles County Department of Social Services has an existing office in Burbank, located at 3307 North Blenoaks Boulevard and within the city limits.

The Relocation Impact Report prepared for this Final EIR/EIS includes the methodology used to identify potential replacement sites for displaced properties (this process is referred to as a "gap analysis"). As described in Section 4, Methods of Evaluating Impacts, of the Relocation Impact Report, replacement sites were sought within, or as near to displacement sites as possible to help ensure comparability and suitability. Electronic versions of Technical Reports prepared for this Final EIR/EIS are available through submitting a written request on the Public Records Act portal (available at: <https://hsr-ca.nextrequest.com/>).

### 4494-9606

The commenter questions the relevance of 2017 housing data in the impact analysis presented in Section 3.12, Socioeconomics and Communities, of the Draft EIR/EIS.

It is noted that the population and housing data included in the Draft EIR/EIS is from 2016, not 2017, as stated by the commenter. As stated in Section 3.12.1, Introduction, of Section 3.12, Socioeconomics and Communities, of the Final EIR/EIS, "During preparation of the Final EIR/EIS, the Authority reviewed more recent census data (U.S. Census 2021) and concluded that the population characteristics in the resource study areas (RSA), including census block group boundaries and low-income and minority populations, have not changed substantially. Section 5.4.4 of the Final EIR/EIS also clarified that between publication of the 2010-2014 ACS and 2017-2021 ACS, the geographic delineation of Census block groups has changed. In this context, "substantially" refers to a deviation of the population and population characteristics in the RSA that is greater than 5 percent. The Authority also reviewed school district funding data from the 2021-2022 fiscal year available from the California Department of Education and determined that the analysis presented in the Draft EIR/EIS remains valid (CDE 2021-2022)." Therefore, the analysis and conclusion for Impact SOCIO#4: Permanent Displacement of Residences from Construction remains valid. No additional analysis is warranted with regard to housing effects from the Build Alternatives.

### 4494-9607

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter requests further information on the logistics of outreach to communities regarding relocation. This topic is further discussed in Standard Response PB-Response-SOCIO-1. Outreach to affected homeowners will be conducted during advanced design and other pre-construction work. Consistent with the requirements of the Uniform Act and California Relocation Assistance Act, the Authority is committed to working closely and proactively with residents and businesses to help them plan ahead for relocation, find a new home or business site, and solve problems related to the acquisitions and relocation.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9608

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter requests further information on effects to property values and property tax from the project. Effects to property values from the project are discussed in Standard Response PB-Response-SOCIO-2.

As discussed in Appendix C, Economic Analysis, of the Community Impact Assessment prepared for this Final EIR/EIS, reduced property tax revenues would also be a direct effect of project operation because of the potential reductions in property values associated with train nuisances (e.g., visual effects). Property is assessed, and the corresponding property tax is collected at the county level in California. Property owners pay 1 percent of assessed property value in general property tax, along with any special or direct assessments levied by local taxing entities that must be voter-approved. Electronic versions of Technical Reports prepared for this Final EIR/EIS are available through submitting a request on the Public Records Act portal (available at: <https://hsr-ca.nextrequest.com/>).

### 4494-9609

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter refers to the Draft EIR/EIS discussion in Section 3.12, Socioeconomics and Communities, related to Impact SOCIO#5: Permanent Displacement and Relocation of Sensitive Residential Population from Construction, and asks about assistance for and communication with sensitive populations.

Although the displacement of sensitive populations is not considered, in itself, an environmental impact under CEQA, the Authority has nevertheless incorporated Impact Avoidance and Minimization Features (IAMFs) into all six Build Alternatives that will assist sensitive populations, specifically SOCIO-IAMF#2 Compliance with Relocation Assistance and Real Property Acquisition Policies Act which will provide relocation assistance to all residents displaced by the Build Alternative in compliance with the Uniform Act, and SOCIO-IAMF#3 which will establish an appraisal, acquisition, and relocation process in consultation with the affected cities, counties, and property owners.

Please refer to Section 3.12.4.2 and Volume 2, Appendix 2-E, for more information regarding these IAMFs. PB-Response-SOCIO-1: Parcel Acquisitions and Relocations provides more information regarding the Authority's analysis of and efforts to avoid and minimize relocation impacts. Currently, the Authority does not have funding for construction of this project section. Therefore, planning efforts have not begun for this specific stage of the project. Future funding is being sought for continued progress. As funds become available, the Authority will proceed with advanced design and prepare for other pre-construction work, which includes outreach to affected homeowners.

