The commenter asks questions about the State's threshold quantity of hazardous substances, the hazardous substances expected to be stored outside of 0.25 mile from a school, if there are any schools within 0.25 mile of above ground tracks, and what magnitude earthquake might derail a train above ground.

Regarding the question about the State's threshold quantity of hazardous substances, the State does not have a quantified threshold for hazardous substances. Consistent with CEQA Guidelines, the Authority identified the thresholds of significance used in the Draft EIR/EIS in Section 3.10.4.5. The quantity of hazardous materials will be determined in the future, per implementation of HMW-IAMF#1 and HMW-IAMF#4, as described in Section 3.10.4.2 of the Draft EIR/EIS.

Regarding the question about the hazardous substances expected to be stored outside of 0.25 mile from a school, discussion related to hazardous materials handling in relation to schools within 0.25 mile is outlined in Impact HMW#3: Potential for Handling Hazardous Materials or Waste Within 0.25 mile of an Educational Facility during Construction. As described in Impact HMW#3, the Authority would implement HMW-MM#1, which will require the Authority to prepare a memorandum confirming that the construction contractor will not handle or store an extremely hazardous substance within 0.25 mile of a school.

Regarding the question if there are any schools within 0.25 mile of above ground tracks, there are schools located within 0.25 mile of the Build Alternatives. Please refer to Table 3.10-6 in Section 3.10, Hazardous Materials and Wastes and the figures in Appendix 3.10-A Hazardous Materials and Wastes Figures of the Draft EIR/EIS for schools located within 0.25 mile of the Build Alternatives.

Regarding the question what magnitude earthquake might derail a train above ground, calculations to determine a specific earthquake magnitude that would result in derailment of the HSR train was not performed as part of the Draft EIR/EIS, as the

### 4494-9626

magnitude can vary drastically depending on the fault where earthquake occurs, distance of that fault to the alignment, and depth of the fault. However, the Authority did consider seismic activity and safety in its Draft EIR/EIS. Please refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, for additional information regarding how the Authority considered seismic events in the Draft EIR/EIS.

### 4494-9627

The commenter requests further information on the timing of outreach to affected homeowners under SO-MM#1. Consistent with the requirements of the Uniform Act and California Relocation Assistance Act, the Authority is committed to working closely and proactively with residents and businesses to help them plan ahead for relocation, find a new home or business site, and solve problems related to the acquisitions and relocation. The Uniform Act program ensures that persons displaced as a result of a federal action or by an undertaking involving federal funds are treated fairly, consistently, and equitably. This helps to ensure persons will not suffer disproportionate injuries as a result of projects designed for the benefit of the public as a whole. Currently, the Authority does not have funding for construction of this project section. Therefore, planning efforts have not begun for this specific stage of the project. Future funding is being sought for continued progress. As funds become available, the Authority will proceed with advanced design and prepare for other pre-construction work, which includes special outreach to affected homeowners.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9628

The commenter requests further information on the logistics of workshops for the project. Currently, the Authority does not have funding for construction of this project section. Therefore, planning efforts have not begun for this specific stage of the project. Future funding is being sought for continued progress. The public can participate in the project by staying informed and offering comments and suggestions throughout each project phase, including public comment periods. This engagement helps the Authority gather important information for decision-making. Table 5-A-1 lists Regional Household Income Corridor Environmental Justice Advocacy and Community Groups that are targeted for inclusion in the master Project Section database. Once added, these organizations will be part of the project's notification list and receive updates and notifications for future meetings and events. If a community organization wants to schedule a meeting with the Authority to discuss project-related concerns, they can do so by calling the project information line at (800) 630-1039 or sending an email to [palmdale\\_burbank@hsr.ca.gov](mailto:palmdale_burbank@hsr.ca.gov).

### 4494-9629

The commenter appears to be requesting further information on the funding of project mitigation, and the potential for impacts from implementing mitigation measures, in the context of SO-MM#1, SO-MM#2, and SO-MM#3. Mitigation and maintenance of these changes is expected to be funded by the Authority. Under SO-MM#1, SO-MM#2, and SO-MM#3, identifying replacement residential properties, consulting with local authorities, conducting community workshops, and implementing of design concepts suggested during public workshops would not result in secondary environmental effects. However, if replacement sites for displaced residents and businesses are built, new development could result in construction and operation period effects typical of residential and commercial / industrial business facility development. These may include emissions and noise from construction equipment, traffic effects from road closures, and effects on biological and cultural resources

### 4494-9630

The commenter requests additional information on the nature of construction employment during project construction. As discussed in Section 5.8.3, in Chapter 5, Environmental Justice, of this Final EIR/EIS, through the Authority's Community Benefits Agreement, the Authority has implemented a variety of programs to increase both the number and ability of local workers and firms to compete for available HSR construction jobs. Through this cooperative partnership with skilled craft unions, the Authority is promoting and helping to develop education, pre-apprenticeship, and apprenticeship training programs. These activities in economically disadvantaged communities focus on helping lower-income persons, persons receiving public assistance, single parents, persons with no high school or a General Education Development diploma, and/or those who suffer from chronic unemployment to compete for available jobs. Community organizations have implemented similar programs to get workers trained, retrained, and certified for upcoming construction work. Through the Community Benefits Agreement, the Authority would require each prime contractor of an awarded construction package to commit 30 percent of all construction dollars to hiring small businesses, including separate goals for the hiring of disadvantaged and disabled veterans' businesses. The jobs noted in this EIR/EIS would be specific to construction of the Palmdale to Burbank project section and separate from employment and training occurring on other project sections throughout the state.

### 4494-9631

The commenter queried the use of 2023 as the "peak year" of construction for the purposes of the Draft EIR/EIS. Commencement of the Palmdale to Burbank Project Section EIR/EIS, including technical reports and appendices, began in 2016, and thus the analysis is based on data available in 2016, at which point peak construction was projected to occur in 2023. Although 2023 is no longer the "peak year" of construction, the analysis of the project's effects would not change (as explained in footnote 4 of Section 3.12 of the Draft EIR/EIS). The level of activity and employment generated by the project during its "peak year" of construction has not changed, and comparing the project's peak activity to recent/current data provides a reasonable and accurate evaluation of the project's impacts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9632**

The commenter requests additional information on increases in local and regional sales tax resulting during project construction. Impact SOCIO#8, in Section 3.12 of this Final EIR/EIS, provides further discussion of temporary sales tax revenue gains during construction. Sales tax gains would be generated from taxable purchases made for the construction of the project. Sales tax revenue estimates were generated using preliminary cost estimates from the project engineer (please refer to Appendix 6-B, PEPD Record Set Capital Cost Estimate Report for preliminary cost estimates for the project). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### **4494-9633**

Refer to Standard Response PB-Response-SOCIO-3: Health and Safety of Children.

The commenter requested further information on the effects of project construction on children's health and safety. A detailed assessment of the potential for the construction and operation of the Build Alternatives to result in effects on children's health and safety found that none of the six Build Alternatives are anticipated to result in a substantial risk to children's health and safety over the long term. The assessment is provided in Appendix 3.12-C, Children's Health and Safety Risk Assessment, of the Final EIR/EIS. This topic is further discussed in Standard Response PB-Response-SOCIO-3: Health and Safety of Children.

### **4494-9634**

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter requests further information on relocation assistance for residents displaced that are located on private property in the Angeles National Forest. This topic is discussed in Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations. Consistent with the requirements of the Uniform Act and California Relocation Assistance Act, the Authority is committed to working closely and proactively with residents, including those located on private in-holdings in the Angeles National Forest, to help them plan ahead for relocation, find a new home, and solve problems related to the acquisitions and relocation.

### **4494-9635**

The commenter provides brief summary overview of Appendix 3.12-A, Residential, Business, and Mobile Home Relocation Assistance Brochures, of this Final EIR/EIS. No further response is required.

### **4494-9636**

The commenter provides a brief summary overview of Appendix 3.12-B, Effects on School District Funding and Transportation Bus Routes, of this Final EIR/EIS. No further response is required.

### **4494-9637**

The commenter provides a brief summary overview of Appendix 3.12-C, Children's Health and Safety Risk Assessment, of this Final EIR/EIS. No further response is required.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9638

The commenter asserts that the Palmdale to Burbank Project Section would be inconsistent with the Federal Land Policy and Management Act of 1976 (FLPMA) due to impacts to the Angeles National Forest (ANF), the San Gabriel Mountains National Monument (SGMNM), and the Hansen Dam Open Space/Recreation Area. The commenter asks how the project would be consistent with the federal directive under FLPMA to preserve and protect public lands in their natural condition, or how the Authority determined that the ANF, the SGMNM, and Hansen Dam Open Space are not worthy of protection. To the contrary, the Authority is acting consistently with the federal laws and directions the commenter identified. As noted by the commenter, Section 102(a)(8) of the FLPMA, 43 U.S.C. 1701(a)(8), states that it is the policy of the United States that, “the public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values; that, where appropriate, will preserve and protect certain public lands in their natural condition; that will provide food and habitat for fish and domestic animals; and that will provide for outdoor recreation and human occupancy and use.” Congress’s policy statement contains caveats. It directs preservation “where appropriate,” and it allows “human occupancy and use.” Agencies routinely balance multiple directives in different statutes, and the NEPA process provides decision-makers information they need to make those difficult decisions. As noted in Section 2.7 in Appendix 3.1-B, Section 501(a) of the Draft EIR/EIS, the FLPMA authorizes the Secretary of Agriculture to grant, issue, or renew rights-of-way through National Forest System Lands for a variety of uses which may include railroads, tunnels, or other necessary means of transportation that are in the public interest [43 U.S.C §1761(a)]. Furthermore, Section 505 of FLPMA provides that right-of-way authorizations are required to provide terms and conditions that will, among other things, minimize damage to scenic and aesthetic values and fish and wildlife habitat and otherwise protect the environment, and require compliance with applicable air and water quality standards established by or pursuant to applicable Federal or State law [43 U.S.C. §1765]. Regulations guiding the issuance of special use authorizations are found in Forest Service, Department of Agriculture (Title 36 of Code of Federal Regulations [CFR], Chapter II, part 251, subpart B), under Special Uses. Pursuant to the requirements of FLPMA, the HSR Project would be consistent with these laws and regulations.

### 4494-9638

Consistency of the HSR Project with the requirements of FLPMA is discussed in Section 4 of Appendix 3.1-B, USFS Policy Consistency Analysis of the Draft EIR/EIS. As noted on page 3.1-B-35, the Build Alternatives would be implemented pursuant to the special use authorization (SUA) issued by USFS. However, as noted by the USFS in its comments (See Comment #10297), the Secretary of Transportation may have separate authority to issue an easement for the project under the FAST Act. The Authority has not determined that the ANF, the SGMNM, or the Hansen Dam Open Space are unworthy of protection, as suggested by the commenter. The Hansen Dam Open Space is not located within the ANF or the SGMNM and therefore not subject to these federal-land-management statutes. The Authority believes that the proposed project would be consistent with FLPMA and provides this analysis in Appendix 3.1-D.

The Refined SR14, SR14A, E1 and E1A alternatives would all avoid the Hansen Dam Open space area. The E2 and E2A Build Alternatives would cross the Hansen Dam open space area (Big Tujunga Wash) and the impacts associated with these Build Alternative on the Open Space area are discussed in Section 3.15, Parks and Recreational Facilities in Table 3.15-4. The E2 and E2A Build Alternatives would construct a viaduct within the Hansen Dam Open Space. The viaduct structure, vertical piers, and distant tunnel portals would be highly visible and would contrast with the existing visual setting. Patrons of the open space area would be highly sensitive to these visual changes, as the changes would impinge upon the natural harmony of the views in this area. The total area of the Hansen Dam Open Space is 813 acres, and the total permanent acquisition area for the E2 and E2A Build Alternatives would be approximately 13 acres. The resource would remain accessible in the long term, and users would be able to pass under the viaduct to move from one area of the open space to another. Noise from passing trains would be perceptible to patrons of the open space area. Given the above visual and noise-related impacts associated with operation of the viaduct within the Hansen Dam Open Space area, the E2 and E2A Build Alternatives would change the character of this recreation resource. However, these changes would not reduce the capacity or the value of the open space area to the surrounding communities.

All Build Alternatives would utilize bored tunnels to travel underneath the ANF to avoid impacts to surface features and resources present. While construction activities would

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9638

occur within the ANF and SGMNM, permanent project elements would be limited within the ANF to utility and roadway improvements which generally follow existing utility and roadway corridors as a way to reduce effects on the resources within the ANF.

Permanent facilities associated with portals would be located immediately adjacent to, but outside the boundaries of the ANF and SGMNM. Adits would be located on private in-holding property within the ANF.

Please also refer to Table 3.1-B-1 through Table 3.1-B-3 in Appendix 3.1-B, USFS Policy Consistency Analysis in the Draft EIR/EIS for a discussion of consistency of the proposed Build Alternatives with specific policies of the ANF Management Plan and the SGMNM Management Plan.

### 4494-9639

The commenter inquired about the project's applicability with Section 36 CFR, Chapter II of the Forest Service, Department of Agriculture. The commenter also questions what permanent structures would be located within the Angeles National Forest (ANF) and San Gabriel Mountains National Monument (SGMNM), and what the impacts associated with permanent structures would entail. The commenter stated that unless the alignment is vacated at some point in the future, the tunnels and other infrastructure could create a perpetual right of use or occupancy under 36 C.F.R. 251.54(e)(4), such that the project would not qualify for a U.S. Forest Service (USFS) Special Use Permit, and asked whether there is a plan to remove facilities at the end of the train's lifecycle.

The specific authorization for the project to use the ANF has not yet been determined. While the Authority anticipates it will apply for a special use authorization pursuant to 36 CFR part 251, the Authority will continue coordinating with the USFS and other applicable federal agencies to obtain a permit, easement, or other authorization for the project to use the ANF. (Refer to Submission PB-4525, Comment #10297, and the Authority's response to that comment.) If the USFS grants a special use authorization for the project, the USFS could allow the Authority to abandon project infrastructure in-place rather than removing it at the end of its beneficial life, pursuant to 36 CFR 251.60(i). The approach and process for the project lifecycle will be addressed during the special use authorization application process.

The commenter correctly identifies project infrastructure that would be located outside, and adjacent to, the ANF. The commenter asserts that this project infrastructure will unreasonably conflict with or interfere with the use of lands adjacent to the forest. As discussed, throughout Section 3.13.6, all six Build Alternatives would require land acquisition and right-of-way easements adjacent to the ANF. In addition, the Authority would acquire private inholdings within the ANF, including within the SGMNM, to construct and maintain adit facilities. Acquisition and use of property within and adjacent to the ANF would not interfere with USFS land acquisitions that would support appropriate national forest activities, public needs, or other goals per Part 2 of the Angeles National Forest Management Plan Section.

As described in Section 3.13.10.2 operation of the HSR trains within the tunnels would not have direct surface effects on USFS lands. Tunnel depth and construction design

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9639

would prevent vibration- and noise-related effects within the ANF, as shown on Figure 3.13-29 through Figure 3.13-41. Given that portal locations would be immediately adjacent to ANF there could be some increase in noise levels on lands within USFS lands immediately adjacent to the portal areas. Land uses within the ANF immediately surrounding proposed portals do not include human activity areas (e.g., campgrounds, hiking paths, etc.). Land uses within the ANF and immediately adjacent to portal areas would predominantly provide habitat for wildlife.

As indicated in Section 3.4, Noise and Vibration, and Section 3.7, Biological and Aquatic Resources, noise increases that would affect animals/wildlife would be limited to areas within 50 feet from the alignment centerline which would be predominately within the operating railroad right of way. Activities at adits would consist of occasional access for maintenance. For further information on the potential effects of tunneling on wildlife and flora in the ANF and water resources in the ANF including the SGNMN, see Section 3.7.11 and Section 3.8.11, respectively, of the EIR/EIS. As explained in these sections of the EIR/EIS, the project (with implementation of identified mitigation) will not have significant impacts on wildlife, flora, and water resources in the ANF. Therefore, HSR operations of underground tunnels, adits on in-holdings and in areas immediately adjacent to the ANF would have limited effect on the land use within the ANF and would not inhibit implementation of the ANF Land Management Plan.

The USFS recognized that "[t]he criterion is limited to unreasonable conflicts or interference; some conflict or interference with existing uses would still be allowed." Special Uses, 63 Fed. Reg. 65,950, 65,955 (November 30, 1998). This criterion would be considered by the USFS as part of the special use authorization process.

The commenter also asserts that the project will have significant impacts to authorized existing uses of the ANF including wildlife, flora, and water resources. The Authority disagrees with this assertion and as noted immediately above believes that impacts of the project both on in-holdings within the ANF and at portals immediately adjacent to the ANF will not result in significant impacts to existing uses in the ANF.

In addition to the Authority's analysis of effects on uses within the ANF described in this EIR/EIS, the project's impacts on authorized existing uses will also be evaluated further by the USFS as part of the special use authorization process.

### 4494-9640

The commenter raises concerns about the project's consistency with USFS policy, specifically the consistency of the project with the following five evaluation criteria: "(i) The proposed use would be inconsistent or incompatible with the purposes for which the lands are managed, or with other uses; or (ii) The proposed use would not be in the public interest; or (iii) The proponent is not qualified; or (iv) The proponent does not or cannot demonstrate technical or economic feasibility of the proposed use or the financial or technical capability to undertake the use and to fully comply with the terms and conditions of the authorization; or (v) There is no person or entity authorized to sign a special use authorization and/or there is no person or entity willing to accept responsibility for adherence to the terms and conditions of the authorization. The commenter contends that the USFS should deny the Palmdale to Burbank Project Section special use authorization because it asserts the Authority's plans do not meet the requirements of USFS special authorization requirements related to the compatibility of the project with the land use designations in the ANF and related to the economic feasibility requirement. The commenter asks for clarification as to how the Authority will meet these requirements to secure a special use authorization from the USFS.

The USFS is a cooperating agency in the preparation of this EIR/EIS and the Authority has coordinated and consulted with the USFS regarding the project for many years. Appendix 3.1-B, USFS Policy Consistency Analysis in the Draft EIR/EIS concludes that the project would be consistent with non-recreation special use authorization because the Build Alternatives would be implemented pursuant to the special-use authorization issued by USFS. HSR would demonstrate compliance with all laws, regulations, and policies governing the issuance of a Special Use Authorization (SUA). Please refer to Appendix 3.1-B for further details. The Draft EIR/EIS also includes an evaluation of the project alternatives' consistency with the land use designations in the ANF in Section 3.13.10, United States Forest Service Impact Analysis; any inconsistencies with these land use designations are appropriately disclosed. With respect to economic feasibility of the project, the comment is correct that the Palmdale to Burbank Project Section is not fully funded to proceed into detailed design and construction. The Authority is actively seeking additional funding and would submit a SUA application to the USFS once funding for detailed design and construction has been identified. Accordingly, the Authority would meet the economic feasibility requirement at the time of submittal of the SUA application. The Final EIR/EIS is intended to include a sufficient level of analysis to

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9640

support the issuance by the USFS of a SUA that would allow for construction and operation of the selected Preferred Alternative. Ultimately, the USFS would need to make a determination of consistency with USFS laws, regulations, and policies before issuing a Special Use Authorization.

### 4494-9641

The commenter underscores the importance of the San Gabriel Mountains National Monument (SGMNM) and notes that new mineral and energy resource exploration is not permitted within the Monument. The commenter questions the justification for allowing tunneling through the Monument based on the opinion that many of the impacts of mining overlap with and yet are less invasive than the impacts of tunneling. The commenter also questions how constructing a tunnel through the Monument does not constitute a violation of the spirit of the USFS directive when mineral and energy resource exploration is not permitted.

As discussed in Section 3.13.6, tunnel construction would not result in inconsistencies with land use designations within the Angeles National Forest (ANF), including SGMNM, because all construction activities would occur below the surface, except for the Vulcan Mine area, where a section of the at-grade, covered tunnel would be located in an area disturbed by existing mining operations. Construction within the Developed Area Interface designation would be generally consistent with allowable uses. Operation of the HSR trains within the tunnels would not have direct surface effects on USFS lands. Tunnel depth and construction design would prevent vibration- and noise-related effects, as shown on Figure 3.13-29 through Figure 3.13-41 of the Draft EIR/EIS.

Given that portal locations would be immediately adjacent to the ANF, including the SGMNM, there could be some increase in noise levels on lands within USFS lands immediately adjacent to the portal areas, but HSR operations would have limited effect on the land use within the ANF including the SGMNM and would not inhibit implementation of the LMP. As discussed under Impact LU#2, such related effects would be temporary in nature and would be minimized through the implementation of appropriate IAMFs. Therefore, construction-related land use conflicts in these areas would be avoided. Additionally, the USFS is a cooperating agency and is involved with ongoing coordination regarding the ANF including the SGMNM.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9642

The commenter refers to Appendix 3.1-B: USFS Consistency Analysis; specifically, Section 4.3, San Gabriel Mountains National Monument (SGMNM) Management Plan ([www.fs.usda.gov/Internet/FSE\\_DOCUMENTS/fseprd1055780.pdf](http://www.fs.usda.gov/Internet/FSE_DOCUMENTS/fseprd1055780.pdf)). The commenter asserts that stated goals of the San Gabriel National Monument Management Plan are “1. Road density within the Monument remains stable or is decreasing,” and “2. Consider opportunities to reduce the size of the road system by decommissioning individual roads or converting them to non-motorized trails.”

The SGMNM Management Plan defines a goal as “a broad statement of intent, other than desired conditions, usually related to process or interaction with the public. Goals are expressed in broad, general terms, but do not include completion dates.” Although the commenter suggests that the quoted text from the SGMNM Plan refers to goals, the cited text regarding road density is located in Chapter 2 on of the SGMNM Plan under the heading Plan Components, sub-heading Transportation, and sub-sub-heading Desired Conditions. The cited text regarding reducing the size of the road system is located in Chapter 3, under the heading Transportation System Maintenance and the sub-heading Maintenance Strategy. These quotes, therefore, relate to desired conditions and maintenance strategy, but are not goals of the SGMNM Management Plan.