The following guidelines are used to conduct outreach during all phases of the project: Title VI of the Civil Rights Act of 1964; Executive Order 12898 (February 16, 1994); Executive Order 13166 (August 11, 2000); U.S. Department of Transportation Order 5610.2. Please refer to Section 5.2.1, Federal Laws, Regulations, and Order, in Chapter 5 of this Final EIR/EIS for further description of federal policies concerning EJ communities, including EJ programs and outreach.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9610

The commenter refers to page 3.12-77 of the Draft EIR/EIS and asks what constitutes a “substantial number of existing homes.” The commenter also asks why the conclusion of Impact SOCIO#5 is less than significant when the project would result in displacement.

The term referenced by the commenter, “substantial number of homes,” comes from the CEQA Guidelines. Appendix G of the CEQA Guidelines identifies that a significant impact could occur if a project would “displace substantial numbers of existing people or housing units, necessitating the construction of replacement housing elsewhere.” The Authority identifies that they use this threshold on page 3.12-29 in Section 3.12, Socioeconomics and Communities of the Draft EIR/EIS. Consistent with CEQA, the Authority defines a significant impact as occurring if the project would displace substantial numbers of existing people or housing units, necessitating the construction of replacement housing elsewhere. In other words, if a certain number of homes would be displaced, such that it would necessitate the construction of replacement housing elsewhere, then that would be considered a “substantial number of homes.”

As discussed in Impact SOCIO#4 in Section 3.12, Socioeconomics and Communities of the Draft EIR/EIS, construction of the Build Alternatives would result in displacement of 28 to 64 residences, depending on the adit and window options. Southeast Antelope Valley and Lake View Terrace were found to have insufficient replacement housing for the households displaced by the Palmdale to Burbank Project Section; however, adequate replacement housing could be available in nearby communities, provided that such housing can be made available at affordable prices. As there is available housing in nearby communities, the impact would not necessitate the construction of replacement housing and is not considered significant.

Although mitigation is not required, SOCIO-IAMF#2 (Compliance with Uniform Relocation Assistance and Real Property Acquisitions Act) will provide relocation assistance for persons displaced. SOCIO-IAMF#3 (Relocation Mitigation Plan) will require the Authority to develop a relocation mitigation plan which will establish an appraisal, acquisition, and relocation process to minimize economic disruption related to relocation in consultation with affected property owners. Additionally, prior to construction, fulfillment of SO-MM#1 will require special outreach efforts to affected residential neighborhood and community residents to better determine relocation needs

### 4494-9610

and locate suitable replacement properties and facilities. Impact SOCIO#5 in Section 3.12, Socioeconomics and Communities of the Draft EIR/EIS, analyzes the potential for those residential displacements identified under Impact SOCIO#4 to affect sensitive populations in particular. For these reasons, which are described in further detail in Section 3.12 of the Draft EIR/EIS, the Authority concluded that impacts would be less than significant.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9611

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter refers to the Draft EIR/EIS discussion in Chapter 3.12 related to Impact SOCIO#6: Permanent Displacement of Commercial and Industrial Businesses from Construction, and notes the difficulties facing relocated businesses with respect to locating suitable replacement sites, which the Authority acknowledges.

Chapter 3.12 of the Draft EIR/EIS discusses commercial and industrial business displacements that would result from the construction of each Build Alternative and the availability of suitable replacement sites in each affected community at a general level. For greater detail, Section 6.4 Commercial and Industrial of the Draft Relocation Impact Report prepared for this Final EIR/EIS. (Please note: the Relocation Impact Report is available upon request to the Authority). As described in Section 4 of the Relocation Impact Report, Methods of Evaluating Impacts, identifying potential replacement sites for non-residential properties required a search for properties currently for sale or lease within each of the project's replacement area cities. Searches were performed using CoStar and a gap analysis was performed between the number of resulting potential replacement units and the displacements identified for each city. Replacement sites were sought within, or as near to displacement sites as possible to help ensure comparability and suitability. However, until appraisals and relocation interviews are conducted, it isn't possible to know for certain that replacement sites will be able to accommodate the specific needs of each displaced business.