Table 3.1-B-3 in Section 4.3, SGMNM Management Plan (Draft EIR/EIS Appendix 3.1-B, USFS Policy Consistency Analysis) sets forth the Authority’s analysis of the Palmdale to Burbank Project Section’s consistency with the Management Plan’s goals. SGMNM Management Plan’s goal with respect to Transportation reads “Evaluate alternative transportation and public transportation opportunities, including identifying programs that facilitate access from underserved communities, ways to link to public transportation options in gateway communities, and sites appropriate for bus access at key recreation areas,” which the Authority concludes in Table 3.1-B-3 is not applicable to the proposed work in the SGMNM related to the Palmdale to Burbank Project Section. As discussed in Section 4.3 SGMNM Management Plan in Appendix 3.1-B, USFS Policy Consistency Analysis, the Authority concludes that Palmdale to Burbank Project Section is consistent with the SGMNM Management Plan.

Predicated on erroneous characterizations of the SGMNM Management Plans goals,

### 4494-9642

the commenter asks how the Authority justifies the introduction of access roads within the SGMNM. The introduction of new access roads would not be inconsistent with the goals of the SGMNM Management Plan.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9643**

The commenter inquires how construction of the project is not in violation of the 2014 Presidential Proclamation on the SGMNM (Proclamation), because construction equipment would be used in areas without existing roads. The Proclamation is silent on the use of temporary construction equipment, directs the preparation of a transportation plan, and allows exceptions to the limitations on motor vehicle use for authorized administrative purposes.

Consistency of the Build Alternatives with the Presidential Proclamation of the SGMNM is discussed in Table 3.1-B-3 of Appendix 3.1-B in the Draft EIR/EIS. The Build Alternatives for the most part would tunnel under USFS lands thereby avoiding impacts to resources at the surface. Some facilities would be located within the forest such as adits and utilities (water and power) during construction. Adits would be located on in-holdings, which are private property within the ANF. Utilities needed for construction would be located along existing roads and/or follow existing utility corridors within the forest, thereby reducing impacts and complying with the 2014 Presidential Proclamation on the SGMNM. Additionally, as described in Appendix 3.1-B of the Draft EIR/EIS, in 2016, the U.S. Forest Service proposed to amend the 2006 ANF Land Management Plan with a specific management plan to provide for the proper care and management of the objects protected by the proclamation establishing the SGMNM. The plan is intended to provide for protection and interpretation of the scientific and historic objects identified in the proclamation and for continued public access, consistent with their protection. The draft environmental assessment associated with the draft SGMNM Plan Amendment was published in August 2016 for public review and finalized in May 2019.

### **4494-9644**

The commenter asks how the desired future conditions with the San Gabriel Mountains National Monument are expected to be met, including stable and improving habitat conditions and special status species managed for preservation and protection. The majority of the HSR Palmdale to Burbank Project Section for all Build Alternatives would be tunneled under the ANF and SGMNM and result in little direct temporary or permanent surface construction or operation and maintenance disturbances. A small section of the overlapping portion of the E1, E1A, E2, and EA2 Build Alternatives is at grade and on viaduct at Aliso Canyon Road, just adjacent and outside of the SGMNM, where medium- to high-density residential development occurs (see Figure 3.13-9). A tunnel entrance portal for the overlapping portion of the Refined SR14 and SR14A Build Alternatives would be constructed on the existing development of Vulcan Mine, which is within the SGMNM, but is historically developed (see Figure 3.13-4). Acreages of surface footprint within the ANF and SGMNM can be seen on Table 3.13-17. Minimal surface footprint occurs that would affect critical biological areas across all Build Alternatives, and no surface footprint to undisturbed areas occurs for the SR14A Preferred Alternative. These temporary and permanent construction footprints are not expected to interfere with meeting the desired future conditions for the SGMNM according to the Management Plan. The Authority determined in Section 3.13 that the project would have no temporary or permanent land use conflicts with the SGMNM Management Plan.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9645

The commenter asks how the Authority plans to stage construction for more than 7 years adjacent to a wilderness area is consistent with USFS directives.

The Magic Mountain Wilderness Area is the only wilderness area within the study area. No surface construction would occur within this wilderness area, nor would any tunnels cross underneath this wilderness area. The closest surface construction to the wilderness area would occur at the Vulcan mine site, which is located within the SGMNM portion of the ANF. The Vulcan mine site has been an active mining operation within the ANF for many years. The Refined SR14 and SR14A Build Alternatives would utilize this mine site to construct a tunnel portal. Upon completion, approximately 219 acres of land within the Vulcan Mine site would be regraded and restored to a condition better reflecting the surrounding topography, improving the appearance of the area and no above-ground HSR facilities would be located within the SGMNM boundary. Given project's activities will occur within the Vulcan mine site, which is already highly altered and was an active mining operation for many years, and is not located within an area designated as Wilderness nor an area recommended to be designated as wilderness, the project would not conflict with the conditions cited by the commenter.

Regarding construction activities, no construction activities would occur within designated wilderness areas or areas recommended for wilderness designation. While the project would result in construction activities near the designated wilderness area, this would not create a substantially different condition than what existed for many years while the Vulcan mine was in operation which was much longer than the construction period for the project. Once HSR construction is complete, and as noted above, the project would result in an improved condition in this area near the wilderness area as the area's topography would be restored to a more natural condition. Section 4 of Appendix 3.1-B, USFS Policy Consistency Analysis in the Draft EIR/EIS, analyzes consistency with specific policies and regulations of the adopted plans for ANF and SGMNM. The analysis concludes the project is consistent with protecting and managing wilderness, since the build alternatives do not include any construction, surface activities or subsurface facilities within the designated wilderness area in the project study area, the Magic Mountain Wilderness Area.

### 4494-9646

The commenter asks how potential hydrogeological impacts from tunneling may contravene USFS policies and goals to reduce wildfires and to reduce drought-caused mortality in Southern California National Forests. The high and moderate impact risk areas associated with the build alternative alignments are anticipated to be restricted to areas where geologic faults cross the alignments. The Refined SR14 and SR14A Build Alternative alignments would cross the fewest identified risk areas compared to the other build alignments. The ANF Land Management Plan Goal 1.1, indicated in the comment, is tied to limiting loss of life and property and of life and property recovery from high intensity wildfires in the wildland-urban interface. USFS stated that it aims to treat vegetation to enhance community protection and to reduce the risk of loss of human life, structures, improvements, and natural resources from wildland fire and subsequent floods. Firefighters have improved opportunities for tactical operations and safety near structures, improvements, and high resource values. This goal focuses on providing defensible space and enhanced safety. Local jurisdictional authorities, citizen groups and the Forest Service act together to mitigate hazardous fuel conditions in areas surrounding urban interface, urban intermix, and/or outlying improvements. Since the project would be constructed and operate underground beneath the ANF, it would not impede or preclude achieving these goals in the ANF. Likewise, any potential impacts to groundwater would not contravene this goal because such impacts would not preclude the ability to limit the loss of life and property resulting from wildfires because the Authority anticipates no reasonably foreseeable changes to the hydrogeological conditions resulting from implementation of the Build Alternative alignments and therefore would not impede the Forest Service's ability to reduce wildfires or to reduce drought-caused mortality in Southern California National Forests. The ANF Land Management Plan Goal 1.2, indicated in the comment, is tied to restoring forest health where alteration of natural fire regimes have put human and natural resource values at risk. This includes reducing the potential for widespread losses of montane conifer forests caused by severe, extensive, and stand replacing fires. This also includes reducing the number of acres at risk from excessively frequent fires while improving defensible space around communities, and maintaining long fire-free intervals in habitats which are slow to recover. While changes in groundwater levels may temporarily occur during tunnel construction, the Authority will implement an AMMP (BIO-MM#93 and HWR-MM#4), described in Appendix 3.8-C. The AMMP includes monitoring protocols to establish baseline conditions for surface water resources and to allow for the detection

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9646

of changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial measures. The monitoring program would continue for up to 10 years after the completion of construction. The AMMP also includes provisions for augmenting water supplies for surface water resources and wells and establishes performance standards that the remedial actions must achieve to approximately match baseline conditions. The sources and means of conveyance of such water supplies are discussed in Appendix 3.8-D. The AMMP also includes actions to restore affected resources and, if necessary, to provide compensatory mitigation for affected water resource if effects cannot be arrested or substantially reduced through other response actions. As a result, the AMMP would effectively mitigate or offset impacts to affected water resources. The project will have no reasonably foreseeable permanent changes to groundwater levels or impact the stated goals in the Land Management Plan Goal 1.2.

### 4494-9647

The commenter asks how the project is consistent with USFS Policy WL-1 of LMP2, which addresses Threatened, Endangered, Proposed, Candidate, and Sensitive Species Management. The USFS directive is to “Use vegetation management practices to reduce the intensity of fires to reduce habitat loss due to catastrophic fires.” The commenter notes on page 3.1-B-9 of the Draft EIR/EIS, CHSRA claims that its plans are consistent with this directive as, “Implementation of BIO-MM#54 involves preparation and implementation of an Annual Vegetation Control Plan (VCP). The Authority will prepare a VCP to address vegetation removal for the purpose of maintaining clear areas around HSR facilities and reducing the risk of fire.” The commenter also suggests the CHSRA’s response is limited to “vegetation removal,” but vegetation management includes ensuring that projects do not deplete natural water supplies. Lastly, the commenter claims that CHSRA is anticipating dewatering of Forest land as a result of tunneling. The Authority disagrees with the commenter’s statement that the Authority intends to dewater the forest. While temporary changes to groundwater levels may occur during tunnel construction, water levels are anticipated to return to pre-tunnel construction levels. The project’s consistency with Forest Service Policy is analyzed in Appendix 3.1-B. Consistency with invasive species management is discussed on pages 3.1-B-10 and 3.1-B-11. These are all identified as consistent or not applicable to the project. The potential surface effects of tunnel construction were more appropriately evaluated under other Forest Service Standards and WL-1 is not applicable. Constructing the project within a tunnel is expected to reduce wildland fire potential, as this greatly reduce the surface area of the Build Alternatives in the ANF. Furthermore, as discussed in Section 3.11, Safety and Security, the Authority would form a statewide FLSSC to comply with state and local fire code standards and hazard programs during design of the Build Alternatives. The Authority would invite the USFS to participate in the FLSSC to ensure incorporation of applicable vegetation protection policies outlined in the ANF LMP. Implementation of HWR-MM#4, HYD-IAMF#5 (using a tunnel boring machine capable of preventing groundwater seepage while drilling preventing changes in groundwater levels during construction), HYD-IAMF#6 (creating a tunnel lining capable of resisting the groundwater pressure with minimal groundwater leakage into the tunnel during construction and operations), HYD-IAMF#7 (A grouting program used during the construction of the tunnels to reduce or prevent potential groundwater flows into the tunnels during construction and operation), HWR-MM#4 (The Authority will implement an AMMP to detect adverse changes in surface and subsurface conditions

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9647**

within the ANF that could occur during and after construction of the HSR tunnels including the construction of associated adits. The actions described in this mitigation measure would provide for timely detection of hydrological changes and, if necessary, appropriate remediation. Monitoring would ensure the effectiveness of the measures and determine if additional action would be required. Additionally, monitoring activities would continue for a period of 10 years after completion of the Palmdale to Burbank Project Section. If impacts persist after this period, monitoring would continue, as necessary), and BIO-MM#93 (The Authority will avoid, minimize and mitigate for impacts on seeps, springs, streams, riparian vegetation, and special-status plant and wildlife species, the Authority will prepare and implement an adaptive management and monitoring plan (AMMP) prior to, during, and after tunnel construction to implement the requirements described under HYD-MM#4 and as described below concerning biological resources. The AMMP will require monitoring of groundwater-dependent biological resources within the tunnel construction RSA to detect and remediate adverse effects on habitat function in a timely manner.). The measures are intended to avoid or minimize the noted risk. Given the above, the Build Alternatives are consistent with Forest Service Standards for reducing risk of wildland fire.

### **4494-9648**

Refer to Standard Response PB-Response-S&S-1: Wildfire.

The commenter requested further information on the project's consistency with the United States Forest Service (USFS) Angeles National Forest (ANF) Management Plan's policies on wildfire minimization. Please refer to Standard Response PB-Response-S&S-1: Wildfire, which describes the potential for wildfire effects from construction activities and operations associated with the project, including those associated with above-ground ancillary features. The presence of electrical facilities and operation of cars and trucks on new access roads could increase fire risks. As outlined in Section 3.11.6.3, in Section 3.11, Safety and Security, of this Final EIR/EIS, implementation of the Fire and Life Safety and Security Committee (FLSSC) will require the incorporation of fire safety measures and statewide building code requirements into the construction activities. SS-IAMF#1 and SS-IAMF#2 will require the incorporation of fire safety measures into project operations. These measures would be developed in coordination with the USFS to ensure compliance with any Special Use Authorization issued by the USFS for the project. The USFS would make a determination of consistency with USFS laws, regulations, and policies before issuing a Special Use Authorization, including requirements pertaining to safety and security of the project. For additional information about potential impacts related to wildfires, please refer to Standard Response PB-Response-S&S-1: Wildfire.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9649

Refer to Standard Response PB-Response-S&S-1: Wildfire.

The commenter requested further information on the project's consistency with Policy FIRE-2 of the LMP2 regarding wildfire minimization. The Authority believes this comment refers to the USFS ANF Management Plan's (ANFMP) Policy Fire-2, as referred to in Section 3.11 of the Draft EIR/EIS. Policy Fire-2 entails the management of high/moderate risk wildfire areas by reducing the potential for fire risks using methods including mechanical treatments, grazing, and prescribed fire. Formation of the project Fire and Life Safety and Security Committee (FLSSC) under SS-IAMF#2 will require the incorporation of fire safety measures and statewide building code requirements into project construction activities. SS-IAMF#2 will further require the incorporation of fire safety measures into project operations. These measures would be developed in coordination with the USFS to ensure compliance with any Special Use Authorization issued by the USFS for the project. The USFS would make a determination of consistency with USFS laws, regulations, and policies before issuing a Special Use Authorization, including requirements pertaining to safety and security of the project. In addition, the electrical utilities proposed within the ANF would generally follow existing utility and road corridors that currently exist within the forest. This is being done to minimize/avoid increasing areas within the forest that would be exposed to high fire risk. For additional information about potential impacts related to wildfires, please refer to Standard Response PB-Response-S&S-1: Wildfire.

### 4494-9650

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

Commenter provided an overview of how water provisions in California are dependent on the health of our national forests, and is requesting verification on how the CHSRA will protect or improve water conditions when tunneling within the ANF. The Authority will use state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, including through the use of tunnel boring machines (TBMs) with features to reduce or prevent inflows and grouting and tunnel-lining approaches that have proven effective at controlling water seepage. These measures are identified in HYD-IAMF#5 (TBM Design Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting). HYD-IAMF#5 (TBM Design Features) would use closed-mode operations to effectively prevent water seepage from occurring at the TBM cutterhead area, with ports for drilling horizontal probe holes through the TBM cutterhead, and angled probe holes through the TBM shields. Notwithstanding these measures, in High-Risk Areas, which are zones associated with tunnels intersecting areas with faults and high hydrostatic pressure, groundwater inflow into the tunnels would likely occur during construction. Groundwater seepage into tunnel structures during construction could affect water levels of streams, springs and wells reliant on groundwater aquifers. The extent to which groundwater drains into tunnel structures depends on the tunnel lining system's ability to resist hydrostatic pressures. Specialized tunnel design (e.g., one-pass gasketed segmental lining and two-pass tunnel linings) can withstand higher hydrostatic pressure at greater depths.

To address any substantial losses of groundwater and impacts to surface aquatic resources, the Authority will implement an Adaptive Management and Monitoring Plan (AMMP) (See HWR-MM#4). The AMMP would be implemented throughout the tunnel construction RSA. HWR-MM#4 requires that the AMMP include monitoring protocols to establish baseline conditions of surface water resources and to detect changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial measures. The purpose of the AMMP is to ensure that adverse effects on subsurface and surface water resources and associated habitat within the ANF caused by tunnel construction activities are identified and that appropriate responses to address those effects are expeditiously implemented. This AMMP involves a multi-step iterative

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9650

process to comply with U.S. Forest Service (USFS) standards, which includes remedial measures. The remedial measures include actions such as establishing adaptive management triggers for each water resource being monitored, implementation of compensatory mitigation for each affected water resource, and the minimization of effects on water resources associated species as a result of tunnel construction. For a full list of USFS standards for remedial measures, see Appendix 3.8-C, Adaptive Management and Monitoring Plan for Potential Hydrologic Effects within the Angeles National Forest. The hydrogeological changes that may occur during tunnel construction would be primarily influenced by a combination of risk factors identified above.

Based on the comparative assessment of tunnel-related hydrologic impacts between the six Build Alternatives, the Refined SR14 and SR14A Build Alternatives pose the least risk of hydrologic impacts occurring among the Build Alternatives. The Refined SR14 and SR14A Build Alternative alignments would cross the fewest identified risk areas compared to the other two alignments (E1/E1A and E2/E2A). Within those risk areas, no known seeps, springs, intermittent or perennial streams are present. As such, the Refined SR14 and SR14A Alternatives pose the least risk of hydrologic impacts occurring among the Build Alternatives. Moreover, to the extent such impacts associated with the Refined SR14 and SR14A Build Alternatives may occur, they would likely be of less severity than the other Build Alternatives. The E2 and E2A Build Alternative alignments traverse the greatest number of Moderate- and High-Risk areas and have the greatest length of tunnel in water pressure zones above 25 bar. As such the E2 and E2A alternatives would pose the highest risk of hydrologic impacts occurring when compared to the other Build Alternatives. If through further investigation additional seeps, spring, intermittent or perennial streams are discovered within the tunnel construction RSA, the risk of hydrologic impacts may increase accordingly. As noted above, implementation of HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 would minimize the severity and duration of groundwater inflow during tunnel construction, but groundwater inflow into the tunnel excavations may still occur. Implementation of the Water Resources AMMP set forth in HYD-MM#4 would minimize impacts that occur and, if necessary, provide compensatory mitigation for unavoidable impacts to surface aquatic resources, including water supply wells. See Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, for additional information regarding concerns about tunneling in the ANF.

### 4494-9651

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

Commenter provides an overview of HYD-MM#4, which calls for importing water to meet U.S. Forest Service needs and maintain baseline water levels during tunneling construction. Commenter is requesting clarification on how the proposed tunneling plans will conserve and protect water sources to meet the needs of the Angeles National Forest. The Authority will use state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, including through the use of tunnel boring machines (TBMs) with features to reduce or prevent inflows and grouting and tunnel lining approaches that have proven effective at controlling water seepage. These measures are identified in HYD-IAMF#5 (TBM Design Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting). HYD-IAMF#5 (TBM Design Features). The TBM would use closed-mode operations to effectively prevent water seepage from occurring at the TBM cutterhead area, with ports for drilling horizontal probe holes through the TBM cutterhead, and angled probe holes through the TBM shields. These holes will allow for water pressures and flow rates to be measured ahead of the TBM, and further allow for pre-excavation grouting ahead of the TBM to cut-off groundwater inflows into the tunnel. HYD-IAMF#6 (Tunnel Lining Systems) will consist of segmental, precast, concrete lining with bolted and gasketed joints, creating a tunnel lining capable of resisting the groundwater pressure with minimal, leakage in circumstances where groundwater pressures are 25 bar or less. In sections where groundwater pressures are above 25 bar, a second lining will be put in place to ensure that tunnels are watertight over time. HYD-IAMF#7 (Grouting) involves pouring coarse mortar into various narrow cavities along the tunnel lining. Several grouting methods will be used during the construction of the tunnels to avoid and minimize groundwater flows into the tunnels, including pre-excavation grouting, backfill grouting with two-component grout, and check grouting (refer to Appendix 2.0-E of the Palmdale to Burbank Project Section EIR/EIS for further descriptions of IAMFs that will be implemented as part of the project, including HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7). For proper implementation of this approach, a detailed site-specific geotechnical and hydrogeological characterization would be carried out for the selected Alternative. Notwithstanding these measures, in High-Risk Areas, which are zones associated with tunnels intersecting areas with faults and high hydrostatic pressure, groundwater inflow

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9651

into the tunnels would likely occur during construction. Groundwater seepage into tunnel structures during construction and operation could affect water levels of streams, springs, and wells reliant on groundwater aquifers. To address this, the Authority will implement an Adaptive Management and Monitoring Plan (AMMP) (See HWR-MM#4). The AMMP would be implemented throughout the tunnel construction RSA. HWR-MM#4 requires that the AMMP include monitoring protocols to establish baseline conditions of surface water resources and to detect changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial measures. The purpose of the AMMP is to ensure that adverse effects on surface water resources and associated habitat within the ANF caused by tunnel construction activities are identified and that appropriate responses to address those effects are expeditiously implemented. This AMMP involves a multi-step iterative process to comply with U.S. Forest Service (USFS) standards, which includes remedial measures. The remedial measures include, but are not limited to actions such as establishing adaptive management triggers for each water resource being monitored, implementation of compensatory mitigation for affected surface waters, and the minimization of effects on water resources-associated species as a result of tunnel construction. For a full list of USFS standards for remedial measures, see Appendix 3.8-C, Adaptive Management. See Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, for additional information regarding concerns about tunneling in the ANF.

### 4494-9652

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter asks why the Authority did not design and select an alternative that would not tunnel through the Angeles National Forest, thereby not jeopardizing natural water sources. Please refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, which provides information how the Build Alternatives were evaluated and selected for consideration. Additionally, refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, for concerns regarding impacts to water resources, wildlife, and fauna within the Angeles National Forest.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9653**

The commenter requests further details regarding calculation of in-lieu fees and project impacts to national forests, and indicates that the preferable course of action is to avoid causing unmitigable damage in the first place. The Authority has no intention of impacting sensitive resources any more than absolutely necessary after implementing IAMFs and MMs, including HYD-IAMF#5, HYD-IAMF#6, HYD-IAMF#7, BIO-MM#93, to avoid and to minimize impacts on those sensitive resources. The Authority designed the project with a tunnel under the ANF in an effort to avoid substantial impacts and to minimize direct impacts to sensitive surface resources (see Draft EIR/EIS Chapter 2, Alternatives, Section 2.4). It also designed a project with no at-grade or above-ground project facilities in the SGMNM other than Vulcan mine—and there, the Authority found that the project could provide substantial restoration beyond the reclamation requirements currently in place (see Draft EIR/EIS, Section 2.5.3.1). Where the project requires at grade/above-ground facilities within the ANF, these would be located on private in holding (private property) or along existing roads or utility corridors where they would cause less impacts. Based on these careful efforts, the Draft EIR/EIS found impacts within and near national forests to include impacts to FSS species habitat within the ANF, including the SGMNM, by all six build alternatives. Most impacts on FSS species would occur during construction-period ground disturbance and installation of trackway and ancillary features. Implementation of IAMFs and MMs listed above would minimize impacts on biological resources and aquatic resources during construction and operation of the six Build Alternatives (see Draft EIR/EIS, Section 3.7.11). If, after these efforts, the Authority nonetheless finds that the project impacted the ANF in ways that require compensatory mitigation, the amount and type of compensatory mitigation will be determined through consultation with the USFS and/or other applicable natural resource agencies.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9654

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter asks why the Authority did not design and select an alternative that would not tunnel through the Angeles National Forest, thereby not jeopardizing natural water sources and affecting wildlife, flora, and humans dependent upon the water sources. Please refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, which provides information relating to how the Build Alternatives were evaluated and selected for consideration. Additionally, refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, for concerns regarding impacts to water resources. Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife addresses concerns regarding impacts to wildlife.