Although the displacement of local businesses is not considered an environmental impact under CEQA, the Authority has nevertheless incorporated Impact Avoidance and Minimization Features (IAMFs) into all six Build Alternatives that will assist displaced businesses, specifically SOCIO-IAMF#2 Compliance with Relocation Assistance and Real Property Acquisition Policies Act which describes the Authority's commitment to compliance with the Act, and SOCIO-IAMF#3 Relocation Mitigation Plan, which requires the Authority to develop a relocation plan that includes a program to minimize economic disruption. Refer to Section 3.12.4.2 of Chapter 3.12 and Appendix 2-E for more information regarding these IAMFs. PB-Response-SOCIO-1: Parcel Acquisitions and Relocations provides more information regarding the Authority's analysis of and efforts

### 4494-9611

to avoid and minimize relocation impacts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9612

The commenter refers to the Draft EIR/EIS discussion in Chapter 3.12 related to Impact SOCIO#6: Permanent Displacement of Commercial and Industrial Businesses from Construction, specifically to Expanded Commercial and Industrial Resources Areas for the E1 Build Alternative, and questions their merit.

Section 6.4 Commercial and Industrial of the Draft Relocation Impact Report prepared for this Final EIR/EIS discusses potential commercial and industrial business displacements that would result from the construction of each Build Alternative, the availability of suitable replacement sites in each affected community, and provides details of the Expanded Replacement Area analysis. (Please note: an electronic version of the Relocation Impact Report is available upon request to the Authority). As described in Section 4, Methods of Evaluating Impacts, identifying potential replacement sites for non-residential properties required a search for properties currently for sale or lease within each of the project's replacement area cities. Searches were performed using CoStar and a gap analysis was performed between the number of resulting potential replacement units and the displacements identified for each city. Replacement sites were sought within, or as near to displacement sites as possible to help ensure comparability and suitability. However, until appraisals and relocation interviews are conducted, it isn't possible to know for certain that replacement sites will be able to accommodate the specific needs of each displaced business. Therefore, the resource areas themselves remain valid for future construction but potential replacement sites would be different.

Although the displacement of local businesses is not considered an environmental impact under CEQA, the Authority has nevertheless incorporated Impact Avoidance and Minimization Features (IAMFs) into all six Build Alternatives that will assist displaced businesses, specifically SOCIO-IAMF#2 Compliance with Relocation Assistance and Real Property Acquisition Policies Act which describes the Authority's commitment to compliance with the Act, and SOCIO-IAMF#3 Relocation Mitigation Plan, which requires the Authority to develop a relocation plan that includes a program to minimize economic disruption. Please refer to Section 3.12.4.2 of Chapter 3.12 and Appendix 2-E for more information regarding these IAMFs.

### 4494-9613

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter refers to the Draft EIR/EIS discussion in Section 3.12, Socioeconomics and Communities, related to Impact SOCIO#6: Permanent Displacement of Commercial and Industrial Businesses from Construction, specifically to potential business displacements under the E2 Build Alternative, and asks whether the Draft EIR/EIS analyzes the potential loss of revenue related to a business relocating from Shadow Hills to Pacoima.

The loss of business revenue in such a circumstance is not possible to predict. Moreover, the displacement of local businesses is not considered an environmental impact under CEQA. Nevertheless, the Authority has incorporated Impact Avoidance and Minimization Features (IAMFs) into all six Build Alternatives that will assist displaced businesses and their employees, specifically SOCIO-IAMF#2 Compliance with Relocation Assistance and Real Property Acquisition Policies Act which describes the Authority's commitment to compliance with the Act, and SOCIO-IAMF#3 Relocation Mitigation Plan, which requires the Authority to develop a relocation plan that includes a program to minimize economic disruption. Refer to Section 3.12.4.2 and Volume 2, Appendix 2-E, for more information regarding these IAMFs. As discussed further in PB-Response-SOCIO-1: Parcel Acquisitions and Relocation, displacement businesses may receive financial support as part of the relocation process.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9614

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter expresses concern regarding displacements and community deterioration, and asks about individual business owners and employees. The commenter quotes from the Draft EIR/EIS discussion in Section 3.12, Socioeconomics and Communities, related to Impact SOCIO#9: Potential for Permanent Physical Deterioration from Construction. However, the commenter's concerns regarding displacement of individual business owners and employees are better addressed under Impact SOCIO#6: Permanent Displacement of Commercial and Industrial Businesses from Construction, which describes and acknowledges the difficulties likely to be faced by such businesses and their employees due to displacement.