### 4494-9655

The commenter asks how compensatory mitigation can mitigate project impacts to aquatic, riparian, and upland ecosystems. The Authority has developed IAMFs as design features to avoid and minimize impacts (BIO-IAMF#1 - BIO-IAMF#12) as well as MMs to avoid, minimize, and compensate project impacts to sensitive resources within national forests (BIO-MM#1 - BIO-MM#101). With implementation of mitigation measures, the project would have a less-than-significant effect on biological resources within national forests (see Draft EIR/EIS Section 3.7.11). The Authority has developed a contingency plan through coordination with the USFS, as explained in the last provision of BIO-MM#92 (see Draft EIR/EIS, p. 3.7-237), where the Authority would fund compensatory mitigation to offset the loss of habitat pursuant to terms set forth in BIO-MM#47 and BIO-MM#53. This compensatory mitigation would not be paid to the USFS, as indicated in the comment, but to applicable agencies or organizations approved by agencies who provide the mitigatory habitat that is created and maintained. See BIO-MM#47 and BIO-MM#53 for more detail, as well as BIO-MM#38, BIO-MM#39, BIO-MM#44, BIO-MM#46, BIO-MM#67, BIO-MM#70 where compensatory mitigation is further discussed.

### 4494-9656

The commenter notes that mitigation measures exist to mitigate impacts to aquatic and other ecosystems within USFS jurisdiction land, and appears to question the authenticity of certain impact conclusions that require mitigation and/or IAMFs to achieve a less-than-significant or non-adverse impact conclusion. These implications, however, are unwarranted. CEQA explicitly provides that mitigation measures may be used to minimize, rectify, reduce, or compensate for a potential impact where such an impact cannot be fully avoided (see CEQA Guidelines sections 15126.4 and 15370). Here, however, often times a potential impact is indeed avoided through the use of project design features, i.e., IAMFs.

The Authority identifies potential adverse effects to aquatic, riparian and upland ecosystems, however, the implementation of IAMFs described below are anticipated to avoid or minimize those potential effects resulting in a no adverse impact determination for this resource. If and where these impacts may not be fully avoided and may remain at a certain level of significance, the EIR/EIS includes mitigation, also described below.

The Authority has incorporated HYD-IAMF#5, Tunnel Boring Machine Design, HYD-IAMF#6, Tunnel Lining Systems, and HYD-IAMF#7, Grouting into the project design and construction methods for tunnels under the ANF to avoid or minimize groundwater inflows into and around tunnels during and after construction. While HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 are anticipated to reduce the amount of potential groundwater depletion due to tunnel construction some groundwater inflow into the tunnels could still occur in during construction. Implementation of the Adaptive Management and Monitoring Program (BIO-MM#93 and HYD-MM#4) to monitor ground water dependent surface water resources and riparian resources would use supplemental watering if necessary to minimize impacts during the construction phase. Only if this approach results in unsuccessful avoidance or minimization of the impact specifically after construction is completed would compensatory mitigation be applied to further offset these impacts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9657

The commenter believes that the project is in violation with USFS directive WAT-1. The Authority disagrees with the comment and indicates in Appendix 3.1-B USFS Policy Consistency Analysis of the Draft EIR/EIS, that the project is consistent with WAT-1. IAMFs such as BIO-IAMF#1, BIO-IAMF#2, BIO-IAMF#3, and BIO-IAMF#5 through BIO-IAMF#11 (described in Section 3.7.4.2 in Section 3.7, Biological and Aquatic Resources of the Draft EIR/EIS) would ensure that construction activities comply with all regulatory requirements (such as USFS directive WAT-1) to avoid and minimize impacts on to riparian habitat, watersheds, streams, and other riparian-dependent upland ecosystems from the Build Alternatives to the extent feasible. BIO-IAMF#5, for example, would require the preparation and implementation of a Biological Resources Management Plan that would compile the specific mitigation measures for the protection of vernal pool habitat and riparian areas and resources during construction and operation of the Build Alternatives. Implementation of mitigation measures such as BIO-MM#32 and BIO-MM#46 would minimize temporary and permanent impacts to riparian habitat through habitat restoration and revegetation. In addition, the implementation of BIO-MM#34 during construction activities will minimize temporary construction impacts to riparian resources. Any permanent impacts to riparian habitats would be compensated at a 2:1 (or greater) ratio to fully mitigate and offset these impacts (BIO-MM#46).

### 4494-9658

The commenter questions the determination that the project is consistent with USFS directive WAT-1.

The primary goal of directive WAT-1 is to protect, maintain and restore natural watershed functions including slope processes, surface water and groundwater flow and retention, and riparian area sustainability. Under this goal WAT-1 includes the following desired conditions: Assess impacts of proposed groundwater extraction proposals to assure that developments will not adversely affect aquatic, riparian or upland ecosystems; Restore, maintain and improve watershed conditions. Assure approved and funded rehabilitation and emergency watershed treatments are implemented in an effective and timely manner.

As discussed in Appendix 3.1-B (page 3.1-B-15 in the Draft EIR/EIS), tunnel construction under the ANF has the potential to alter hydrogeological conditions, resulting in inflows of groundwater into the tunnel and the subsequent depletion of groundwater aquifers. Depletion of groundwater aquifers could affect the hydrology of groundwater-dependent ecosystems, resulting in effects on species. The Authority has incorporated HYD-IAMF#5, Tunnel Boring Machine Design, HYD-IAMF#6, Tunnel Lining Systems, and HYD-IAMF#7, Grouting into the design and construction methods for tunnels under the ANF to avoid or minimize groundwater inflows into and around tunnels during and after construction. These measures are specifically intended to avoid or reduce these potential impacts from occurring in the first place. The mitigation measures cited by the commentator would only be implemented if the measure above do not fully reduce or avoid the impact from occurring. The approach the Authority has taken is consistent with the desired conditions under WAT-1. The Authority has assessed the impacts of tunneling on groundwater and potential effects on surface aquatic, riparian ecosystem and will implement multiple measure to assure these effects are avoided or substantially reduced.

The Authority has also committed to prepare and implement an AMMP (HWR-MM#4) to monitor and restore potential effects to aquatic and riparian ecosystems in an effective and timely manner if they were to occur. The primary approach to restoring and maintaining affected aquatic and riparian ecosystems affected by tunneling would be to maintain the baseline surface water requirements of the affected ecosystem through

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9658

application of supplemental water. Contrary to the commenter's assertion, compensatory mitigation strategies would only be applied should application of supplemental water not be effective or not feasible. These compensatory mitigation strategies would focus on restoring and improving habitat within the ANF. Restoring and improving habitat would be consistent with the desired conditions of WAT-1 to maintain, restore and improve watershed conditions.

### 4494-9659

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter expresses concerns about the effect of tunneling on groundwater in the ANF and how this may affect aquatic, riparian, or upland ecosystems and be consistent with directives from USFS.

Please refer to standard response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, which discusses the potential impacts on groundwater-surface water resources in the ANF and measures to reduce and mitigate potential impacts. With the implementation of the measures specified in the EIR/EIS, the amount of water lost due to tunnel construction would be minimal and as noted would return to pre-construction levels once tunnel construction is complete and groundwater levels are allowed to recover.

### 4494-9660

Refer to Standard Response PB-Response-ALT-2: Unique Tunnel Elements – Windows, Adits, Tunnel Boring Machines, etc., PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter raises concerns about conflicts between USFS directives related to water conservation and water required to construct the project, including water required to bring groundwater levels back to baseline.

As noted in Response to Comment #9659, with the implementation of measures specified in the EIR/EIS the amount of groundwater loss during construction would be avoided and minimized, and once construction is complete groundwater levels are expected to return to baseline conditions. The Authority does not anticipate that supplemental water will be needed or used for recharging groundwater in the ANF. Trucking of water into the ANF would be done if needed to support a habitat that is affected by tunnel construction. The measures included in the EIR/EIS involve steps to avoid impacts on surface habitat from occurring, such as changing tunnel construction techniques. The intent of these measures is to reduce or avoid the need for supplemental water in the first place.

### 4494-9661

The commenter inquired what mitigation measures involve the application of water, and if the mitigation measures are consistent with the USFS directive to conserve water at authorized facilities. See Response to Comments #9659 and #9660.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9662

Refer to Standard Response PB-Response-ALT-2: Unique Tunnel Elements – Windows, Adits, Tunnel Boring Machines, etc..

The commenter requested further information on IAMFs and mitigation measures that the Authority will implement as part of the project to avoid and minimize adverse effects on groundwater and surface water features within the ANF. The Authority understands that the construction of tunnels within the ANF may adversely affect groundwater and other aquatic resources. These potential impacts are analyzed in detail in Section 3.8, Hydrology and Water Resources, specifically in Impact HWR#4 (Changes in Groundwater Recharge Associated with Temporary Construction Activities and Permanent Structures Required for the Build Alternatives) and HWR#5 (Changes in Hydrogeologic Conditions Associated with Tunnel Construction Beneath the ANF which May Affect Surface and Subsurface Water Resources). Please refer to standard responses PB-Response-ALT-2: Unique Tunnel Elements –Windows, Adits, Tunnel Boring Machines, etc., which discusses the Authority's analysis of this issue as well as the tunneling equipment, techniques and measures that would be implemented to avoid and minimize groundwater seepage into the tunnels during construction. Based on these measures, the Authority anticipates that the project will be in compliance with USFS LMP3 policies pertaining to "Soil, Water, Riparian, and Heritage Standards."

### 4494-9663

The commenter inquired how the Authority proposes to import water to offset the loss due to its extraction and asserts that water extracted as a result of tunnel construction within the ANF would be considered excess to the current and foreseeable needs of forest resources. Please see Response to Comments #9659 and #9660.

### 4494-9664

The commenter cites the LMP2 and questions how tunneling and building corollary infrastructure within the Angeles National Forest (ANF) is not a violation of the legislative mandate to use forest lands conservatively.

As discussed in Section 3.13.6 of the Draft EIR/EIS, tunnel construction would not result in inconsistencies with land use designations within the ANF, including the San Gabriel Mountains National Monument (SGMNM), because all construction activities would occur below the surface, except for the Vulcan Mine area, where a section of the at-grade, covered tunnel would be located in an area disturbed by existing mining operations.

Construction within the Developed Area Interface designation would be generally consistent with allowable uses. Operation of the HSR trains within the tunnels would not have direct surface effects on USFS lands. Tunnel depth and construction design would prevent vibration- and noise-related effects, as shown on Figure 3.13-29 through Figure 3.13-41 of the Draft EIR/EIS. There would be no aboveground Build Alternative alignment within the ANF, and wildlife would not experience adverse noise or startle effects on USFS lands. Therefore, HSR operations would have limited effect on the land use within the ANF including the SGMNM and would not inhibit implementation of the LMP. Please refer to Section 3.13.10 for a discussion on Land Use consistency with the ANF and SGMNM LMPs.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9665

The commenter notes that Table 2.1.3 of the LMP2 states that Major Transportation Corridors are not a suitable use in several categories of USFS land. The commenter questions whether tunneling and building corollary infrastructure within the Angeles National Forest (ANF) is a violation of the USFS "Suitable Uses" as delineated in Table 2.1.3 of the LMP2. The commenter questions if CHSRA would be granted a Special Use Permit by the USFS for the construction and operation of its high-speed rail system.

The LMP defines Major Transportation Corridors as "county, state, and federal highways." As the project is a rail line that would be in tunnel through most of the ANF, it would not be considered a Major Transportation Corridor as defined by the LMP. Additionally, since temporary footprint areas would not permanently alter existing land uses, impacts associated with temporary construction areas would not be inconsistent with the LMP. For all six Build Alternatives, temporary construction areas (staging areas, grading, and earthwork) within the ANF, including the San Gabriel Mountains National Monument (SGMNM), will be revegetated or restored following construction (see LU IAMF#3 described in Section 3.13.4.2). Furthermore, as part of the evaluation of the Authority's application for a Special Use Authorization, the USFS would evaluate and determine the Palmdale to Burbank Project Section's consistency with ANF and the SGMNM LMPs, including existing and planned uses.

### 4494-9666

The commenter cites the Land Management Plan (LMP) in which the intent for "Back Country" is to retain the natural character inherent in the zone and limit the level and type of development. Based on this designation, the commenter questions how tunneling through the Angeles National Forest (ANF) and building corollary infrastructure is not a violation of USFS's intent.

As discussed in Section 3.13.6, all six Build Alternatives would require the construction of adit structures and associated utilities in the ANF. The Refined SR14 and SR14A Build Alternatives would require the construction of the adit structure SR14-A1 while the E1, E1A, E2, and E2A Build Alternatives would require an adit to be constructed near Arrastre Canyon Road. As identified in the ANF LMP and the San Gabriel Mountains National Monument (SGMNM) LMP, moderate levels of human use and infrastructure development may be permissible within the Back Country land use designation. Therefore, the construction of adits may be consistent with the allowable uses with in "Back Country" designation identified in the ANF LMP and the SGMNM LMP. In addition, most temporary or permanent land conversions to accommodate the adits would involve the removal of existing development, including residential structures, and lands that have been previously disturbed. The adit structure and associated utilities would be consistent with the existing development on the private in-holding.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9667

The commenter questions whether tunneling and building corollary infrastructure within the ANF is a "violation of the intent of USFS." Allowable land uses within the Angeles National Forest (ANF) are designated and defined by the ANF Land Management Plan (LMP) and the 2019 San Gabriel Mountain National Monument LMP Amendment, which was mandated by the 2014 Presidential Proclamation 9194 (USFS 2017). These land use designations indicate allowable land use types and intensities within the ANF and within areas designated as the SGMNM. Proposed uses are evaluated against these land use designations to determine whether such uses would be consistent with the LMP. Operation of the HSR trains within the tunnels would not have direct surface effects on USFS lands. Therefore, HSR operations would have limited effect on the land use within the ANF including the SGMNM and would not inhibit implementation of the LMP's. See Section 2.4.2, Alternative Considered and Findings, of Chapter 2.0, Alternatives of the Final EIR/EIS, for more information regarding the alternative routes considered but not applied due to the avoidance of impacts to the ANF.

### 4494-9668

The commenter inquires how the project would restore impacted areas of the ANF to existing conditions, and remove significant infrastructure upon completion or termination of the Special Use Authorization from the USFS. The terms and duration of any SUA for the project have not been identified at this time. However, given the project involves construction of vital transportation infrastructure, it is not envisioned that the infrastructure for the HSR project would be removed from the ANF; rather, it is anticipated that the SUA would permit the HSR project to operate in perpetuity. The Build Alternatives for the most part would tunnel under USFS lands thereby avoiding impacts to resources at the surface. Some facilities would be located within the forest such as adits and utilities (for water and power supply) during construction. Adits would be located on in-holdings which are private property within the ANF. Utilities needed for construction would be located along existing roads and/or follow existing utility corridors within the forest thereby reducing their environmental impacts. If above ground facilities such as utilities and adits were removed at some point, these areas would be restored as specified in any SUA issued by the USFS.

### 4494-9669

The commenter inquires how numerous threatened, endangered, proposed, candidate, and sensitive species in the ANF (Angeles Uplands West) would be protected and enhanced during construction of the project, consistent with the goals of the ANF LMP.

The Authority has endeavored to design the project and incorporate project features that would be protective of the natural environment. For the most part, the Build Alternatives would tunnel under USFS lands thereby avoiding impacts to biological resources at the surface. Accordingly, relatively little suitable habitat for special-status plants and wildlife would be directly or indirectly affected by construction and operation of the project in the ANF. Refer to Tables 3.7-39 through 3.7-41 in Section 3.7, Biological and Aquatic Resources of the Draft EIR/EIS, for quantification of potential impacts to the special-status plant, wildlife, and aquatic life within the ANF. As shown in these tables, the project alternatives have differing impacts on special-status species and certain alternatives avoid impacts to some special-status species in the ANF (e.g., Alternatives E1, E1A, E2, and E2A avoid impacts to arroyo toad; SR 14A avoids impacts to Southwester willow flycatcher). To minimize impacts on biological resources during project construction, the Authority has incorporated numerous project features that would facilitate the identification and preservation of biological resources in compliance with relevant regulatory requirements (e.g., BIO-IAMF#1, BIO-IAMF#2, BIO-IAMF#3, BIO-IAMF#5, BIO-IAMF#8, BIO-IAMF#9, BIO-IAMF#10, and BIO-IAMF#11). In addition, the Authority has proposed extensive mitigation measures to minimize and compensate for the adverse effects on special status plants and wildlife, which are described in detail in Draft EIR/EIS Section 3.7.7, Mitigation Measures. With implementation of these measures, the analysis concluded that impacts to special-status plant, wildlife, and aquatic resources would be less than significant.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9670

The commenter requests further detail regarding hydrogeological impacts associated with tunnel construction as they pertain to the Program Emphasis in Big Tujunga Canyon Place. The Authority has incorporated HYD-IAMF#5, Tunnel Boring Machine Design, HYD-IAMF#6, Tunnel Lining Systems, and HYD-IAMF#7, Grouting into the design and construction methods for tunnels under the ANF to avoid or minimize groundwater inflows into and around tunnels during and after construction. Although HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 would reduce the amount of potential groundwater depletion due to tunnel construction, based on the available information and based on prior tunnel construction experience elsewhere, some groundwater inflow into the tunnels could still occur during construction. There may be times and locations during construction when these IAMFs do not fully avoid or minimize impacts and additional measures may be appropriate as a contingency to mitigate impacts. To address this issue, the Authority will prepare a long-term AMMP (HWR-MM#4) to monitor and remediate potential changes in groundwater conditions resulting from implementation of the build alignment alternative tunneling. The Build Alternatives would be consistent with USFS Program Emphasis to manage forest ecosystem needs and instream flows necessary to support surface and subsurface resources because the IAMFs would be implemented to avoid or minimize impacts, and mitigation would be provided when avoidance and minimization does not sufficiently reduce the impact (HWR-MM#4) such that forest ecosystem needs are maintained.

### 4494-9671

The commenter references the Angeles National Forest Land Management Plan Program Emphasis, specifically Big Tujunga Canyon Place, and asks how the project construction in multiple locations is consistent with the USFS stated objectives of protection and enhancement of sensitive biological species. The Angeles National Forest Land Management Plan includes a discussion of place-based program emphasis, which endeavors to provide readers with a better understanding of what types of management is expected in specific areas of the national forest. The Build Alternatives would have minimal surface disturbance within the USFS geographical unit, Big Tujunga Canyon, as the alignments are primarily within a tunnel under the forest. The construction of the viaduct over Big Tujunga Wash would be constructed outside of the Angeles National Forest jurisdiction. Any potential impacts within Big Tujunga Wash inside or outside the forest jurisdiction to impacts to threatened, endangered, proposed, candidate and listed species would be avoided or minimized by the implementation of BIO-IAMF#1 - BIO-IAMF#12 (3.7.4.2) and BIO-MM#1 - BIO-MM#101 (3.3.7). While the E2 and E2A Build Alternatives would cross Big Tujunga Wash as a viaduct, the Authority's Preferred Alternative (SR14A) would avoid impacts to Big Tujunga Wash altogether. Page 3.8-87 describes the E2 and E2A alignment alternative in relationship to Big Tujunga Wash. Given the above, the Build Alternatives would not conflict with the Angeles National Forest Land Management Plan program emphasis for Big Tujunga Canyon.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9672

The commenter asks how the project can be considered consistent with the goals and objectives relating to the Soledad Front Country. Surface construction for the project within the Soledad Front Country would be limited to the Vulcan mine area (SR14A and Refined SR14) and utilities (E1/E1A, E2/E2A). The Build Alternatives would be underground within areas designated as the Soledad Front Country. The portions of the Build Alternatives that are above ground within the Soledad Front Country would consist of utilities along Aliso Canyon Road. These utilities would follow existing utilities within the Soledad Front Country. Vulcan mine is an existing mining operation located within the Soledad Front Country. The project (SR14A and Refined SR14) would utilize this site for a tunnel portal as well as disposal of tunnel spoils material. The tunnel spoils material would be used to restore the area to more natural topography. Once construction is completed, all permanent HSR facilities, including the tunnel portal, would be located outside the Soledad Front Country. The project would not construct or operate any at-grade or viaduct structures within the Soledad Front Country. As noted above, the Build Alternatives are underground. For these reasons, because the project would not include at-grade or viaduct structures through the Soledad Front Country, it would support the USFS goals and program emphasis related to the Soledad Front Country.

### 4494-9673

Refer to Standard Response PB-Response-AVQ-1: Impacts to Scenic Vistas and Scenic Drives, PB-Response-AVQ-2: Visual Effects on Big Tujunga Wash, PB-Response-AVQ-3: Effects on Visual Quality during Construction.

The commenter is concerned with impacts to visual resources as a result of the project. Refer to Section 3.16.4, Methods for Evaluating Impacts, which describes the methods used to analyze aesthetic and visual quality impacts of the Palmdale to Burbank Project Section. Specifically, Section 3.16.4.4, Methods for Evaluating Impacts under NEPA, and Section 3.16.4.5, Method for Determining Significance under CEQA, describe the considerations and thresholds used to assess project impacts. Please also refer to Standard Responses PB-Response-AVQ-1: Impacts to Scenic Vistas and Scenic Drives, PB-Response-AVQ-2: Visual Effects on Big Tujunga Wash, and PB-Response-AVQ-3: Effects on Visual Quality During Construction, which address the specific areas of visual concern raised by the commenter.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9674**

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest.

The commenter inquired about the project's consistency with the plans and federal laws and regulations regarding the ANF Land Management Plan, and questioned the project's consistency with the Landscape Character section of the Land Management Plan. Appendix 3.1-B of the Draft EIR/EIS, USFS Policy Consistency Analysis, assesses the consistency of the Palmdale to Burbank Project Section Build Alternatives with applicable laws, regulations, plans, and policies governing proposed uses and activities within the national forests and national monuments, specifically the Angeles National Forest and the San Gabriel Mountains National Monument. The analysis in this appendix determined that the project would be consistent with the directives in the LMP with respect to landscape character because, as discussed in Section 3.16 of the Draft EIR/EIS, Aesthetics and Visual Quality, the Build Alternatives would generally be underground within the ANF and SGMNM and would therefore have minimal visual effects on USFS land. Above-ground infrastructure would typically be located on private in-holdings within the ANF and would therefore have limited visibility from public vantage points. Publicly accessible viewpoints from within the ANF towards areas outside of the ANF boundaries where the Build Alternatives would be visible are limited. The main location where this would occur along Aliso Canyon Road looking north toward Blum Ranch (KVP 1.13). Although the E1, E1A, E2, and E2A Build Alternatives would introduce highly visible elevated trackway in this area, viewers would be limited to motorists along Aliso Canyon Road who would not be particularly sensitive to visual changes and whose views would be brief in duration.

The commenter asserts that the project's tunneling would negatively impact water resources in the ANF, resulting in an increase in fire fuels, and questions how this is consistent with the Landscape Character directives established in the LMP. Regarding concerns about the tunnels affecting groundwater and surface flora, please refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, which explains that implementation of HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 would minimize and, if necessary, mitigation measure HWR-MM#4 would compensate for, any changes to surface and groundwater conditions and associated habitat due to project construction.

### **4494-9674**

Accordingly, the analysis concludes that tunnel construction would not result in substantial adverse effects on surface water resources, groundwater resources, or special-status species and habitat. For this reason, the Authority disagrees with the commenter's assertion that the tunnel construction would result in an increase in fire fuels that is inconsistent with the Landscape Character directives of the LMP.

### **4494-9675**

The commenter inquires about the issuance and duration of the USFS Special Use Permit that the project will require. The terms and duration of any Special Use Permit for the project have not been identified at this time. The Authority recognizes that the USFS may not issue a Special Use Permit that "create[s] an exclusive or perpetual right of use or occupancy." 36 C.F.R. §251.54(e)(1)(iv). However, the USFS may issue a Special Use Permit of sufficient duration to accommodate the long-term operation of the HSR and that includes provisions that establish that the Authority is not being granted an exclusive right of use.

### **4494-9676**

The commenter asks how the project is not violating the Angeles National Forest's status as a class I area under the Clean Air Act. The project is committed to generating the least amount of emissions possible during construction (please refer to IAMFs and MMs). In addition, emissions generated during construction will be offset with the SCAQMD. Finally, the Clean Air Act does not apply because the project does not have the potential to emit two hundred and fifty tons per year or more of any air emissions generated from stationary sources inside the ANF.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9677

Specifically with respect to the Angeles National Forest (ANF), the commenter inquired how the proposed project would protect the quality of air and atmospheric values that are required under the Federal Land Policy and Management Act (FLPMA) of 1976, given the commenter's assertion of pollution generated during project construction. Additionally, the commenter inquired how the proposed project would protect the quality of groundwater resources in the ANF. The text quoted by the commenter is located within Title 1 General Provisions of the FLMPA ([www.blm.gov/sites/default/files/AboutUs\\_LawsandRegs\\_FLPMA.pdf](http://www.blm.gov/sites/default/files/AboutUs_LawsandRegs_FLPMA.pdf)).

As discussed in Section 3.3, Air Quality and Global Climate Change of the Draft EIR/EIS, specifically Section 3.3.10.2, most of the infrastructure associated with the proposed Build Alternatives on U.S. Forest Service (USFS) lands would consist of underground tunnels, and construction-related emissions in the ANF would be concentrated around portals and adit locations. Construction activities, therefore, could generate fugitive dust in the ANF. Section 3.3.6.3, specifically Impact AQ#2, includes discussion of these potential impacts and the Authority's commitment to implement impact avoidance and minimization features (IAMFs) such as AQ-IAMF#1, which requires the preparation of fugitive dust control plans. Nevertheless, project construction activities would result in a temporary increase in emissions. Mitigation measures (AQ-MM#1, AQ-MM#2, and AQ-MM#3) would offset project emissions by funding stationary and mobile-source emission reduction strategies and would commit to stringent emissions requirements from project-related on-road vehicles and off-road equipment. Project operations would have a beneficial long-term effect on statewide and regional air emissions and greenhouse gases because it is anticipated that people would shift from using on-road vehicles and aircraft to the California HSR System, which is less emissions intensive than other transportation modes.

Section 3.8, Hydrology and Water Resources in the Draft EIR/EIS, specifically Section 3.8.10, acknowledges that groundwater impacts may occur where the construction of aboveground and at grade alignments, grading, trenching, and the placement of utility lines would be required within groundwater basins mapped in the ANF. Please refer to Impact HWR#2 which concludes that with implementation of construction BMPs (e.g., erosion control requirements, stormwater management) to minimize water quality impacts and mitigation measure HWR-MM#1, which requires the Authority to treat

### 4494-9677

potential groundwater contamination pursuant to RWQCB permit requirements, project construction would not substantially degrade water quality. Similarly, the analysis under Impact HWR#6 concludes that project operation would not substantially degrade surface or groundwater quality.

A summary of FLPMA is provided in Land Management Plan, Part 3 Design Criteria for the Southern California National Forests (including the ANF) (Part 3), specifically Appendix A –Relevant Laws, Regulations, Agreements, and Other Management Direction of the Draft EIR/EIS. Appendix A summarizes over 150 federal statutes (including FLPMA), and additionally summarizes federal regulations, executive orders, executive memorandums, agreements, federal agency management direction, and state and local laws and regulations that, while not inclusive, "provide overarching management direction for the southern California revised land management plan." ([www.fs.usda.gov/Internet/FSE\\_DOCUMENTS/stelprdb5166878.pdf](http://www.fs.usda.gov/Internet/FSE_DOCUMENTS/stelprdb5166878.pdf))

Part 3 plan standards relevant to groundwater are found starting on page 10 under the heading Soil, Water, Riparian and Heritage Standards. Standards 45 and 46 relate to groundwater. Draft EIR/EIS Appendix 3.1-B, specifically Table 3.1-B-2, provides a consistency analysis with Part 3. The Authority's analysis in Table 3.1-B-2 concludes that that the project is consistent with Standards 45 and 46. Part 3 does not include standards specific to air and atmospheric values.

The Authority has and will continue to coordinate with the USFS regarding the project's impacts on the ANF and any USFS permitting decisions for the project, including any requirements.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9678

The commenter inquires as to how the project would be consistent with the federal directive under the Federal Land Policy and Management Act of 1976 to retain public lands in federal ownership and to preserve and protect certain public lands in their natural condition. Refer to Appendix 3.1-B, USFS Policy Consistency Analysis, of the Draft EIR/EIS, which assesses the consistency of the Palmdale to Burbank Project Section with applicable laws, regulations, plans, and policies governing proposed uses and activities within the ANF and SGMNM. Specifically, Section 2.7 in Appendix 3.1-B discusses project consistency with the Federal Land Policy and Management Act of 1976 and explains that Section 501(a) of the act authorizes the Secretary of Agriculture to grant, issue, or renew rights-of-way through National Forest System Lands for a variety of uses which may include railroads, tunnels, or other necessary means of transportation that are in the public interest [43 U.S.C §1761(a)].

The Authority has endeavored to design the project and incorporate design features that would be protective of the natural environment. The project's surface footprint within the ANF is primarily sited on in-holdings/private land within the ANF, which are not currently in a natural state. Utilities that would be constructed within the ANF would follow existing utility corridors and/or roads. Areas around portals next to the ANF boundaries would require some disturbance of areas during construction but all areas within the ANF boundaries would be restored to natural topography and vegetation once construction is complete.

### 4494-9679

The commenter asks about the cost the Authority will pay to USFS for use of the land for the HSR system. The terms of a USFS Special Use Authorization (SUA) for the project, including any associated fees, if any, have not been identified at this time. The USFS, in consultation with the Authority, would determine appropriate fees, if any, prior to issuance of an SUA.

### 4494-9680

The commenter notes that in Land Management Plan (LMP3), the USFS delineates a number of federal statutes that apply to the use and management of the ANF, including the Occupancy Permits Act of 1915. The commenter questioned how the Palmdale to Burbank Project Section would not be in violation of the Occupancy Permits Act of 1915, which limits USFS authorizations under that Act to 80 acres for no more than 30 years. The Occupancy Permits Act of 1915 is limited in scope to authorizations for uses such as hotels, resorts, and other structures and facilities for recreation, public convenience, or safety, education or public activities, and summer homes and stores. The Occupancy Permits Act of 1915 is not applicable to the High-Speed Rail project. Under the Federal Land Policy and Management Act (FLPMA), USFS may issue authorizations for, among other things, roads, trails, highways, railroads, canals, tunnels, tramways, and airways. The Authority will apply for a special use authorization under FLPMA, which provides that subsequent to 1976, no right-of-way for purposes listed under FLPMA (including railroads) shall be granted except under and subject to the provisions of FLPMA (see 43 U.S.C. Section 1770).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9681

The commenter disagrees with the Authority's conclusions that the project's permanent impacts will occur outside of the Angeles National Forest boundaries. The commenter also asserts that on Page 3.14-28 of the Draft EIR/EIS highlights the "permanent facility surface footprint(s)" within the ANF that would be required to be constructed as part of each of the Build Alternatives. The commenter also states the ANF and the SGMNM lie within the "California Floristic Province," an area designated by Conservation International as a Biodiversity Hotspot—an area where, "exceptional concentrations of endemic species are undergoing exceptional loss of habitat." The commenter notes these permanent facilities would include adit structures, electrical power lines, and, in several of the Build Alternatives, a temporary construction staging area. The Authority is proposing adits and construction staging areas to be located on private in-holdings within the Angeles National Forest and not on forest managed lands. The electrical power line would be located within the existing utility corridor along Little Tujunga Road on forest managed lands. Construction staging areas are also not considered permanent disturbance and would be returned to pre-disturbance conditions upon completion of the project (AG-IAMF#1). The project is largely within a tunnel through the ANF, SGMNM and areas where historic wildlife movement occurred. This eliminates the surface impacts to wildlife movement corridors. Placement of the adits, windows, and construction staging areas outside the ANF minimizes impacts to both mountain lion and black bear habitats. Black bear are listed as a game species by CDFW and population trends for this species includes a statewide increase in the population. The black bear is not listed as a sensitive species in California. While black bear habitat in California includes a diverse range of vegetation communities, the most dense populations occupy montane hardwood and chaparral forests with a diverse vegetative structure and food sources. Mountain lion habitat includes large areas of undisturbed habitat with connectivity to allow for individual dispersal and gene flow. The use of the private inholding with modified vegetation communities and reduced habitat quality is intended to avoid impacting higher quality mountain lion and black bear habitats and the endemic plants that define the biodiversity hotspot.

### 4494-9682

The commenter indicates that mountain lions and black bears may be disproportionately impacted by the project and states the opinion that the Authority has suggested individuals of these species will be relocated away from the project and that this is an unacceptable measure. The Build Alternative alignments within the boundaries of the ANF are in an underground tunnel. Mountain lion habitat within the Resource Study Area of all Build Alternatives is shown in Figure 3.7-25 of the Draft EIR/EIS and potential effects to mountain lion are discussed in Impact Bio#6 and project effects on wildlife movement corridors are discussed in Impact BIO#13. Wildlife corridor impermeability maps are shown in Figures 3.7-47 through 50. BIO-MM#77 and BIO-MM#83 (fencing), BIO-MM#78 (jump-outs), BIO-MM#96 (pre-construction survey), and BIO-MM#97 (compensatory mitigation) will ensure that the effects of construction and operation on mountain lion are avoided, minimized and mitigated. Relocation of mountain lion and black bears has not been proposed as part of the project or as a mitigation measure. Occupied mountain lion dens will have a no-disturbance buffer placed around them until dens are no longer active. While black bear are not a listed special status species, the bio IAMFs and MMs developed for other species will serve to minimize impacts to black bear.

### 4494-9683

The commenter asks about project features within land managed by USFS and whether new power lines would put condors at risk of electrocution. The Build Alternative alignments overlay a very small percentage of the species range and there is a lack of suitable condor nesting and roosting habitat proximal to the build alternative alignments (Section 3.7.5 and Figure 3.7-19 in the Draft EIR/EIS illustrates the portions of the build alignment alternatives that are within California Condor habitat). The majority of these areas coincide with the alignments being within a tunnel. The transmission lines would be constructed to follow existing disturbances including existing roadways. The addition of this utility corridor is not considered a substantial change over the existing condition in this particular geography. In addition, implementing BIO-IAMF#12 will ensure that the electrified components are bird and raptor safe. Implementation of BIO-MM#16, BIO-MM#71, BIO-MM#72, BIO-MM#73 will minimize the potential for other types of adverse impacts to California Condor.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9684

Refer to Standard Response PB-Response-N&V-5: Impacts of Spoils Hauling (Noise), PB-Response-TRA-2: Impacts of Tunnel Spoils Off-Haul/Deposition.

The commenter expresses concerns related to the transportation of spoils, including noise and vibration impacts that will occur near forest portal entries. The commenter also claims these portals will impact Forest Service land and the San Gabriel Mountains National Monument (SGMNM), both during construction and operation of the train.

As described in Standard Response PB-Response-TRA-2: Impacts of Tunnel Spoils Off-Haul/Deposition, the EIR/EIS discloses the traffic effects of construction period spoils hauling. In addition, please refer to Standard Response PB-Response-N&V-5: Impacts of Spoils Hauling (Noise), which discusses noise impacts from spoils hauling trucks throughout the Angeles National Forest (ANF). Tunnel construction would not result in noise impacts at the surface because of the depths of the tunnels beneath the ANF. Some portions of the Build Alternative alignments would entail surface construction activities (e.g., portals and construction of adits) within and immediately adjacent to the ANF, including the SGMNM. Construction activities would generate noise at the screening distances listed in Table 3.4-24 in Section 3.4, Noise and Vibration of the Draft EIR/EIS. Truck hauling of spoils from a portal location would not last for seven years as described by the commenter. For example, the duration of truck spoils hauling from Portal 4 (E2/E2A located in Lake View Terrace area) is anticipated to be 5.1 years (See Appendix 2.0-I of the Draft EIR/EIS). Construction activities within and adjacent to the ANF, including the SGMNM, would result in perceptible noise effects during construction activities. However, this does not represent an adverse effect because the USFS-managed lands adjacent to California HSR System facilities do not contain designated recreational areas (e.g., trails, and campgrounds) and as such are not considered noise sensitive. Surface construction activities may cause ground-borne vibration levels that range from 87 VdB to 94 VdB at 25 feet from construction activities. However, this does not represent an adverse effect because the USFS-managed lands adjacent to California HSR System facilities, for the same reason as noted above, do not contain designated recreational areas (e.g., trails, and campgrounds) and are not considered sensitive to vibration effects. Regarding noise at tunnel portals during train operation, this effect is discussed under Impact N&V#5 in the Draft EIR/EIS. It should be noted that the tunnel portal would consist of two tunnel portals, one for each track and

### 4494-9684

would be immediately adjacent to each other, hence a reference to "twin tunnel portal." However, there are no twin tunnel portals within 0.5 mile of each other as noted by the commenter.

Regarding train noise at tunnel portals, the analysis states the following: based on the current tunnel designs, it is anticipated that roughly half of the sound generated in the tunnel would pass out through the portal, and the other half would propagate into the interior of the tunnel. The effect would be a rapid rise in sound level as the train leaves the tunnel and portal, forewarned by a propagating wave ahead of the train. Depending on the shape of the portal, shape of the train nose, and blockage ratio, the rate of pressure rise may be substantial. The pressure wave front rate of rise is reduced by friction between the moving air column and tunnel wall, so that the pressure wave does not easily develop into a shock wave. This portal noise effect has been studied theoretically and experimentally and is well understood. Attenuation of the portal noise is achieved with long, flared portals and low blockage ratios. In-tunnel cross passages and vents can reduce pressure magnitudes and rates of rise, though passage of these vents may generate additional propagating and steepening wave fronts. These tunnel and tunnel portal design features will be used to attenuate any additional noise associated with a train entering or exiting a tunnel. As such train operations at the tunnel portals would have little effect on the Forest Service lands surrounding the portals. Regarding adits and other facilities to be located within the ANF, adits would be located within in-holdings (private property not for recreational use) near existing roadways within the ANF and utilities such as electricity and water needed for the project would be conveyed along existing utility corridors and roadways within the ANF. Portions of the ANF would experience perceptible vibration during construction activities at the adit locations within the ANF. However, there are no designated recreational areas, formal campgrounds, or other noise or vibration sensitive receivers located near the adits.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9685

The commenter expresses concern regarding how visual impacts are assessed within the context of the ANF and SGMNM, and specifically critiques the use of comparing potential impacts of the project to the total acreage of the Angeles National Forest (ANF). The commenter also asks what is the rationale for the conclusion that the proposed project will not result in a change of character to ANF lands in proximity to the proposed alignment.

The Authority's analysis of operations and maintenance of permanent HSR facilities does not solely rely on comparing the acreage impacted to the total acreage of the ANF; it is just one of several factors that were considered in the analysis. As discussed in Table 3.15-4 of the Draft EIR/EIS, the conclusion was also made based on the fact that these areas do not provide active recreation resources, are not open to the public, and are not publicly owned. Thus, the Authority analyzed impacts both globally on the ANF and locally on the areas specifically impacted.

As discussed in Section 3.15.6.3 of the Draft EIR/EIS, the Build Alternatives and the Preferred Alternative would have minimal surface features within the ANF. Construction staging areas (adits) would be located on private property within the Forest. Construction period truck traffic would use existing paved and Forest Service roads. Utilities (water and power) would be installed by following existing roads and utility corridors already present on the ANF. The Build Alternative alignments cross the ANF, including the SGMNM, in underground tunnels; consequently, operations would not cause noise or vibration impacts at the surface except at areas surrounding portals (see discussion on noise effect surrounding portals near the ANF in Section 3.4, Noise and Vibration of the Draft EIR/EIS). Permanent, non-adit, non-portal facilities would be limited to one small access building located on private in-holding (private property) within the ANF. Operations of permanent HSR facilities within the ANF, including adits and tunnel portals, could require occasional maintenance visits, but these activities would be limited, short in duration, and would not alter surrounding areas within the ANF, including the SGMNM. In conclusion, as discussed in Section 3.15.8 of the Draft EIR/EIS, NEPA Impacts Summary, with the inclusion of the applicable IAMFs and implementation of the mitigation measures identified in Section 3.15.7, all six Build Alternatives would avoid, minimize, reduce, or compensate for impacts on these resources.

### 4494-9686

The commenter asserts that applicable law and agency standards regarding the management of landscapes aims to maintain the character and integrity of unencumbered landscape and questions if the project would violate these standard. The Authority's evaluation of project consistency with USFS policies is contained in Appendix 3.1-B USFS Policy Consistency Analysis. As noted in the evaluation the Build Alternatives would be generally be underground within the ANF and SGMNM and would therefore have minimal visual effects on USFS land. Above-ground infrastructure would typically be located on private inholdings within the ANF and would therefore have limited visibility from public vantage points. Publicly accessible viewpoints from within the ANF towards areas outside of the ANF boundaries where the Build Alternatives would be visible are limited.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9687

The commenter inquires how compensation will be determined for the taking of public resources, like Hansen Dam Open Space, and how replacement of property acquisitions will be considered.

As discussed in Section 3.15.7, PR-MM#6 will return temporarily acquired land to the property owners after construction. PR-MM#7 and PR-MM#9 will require the Authority to consult with property owners and public agencies for the acquisition or easement of private and public lands. Compensation, replacement, or enhancement will be granted as deemed necessary. These mitigation measures will ensure that each resource acquired would be accessible during construction. If construction would result in a permanent loss, the Authority will provide necessary compensation. The Authority will provide compensation or land, or both, for all permanent acquisitions of property for HSR improvements from publicly owned parks, consistent with the requirements of the California Park Preservation Act of 1971. The California Park Preservation Act requires that the compensation or land, or both, for the taking of the park land and facilities be equal to one of the following:

- The cost of acquiring substitute park land of comparable characteristics, substantially equal size, and condition
- Substitute park land of comparable characteristics, substantially equal size, and condition
- Any combination of substitute park land and compensation in an amount sufficient to provide substitute park land of comparable characteristics, substantially equal size, and condition

The Authority will work with the jurisdictional agency to establish the specific conditions of acquisition and compensation for, or replacement or enhancement of, other park property for the land that would be procured. This process would apply to all public resources, including Hansen Dam Open Space. Until such time as it is determined whether or not replacement is the appropriate remedy, it cannot be known what replacement land might be considered. This determination would be made on a case-by-case basis.

With the implementation of the standards required by SOCIO-IAMF#2 and by PR-MM#6, PR-MM#7, and PR-MM#9, there would be no net loss of park, recreation, or open space

### 4494-9687

resources. The Authority will coordinate in advance with City of Los Angeles Department of Recreation and Parks (DRP) on any temporary or permanent impacts to DRP facilities associated with the Preferred Alternative. In Table 3.15-4, the EIR/EIS specifically analyzed impacts on the Hansen Dam Open Space associated with acquisition.

### 4494-9688

The commenter is concerned the Authority will not comply with local requirements, and specifically that the Project's impact on the Hansen Dam Open Space is inconsistent with Policy LU 6.3 of the Los Angeles County General Plan 2035. The Authority recognizes the importance and the spirit of the local policies, and it completed a thorough analysis of them. In Appendix 2.0-H, Regional and Local Policy Consistency Analysis, it recognized that, for all six Build Alternatives, the project is inconsistent with Policy LU 6.3. Nevertheless, the Authority believes that PR-MM#8 will advance that policy, in part, even if the Authority chooses a build alternative that is inconsistent with it. Related to the Hansen Dam Open Space, Table 3.15-4 presents the analysis of the alternatives and concluded that the Hansen Dam Open Space is outside the resource study area (RSA) which is defined as 1,000 feet from any above ground activity for the Refined SR14, SR14A, E1, and E1A Build Alternatives. Only the E2 and E2A Build Alternatives would impact the Hansen Dam Open Space. Table 3.15-4 recognizes that PR-MM#8 will maintain accessibility to park facilities or provide alternative access to ensure the park or recreation resources remain accessible. In accordance with PR-MM#8, the Authority will provide compensation for, or enhancement of, access driveways or parking areas at the recreation resource.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9689

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife.