Although the commenter is correct that the displacement of local businesses is not considered an environmental impact under CEQA, the Authority nevertheless has incorporated Impact Avoidance and Minimization Features (IAMFs) into all six Build Alternatives that will assist displaced businesses and their employees, specifically SOCIO-IAMF#2: Compliance with Relocation Assistance and Real Property Acquisition Policies Act, which describes the Authority's commitment to compliance with the Act, and SOCIO-IAMF#3: Relocation Mitigation Plan, which requires the Authority to develop a relocation plan that includes a program to minimize economic disruption.

Please refer to Section 3.12.4.2 and Volume 2, Appendix 2-E, for more information regarding these IAMFs. As discussed further in PB-Response-SOCIO-1: Parcel Acquisitions and Relocation, displacement businesses may receive financial support as part of the relocation process.

### 4494-9615

The commenter expresses concern about interruptions in utility service during construction; asks about the measures that will be required to reduce water loss during construction; asks how often there will be routine shutdowns of the California Aqueduct; and asks how landowners will be helped to protect pipes and ditches. The topic of interruptions in utility services is discussed under Impact PUE#2 in Section 3.6 of the Draft EIR/EIS. Given the standard precautions that would be instituted prior to and during construction, including PUE-IAMF#4, the Palmdale to Burbank Project Section would be unlikely to result in accidental disruption of utility systems. The Authority would work with irrigation agencies and landowners to protect pipelines, ditches, and related irrigation systems. Canals/ditches may be bridged or placed in pipelines beneath the HSR right-of-way. Irrigation pipelines crossing the HSR would be either re-routed or buried and placed in protective casing so that future maintenance of the line would be accomplished outside of the HSR right-of-way. The Authority's contractors will be responsible for implementing the re-routing, relocations, or protection in place of these utilities during construction. PUE-IAMF#2 requires new or relocated systems to be operational prior to disconnecting the original system, to the extent feasible. With implementation of PUE-IAMF#2, temporary utility conflicts and/or relocations associated with irrigation infrastructure would not result in lengthy and harmful interruption of service. PUE-IAMF#4 is incorporated as part of the project design to ensure construction activities will be coordinated with service providers to minimize or avoid disruptions.

The SR14A, E1A, and E2A Build Alternatives would cross the East Branch of the California Aqueduct in an elevated viaduct where the aqueduct crosses beneath the Sierra Highway. Construction of the SR14A, E1A, and E2A Build Alternatives would not result in temporary stoppage of water delivery through the aqueduct because those Build Alternatives cross over the Sierra Highway and the Soledad Siphon via an elevated viaduct and would not require realignment, nor impact any facility of the aqueduct.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9616

The commenter requests further information on the nature of construction employment during project construction. The Authority has adopted a Community Benefits Policy to support employment of individuals who reside in disadvantaged areas and those designated as disadvantaged workers, including veterans returning from military service. The Community Benefits Agreement is designed to assist small businesses and job seekers in finding or obtaining construction contracts, jobs, and training opportunities for residents who live in economically -disadvantaged areas and helps to remove potential barriers to small businesses, disadvantaged business enterprises, disabled veteran business enterprises, women-owned businesses, and microbusinesses that want to participate in building the HSR System. See California High-Speed Rail Authority, Community Benefits Agreement website at: <https://hsr.ca.gov/business-opportunities/general-info/community-benefits-agreement/>. Currently, the Authority does not have funding for construction of this project section. Therefore, planning efforts have not begun for this specific stage of the project. Future funding is being sought for continued progress.

### 4494-9617

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter asks how long a period of time would 89 A-weighted decibels be evident and asks what decibel level is acceptable for grazing animals and what grazing animals would be in the vicinity of project construction.

The FRA Noise and Vibration Manual (FRA 2012) establishes the noise exposure limit of a 100-dBA sound exposure level for domestic animals as an effective criterion for determining impacts of a train pass-by. Please refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which addresses this issue.

Regarding the commenter's question about how long of a period of time 89 dBA would be evident, as discussed under Impact SOCIO#10 in Section 3.12 of the Draft EIR/EIS and in Section 3.4 of the Draft EIR/EIS, construction noise levels are estimated to be 89 dBA of equivalent continuous sound level (Leq) at 50 feet for an 8-hour workday. During operations, the noise exposure limit of a 100-dBA sound exposure level for domestic animals would be limited to locations within 40 to 50 feet of the aboveground alignment, which is typically within the fenced right-of-way. At the maximum speed, for an HSR train pass-by, any associated noise (at any decibel level) would last for approximately 2 seconds. The sound exposure level for grazing animals would be less than 100 dBA during construction and operations at a distance of 50 feet; therefore, noise impacts to grazing animals would be less than significant.

The commenter also asks what grazing animals would be in the vicinity of project construction. As discussed under Impact AG#6: Noise and Vibration Effects on Farm Animals in Chapter 3.14 of the Draft EIR/EIS, livestock (cattle) are currently unconfined and can roam freely in the areas shown on Figures 3.14-9 and 3.14-16 in Chapter 3.14 in the Draft EIR/EIS. Because livestock would not be in a confined situation and could move away from noise sources during construction, noise impacts associated with construction of at-grade segments of the Build Alternatives would be limited. AG-IAMF#5 will be implemented to notify the agricultural property owners of noise impacts that could occur as a result of construction activities.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9618

The commenter requested further information on the project's fugitive dust control plan and Valley Fever action plan. Note that the discussion on the page referenced by the commenter is for Impact SOCIO#11, which addresses temporary effects on children's health and safety from construction, and the commenter's questions on the topic are broader. Therefore, this response is also broader.

The fugitive dust control plan and Valley Fever action plan are described in Appendix 2-E, Impact Avoidance and Minimization Features (under AQ-IAMF#1 and SS-IAMF#2, respectively) of the Draft EIR/EIS. The fugitive dust control plan will be prepared by the construction contractor and will include measures to minimize fugitive dust and PM10, as well as to reduce the risk of Valley Fever exposure. These measures include covering vehicles, cleaning trucks, watering exposed surfaces, suspending dust-generating activities when average wind speed exceeds 25 mph, and stabilizing disturbed areas. The project will also implement SS-IAMF#2, requiring a project Valley Fever action plan prepared by the construction contractor. The Valley Fever action plan will require dissemination of information, coordination, and outreach with pertinent Health Departments, and providing a qualified person dedicated to overseeing implementation of the Valley Fever prevention measures to encourage a culture of safety of the contractors and subcontractors. The Valley Fever Health and Safety (VFHS) designee is responsible for ensuring the implementation of measures in coordination with the county Public Health Officer. The VFHS designee in coordination with the county Public Health Officer will determine what measures will be added to the requirements for the Safety and Security Management Plan regarding preventive measures to avoid Valley Fever exposure. Measures shall include, but are not limited to the following: (1) Train workers and supervisors on how to recognize symptoms of illness and ways to minimize exposure; (2) Provide washing facilities nearby for washing at the end of shifts; (3) Provide vehicles with enclosed, air conditioned cabs and make sure workers keep the windows closed; (4) Equip heavy equipment cabs with high efficiency particulate air filters; and (5) Make NIOSH-approved respiratory protection with particulate filters available to workers who request them.

Regarding the number of workers who have contracted Valley Fever in the Central Valley, as of December 2023, the Authority has had no reported cases of Valley Fever for its construction workers or staff. That said, Impact S&S#10 in Section 3.11, Safety

### 4494-9618

and Security, of the Draft EIR/EIS provides location-specific discussion of construction exposure to Valley Fever and identifies extensive measures to avoid spread of Valley Fever. During staff orientation the Authority does provide construction workers with information on how to avoid, diagnose, and treat exposure to Valley Fever. The Authority also provides staff with a Valley Fever Fact Sheet prepared by the California Department of Public Health with additional detailed guidance. In the event a construction worker or an Authority staff member is diagnosed with Valley Fever, the individual is instructed to see a healthcare provider and stay home until the symptoms have subsided and its safe for the person to return to work.