The commenter inquires if the proposed Build Alternative alignments would violate Angeles National Forest Management Plan Section WL-1 or the "spirit" of WL-1. The EIR/EIS evaluates and discloses the effects noted in the comment and includes mitigation where significant impact and adverse effects have been identified. The Authority designed the Build Alternatives to avoid impacts on sensitive species not only within the ANF, but also outside the ANF. This design choice advances the spirit of WL-1, which, as discussed below, includes the implementation conservation strategies.

For information about the Palmdale to Burbank Project Section consistency with the Land Management Policy WL-1, see Appendix 3.1-B, USFS Policy Consistency Analysis. As discussed in Table 3.1-B-1 on page 3.1-B-9 therein, the applicable policies for WL-1 include the implementation of priority conservation strategies, and the use of vegetation management practices to reduce the intensity of fires to reduce habitat loss due to catastrophic fires. As noted in Table 3.1-B-1 on page 3.1-B-9, the Project would be consistent with both policies, as the Build Alternatives avoid significant wash and open space areas within the ANF in order to protect sensitive species. Where impacts cannot be avoided, the Authority has proposed mitigation measures to address impacts to special-status species. Implementation of BIO-MM#54 involves preparation and implementation of an Annual Vegetation Control Plan (VCP). The Authority will prepare a VCP to address vegetation removal for the purpose of maintaining clear areas around HSR facilities and reducing the risk of fire. These topics are further discussed in PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife.

### 4494-9690

Refer to Standard Response PB-Response-BIO-3: Wildlife Movement Corridors.

The commenter raises concerns about the emergence of the train through the portals at the border of the ANF and its continuation on an elevated viaduct across the Big Tujunga Wash being consistent with protecting National Forest values. The comment is referring to permanent facilities associated with the E2 and E2A Build Alternatives. All permanent infrastructure noted in the comment (portals, viaduct across the I-120 freeway and Big Tujunga wash) would be located outside the ANF boundary. The portals referred to in the comment would emerge outside the ANF boundary in an area that is already developed with urban/suburban uses (residential, commercial, schools) which already abut the ANF boundaries. There is also large electrical transmission facilities located throughout this portion of the ANF and its borders and the I-210 Freeway, an 8-10-lane freeway parallels to ANF through this area less than 0.5 miles to the south. Given the existing development and infrastructure present along the boundary of the ANF in this location, the HSR facilities that would be part of the E2 and E2A alternatives would not substantially change the current condition which consists of urban and suburban development and infrastructure in the areas immediately adjacent to the ANF.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9691

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, PB-Response-PR-2: Impacts on Big Tujunga Wash – Recreational Uses, Equestrian Use.

The commenter asserts that horses will not respond well to noise and visual impacts that would occur as a result of the project. The commenter inquires how noise and visual impacts to horses would be mitigated. The EIR/EIS evaluates and discloses the effects noted in the comment and includes mitigation where significant impact and adverse effects have been identified. This topic is further discussed in PB-Response-PR-2: Impacts on Big Tujunga Wash –Recreational Uses, Equestrian Use. The Horse Park referenced by the commenter is nearly 1 mile east of the proposed viaduct. The Horse Park is located on Wentworth Street which is a major 4-lane arterial and the I-210 freeway, an 8-10 lane freeway is located within 1/4 of a mile. It is also valid to note that equestrians and horses currently using trails in the Big Tujunga Wash area are already exposed to traffic and freeway noise from the roads and freeways noted above. See PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which addresses the potential for startle effects and mitigation measures set forth to reduce startle effects on hikers, domestic animals, and wildlife.

### 4494-9692

Refer to Standard Response PB-Response-PR-2: Impacts on Big Tujunga Wash – Recreational Uses, Equestrian Use.

The commenter asserts that noise and visual impacts to horses may result in safety concerns and questions how the Authority concludes that use of the resource would not decrease as a result. The EIR/EIS evaluates and discloses the effects noted in the comment and includes mitigation where significant impact and adverse effects have been identified. This topic is further discussed in PB-Response-PR-2: Impacts on Big Tujunga Wash –Recreational Uses, Equestrian Use. Existing equestrian use within the Big Tujunga wash is currently exposed to elevated noise and startle effects from existing roads and freeways which border this area. Wentworth street which is a major 4-lane arterial and the I-210 freeway, an 8-10 lane freeway parallel the Big Tujunga Wash to both the north and the south, about 1/2 mile apart. Residential development encroaches into this area along Cristy Avenue and Woldrich street. Horse owners that live south of the wash must ride/walk their horse along public roadways and then cross Wentworth Street (a 4 lane major arterial) to access the trails in question. As such, the horses and equestrians that use this area are already exposed to traffic noise and other noise and potential startle effects as the trails are surrounded by major transportation facilities, residential, commercial and industrial development. This is called a masking effect, which is defined as reduced perception of one sound due to the persistence of on-going ambient sound. Therefore, noise in this area is not anticipated to affect or startle horses given the existing ambient noise levels.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9693

Refer to Standard Response PB-Response-PR-2: Impacts on Big Tujunga Wash – Recreational Uses, Equestrian Use.

The commenter raises concerns about construction period effects on the Hansen Dam open space and asks what mitigation would be implemented to allow Hansen Dam Horse Park to continue to operate during the construction period.

As a matter of clarification, the Refined SR14, SR14A, E1, and E1A Build Alternatives would be located approximately 2 miles west of the Hansen Dam Horse Park. The E2 and E2A Build Alternatives would be located approximately 2,295 feet east of the Hansen Dam Horse Park and construction is expected to last 8.33 to 9.25 years, depending on the Build Alternative. Because specific equipment, methods and durations of construction activities cannot be fully defined in the EIR/EIS stage, NV-IAMF#1 requires the Authority's construction contractor to prepare a noise and vibration technical memorandum documenting how the Federal Transit Administration and Federal Railroad Administration guidelines for minimizing construction noise impacts will be employed when work is being conducted within 1,000 feet of sensitive receivers. Although NV-IAMF#1 would reduce construction noise, noise impacts would temporarily or periodically substantially increase ambient noise levels in the project vicinity above levels existing without the project. Mitigation Measure N&V-MM#1 (discussed in Section 3.4.7 of this Final EIR/EIS) will require the Authority's construction contractor to prepare a noise-monitoring program describing how the contractor will monitor construction noise to verify compliance with the noise limits. Given the distance of the Build Alternatives from the Hansen Dam Horse Park, as well as the mitigation that would be implemented, the Authority anticipates that Hansen Dam Horse Park can remain operational during construction of the HSR Palmdale to Burbank Project Section. Please refer to Standard Response PB-Response-PR-2: Impacts on Big Tujunga Wash –Recreational Uses, Equestrian Use.

### 4494-9694

The commenter asks about the safe harboring of birds at the Tujunga Ponds Wildlife Sanctuary (Sanctuary) during construction and operation of the HSR Palmdale to Burbank Section. The closest Build Alternative alignment is not immediately adjacent to the Sanctuary; instead, it is located approximately 1 mile west of the Sanctuary. Additionally, abundant other sources of noise and vibration generation and air quality or visual changes occur between the nearest Build Alternative alignment and Tujunga Ponds. The Sanctuary is located immediately adjacent to the existing I-210 freeway (an 8- to 10-lane elevated freeway). The existing Angeles National Golf Club lies to the east across the freeway and the City of Shadow Hills lies immediately to the west. Combined, these developments already exposes birds and other wildlife to potential impacts from noise, vibration, air quality, and visual conditions. Pursuant to the Endangered Species Act Section 7, the Authority prepared a Biological Assessment (BA) for the preferred alternative (SR14A Build Alternative). As part of the BA effects analysis, a noise analysis was completed that determined noise attenuates to less than 65 dBA (an acceptable dBA level for birds) at 1,900 feet from the viaduct section of the Preferred Alternative (SR14A) alignment crossing over the I-210, and noise attenuates near at-grade sections to less than 65 dBA at only 700 feet away. Given the distance of the Sanctuary from the closest Build Alternative alignment, construction and operation of any of the six HSR Build Alternatives would not be expected to further exacerbate the existing noise and vibration conditions at the Sanctuary, nor exacerbate conditions related to air quality or visual conditions. Therefore, the project would not result in an incremental increase in impacts that would deter birds or other wildlife from safe harboring at the Sanctuary. Professional ornithologists have been consulted on project impacts to birds and the Regional Consultants include professional ornithologists on staff. Mitigation relative to birds and other wildlife will be implemented as noted throughout Section 3.7, Biological and Aquatic Resources of the Final EIR/EIS, but the mitigation does not specifically apply to the Sanctuary because direct and indirect impacts from the HSR Palmdale to Burbank Section would not occur.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9695

The commenter requests information on measures the Authority will use to avoid and minimize the potential for avian collisions with trains, catenary systems, and other infrastructure elements. As described under Impact BIO#14, the Draft EIR/EIS describes that moving trains could kill or injure birds through bird strikes or through interactions with fencing and electrical systems. As required under BIO IAMF #12, the Authority has included design features to minimize avian train strike and electrocution, including, but not limited to the following:

- (1) Install perch deterrents such as pigeon wire to discourage birds from perching on the overhead catenary system throughout the rail system (as perching is one of the bird behaviors that makes birds most vulnerable to train strike)
- (2) Install fencing or flight diverter poles on all viaduct structures to encourage birds to fly up and over the rail (At-grade and embankment sections are already fenced)
- (3) Mark all lines in the catenary system so they have increased visibility to birds
- (4) Configure catenary system lines to reduce the vertical spread (and thus the spatial extent of collision risk)
- (5) Ensure sufficient spacing or covering of phase conductors to prevent bird electrocution.

In addition to these rail-wide measures, flight barriers such as fencing, pole barriers or a tubular screen will be placed to the height of the overhead catenary system in the following areas identified by the impact analysis in the Draft EIR/EIS for Palmdale to Burbank to avoid train strike and collision with the overhead catenary system in areas identified as having important avian resources:

- (a) Refined SR14/SR14A/E1/E1A/E2/E2A in the vicinity of Una Lake;
- (b) Refined SR14/SR14A at Agua Dulce Canyon, Bee Canyon, the Santa Clara River; crossing, and the Vulcan Mine;

### 4494-9695

(c) E1/E1A/E2/E2A at the Aliso Canyon Creek crossing; and

(d) E2/E2A at the Big Tujunga Wash crossing.

Lastly, the Authority notes that the commenter cites the work of Malo et al. (2017), extensively in their comments. The Authority has reviewed Malo et al. (2017), which generally addresses behavior as one of the primary factors for increasing risk, as well as the use of measures such as tubular screens and perching deterrents to minimize risk. The Authority concludes that the Draft EIR/EIS analysis is generally consistent with the source cited by the commenter, because it also considers bird behavior as a primary risk factor and has included sufficient design features and measures, including the use of screens and perching deterrents, as a method to reduce the potential impacts. Consequently, the Authority did not make any changes to the analysis or measures in the Draft EIR/EIS in response to this comment.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9696**

Commenter expresses concern related to the tranquility of the PCT during construction and whether there are any violations to the directive of the Monument Plan. Consistency with the San Gabriel Mountains National Monument Management Plan is analyzed in in Appendix 3.1-B under Table 3.1-B-3. As discussed in Table Appendix 3.1-B-3, San Gabriel Mountains National Monument Management Plan Policy Consistency Analysis, the Build Alternatives would not affect any active recreational resources (i.e., campgrounds, trails, etc.) or the management of such resources within the SGMNM, and therefore, would not conflict with Goal 1 under the Monument Plan related to sustainable recreation. In addition, temporary construction visual impacts would be addressed through AVQ-MM#1. As discussed in Section 3.16.6.4, temporary construction impacts, AVQ-MM#1 will require the contractor to implement measures to minimize construction-related disruption to aesthetics and visual quality, including activities such as minimizing pre-construction clearing, limiting building removal, post-construction regrading, and avoiding locating construction staging areas (CSAs) within 500 feet of existing residential neighborhoods, recreational areas, and other sensitive land uses. Furthermore, AVQ-MM#1 will require the preservation of existing vegetation where feasible that may screen views of construction activities, and require the regrading, re-contouring, and revegetation of areas disturbed by construction, staging, and storage. These measures will open up and minimize views of construction elements that may contribute to impacts to the natural and cultural environment regarding visual quality, and locate CSAs away from sensitive viewer groups, including travelers and users of recreational areas in the RSA. For the Refined SR14 Build Alternative, as noted in Section 3.15, Parks, Recreation, and Open Space, and Table 3.15-4, construction would temporarily increase dust and noise at the PCT, which could inhibit the use of the trail. Therefore, the Authority consulted with the Pacific Crest Trail Association, the Bureau of Land Management, and the USFS to develop a preliminary trail realignment that would be part of the Refined SR14 Build Alternative, if selected. Furthermore, IAMFs would reduce and avoid impacts related to dust and noise during construction (see Section 3.3, Air Quality and Global Climate Change, and Section 3.4, Noise and Vibration). Prior to construction, the contractor will prepare a fugitive dust control plan and a noise and vibration technical memorandum documenting the pertinent federal guidance for minimizing construction fugitive dust, noise, and vibration impacts. These measures would be applied when work is conducted within 1,000 feet of sensitive receivers, including the existing and proposed PCT realignment (AQ-IAMF#1 and NV-

### **4494-9696**

IAMF#1). The measures, developed as part of the construction plans, will ensure that temporary increases in dust, noise, and vibration would be reduced to a level that would allow the PCT extension to continue to operate. Staging areas would introduce major visual changes to the immediate surroundings with visually intrusive accumulations of stored material and equipment, but these impacts would only be temporary and the Authority would restore disturbed areas after construction. The PCT is outside of the RSA for SR14A, E1, E1A, E2, and E2A Build Alternatives. However, the following mitigation measures would be implemented for the construction of the E1, E1A, E2, and E2A Build Alternatives. PR-MM#1 through PR-MM#5 will be employed to reduce the effects of construction-related access, noise, vibration, air quality, and visual changes. PRMM#1 and PR-MM#2 will ensure that access to the PCT would remain unaffected by construction activities by providing alternative access routes to temporarily restricted park facilities and by ensuring that connectivity would remain after construction. PR-MM#3 will implement standard safety measures for detours, signage, and post-construction access. PR-MM#4 will set conditions for the temporary closure and/or detouring of existing trails. PR-MM#5 will set conditions to use land from park, recreation, and school play areas for temporary impact areas during the construction period.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9697

Commenter expresses concern related to construction impacts on the PCT and whether there are any violations to the directive of the Monument Plan. As noted in Section 3.15, Parks, Recreation, and Open Space, construction associated with the Refined SR14 Build Alternatives would temporarily increase dust and noise at the PCT, which could inhibit the use of the trail. Furthermore, IAMFs would reduce and avoid impacts related to dust and noise during construction (see Section 3.3, Air Quality and Global Climate Change, and Section 3.4, Noise and Vibration). Prior to construction, the contractor will prepare a fugitive dust control plan and a noise and vibration technical memorandum documenting the pertinent federal guidance for minimizing construction fugitive dust, noise, and vibration impacts. These measures would be applied when work is conducted within 1,000 feet of sensitive receivers, including the existing and proposed PCT realignment (AQ-IAMF#1 and NV-IAMF#1). The measures developed as part of the construction plans will ensure that temporary increases in dust, noise, and vibration would be reduced to a level that would allow the PCT extension to continue to operate. The PCT is outside of the RSA for SR14A, E1, E1A, E2, and E2A Build Alternatives. However, the following mitigation measures would be implemented for the construction of the E1, E1A, E2, and E2A Build Alternatives. PR-MM#1 through PR-MM#5 will be employed to reduce the effects of construction-related access, noise, vibration, air quality, and visual changes. PRMM#1 and PR-MM#2 will ensure that access to the PCT would remain unaffected by construction activities by providing alternative access routes to temporarily restricted park facilities and by ensuring that connectivity would remain after construction. PR-MM#3 will implement standard safety measures for detours, signage, and post-construction access. PR-MM#4 will set conditions for the temporary closure and/or detouring of existing trails. PR-MM#5 will set conditions to use land from park, recreation, and school play areas for temporary impact areas during the construction period.

### 4494-9698

Commenter inquires if the construction staging area of the Pacific Crest Trail will violate the letter or spirit of the Monument Plan. The effects of concern cited by the commenter would arise solely for the Refined SR14 Build Alternative and are disclosed in Table 3.15-4 in Section 3.15, Parks, Recreation, and Open Space. The Authority's Preferred Alternative is SR14A which avoids impacts to the PCT, both during construction and operation, by being underground through this area. The PCT is outside the SR14A, E1, E1A, E2, and E2A Build Alternatives' RSAs. Therefore, if the Authority chooses Build Alternatives SR14A, E1, E1A, E2, or E2A, the Project would not raise any of the issues the commenter identified.

The Refined SR14 Build Alternative could have temporary and permanent improvements that would directly conflict with the PCT. The portion of the PCT that would be affected is not located within the Monument. However, the Authority has consulted with the Pacific Crest Trail Association, the Bureau of Land Management, and the USFS regarding trail realignment options and has developed a preliminary trail realignment that would be part of the Refined SR14 Build Alternative, if selected. The realignment would be built and accessible to the public before construction of the Refined SR14 Build Alternatives begins, so the Authority could ensure continuous access to the PCT through the Refined SR14 Build Alternative construction footprint.

The proposed realignment has been designed to minimize visual impacts on users of the PCT by routing trail uses away from both the SR 14 freeway and the HSR rail alignment as quickly as possible. This may be an overall benefit to trail users as the existing trail runs parallel to the east side of the SR 14 freeway for roughly 0.75 mile before heading further east. Therefore, operations and maintenance of the Refined SR14 Build Alternatives would not result in adverse changes to the character of this recreation resource or reduce its capacity or value in the long term and could result in beneficial effects for PCT users.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9699

Commenter inquires how construction staging areas near the Pacific Crest Trail protect scenic integrity per ANF Forest-specific Design Criteria ANF S1, which requires the Forest Service to "protect scenic integrity of foreground views as well as from designated viewpoints" for the Pacific Crest Trail. The concerns raised by the commenter would be related to the Refined SR14 Build Alternative and are disclosed in the EIR/EIS. The Authority has consulted with the Pacific Crest Trail Association, the Bureau of Land Management, and the USFS regarding trail realignment options and has developed a preliminary trail realignment that would be part of the Refined SR14 Build Alternative, if selected. The realignment would be built and accessible to the public before construction of the Refined SR14 Build Alternative begins to ensure continuous access to the PCT through the Refined SR14 Build Alternative's construction footprint (see Figure 3.15-17). The proposed realignment has been designed to minimize visual impacts on users of the PCT by routing trail uses away from both the SR 14 freeway and the HSR rail alignment as quickly as possible. This may be an overall benefit to trail users as the existing trail runs parallel to the east side of the SR 14 freeway for roughly 0.75 mile before heading further east. Therefore, because that realignment would result in keeping the construction staging areas out of the PCT foreground views, the proposed, realigned trail would accord with Design Criteria ANF S1. The Authority's Preferred Alternative is SR14A, which avoids impacts both during construction and operation to the PCT by being underground through this area. The PCT is outside the E1, E1A, E2, and E2A Build Alternatives' RSAs.

### 4494-9700

The commenter expresses concerns related to the impacts on the Rim of the Valley trail extension and its compliance with ANF Forest-specific Design Criteria ANF S1, which states, "Pacific Crest Trail - Protect scenic integrity of foreground views as well as from designated viewpoints."

ANF S1 by its terms only applies to the Pacific Crest Trail, so it does not apply to the Rim of the Valley trail. Nevertheless, the Authority has analyzed the impacts on the Rim of the Valley Trail. Physical construction impacts on the Rim of the Valley Trail and the impacts on the trail's viewshed would occur if either adit location SR14-A2 or SR14-A3 were selected. Adit location SR14 - A1 would avoid this impact. With regard to the Rim of the Valley Trail, the EIR/EIS includes the following mitigation measures to reduce construction impacts from the Refined SR14, SR14A, E2, and E2A Build Alternatives. PR-MM#6 will return temporarily acquired land to the property owners after construction. PR-MM#7 and PR-MM#9 will require the Authority to consult with property owners and public agencies for the acquisition or easement of private and public lands. Compensation, replacement, or enhancement would be granted as deemed necessary. If the Authority chooses one of those build alternatives, these mitigation measures will ensure access to the Rim of the Valley Trail Extension during construction. If construction would result in a permanent loss, the Authority will provide necessary compensation. With the implementation of the standards required by PR-MM#6, PR-MM#7, and PR-MM#9, there would be no net loss of park, recreation, or open space resources. The EIR/EIS concludes there would be a less-than-significant impact with the implementation of PR-MM#6, PR-MM#7, and PR-MM#9 under the Refined SR14, SR14A, E2, and E2A Build Alternatives. The EIR/EIS recognizes that construction associated with the Refined SR14, SR14A, E2, and E2A Build Alternatives would temporarily increase dust and noise at the proposed Rim of the Valley Trail extension, which would inhibit use of the trail. Additionally, Rim of the Valley Trail users would have unobstructed views of the construction activities. Staging areas would introduce major visual changes to the immediate surroundings with visually intrusive accumulations of stored material and equipment. However, these impacts would be temporary and disturbed areas would be remediated after completion of construction. There would be no impact under the E1 and E1A Build Alternatives.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9701

Commenter expresses concerns related to the impacts of construction on the Rim of the Valley trail extension. The effects cited in the comment relative to the Rim of the Valley trail extension would occur if either adit location SR14-A2 or SR14-A3 were selected. Adit location SR14 - A1 would avoid this impact. The EIR/EIS discloses that the Refined SR14, SR14A, E2 and E2A Build Alternatives would require temporary construction staging areas that would directly conflict with the proposed Rim of the Valley Trail extension (see Impact PK#1) and would temporarily create a barrier for access or inhibit use of the trail. Construction associated with the Refined SR14 and SR14A Build Alternatives would temporarily increase dust and noise at the proposed Rim of the Valley Trail extension, which would inhibit use of the trail. However, IAMFs incorporated into the construction methods will control dust and noise during construction (see Section 3.3, Air Quality and Global Climate Change, and Section 3.4, Noise and Vibration). Prior to construction, the contractor will prepare a fugitive dust control plan and a noise and vibration technical memorandum documenting the pertinent federal guidance for controlling construction fugitive dust, noise, and vibration effects. These IAMFs will be applied when work is conducted within 1,000 feet of sensitive receivers, including the proposed Rim of the Valley Trail extension (AQ-IAMF#1 and NV-IAMF#1). The measures developed as part of the construction plans will ensure that temporary increases in dust, noise, and vibration would be reduced to a level that would allow the trail extension to continue to operate. Rim of the Valley Trail users would have unobstructed views of the construction activities. Staging areas would introduce major visual changes to the immediate surroundings with visually intrusive accumulations of stored material and equipment. However, these impacts would be temporary and disturbed areas would be remediated after completion of construction. If the proposed Rim of the Valley Trail extension is not operational at the time of project construction, there would be no temporary access, noise, vibration, air quality, or visual changes associated with the Refined SR14 and SR14A Build Alternatives. The following mitigation measures would be implemented for the construction of the Refined SR14, SR14A, E2, and E2A Build Alternatives. PR-MM#1 through PR-MM#5 will be employed to reduce the effects of construction-related access, noise, vibration, air quality, and visual changes. PR-MM#1 and PR-MM#2 will ensure that access to Rim of the Valley Trail would remain unaffected by construction activities by providing alternative access routes to temporarily restricted park facilities and by ensuring that connectivity would remain after construction. PR-MM#3 will implement standard safety measures for

### 4494-9701

detours, signage, and post-construction access. PR-MM#4 will set conditions for the temporary closure and/or detouring of existing trails. PR-MM#5 will set conditions to use land from park, recreation, and school play areas for temporary impact areas during the construction period.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9702

The commenter asked how compensation for public resources, specifically the Rim of the Valley Trail, is determined.