As discussed above, IAMFs would be implemented to prevent the spread of Valley Fever during construction. Regarding contractor experience, contractors would be required to comply with applicable IAMFs, and their compliance would be monitored according to CEQA requirements as described in Response to Comment #9564. Furthermore, the Valley Fever discussion in Section 3.11.5, Affected Environment, in Section 3.11, Safety and Security of the Final EIR/EIS, has been updated to reflect the most recent California Department of Public Health Data.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9619

The commenter asks who will be supervising the contractors to ensure that federal guidelines for noise reduction are met pertaining to neighborhoods, schools, parks, and construction workers. The Authority will be responsible for the implementation of the noise and vibration mitigation measures identified in the Draft EIR/EIS, for both construction and operation. The mitigation measures will be implemented in accordance with the CA HSR Noise Mitigation Guidelines, which are included as Appendix 3.4-C of the EIR/EIS. The Authority will be responsible for ensuring that construction activities throughout the corridor are carried out in compliance with federal noise reduction guidelines. In addition to the Authority's oversight as required by N&V-MM#1: Construction Noise Mitigation Measures, contained in Section 3.4, Noise and Vibration, the Authority will require contractors to prepare a noise monitoring program for the construction.

The MMEP would serve as the binding instrument to require the enforceability of mitigation measures and IAMFs identified to reduce project impacts in compliance with CEQA Guidelines section 15126.4(a)(2). The Authority will therefore regularly monitor the construction contractor to ensure the construction standards in management plans will be met, which would be outlined in the MMEP that is adopted if the project is approved.

As such, the development and implementation of management plans prepared by the construction contractor will be reviewed and monitored by the Authority. For example, the noise monitoring program described above must be approved by the Authority.

In addition, as part of N&V-MM#1, the Authority will establish and maintain (until construction is completed) a toll-free hotline for construction-related activities. The Authority will arrange for all incoming hotline messages to be logged (with summaries of the contents of each message) and for a designated representative of the Authority to respond to hotline messages within 24 hours (excluding weekends and holidays). The Authority will make a reasonable good-faith effort to address all concerns and answer all questions, and shall include on the log its responses to all callers.

### 4494-9620

The commenter asks how the health of students and the surrounding community would be protected in the event of an accident on the Interstate 5 Freeway involving a vehicle with hazardous wastes. Construction of the each of the six Build Alternatives could entail the handling of hazardous substances within 0.25 mile of educational facilities, thereby posing a potential health and safety hazard to students or employees.

Potentially hazardous materials and wastes generated during demolition, site preparation, and construction could pose a risk to individuals at school sites within 0.25 mile of the construction area, including school sites within 0.25 mile of a haul route. Construction of each of the six Build Alternatives would increase the quantity of hazardous materials moving along major transportation corridors (i.e., State Route 14 and Interstate 5) during construction. If unaddressed, the presence of hazardous waste near educational facilities would represent a direct hazard throughout the construction period. This represents a potentially significant impact. HMW-MM#1, described in Section 3.10.7 of the Draft EIR/EIS will require the Authority to prepare a memorandum confirming that the construction contractor will not handle or store an extremely hazardous substance within 0.25 mile of a school. Signage will be installed prior to construction to delimit work areas within 0.25 mile of a school, informing contractors not to bring extremely hazardous substances into the area. The Authority will implement IAMFs that would include steps and procedures to minimize impacts of spills to any impacted party. The Authority explains the plans that would be implemented to minimize impacts from accidental spills in Impact HMW#1 in Section 3.10, Hazardous Materials and Wastes of the Draft EIR/EIS. As explained in Impact HMW#1, HMW-IAMF#6 requires that the contractor prepare a CMP addressing spill prevention and HMW-IAMF#7 will apply regulations, such as RCRA, CERCLA, the Hazardous Materials Release Response Plans and Inventory Law, and the Hazardous Waste Control Act. A SWPPP (HYD-IAMF#3) would be prepared in advance to outline procedures for rapidly, effectively, and safely cleaning up and disposing of any spills or releases. Federal and state regulations, implemented by HMW-IAMF#4 through HMW-IAMF#8, manage and minimize threats associated with the usage, storage, transport, and disposal of hazardous materials and wastes. The IAMFs require the contractor to transport, use, and dispose of hazardous materials following procedures that avoid or reduce the potential for releases and foreseeable upset conditions that would expose persons or the environment to substantial hazards.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9621

Refer to Standard Response PB-Response-HAZ-1: Materials Hauling and Transportation of Hazardous Materials, PB-Response-SOCIO-3: Health and Safety of Children.