As described in Section 3.15.7 in Section 3.15, Parks, Recreation, and Open Space, of the Draft EIR/EIS, PR-MM#7 and PR-MM#9 would require the Authority to consult with property owners and public agencies for the acquisition or easement of parks, recreation resources, and trails. Compensation would be provided in accordance with the Uniform Act and the California Park Preservation Act. As described in page 3.15-177 of the Draft EIR/EIS, the California Park Preservation Act requires that the compensation or land, or both, for the taking of the park land and facilities be equal to one of the following: the cost of acquiring substitute park land of comparable characteristics, substantially equal size, and condition; substitute park land of comparable characteristics, substantially equal size, and condition; or any combination of substitute park land and compensation in an amount sufficient to provide substitute park land of comparable characteristics, substantially equal size, and condition.

As discussed in Section 3.15 of the Draft EIR/EIS, the Rim of the Valley Trail is a proposed trail extension. The E1 and E1A Build Alternatives would have no impact on the proposed Rim of the Valley Trail extension. An approximately 330-foot segment of the proposed Rim of the Valley Trail extension would be used as a construction staging area under the Refined SR14 and SR14A Build Alternatives, and an approximately 400-foot segment of the proposed Rim of the Valley Trail extension would be used as a construction staging area under the E2 and E2A Build Alternatives. There would be no effect on the trail if the project is constructed before the trail extension is built and opened to the public. However, if the trail extension is built prior to construction of the Refined SR14, SR14A, E2, or E2A Build Alternatives, temporary relocation of the trail may be necessary. As required by PR-MM#6, the Authority would return temporarily acquired land to the property owner in its original or better condition after construction is completed. Given that the proposed trail extension does not currently exist, the Refined SR14, SR14A, E2, and E2A Build Alternatives would not result in permanent acquisition of the proposed Rim of the Valley Trail extension; therefore, no compensation would need to be provided.

### 4494-9703

Refer to Standard Response PB-Response-GEN-4: General Opinions, Opposition or Support.

The commenter summarizes and provides a conclusion to prior comments presented, expresses concern with cumulative impacts to park and recreational areas, and expresses support for the No Project Alternative. The commenter contends that the Authority diluted the impacts by comparing them to the entire acreage of the Angeles National Forest.

Contrary to the commenter's suggestion, the Authority's analysis of operations and maintenance of permanent HSR facilities does not solely rely on comparing the acreage impacted to the total acreage of the ANF. As discussed in Table 3.15-4 in Section 3.15, Parks, Recreation, and Open Space of the Draft EIR/EIS, the conclusion was also made based on the fact that the impacted areas do not provide active recreation resources and do not provide public access, among other factors. The Authority analyzed impacts both globally on the ANF and locally on the areas specifically impacted. The comment is accurate in its statement that a total of 28 parks, recreation areas, and open space resources could be impacted by the project. This is the total number of resources within the resource study area (RSA) for all Build Alternatives. The Authority will select and only build one alternative between Palmdale and Burbank. State and local regulations typically require adequate compensation for impacts on most parks, recreation, and open space resources within the RSA. However, increased population and development near the ANF, including SGMNM, could increase usage beyond the current capacity of this recreational resource. This represents a significant cumulative impact. However, the Build Alternatives would not contribute considerably to this cumulative impact because the Build Alternatives would not affect the character or usage of recreational areas within the ANF, including SGMNM.

As discussed in Section 3.15.8, NEPA Impacts Summary, with the inclusion of the applicable IAMFs and implementation of the mitigation measures identified in Section 3.15.7, all six Build Alternatives would avoid, minimize, reduce, or compensate for impacts on these resources. Furthermore, as discussed in Section 7.2, Public Benefits of the High-Speed Rail System to Los Angeles County, the California HSR System would provide a number of public benefits, including increasing mobility options, contributing to a cleaner environment, stimulating economic activity and creating jobs,

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9703

minimizing open space conversion, and improving safety and security. Project benefits are further described in PB-Response-GEN-4, General Opinions, Opposition or Support. The Authority, as the CEQA lead agency, will have to weigh these and other benefits of the project against identified environmental impacts pursuant to CEQA Guidelines Section 15093.

### 4494-9704

The commenter asks whether, in the counterfactual situation that the Authority had followed the July 16, 2020, NEPA regulations (effective September 14, 2020) instead of the NEPA regulations in effect before that, whether the Authority would have modified the analysis or the project route in a "drastic[]" way. To be clear, the Council on Environmental Quality (CEQ) updated the regulations again on April 20, 2022. Those regulations restored several provisions that were in effect decades before the 2020 modifications. As described in Footnote 1 in Section 3.16.4.5 of this Draft EIR/EIS, this project was initiated before September 14, 2020, and is therefore not subject to the new NEPA regulations, which is why the prior version was used for this analysis. Regardless of the regulations in place, NEPA could not conceivably have required any "rerout[ing]" of the project. NEPA requires only procedures and not substantive changes to a project. Although the comment speculates that some regulation may have required different analyses, it does not identify a particular regulation change that could have required a particular, different analysis. In any event, the NEPA regulations do not require the analysis under every set of NEPA regulations that the commenter raises.

### 4494-9705

The commenter expresses concerns with the access roads to tunnel portals including if the roads are paved and the impacts from installation of the roads.

As discussed in Section 2.3.5.3 of this Final EIR/EIS, access roads to provide emergency and maintenance access from public roadways to HSR facilities would be required. Access roads would be constructed at traction powered substations (TPSSs) (Section 2.3.7.1) and at portal facilities as listed in Section 2.5.3. Access roads within the HSR right-of-way would be paved, with a minimum width of 22 feet. Access roads within the HSR right-of-way would be restricted to use by authorized HSR personnel and emergency responders. Use would be unrestricted from public roads to the HSR right-of-way. All parcels would have roadway access or would be acquired if access to the parcel cannot reasonably be otherwise provided. For more detail on right-of-way acquisitions, see Section 3.12, Socioeconomics and Communities. Section 2.5.3 of this Final EIR/EIS provides locations and construction requirements for access roads for each of the six Build Alternatives. Additionally, Volume 3 PEPD Record Set Roadway and Grade Separation Plans show the plans, profiles, and typical sections for access road planned in the Palmdale to Burbank Project Section.

As described in Section 3.2.6.3, impacts to access roads were evaluated under Impact TRA#2 and shown in Table 3.2-23 through Table 3.2-25. Spoils hauling would degrade intersection LOS to E or F and increase vehicle delay. TR-IAMF#2, TR-IAMF#6, and TR-IAMF#7 (discussed in Section 3.2.4.2) will implement a Construction Transportation Plan (CTP), limit spoils hauling hours, and establish spoils hauling routes to minimize intersection impacts during spoils hauling. Additionally, TR-MM#12 (discussed in Section 3.2.7) will require the development of a Construction Management Plan (CMP) to address traffic circulation during spoils hauling activities, including by relocating spoils collection areas and access to minimize delays during peak hours. The CMP (TR-MM#12) is anticipated to be effective in reducing impacts associated with spoils hauling traffic. The Authority would also add traffic signals to affected unsignalized intersections to improve LOS and intersection operation. While these traffic measures are anticipated to achieve adequate LOS and decrease vehicle delay at affected intersections, impacts during spoils hauling may still occur.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9706

The commenter expressed concerns about lighting from construction and operation of the Palmdale to Burbank Project Section.

As noted in Impact AVQ#2 of this Final EIR/EIS, construction light and glare would be an impact to viewers in Landscape Unit 1 and Landscape Unit 2, reducing the visual quality rating by one or more levels depending upon the setting. Implementation of AVQ-MM#2 will require nighttime construction lighting to be shielded and directed downward to minimize light that falls outside the construction site boundaries. The contractor will be required to prepare a technical memorandum prior to construction verifying how nighttime lighting would be shielded and directed downward to reduce impacts. Shielding nighttime construction lighting would minimize the light and glare within developed areas at nighttime.

As discussed in Table 3.16-13, train lighting from HSR train headlights would be temporary and directed along the guideway, which should not cause glare that would affect nighttime views. If not properly designed and shielded, project-related lighting could create glare, increase the ambient light levels in nearby areas, and increase skyglow, which can adversely affect nighttime star viewing. This would be true during construction and operations of the California HSR System, where design-related measures, such as shielding and directing lights, would be used where appropriate to reduce glare while providing adequate lighting for safety and security.

Impact AVQ#5 of this Final EIR/EIS notes that operational lighting associated with maintenance and security would be minimal.

### 4494-9707

The commenter inquired as to the cleanliness and maintenance of potential transparent materials used in sound walls implemented as part of the project. As discussed in Mitigation Measure N&V-MM#3, maintenance of noise barriers would be considered in the determination and selection of noise barrier materials. Additionally, the Authority would be responsible for the maintenance of all project infrastructure, including the maintenance of noise barriers.

### 4494-9708

The commenter asks where the Traction Power Substations (TPSSs) would be located, how the public can ascertain impacts related to TPSSs if locations are unknown, and which properties would be acquired for TPSS locations. Section 2.5.3, High-Speed Rail Build Alternatives - Detailed Description in Chapter 2, Alternatives of the Draft EIR/EIS, describes the location of each TPSS, which would be built under each Build Alternative. Specific TPSS locations are provided in Draft EIR/EIS Figure 2-48 through Figure 2-52 for the Refined SR14 Build Alternative, Figure 2-56 through 2-60 for the SR14A Build Alternative, Figure 2-62 through 2-65 for the E1 Build Alternative, Figure 2-67 through 2-70 for the E1A Build Alternative, Figure 2-72 through 2-75 for the E2 Build Alternative, and Figure 2-77 through 2-80 for the E2A Build Alternative. Draft EIR/EIS Volume 3 consists of the Preliminary Engineering for Project Definition (PEPD) plans. TPSS locations of all Build Alternatives are also detailed within two PEPD documents, both titled Railway Systems Plan. Because the locations of TPSSs are known and included within the project footprint, impacts associated with them are disclosed and described within the Draft EIR/EIS. Please refer to the Authority's web-based interactive map that identifies property acquisitions associated with SR14A Build Alternative: <https://geografika.maps.arcgis.com/apps/MapJournal/index.html?appid=ccac46af003e4a2da4528b2a7595141b>.

### 4494-9709

The commenter inquires about the location of switching stations. The locations for switching stations are described for each Build Alternative in Section 2.5.3 of the Draft EIR/EIS. Switching stations are encompassed in the project footprint used to analyze impacts.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9710**

The commenter asks about the location of communication towers, how the public can ascertain impacts related to communication towers if locations are unknown, and which properties would be acquired for communication towers. The commenter further asks whether communication towers would be located near Burbank Airport, expresses concern regarding interference with airport operations, asks whether the Authority has contacted Burbank Airport regarding possible interference, and what the airport's response is.

All open-air Traction Power Facilities and Tunnel Portals would include a 100-foot communication tower inside the project footprint. Locations for communication towers are described for each Build Alternative in Section 2.5.3, High Speed Rail Build Alternatives –Detailed Description in Chapter 2, Alternatives of the Draft EIR/EIS. Specific communication tower locations are provided in Draft EIR/EIS Figure 2-48 through Figure 2-52 for the Refined SR14 Built Alternative, Figure 2-56 through 2-60 for the SR14A Build Alternative, Figure 2-62 through 2-65 for the E1 Build Alternative, Figure 2-67 through 2-70 for the E1A Build Alternative, Figure 2-72 through 2-75 for the E2 Build Alternative, and Figure 2-77 through 2-80 for the E2A Build Alternative. Because the locations of communication towers are known and included within the project footprint, impacts associated with them, including any impacts to communities are disclosed and described within the Draft EIR/EIS. Appendix 3.1-A Palmdale to Burbank: Footprint Mapbook, of the Draft EIR/EIS includes detailed maps of the project footprint, and depicts the parcels (including their APNs) that would be needed temporarily and permanently for the HSR Palmdale to Burbank Section. In addition, please refer to the Authority's web-based interactive map that identifies property acquisitions associated with the SR14A Build Alternative:  
<https://geografika.maps.arcgis.com/apps/MapJournal/index.html?appid=ccac46af003e4a2da4528b2a7595141b>.

Figures 2-60, 2-65, 2-70, 2-75, and 2-80 provide the locations for the communication towers closest to the Burbank Airport. In Section 3.11.6 of the Draft EIR/EIS, potential safety hazards to aviation including development of land uses that are inconsistent with airport operations are addressed under Impact S&S#9 Permanent Interference with Airport Safety, which concludes that the Palmdale to Burbank Project Section would not substantially increase hazards as a result of being adjacent to an airport or within the

### **4494-9710**

boundary of an adopted airport land use plan and would not expose people residing or working in the project area to a safety hazard in the vicinity of an airport or private airstrip. Project design includes incorporation of SS-IAMF#6 Stakeholder Coordination for the Hollywood Burbank Airport which describes the Authority's commitment to continuing coordination among the Authority, the FAA, and the Burbank-Glendale-Pasadena Airport Authority including, but not limited to, the topic of avoiding conflicts with airport operations.

### **4494-9711**

The commenter expresses concern with the visual impacts associated with spoils hauling and provides suggestions for the Vulcan and Boulevard Mines once spoils hauling is completed.

As discussed in Section 3.16.10.2 of this Final EIR/EIS, upon the completion of mining activities at Vulcan Mine, the leaseholders will be responsible for restoring the mine site consistent with Surface Mining and Reclamation Act regulations and requirements, which would be anticipated to enhance visual harmony at the site relative to existing conditions, constituting a beneficial change in visual quality to the area.

Additionally, as discussed in Section 2.9.5.3 and Section 3.2.6 of this Final EIR/EIS, spoils hauling would occur during construction and lasting for up to 6.4 years, depending on the location and the Build Alternative. While the project would involve the placement of material at both the Vulcan and the Boulevard mine sites, the amount of material would not completely fill either site.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9712

The commenter asks how the Authority will mitigate the HSR's impacts on Pacific Crest Trail scenic views of the Vasquez Rocks. Only the Refined SR14 Build Alternative would have that effect. In Section 3.16.6.5, the EIR/EIS discloses this visual effect on the trail by stating that implementation of the Refined SR14 Build Alternative would change visual quality from high to moderate. Therefore, the Refined SR14 alternative would substantially degrade the existing visual character or quality of public views of the site and its surroundings in a non-urbanized area. Mitigation Measures AVQ-MM#3 and AVQ-MM#4, as described in Section 3.16.7, are required to reduce impacts. These measures will incorporate local design and aesthetic preferences into the design of the viaduct and require landscape treatments to screen the elevated guideway. Implementation of these measures would reduce the prominence of the elevated alignment. However, after mitigation, this impact would remain significant and unavoidable for the Refined SR14 Build Alternative. For contrast, the Authority's Preferred Alternative, SR14A, travels underground through this area and thereby avoids impacts both during construction and operation to the PCT. The commenter also asks what comments the Pacific Crest Trail Association has made on this impact. The Authority is including that comment letter and the Authority's response with these responses to comment.

### 4494-9713

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter asks where mature trees would be sourced from, and the source of the water required to irrigate them. The commenter quotes a requirement in Mitigation Measure AVQ-MM#4, which can be found on pages 3.16-82 and 3.16-83 in Section 3.16, Aesthetics and Visual Quality in the Draft EIR/EIS.

Mitigation Measure AVQ-MM#4 does not state that the Authority will plant mature trees; it requires the Authority's Contractor to plant 8-foot-tall trees that later would mature. As required in AVQ-MM#4, trees will be selected in part based on their drought tolerance. At this time, the location and quantity of trees to be planted to mitigate visual effects has not been determined. Future landscaping plans will include irrigation plans as well as identification of the source of water for irrigation. Typically, water for irrigation of landscape plantings is obtained from the water district/agency serving the specific location. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides additional information about the water districts/agencies that provide water service within the project section.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9714

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter is concerned about visual and noise impacts to Big Tujunga Wash, which is utilized for recreational purposes, including equestrian activities, and provides habitat. The effects cited in the comment and described in Section 3.16 of the Draft EIR/EIS would occur with the E2 and E2A Build Alternative alignments.

As described under Impact AVQ#4 in Section 3.16 of the Draft EIR/EIS, implementation of the E2 and E2A Build Alternatives would introduce project elements that would be highly visible and would contrast with the natural harmony of the view at KVP 1.22: Lake View Terrace, and the Big Tujunga Wash area. Mitigation Measures AVQ-MM#4, AVQ-MM#5, and AVQ-MM#6 would reduce impacts on visual quality by requiring landscape screening adjacent to residential areas, landscape treatments along the HSR embankment, and planting vegetation within land acquired for the E2 and E2A Build Alternatives not used for HSR or related supporting infrastructure. While implementation of these measures would reduce the prominence of the HSR embankment and project features, this impact would remain significant and unavoidable for the E2 and E2A Build Alternatives.

However, the Authority's Preferred Alternative is the SR14A Build Alternative, which would avoid crossing Big Tujunga Wash in the area of concern noted by the commenter. Regarding noise impacts, please refer to PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which discusses impacts to wildlife and equestrian animals from noise, including effects on production and breeding and animal responses to startle.

### 4494-9715

The commenter points out that the Existing View depicted in Figure 3.16-A-30, Key Viewpoint 2.1: San Fernando Road, does not account for the newly built Avion complex. This comment relates to the visual analysis of the Burbank Airport Station, located at the southern end of the Palmdale to Burbank Project Section, which was evaluated as part of the Burbank to Los Angeles Project Section.

The Burbank to Los Angeles Project Section Final EIR/EIS was released on November 5, 2021. The Authority's Board approved the Burbank to Los Angeles Project Section Preferred Alternative, including the Burbank Airport Station, on January 20, 2022. The information and analysis within this Final EIR/EIS about the Burbank Airport Station overlap area should be understood as informational and for reference only. For the most updated information about the Burbank Airport Station approved by the Authority, please refer to the Burbank to Los Angeles Final EIR/EIS, available on the Authority's website.

The Authority is aware the site has been developed with the Avion complex since the visual analysis and simulation was prepared. While the visual setting has changed, the project's impact and resulting visual quality with implementation of the Build Alternatives as present in the Draft EIR/EIS remains accurate, as the project would remove the Avion development and replace it with the HSR station as depicted in the visual simulation.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9716

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding.

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding and PB-Response-SOCIO-1: Parcel Acquisitions and Relocations. The commenter inquires about demolition of the Avion Burbank project and the costs associated with it. The footprint of the Avion Burbank development overlaps with the Burbank Airport Station footprint, specifically the station's platform configuration options. The Burbank Airport Station would remove the Avion Burbank development. The Final EIR/EIS, specifically the Summary, Chapter 2, Section 3.2, Section 3.12, and Section 3.13, has been revised to reflect additional information related to and current status of the Avion Burbank development. Please refer to PB-Response-GEN-2: Project Costs and Funding which discusses the availability of funding for construction of the project and PB-Response-SOCIO-1: Parcel Acquisitions and Relocations which discusses the need for and process related to property acquisitions and relocations. The Burbank Airport Station, which is located at the southern end of the Palmdale to Burbank Project Section, was evaluated as part of the Burbank to Los Angeles Project Section. The Burbank to Los Angeles Project Section Final EIR/EIS was released on November 5, 2021. The Authority's Board approved the Burbank to Los Angeles Project Section Preferred Alternative, including the Burbank Airport Station on January 20, 2022. The information and analysis within this Final EIR/EIS about the Burbank Airport Station overlap area should be understood as informational and for reference only. For the most updated information about the Burbank Airport Station approved by the Authority, please refer to the Burbank to Los Angeles Final EIR/EIS, available on the Authority's website.