The commenter quotes from the CEQA conclusion text on page 3.12-90 and suggests that only adult health is considered in the Draft EIR/EIS. The commenter also expresses concern about children's health.

Although CEQA does not require an impact analysis specific to health of children (persons under 18 years of age), CEQA requires the analysis of potential impacts to the health of humans of all ages. Please refer to Section 3.3, Air Quality and Global Climate Change (see Impact AQ#1 through Impact AQ#11), Section 3.4, Noise and Vibration (see Impact N&V#1 through Impact N&V#5, Impact N&V#8, and Impact N&V#9), and Section 3.10, Hazardous Materials and Wastes (see Impact HMW#1 through Impact HMW#8), of the Draft EIR/EIS. It is noted that CEQA compliance requires an analysis of potential impacts related to handling hazardous materials or wastes within 0.25 mile of a school, which is included in Impact HMW#3 and Impact HMW#8 of the Draft EIR/EIS.

Additionally, Section 3.12, Socioeconomics and Communities, of the Draft EIR/EIS includes the analysis specific to children's health and safety from construction and operation of the project in Impact SOCIO#11 and Impact SOCIO#16, respectively. Please also refer to Appendix 3.12-C, Children's Health and Safety Risk Assessment. Section 3.12 of the Draft EIR/EIS and Appendix 3.12-C discuss impacts such as air quality, noise and vibration, and exposure to hazardous materials (as discussed in detail in Section 3.3, Air Quality and Global Climate Change, Section 3.4, Noise and Vibration, and Section 3.10, Hazardous Materials and Wastes, of the Draft EIR/EIS), and also discusses Impact Avoidance and Minimization Features (IAMFs) that would reduce impacts to children's health. Please refer to Standard Response PB-Response-SOCIO-3: Health and Safety of Children, for further discussion regarding the potential for project effects, and relevant mitigation measures, on children's health and safety. Also, please refer to Impact HMW#8, in Section 3.10, Hazardous Materials and Wastes, of this Final EIR/EIS, and Standard Response PB-Response-HAZ-1: Materials Hauling and Transportation of Hazardous Materials, for further discussion regarding the potential for project effects, and relevant mitigation measures on educational facilities.

### 4494-9622

The commenter asks what recourse schools and residents would have should noise exceed minimal federal requirement standards despite mitigation efforts.

The Authority will be responsible for the implementation of the noise and vibration mitigation measures identified in the Draft EIR/EIS, for both construction and operation. The mitigation measures will be implemented in accordance with the CAHSR Noise Mitigation Guidelines, which are included as Appendix 3.4-C of the Draft EIR/EIS. The Authority will be responsible for seeing that construction activities throughout the corridor are carried out in compliance with federal noise reduction guidelines. In addition to the Authority's oversight, NV-MM#1 requires the contractor to establish a construction noise monitoring program and implement measures to comply with FRA construction noise limits (an 8-hour Leq, dBA of 80 during the day and 70 at night for residential land use, 85 for both day and night for commercial land use, and 90 for both day and night for industrial land use) where a noise-sensitive receptor is present and wherever feasible. The Authority's contractors would implement noise control measures to meet the noise limits, such as installation of temporary construction-site noise barriers near a noise source, use of low-noise emission equipment, and siting of stationary construction equipment away from noise-sensitive receptors.

In addition, as required by N&V-MM#1, the Authority will require contractors to establish and maintain (until construction is completed) a toll-free hotline for construction-related activities. The Authority will arrange for all incoming hotline messages to be logged (with summaries of the contents of each message) and for a designated representative of the Authority to respond to hotline messages within 24 hours (excluding weekends and holidays). The Authority will make a reasonable good-faith effort to address all concerns and answer all questions, and shall include on the log its responses to all callers. This hotline is in active use for construction in the Central Valley, and efforts to address noise complaints have included changes to the construction schedule in certain locations (e.g., minimization of nighttime construction work).

No operational noise impacts were identified on institutional uses, including schools (see pages 3.4-75 [operational traffic noise], 3.4-81 [operational train noise for the SR14A and Refined SR14 Build Alternatives], 3.4-89 [operational train noise for the E1 and E1A Build Alternatives], and 3.4-98 [operational train noise for the E2 and E2A Build

Alternatives] of the Draft EIR/EIS]. Table 3.4-30 in Impact N&V#6: Operation Train Noise Impacts in the Draft EIR/EIS shows the impacts to residential sensitive receivers during operation of the project. Mitigation Measures N&V-MM#3, N&V-MM#4, N&V-MM#5, and N&V-MM#6 would reduce noise from operation of the Palmdale to Burbank Section.