### 4494-9717

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter refers to Draft EIR/EIS Appendix 3.16-A: Photographs of the Existing Conditions and Visual Simulations with the Project and to Vol 3: PEPD Record Set REV01, Burbank Station Area Plans, and notes that the Existing View depicted in Figure 3.16-A-30a of Section 3.16, Aesthetics and Visual Quality of the Draft EIR/EIS does not account for the newly built Avion Burbank complex. As discussed in more detail below, the Notice of Preparation of the Draft EIR for the Avion Burbank Project had not been published at the time studies were initiated in 2015 for the HSR Palmdale to Burbank Project Section; therefore, the project was not considered reasonably foreseeable at that time. The baseline photograph in Figure 3.16-A-30a depicts conditions in 2015 and is consistent with the baseline analysis year identified in Section 3.1, Introduction of the Draft EIR/EIS. The commenter asserts that the Draft EIR/EIS does not comply with CEQA because it does not disclose the potential environmental impacts associated with Avion Burbank complex demolition, including air quality, hazardous materials, and socioeconomics. The Authority acknowledges that the Avion Burbank Project is now fully entitled and constructed. The Authority's goal is to integrate the Burbank Airport Station into the larger development in a mutually beneficial way, where the station enhances the development, even if some structures are displaced or changed. Any property that needs to be acquired from the Avion Burbank Project by the Authority will be done so in accordance with impact avoidance and minimization feature SOCIO-IAMF#2, which requires compliance with the Uniform Relocation and Real Property Acquisitions Policy Act.

The commenter asks where the Authority will dispose of the building spoils from demolition of the Avion Burbank complex. The area occupied by the Avion Burbank complex was evaluated in the Burbank to Los Angeles Project Section Final EIR/EIS. As shown in Table 3.6-7 of the Burbank to Los Angeles Project Section Final EIR/EIS and discussed under Impact PUE #6, there are five active landfills in the vicinity of the Burbank to Los Angeles Project Section that accept construction and demolition (C&D) material. It is estimated that the total volume of C&D material for the Burbank to Los Angeles Project Section would be approximately 77,137 cubic yards before recycling (approximately 0.06 percent of the total remaining capacity of the five active landfills that

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9717

accept C&D material). After diversion, C&D material would occupy 0.03 percent of the total remaining capacity of the active landfills. The footprint of the Avion Burbank complex overlaps with the Burbank Airport Station footprint, specifically the station's platform configuration options. Although the setting has changed, the project's impact with implementation of the Build Alternatives as presented in the Draft EIR/EIS remains accurate as the project would displace the Avion Burbank complex and construct the HSR station in that location as depicted in the visual simulation in Figure 3.16-A-30b of the Palmdale to Burbank Project Section Draft EIR/EIS.

Section 3.6, Public Utilities and Energy, of the Palmdale to Burbank Draft EIR/EIS shows landfill capacity in Table 3.6-15 and effects from solid waste generation during construction in Impact PUE#5, which considers solid waste disposal broadly for the whole Palmdale to Burbank Project Section and explains the Authority's policy of recycling 100 percent of steel and concrete and 75 percent of construction waste. The Palmdale to Burbank Final EIR/EIS, specifically Chapter 2, Section 3.2, Section 3.12, and Section 3.13, has been revised to reflect additional information related to and the current status of the Avion Burbank complex. Additionally, the Burbank Airport Station, which is located at the southern end of the Palmdale to Burbank Project Section, was evaluated as part of the Burbank to Los Angeles Project Section. The Burbank to Los Angeles Project Section Final EIR/EIS was released on November 5, 2021. The Authority's Board approved the Burbank to Los Angeles Project Section Preferred Alternative, including the Burbank Airport Station on January 20, 2022. The information and analysis within this Final EIR/EIS about the Burbank Airport Station overlap area should be understood as informational and for reference only. Please refer to the Burbank to Los Angeles Final EIR/EIS, available on the Authority's website.

### 4494-9718

The commenter refers to Appendix 2-I Spoils Disposal Assumptions used for Environmental Analysis, specifically related to spoils proposed for removal from Portal 10-Spreading Grounds related to the Refined SR14 Build Alternative. The commenter quotes portions of the potential off-hauling scenario for this location as described on Draft EIR/EIS page 2.0-I-3. The commenter inquires what happens to the contamination removed from spoils, whether a local vendor will conduct decontamination, or whether a local vendor will have to be created. The topic of hazardous material decontamination is addressed in Draft EIR/EIS Chapter 3.10, Hazardous Materials and Wastes, specifically Impact HMW#1, Hazards Due to the Routine Transport, Use, or Disposal of Hazardous Materials during Construction. The Authority will be responsible for the transport and disposal of spoils generated by the Palmdale to Burbank Project Section. Hazardous materials would be handled in accordance with Certified Unified Program Agencies (CUPA) regulations and disposed of off-site at a properly licensed/maintained facility located within the state of California. These regulations are administered by the Enforcement and Emergency Response Division of the California Department of Toxic Substances Control. At this stage of Project development, neither the construction contractor nor the facility or facilities used for disposal of hazardous materials have been selected. Ultimate disposition of contamination will be determined in accordance with hazardous materials and wastes plans developed under HMW-IAMF-#4 (Undocumented Contamination), which describes the Authority's commitment to address provisions related to the disturbance of undocumented contamination through coordinating with the contractor to prepare a construction management plan (CMP) prior to construction, HMW-IAMF #5 (Demolition Plans), which addresses the Authority's commitment to ensure the safe dismantling and removal of building components and debris through requiring the contractor to prepare demolition plans, HMW-IAMF #6 (Spill Prevention), which describes the Authority's commitment to address spill prevention through requiring the contractor to prepare a CMP, HMW-IAMF#7 (Transport of Materials), which requires that the construction contractor comply with applicable state and federal regulations pertaining to transport of hazardous materials and wastes, and HMW-IAMF#8 (Permit Conditions), which describes the Authority's commitment to comply with the State Water Resources Control Board Construction Clean Water Act Section 402 General Permit conditions and requirements for transport, labeling, containment, cover, and other best management practices for storage of hazardous materials during construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9719

Refer to Standard Response PB-Response-HAZ-1: Materials Hauling and Transportation of Hazardous Materials, PB-Response-HAZ-2: Potential to Encounter PEC Sites with Known and/or Suspected Contamination during Construction.

The commenter refers to Appendix 2-I Spoils Disposal Assumptions used for Environmental Analysis in the Draft EIR/EIS, specifically with respect to spoils removal associated with the Burbank Airport Station SEM tunnel related to the Refined SR14 Build Alternative. It should be noted that SEM tunnel construction would occur south of the Burbank Airport Station, within the footprint evaluated in the Burbank to Los Angeles Project Section Final EIR/EIS. The Burbank to Los Angeles Project Section Final EIR/EIS was released on November 5, 2021. The Authority's Board approved the Burbank to Los Angeles Project Section Preferred Alternative, including the Burbank Airport Station, on January 20, 2022. The information and analysis within this Final EIR/EIS about the Burbank Airport Station overlap area should be understood as informational and for reference only.

The commenter asks whether closed trucks will be used for off-hauling and for information regarding community protection during loading, transportation, and load shifts/truck tipping. As explained in Impact HMW#1 in Section 3.10, Hazardous Materials and Wastes, in the Draft EIR/EIS, the Refined SR14 and SR14A Build Alternatives would generate the most potentially hazardous spoils (approximately 9.2 million cubic yards [mcy]). The E1 and E1A Build Alternatives would generate approximately 3.0 mcy of potentially hazardous spoils, and the E2 and E2A Build Alternatives would generate approximately 3.8 mcy of potentially hazardous spoils. Hazardous materials would be handled in accordance with state requirements and local Certified Unified Program Agencies (CUPA) regulations and disposed of off-site at a properly licensed/maintained facility located within the state of California. Per the requirements of the Department of Toxic Substances Control, vehicles, containers, and any attached equipment used for transporting hazardous waste must be in sound condition and containers must be designed or maintained to contain hazardous waste (see Draft EIR/EIS, pp. 3.10-4 to 3.10-5). Implementation of HMW-IAMF#4, HMW-IAMF#5, and HMW-IAMF#6 will establish plans for the safe handling of hazardous materials during construction, including those materials associated with contaminated soils or groundwater, construction chemicals, and demolition of structures to ensure hazardous materials are

### 4494-9719

properly handled and there are no adverse environmental or safety impacts. In addition, implementation of HMW-IAMF#7 and HMW-IAMF#8 will require the contractor to comply with federal and state regulations to further reduce risks from handling and disposing hazardous materials during construction activities. For example, the Authority would comply with the Resource Conservation and Recovery Act, overseen by the U.S. Environmental Protection Agency (EPA), which includes Part 263 Standards Applicable to Transporters of Hazardous Wastes. EPA has adopted certain Department of Transportation regulations regarding the transportation of hazardous materials including, but not limited to, using proper containers and reporting discharges (see Draft EIR/EIS, p. 3.10-2). Prior to construction, the Contractor will provide the Authority with a hazardous materials and waste plan describing responsible parties and procedures for hazardous waste and hazardous materials transport. Please refer to Standard Responses PB-Response-HAZ-1: Materials Hauling and Transportation of Hazardous Materials and PB-Response-HAZ-3: Impacts of Spoils Hauling (Hazardous Materials and Waste), which also address this issue.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9720

The commenter inquires about where the spoils from the station area footprint will be stockpiled, and how the contaminated dirt will be sorted so it does not float out into the community. The commenter also questions whether these spoils will be stockpiled on the Avion Burbank site. As shown on Drawing No. CV-14003-E2 in Volume 3, Preliminary Engineering Project Design (PEPD) Record Set REV02 Construction Staging Plans of the Draft EIR/EIS, a 43.0-acre construction laydown area would be located within the Burbank Subsection. It is anticipated that the identified construction laydown area would be used for mobilizing personnel, stockpiling materials, and storing equipment for building HSR or related improvements. IAMFs, as discussed in Section 3.10, Hazardous Materials and Wastes (Section 3.10.4.2) of the Draft EIR/EIS, will require the contractor to implement a series of plans and procedures to minimize hazards associated with use, storage, transportation, and disposal of hazardous material and waste. They include HMW-IAMF#5, which requires the contractor to prepare demolition plans for the safe dismantling and removal of building components and debris, and HMW-IAMF#6, which requires that the contractor prepare a CMP including procedures that avoid or reduce the potential for releases and foreseeable upset conditions that would expose persons or the environment to substantial hazards. Mitigation Measures, specifically HMW-MM#1 which limits the handling of extremely hazardous materials near educational facilities, would reduce impacts associated with such materials. See Response to Comment #9717 for additional information regarding displacement of the Avion Burbank Development. Spoils resulting from excavation, if they are not classified as hazardous, may be re-used in construction of the Build Alternatives, deposited within the permanent Build Alternative footprint, or permanently disposed of at a designated site, as discussed in Chapter 2.0, Alternatives (see Section 2.9.3 of the Draft EIR/EIS). The Avion Burbank site, referenced in the comment, located adjacent to the Hollywood Burbank Airport and the North Burbank Metrolink Station, is included within the permanent Build Alternative footprints. The extent of potential re-use and the need for imported fill from borrow sites would depend on construction sequencing and the suitability of excavated materials for re-use. Nevertheless, the Draft EIR/EIS conservatively assumes the amount of the spoils created during excavations that would require off-hauling to disposal or re-use sites (see Impact HMW#1 and Appendix 2.0-I in the Draft EIR/EIS). Spoils that cannot be re-used as part of HSR construction or nearby projects would need to be hauled to a disposal site within or outside the Build Alternative footprint. There are several identified potential disposal

### 4494-9720

sites within 25 miles of the Palmdale to Burbank Project Section, as described in Chapter 2.0 of the Draft EIR/EIS. As discussed in Section 3.10, contaminated materials would be removed from the tunnel construction areas and could be temporarily stockpiled onsite before being hauled to a suitable hazardous waste treatment site.

The Burbank Airport Station, which is located at the southern end of the Palmdale to Burbank Project Section, was evaluated as part of the Burbank to Los Angeles Project Section and is discussed in the EIR/EIS for this project for informational and reference purposes only. The Burbank to Los Angeles Project Section Final EIR/EIS was released on November 5, 2021. The Authority's Board approved the Burbank to Los Angeles Project Section Preferred Alternative, including the Burbank Airport Station on January 20, 2022. For the most updated information about the Burbank Airport Station approved by the Authority, please refer to the Burbank to Los Angeles Final EIR/EIS, available on the Authority's website.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9721

Refer to Standard Response PB-Response-AVQ-2: Visual Effects on Big Tujunga Wash, PB-Response-PR-2: Impacts on Big Tujunga Wash – Recreational Uses, Equestrian Use.

The commenter identifies construction schedules based on Appendix 2-I and expresses concern about the impacts on Tujunga Wash.

The commenter correctly characterizes construction durations based on Appendix 2-I. Upon receiving the required environmental approvals and securing needed funding, the Authority would begin implementing its construction plan. Given the size and complexity of the California HSR System, the design and construction work could be divided into a number of procurement packages. Table 2-36 shows the estimated durations of construction activities.

The Authority has considered alternatives that would avoid Tujunga Wash. The Refined SR14, SR14A, E1, and E2 Build Alternatives would avoid impacts on Tujunga Wash. The SR14A Build Alternative is the Preferred Alternative. For more information regarding the Preferred Alternative, please refer to Chapter 8 of the Draft EIR/EIS. For responses to comments on impacts to Tujunga Wash, refer to PB-Response-PR-2: Impacts on Big Tujunga Wash - Recreational Uses, Equestrian Use and PB-Response-AVQ-2: Visual Effects on Big Tujunga Wash.

### 4494-9722

The commenter is inquiring about the exact location of CalMat Mine. According to Figure 2-75 E2 Build Alternative included in Chapter 2, Alternatives, of the EIR, CalMat Mine is located at 11520 Sheldon St, Sun Valley, CA 91352. This site is also referred to as the Vulcan Landfill Sun Valley.

### 4494-9723

Refer to Standard Response PB-Response-HAZ-3: Impacts of Spoils Hauling (Hazardous Materials and Waste).

The commenter poses questions related to hazardous materials hauling. The commenter asks why the hazardous materials disposal site is classified. In this context, the word classified means permitted and not undisclosed.

A conservative analysis was conducted regarding the amount of potential hazardous spoils for each of the Build Alternatives; it is likely that each of the Build Alternatives would produce a smaller quantity of hazardous spoils than estimated. As described on page 3.10-22 of the Draft EIR/EIS, the six Build Alternatives would generate different quantities of potentially hazardous spoil materials: Refined SR14 and SR14A, 9.2 million cubic yards (mcy); E1 and E1A, 3.0 mcy; and E2 and E2A, 3.8 mcy of hazardous spoils. Hazardous materials would be handled in accordance with state and local implementation of CUPA regulations and disposed of off-site at a properly licensed/maintained facility located within the state of California. Many of the sites containing hazardous spoils and/or hazardous materials are associated with the PEC sites listed in Section 3.10.5.3. Please refer also to Standard Response PB-Response-HAZ-3: Impacts of Spoils Hauling (Hazardous Materials and Waste), which addresses this issue.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9724

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-TRA-1: Temporary Traffic Associated with Construction.

The commenter inquires if an adit is located at Little Tujunga Canyon Road for the Refined SR14 Build Alternative. The commenter inquires what Sand Canyon Road will be used for and if Sand Canyon Road would be closing.

These roads would not be closed by or for the project but would be utilized for construction access and in some cases utilities such as water and electrical service. During construction these roads would remain open to the public. Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process for more information about the selection of alternatives. Refer to Standard Response-TRA-1: Temporary Traffic Associated with Construction, for more information about road closures or detours during construction.

This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. As a result, no change has been made to the document in response to this comment.

### 4494-9725

Refer to Standard Response PB-Response-TRA-1: Temporary Traffic Associated with Construction.

The commenter inquires about the existing bike path along San Fernando Road, and states that the bike path will be demolished for construction of the project. As noted in Section 3.2, Transportation of the Final EIR/EIS, spoil hauling could affect the pedestrian and bicycle facilities provided along portions of affected roadways in San Fernando Valley. Class I and II bicycle facilities on San Fernando Road and Glenoaks Boulevard, respectively, near the Burbank Station could be affected during peak hours. The addition of spoils trucks during peak hours could cause congestion, such that bicycle and pedestrian movement would be blocked or slowed. The addition of large trucks to the roadway network could also create safety concerns for bicyclists on shared-lane and on-street bike lane facilities. Implementation of TR-IAMF#4 through TR-IAMF#7 will prevent hazardous conditions that would substantially interfere with pedestrian or bicycle movements or access during spoils hauling. Additionally, spoils hauling near non-motorized modes such as the Class I and II bicycle facilities on San Fernando Road and Glenoaks Boulevard, respectively, would be temporary and only occur for a maximum of 3.2 years. However, the bicycle path will not be demolished, nor will the HSR Palmdale to Burbank Project Section preclude future extensions of this bike path along the San Fernando Road corridor. See Volume 3, Alignment Plans, which consists of the Preliminary Engineering for Project Definition Plans, including drawings of the track, structures, grade separations, and other features. Please also refer to Standard Response PB-Response-TRA-1: Temporary Traffic Associated with Construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9726

The commenter requests clarification as to the proposed disposition of parcels depicted in the interactive map regarding proposed property acquisitions provided by the Authority at:

<https://geografika.maps.arcgis.com/apps/MapJournal/index.html?appid=ccac46af003e4a2da4528b2a7595141b>, specifically the parcels shaded in orange in the map and identified for partial acquisition.

Information as to the specific proposed use for each parcel identified for parcel acquisition is not available at this stage of project development. A partial acquisition means that the original entity continues to exist, but that a new entity absorbs or takes over part of the rights and obligations of the original entity. Thus, some of the rights and obligations (and contracts) of the original entity are transferred to the new entity. As discussed in PB-Response-SOCIO-1: Parcel Acquisitions and Relocations in more detail, generally, if the area required for the project appears not to be critical to the property's primary function as a residence or business and/or the remaining portion of the property could be reconfigured to continue serving its purpose without significant disruption to occupants, a partial acquisition is considered. In some instances, aerial or subsurface rights for utility facilities or support structures are required but little to no impact to surface operations would persist in the after condition.

Also, in some circumstances, temporary rights may be required from property owners for material storage, construction activities, or access but these activities would not impact the primary function of the property or cause undue disruption to the occupants and the area may revert to its former use after construction activities have been completed. Additional information on the locations of full and partial parcel acquisitions for the project can be found in Appendix A of the Relocation Impact Report prepared for this Final EIR/EIS. Electronic versions of the Technical Reports are available through submitting a written request on the Public Records Act portal (available at: <https://hsr-ca.nextrequest.com/>).

### 4494-9727

Refer to Standard Response PB-Response-AQ-1: Construction-Period Emissions, PB-Response-AQ-3: Construction Air Quality/Truck Impacts, PB-Response-N&V-4: Tunneling Impacts (Noise and Vibration) under Homes and Businesses, PB-Response-N&V-5: Impacts of Spoils Hauling (Noise), PB-Response-N&V-6: Construction Noise/Truck Impacts, PB-Response-TRA-1: Temporary Traffic Associated with Construction.

The commenter expresses concern regarding the effects to sensitive receivers from noise, vibration, road closures, and air quality effects. These topics are further discussed in Standard Responses PB-Response-N&V-4: Tunneling Impacts (Noise and Vibration) under Homes and Businesses, PB-Response-N&V-5: Impacts of Spoils Hauling (Noise), PB-Response-N&V-6: Construction Noise/Truck Impacts, PB-Response-TRA-1: Temporary Traffic Associated with Construction, PB-Response-AQ-1: Construction-Period Emissions, and PB-Response-AQ-3: Construction Air Quality/Truck Impacts. Each of these standard responses includes discussion of the measures being implemented to reduce and or avoid impacts on the surrounding community including hospitals in the area.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9728

The commenter requests additional information on ownership of parcels temporarily acquired for construction after the project construction period. This topic is discussed in Standard Response PB-Response-SOCIO-1. Land use displacements were determined by evaluating the extent to which the project would impact land uses within the footprint and identifying those properties where the current use would not be able to continue after construction. For this analysis, project design files showing the extent of the project were imported into a geographic information systems dataset along with parcel boundary data from the Los Angeles County Assessor to identify situations where the proposed project facilities would affect a building, driveway, parking lot, or other key feature of a property in a way that may affect that feature's viability after construction. Based on the nature of impacts, the Authority determined where a full acquisition, partial acquisition, permanent easement (surface, subterranean, or aerial), temporary easement, or some combination of these would be required. Generally, full acquisitions were designated where a significant portion of the structure or structures comprising the property's principal dwelling or business facility would be within the area to be acquired for the HSR right-of-way or for an extended period during construction. The Authority would acquire the land of property owners whose land is directly affected by the project in accordance with the Uniform Act. The Uniform Act establishes minimum standards for treatment and compensation of individuals whose property is acquired for a federally funded project. If the area required for the project appeared not to be critical to the property's primary function as a residence or business and/or the remaining portion of the property could be reconfigured to continue serving its purpose without significant disruption to occupants, a partial acquisition was determined. In some circumstances, temporary rights might be required from property owners for materials storage, construction activities, or access, but these activities would not impact the primary function of the property or cause undue disruption to the occupants, and the area could revert to its former use after construction activities were completed.

### 4494-9729

The commenter requested further information on project train emergency protocol in the case of wildfire events, and further information on wildfire mitigation during high wind events, referencing the IET study on electric spark discharge between pantograph and catenary in electrified railway. Application of SS-IAMF#1 and SS-IAMF#2 will require the development and incorporation of a fire and life safety program into the design and construction of the Palmdale to Burbank Project Section. The fire and life safety program is coordinated with local emergency response organizations to provide them with an understanding of the rail system, facilities, and operations, and to obtain their input for modifications to emergency response operations and facilities, such as emergency protocol and evacuation routes for operating trains during wildfire events. Please refer to Appendix 2.0-E, Impact Avoidance and Minimization Measures, of this Final EIR/EIS, for the full descriptions of IAMFs that will be implemented as part of the project design. Within the ANF, project infrastructure including overhead catenary lines, would be primarily underground. When it is underground, the project would not create fire risk in areas on the surface within the ANF. The Authority acknowledges that the Antelope Valley is an area subject to high winds, which would exacerbate fire risks. Fire risks from the project would be reduced by the Authority's formation of a statewide Fire and Life Safety and Security Committee (FLSSC) through implementation of SS-IAMF#2, which will be composed of representatives from fire, police, and local building code agencies. The purpose of the FLSSC will be to review issues that are critical to fire and life safety and security, to acquire input and concurrence from the state and local authorities having jurisdiction over the proposed designs to meet code requirements, and to comply with state and local fire code standards or fire and life safety hazard programs during the design phase of the project, including those pertaining to project catenary system. The fire and life safety program will include regional FLSSCs who will focus on the fire and life safety characteristics specific to the Palmdale to Burbank Project Section and provide input on local building codes or requirements that align with the emergency response characteristics and capabilities of the local agencies for the Palmdale to Burbank Project Section. Representation and operations of the statewide FLSSC and regional FLSSCs will be coordinated with local emergency response organizations to provide an understanding of the California HSR System and its facilities and operations, and to obtain their input for modifications to emergency response operations and facilities. These programs and coordination activities would allow for a rapid response by local emergency responders in the case of an accident, reducing the potential for

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9729

uncontrolled wildfire events.