These mitigation measures would reduce noise by reducing rail gaps and turnouts, by ensuring vehicles meet federal noise regulations to the extent technologically available, and by implementing noise barriers. Noise barriers included in N&V-MM#3, in most cases, would effectively reduce exterior noise below applicable thresholds. However, for all six Build Alternatives, there are scattered and isolated residences that would experience severe noise impacts for which noise barriers would not meet the criteria discussed in Section 3.4.7. In such cases, other noise-reducing measures discussed in Mitigation Measures N&V-MM#3, such as sound insulation and noise easements, would reduce impacts but may not completely reduce noise below thresholds at every location.

The commenter asks how year 2014-2015 "figures" can be relevant for construction that will take place at a later time. Commencement of the Palmdale to Burbank Project Section EIR/EIS preparation, including technical reports and appendices, began in 2016, and thus the analysis is based on baseline data from 2015. The baseline year for the analysis of project impacts can be established after the Notice of Preparation was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis (see Draft EIR/EIS, pp. S-7, 3.3-23 to 3.3-24). CEQA Guidelines section 15125(a)(1) explicitly supports establishing baseline physical conditions in this manner, therefore, the use of a 2015 baseline is appropriate.

Nevertheless, the Authority reviewed existing conditions data during preparation of the Final EIR/EIS and concluded that the 2015 baseline continues to be appropriate. For example, the Draft EIR/EIS relied upon the census data available in 2015 for its analyses in Section 3.12, Socioeconomics and Communities, and Chapter 5, Environmental Justice. Based upon its review of more recent census data, the Authority concluded that the population and population characteristics in the Resource Study Area (RSA) have not changed substantially and the socioeconomics, communities, and environmental justice impact conclusions would not be affected. The Authority also refreshed its economic impact analysis based on the Regional Input-Output Multipliers System (RIMS) using more recent data. This updated analysis did not change the impact conclusions. Chapter 3.1 of the Final EIR/EIS, specifically Section 3.1.4.5 Affected Environment, has been updated to explain the Authority's review of existing conditions data since publication of the Draft EIR/EIS.

### 4494-9624

The commenter requests further information on the estimated number of available housing units in the expanded residential relocation area. Available housing estimates in the nearby communities of Sylmar, Tujunga, and Sunland are included in evaluation of the expanded residential relocation area (as assessed in the Relocation Impact Report prepared for this Final EIR/EIS). Electronic versions of Technical Reports prepared for this Final EIR/EIS are available through submitting a request on the Public Records Act portal (available at: <https://hsr-ca.nextrequest.com/>). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### 4494-9625

The commenter inquired about the quantity of utility poles that would be placed on agricultural land. Currently, the exact count of utility poles is unknown. As noted in Section 3.14, Agricultural Farmland and Forest Land, Impact AG#2, the Refined SR14 and SR14A Build Alternatives would include the construction of a new electrical utility corridor for electrical facilities that would affect 1 acre of a 9-acre vineyard that is considered Important Farmland. AG-IAMF#2 through AG-IAMF#6 will be implemented to reduce indirect impacts from placing utility poles near Important Farmland, through permitting, farmland consolidation programs, notification to affected residents, and creation of temporary livestock and equipment crossings. However, direct conversion of Important Farmland would still represent a substantial impact for the Refined SR14 and SR14A Build Alternatives. Therefore, adherence to AG-MM#1 would be required to avoid placing structures on agricultural lands. This mitigation measure entails coordination with the farm owners to ensure that electrical utilities are placed on poles with powerlines that span agricultural land uses, within the identified project footprint, so that no agricultural land would be converted to a nonagricultural use either directly or indirectly. Electrical utility lines are generally spaced from 125 to 300 feet apart and can often span over 1,000 feet between towers. Therefore, the electrical utility line could span the parcel of farmland for at least a length of approximately 250 feet without requiring conversion of farmland for the relocation of electrical towers. Utility easements would not affect existing agricultural operations and activities. The E1, E1A, E2, and E2A Build Alternatives would not result in permanent surface conversions of Important Farmland. No revisions to this Final EIR/EIS have been made in response to this comment.