### 4494-9730

Refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption.

The commenter asks about the source of electrical power for project operation and asks how the energy used to power the project can be considered clean energy. As explained on page 3.6-86 in Section 3.6, Public Utilities and Energy of the Draft EIR/EIS, the proposed California HSR System would obtain electricity from the statewide grid. Providers in Southern California include Southern California Edison, Los Angeles Department of Public Works, and Burbank Water and Power (see Table 3.6-7 in the Draft EIR/EIS). Please refer to Standard Response PB-Response-PUE-1: Energy Use and Consumption, which provides additional information about the Authority's commitment to use renewable energy for the California HSR System.

The commenter also asks if trains will be stopped during flex alerts so that residential customers receive the power they need. The California Independent System Operator (California ISO) identifies on its website that a flex alert is typically issued in the summer when extremely hot weather drives up electricity use, making the available power supply scarce. None of the recommendations made during a flex alert include stopping critical transportation infrastructure, such as the California High Speed Rail System. Therefore, the Authority does not anticipate stopping trains during flex alerts. The California ISO website describing flex alerts can be accessed here: <https://www.flexalert.org/>

### 4494-9731

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding. The commenter states that all cars on California roads have been mandated to be electric by 2035, therefore diminishing the need for high-speed trains. As a matter of clarification, Governor Newsom's Executive Order would be to phase out gasoline-powered cars by requiring sale of new passenger vehicles to be zero-emission by 2035. While this Executive Order would help in increasing the number of zero-emission vehicles, it would not guarantee that all vehicles on the road would be zero-emission by 2035. In 2035, there would still be people using cars purchased before 2035 that are not zero-emission vehicles. As such, the California HSR System would be a beneficial tool in California to reduce GHG emissions. The purpose of the California HSR System is to provide the public with electric-powered HSR service that provides predictable and consistent travel times between major urban centers consistent with Proposition 1A, and connectivity to airports, mass transit systems, and the highway network in the Antelope Valley and the San Fernando Valley; and to connect the northern and southern portions of the statewide HSR system. For the comments related to cost, please refer to Standard Response PB-Response-GEN-2: Project Costs and Funding.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9732

Refer to Standard Response PB-Response-GSSP-2: Impacts on Paleontological Resources.

The commenter asks about the Authority's protocol if a discovery is made relating to paleontological resources (such as discovery of dinosaur bones, extinct mammals, ancient civilization artifacts), including halting or rerouting the project.

Regarding the comment about paleontological resources, please see Standard Response PB-Response-GSSP-2: Impacts on Paleontological Resources, which addresses the Authority's protocols in the event a paleontological resource is identified during construction. As described in Standard Response PB-Response-GSSP-2: Impacts on Paleontological Resources, the Authority's protocol includes halting construction if there is an unexpected discovery of paleontological resources.

Regarding the comment about ancient civilization artifacts, the Authority understands that the commenter is referring to archaeological resources and not paleontological resources. The following response provides an overview of the protocols to be used if there is a discovery of archaeological resources. As described in Impact CUL#2, in Section 3.17, Cultural Resources of the Draft EIR/EIS, ground disturbance associated with construction of the HSR Build Alternatives may result in impacts on unknown or previously undiscovered archaeological resources located within the Area of Potential Effect (APE). Implementation of CUL-IAMF#3 (refer to Section 3.17.5.3, in Section 3.17, Cultural Resources) would reduce impacts by ensuring the completion of pre-construction cultural resource surveys in previously inaccessible portions of the archaeological APE. As discussed in Section 3.17.7, CUL MM#1 and CUL-MM#3 would further reduce impacts on previously undiscovered archaeological resources from ground-disturbing activities during construction by consulting with MOA signatories, concurring parties, and tribal consulting parties to determine the preferred treatment and appropriate mitigation measures and by developing meaningful mitigation measures for effects on as-of-yet-unidentified Native American archaeological resources that cannot be avoided. In addition, the Authority will implement CUL-MM#2, which will halt construction activities and require compliance with 48 Fed. Reg. 44716-42 and 14 Cal. Code Regs. Chapter 3, Article 9, Sections 15120–15132, should there be an unanticipated archaeological discovery.

### 4494-9733

The commenter requests more information about the archaeological survey effort and what will happen if PTE is not granted for survey locations. Per CUL-IAMF#3, pre-construction surveys of properties within the APE that were not previously surveyed will occur after the Authority obtains legal access to such sites. Stipulation VI.E of the PA provides for phased identification in situations where identification of historic properties cannot be completed—e.g., when private property owners deny permission to enter. In such cases, the development and implementation of a post-review identification and evaluation effort will be stipulated in a MOA to ensure that the historic properties identification effort is completed once the properties become accessible and prior to construction. Consistent with the Section 106 PA, detailed protocols associated with unanticipated discovery of archaeological resources are addressed by the ATP. Further, in the event of an unanticipated discovery of archaeological resources, CUL MM#1 and CUL-MM#3 would reduce impacts from ground-disturbing activities during construction by consulting with MOA signatories, concurring parties, and tribal consulting parties to determine the preferred treatment and appropriate mitigation measures and by developing meaningful mitigation measures for effects on as-of-yet-unidentified archaeological resources that cannot be avoided. In addition, the Authority will implement CUL-MM#2, which will halt construction activities and require compliance with 48 Fed. Reg. 44716-42 and 14 Cal. Code Regs. Chapter 3, Article 9, Sections 15120–15132, should there be an unanticipated archaeological discovery. As discussed in the Archeological Treatment Plan, there are identification, evaluation and mitigation measures agreed upon with SHPO, Native American tribes and other consulting parties to preserve and protect archaeological materials. These treatment plans describe detailed requirements for the treatment of resources affected by the project, site monitoring during construction, handling of unanticipated discoveries, data recovery, and curation of artifacts, among other things. Those procedures, along with the Mitigation Measures outlined above, would be followed. Regarding collection and curation of materials, refer to 36 CFR Part 79, Curation of Federally Owned or Administered Archaeological Collections. The CHSRA will follow those guidelines when curating materials recovered during and prior to construction.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9734

Refer to Standard Response PB-Response-GEN-1: Frequently Asked Questions, PB-Response-GEN-2: Project Costs and Funding.

The commenter refers to Chapter 3.17, Cultural Resources, specifically Section 3.17.7.4, No Project Alternative. The commenter states that the Authority's assertions regarding long-term plans for traffic improvements costing the state increased overtime and the need for Alternate Transportation Systems to address increased population, housing, retail, and schools are not supported in the Draft EIR/EIS. The commenter asks whether the Authority concludes that constructing the project will result in fewer regional impacts than the No Project Alternative. The Authority reviewed Section 3.17.7.4, No Project Alternative, and the entirety of Section 3.17 but could not identify where the assertions the commenter refers to are made. The Authority additionally reviewed the Summary, Chapter 2 Alternatives, Section 3.2, Transportation, and Chapter 8, Preferred Alternative and Station Sites, to determine whether the assertions the commenter references are made elsewhere in the Draft EIR/EIS but could not locate them.

The No Project Alternative assumes that the Palmdale to Burbank Project Section would not be constructed. In assessing future conditions, it was assumed that all currently known, programmed, and funded improvements to the intercity transportation system (highway, rail, and transit) and reasonably foreseeable local development projects with funding sources already identified as discussed in Draft EIR/EIS Section 2.5.1 No Project Alternative would be developed as planned by 2040. The potential impacts of the No Project Alternative are addressed in the following Draft EIR/EIS Chapter 3 sections: Transportation (Section 3.2.6.2), Air Quality and Global Climate Change (Section 3.3.6.2), Noise and Vibration (Section 3.4.6.2), Electromagnetic Interference and Electromagnetic Fields (Section 3.3.6.2), Public Utilities and Energy (Section 3.6.6.2), Biological and Aquatic Resources (Section 3.7.6.2), Hydrology and Water Resources (Section 3.8.6.2), Geology, Soils, Seismicity, and Paleontological Resources (Section 3.9.6.2), Hazardous Materials and Wastes (Section 3.10.6.2), Safety and Security (Section 3.11.6.2), Socioeconomics and Communities (Section 3.12.6.2), Station Planning, Land Use, and Development (Section 3.13.6.2), Agricultural Farmland and Forest Land (Section 3.14.6.2), Parks, Recreation, and Open Space (Section 3.15.6.2), Aesthetics and Visual Quality (Section 3.16.6.2), Cultural Resources (Section 3.17.7.4), and Regional Growth (Section 3.18.6.2). Section S.7 No Project Alternative Impacts in the Draft EIR/EIS Summary Chapter summarizes the impacts of the No Project

### 4494-9734

Alternative.

Draft EIR/EIS Chapter 8, Preferred Alternative and Station Sites, includes a comparison of the environmental impacts of the Authority's Preferred Alternative, Built Alternative SR14, to those of the No Project Alternative. Section 8.5 Environmentally Superior Alternative discloses that the No Project Alternative is not the environmentally superior alternative under CEQA because the Build Alternatives would provide benefits, including reducing vehicle trips on freeways and reducing regional air pollutants, which would not be realized under the No Project Alternative. The Preferred Alternative for the Palmdale to Burbank Project Section is the environmentally superior alternative under CEQA. Implementing the HSR project between Palmdale and Burbank would have adverse environmental impacts regardless of which alternative is selected; overall, however, the Preferred Alternative provides the environmentally superior alternative by best meeting environmental regulatory requirements and best minimizing impacts on the natural environment, farmland, and communities.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9735

The commenter refers to Section 3.17, Cultural Resources in the Draft EIR/EIS, specifically Section 3.17.7 Environmental Consequences under the Impact CUL#1: Effects on Known Archaeological Resources Caused by Construction Activities and Impact CUL#3: Effects on Human Remains Discovered during Construction Activities discussions. The commenter summarizes aspects of the CEQA Conclusions related to Impact Avoidance and Minimization Features and Mitigation Measures, including development of a geospatial data layer and archaeological sensitivity map; the Palmdale to Burbank Project Section Archaeological Treatment Plan (ATP), which addresses unanticipated discoveries and the process by which a discovery is evaluated for National Register of Historic Places/California Register of Historical Resources (NRHP/CRHR) eligibility and how it will be treated; and the Palmdale to Burbank Project Section Memorandum of Agreement (MOA), which describes the review and reporting periods for the technical work and will also describe the timeframes required for consulting party review and comment. The commenter also refers to Impact CUL#4: Effects to Historic Built Resources Caused by Construction Activities, specifically related to East Branch of the California Aqueduct. The commenter refers to an "SR14" Alternative, which the Authority assumes the commenter to mean the SR14A Build Alternative, which is the Authority's preferred alternative. As discussed on page 3.17-90 in Section 3.17, Cultural Resources of the Draft EIR/EIS, the commenter correctly notes (assuming the commenter is referring to the SR14A Build Alternative) that although excavation will be needed to construct at-grade track alignment, neither temporary nor permanent damage to the East Branch of the California Aqueduct is anticipated because the resource is below grade at this location. The commenter asks about the timeline for implementing the mitigation measures related to archaeological discoveries. The ultimate duration of the process to address unanticipated archaeological discoveries is highly dependent on the nature of the discovery and whether the discovery triggers coordination with stakeholders and tribes; resolution could take as few as several days or as long as several months for larger, more complex deposits.

### 4494-9736

Grubbing is the act of removing or clearing a site of trees, shrubs, stumps and rubbish. Grading involves raising or lowering ground levels, adding or removing a slope, or leveling the ground surface of a site. Chapter 13, Glossary, of the EIR/EIS has been revised to include these terms.

### 4494-9737

The commenter provides material that is almost taken directly from the Draft EIR/EIS. The commenter raises concerns regarding long-term population growth, employment growth and opportunities, and housing availability unrelated to HSR, but also makes some assertions as it relates to HSR. The commenter also asks about benefits to the local population if HSR jobs are filled by people outside the County as well as who is building new housing for people moving to the area to work on the project.

The commenter has replicated text from the Draft EIR/EIS around the definitions of regional growth, employment growth, population growth, and housing as resources. While the definitions are largely accurate, it should be noted that while the commenter states that population growth is the number of residents in the resource study area (RSA), population alone is the number of residents in the RSA. Additionally, the commenter's statement that "It must not be assumed that growth in any area is necessarily beneficial, detrimental or of little significance to the environment" is also included in Section 3.18, Regional Growth, and derives from CEQA Guidelines section 15126.2(e). This content appears to be background material unconnected to a comment on the environmental analysis in the Draft EIR/EIS.

The commenter presents an opinion that "HSR is a war on cars," which is noted and included in the record for consideration by decision-makers. The commenter also opines on what SCAG should do in terms of their Alternative Planning Strategy (APS). While Southern California Association of Governments (SCAG) activities are outside the scope of the Authority's jurisdiction, note that the EIR/EIS recognizes SCAG as a Metropolitan Planning Organization in Section 3.18.2.2, of the Draft EIR/EIS. SCAG has the responsibility for preparing and adopting a Sustainable Communities Strategy (SCS) or APS to reduce greenhouse gas emissions in the region. As such, SCAG has adopted a Regional Transportation Plan (RTP)/SCS, which is discussed in Section 3.18.2.3 of the Draft EIR/EIS. Since the commenter has not identified any issues with the EIR/EIS' discussion of the RTP/SCS, no additional response is warranted for this specific concern included in the comment.

The commenter expresses uncertainty about the timeline provided for construction of the Palmdale to Burbank Project Section which is estimated at 8 to 9 years. Construction timeline estimates are described in Table 2-35, in Chapter 2, Alternatives,

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9737

of the Draft EIR/EIS. The project construction timeline was estimated by the project engineers based on experience for completing design, construction and testing of similar HSR projects built around the world. More specifically, the construction periods were calculated considering the production and advancement rates for each construction site, taking into account, for example, the length and cross section of tunnels; type of ground for tunnel excavation; complexity and number of utilities that require relocation or protection; volume of embankments and spoils from excavation; the size, complexity and length of viaducts; retaining walls and other structures to be built; and the length of track to be laid and systems to be deployed.

As mentioned above, one major schedule driver for the Palmdale to Burbank Project Section will be the length of time needed for excavation of the tunnels. It is assumed that tunnel boring machines will work 24 hours a day and 7 days a week. Based on tunnel construction estimates, the following average excavation rates for long tunnels have been assumed as part of the EIR/EIS analysis:

- 1,300 ft per month for tunnels of 28 ft of diameter excavated in rock with TBM
- 1,000 ft per month for tunnels with diameter larger than 28 ft excavated in rock with TBM
- 600 ft per month for tunnels in fault zones excavated with TBM
- 600 ft per month for excavation of tunnels in rock with conventional methods (400 ft per month in fault zones)

While the six Build Alternatives would increase projected population by 0.1 percent, the California HSR System would also result in environmental and local benefits as compared to the No Project Alternative. The diversion of intercity trips from road trips to the HSR system would result in reduced automobile travel on major freeways and reduced long-term air pollutant emissions. As described in Section 5.8.3, in Chapter 5, Environmental Justice, of the Draft EIR/EIS, induced growth associated with the Burbank Airport Station would accelerate the implementation of local development plans in Burbank, and provide an opportunity to achieve transit-oriented development (TOD) planning goals.

The project would also have both short-term and long-term employment benefits for the

### 4494-9737

region. Construction of the Build Alternatives would generate approximately 80,000 to 85,000 direct, indirect, and induced construction job years, and operation of the Build Alternatives would create approximately 5,400 direct and indirect jobs in Los Angeles County. Furthermore, through establishing a Community Benefits Agreement, the Authority would require each prime contractor of an awarded construction package to commit 30 percent of all construction dollars to hiring small businesses, including separate goals for the hiring of disadvantaged and disabled veterans' businesses. Many construction workers residing in Los Angeles County may already have obtained HSR construction experience by working on one of the first several construction packages awarded by the Authority beginning in 2013, and it is anticipated that many local workers will receive these employment benefits.

As explained in greater detail in Final EIR/EIS Section 3.18.6.3, the project-induced population increase of approximately 11,700 people would require approximately 4,030 housing units. Accordingly, the six Build Alternatives would generate an additional 0.8 percent housing need beyond the No Project Alternative projections. While there are housing units needed beyond current projections, CEQA generally does not require a detailed discussion of indirect housing needs. In this instance, given the regional nature of the project and the long-term nature of the projections, it is not possible to indicate precisely where these additional housing units may be constructed. Additionally, as shown by the long-term housing projections, the project would not be the sole cause of growth in any area. While additional housing would need to be constructed elsewhere, sufficient detail cannot be known at this time to forecast the physical effects on the environment accurately or meaningfully. Relatedly, the question of who will build the additional housing and when cannot currently be known.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9738

The commenter asks about the effects of COVID-related population changes as it relates to baselines used in Section 3.12, Socioeconomics and Communities, and Section 3.13, Station Planning, Land Use, and Development of the EIR/EIS analysis. The baseline year for the analysis of project impacts was established after the Notice of Preparation was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis (see Draft EIR/EIS, pp. S-7, 3.3-23 to 3.3-24). CEQA Guidelines section 15125(a)(1) explicitly supports establishing baseline physical conditions in this manner, therefore, the use of a 2015 baseline is appropriate.

According to the U.S. Census Bureau, the population of the City of Los Angeles was 3.983 million in 2019, before the pandemic while the population of the City was 3.898 million in 2020, which is a decrease of 1 percent after the pandemic. The analysis in Sections 3.12 and 3.13 evaluates the impacts of the project alternatives based on projected 2040 future conditions, which is the horizon year for analysis of California HSR System operations. Accordingly, the impact discussions in these sections are based on a projected population of 4.6 million in 2040. Population projections are always snapshots, reflecting the historical data available, and the analysis of trends, growth capacities, and growth constraints apparent at the times the projections are prepared. More important than the specific population projection is the recognition and examination of how the HSR system and its project sections would operate in the context of anticipated growth. Updating the document with 2020 data or with more recent population projections for 2040 would not change the impact determinations presented in Section 3.12 and Section 3.13 as the Palmdale to Burbank Project Section is not anticipated to induce substantial unplanned population growth beyond what is planned for the RSA.

### 4494-9739

The commenter expressed a preference for the No Build Alternative as it would eliminate impacts such as those associated with regional growth and GHG emissions. The commenter also questioned whether the future baseline for cumulative impacts is accounting for projects too early in development to make accurate predictions. As discussed in Section 3.18.5.2 of the Draft EIR/EIS, Employment and Unemployment, unemployment in Los Angeles County is at 7 percent (EDD 2016), or approximately 332,400 unemployed people (BLS 2016) as of 2016, which is higher than the state unemployment rate of 6 percent. While the exact timing and labor needs of other projects under the No Project Alternative are not known at this time, individual projects would require fewer workers than the Build Alternatives, and the timing of these projects would be spread out over many years. As such, the regional construction labor force is anticipated to be large enough that workers from outside Los Angeles County would not move to the area to meet the demand for construction-related jobs. Table 3.18.2 shows the total civilian labor force for Los Angeles County was 5,011,700 in 2015. As displayed in Table 3.18.4, approximately 126,000 jobs were in the construction sector for Los Angeles County in 2015 (EDD 2016), representing approximately just 2.5 percent of the total labor force in the county.

Table 3.3-44 in Section 3.3, Air Quality and Greenhouse Gas Emissions show that the total increase in construction GHG emissions listed for each Build Alternative would be offset in less than a year by the net GHG emissions reductions from Palmdale to Burbank Project Section operations. Emission reductions during operations from reduced auto and aircraft trips would offset the short-term construction-related contribution to increased GHG emissions. The Build Alternatives construction would generate GHG emissions during the 7 to 8-year construction period. However, these emissions would be almost fully offset after 4 to 6 months of operations (depending on the ridership scenario and Build Alternative). After a maximum of 6 months, the Build Alternatives would result in net annual emissions reductions and a GHG benefit (Draft EIR/EIS, p. 3.3-126), meaning that it would take between 4 to 6 months of operation of the Palmdale to Burbank Project Section to offset construction-related GHG emissions and begin contributing to an overall reduction in regional and statewide GHG emissions. As described in Section 3.19.3.5, Cumulative Projects and Growth Forecasts, for the purpose of this analysis, reasonably foreseeable future projects are defined as those likely to occur in the 2040 planning horizon for the Build Alternatives, and that would

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9739

contribute to the cumulative impact on a particular resource. This analysis assumes these proposed projects would be constructed during the same time frame as the Build Alternatives, to provide a worst-case analysis of cumulative impacts. Appendix 3.19-A provides detailed information about cumulative projects and plans, including transportation projects, in the RSA. The methodology used for this analysis follows the guidelines of the Guidance for Preparers of Cumulative Impact Analysis, the CEQA Handbook, and the CEQA Guidelines. Refer to Section 3.19.3 for a more detailed discussion of the methodology used to evaluate cumulative impacts.

### 4494-9740

The commenter requests further detail regarding project-induced employment. The 500 direct, indirect, and induced employment figure for project operations derives from the RIMS II Modeling analysis conducted for the project section (please refer to Appendix 3.18-A).

The 0.1% growth figure comes from dividing the Total 2040 HSR Build Alternative Employment Projection (5,231,400) by the 2040 No Project Alternative Projection (5,226,000) (please refer to Table 3.18-14).

### 4494-9741

The commenter states that there will be no reduction in station-to-station travel time until the project is completed to Union Station. The commenter also indicates that the population growth and employment growth anticipated with the Build Alternatives would be consistent with regional planning and local demand.

As stated in the 2022 Business Plan, the Palmdale to Burbank Project Section will reduce travel time to 13 minutes. The Draft EIR/EIS reaches the same conclusions as the commenter. For more detail refer to Section 3.18, Socioeconomics and Communities, of the Draft EIR/EIS.

### 4494-9742

The commenter asks about housing needs associated with employment growth. The total number of jobs that would be induced by the California HSR System is estimated to be approximately 5,380 jobs, based on the RIMS II Model used to assess project employment effects (please refer to Appendix 3.18-A). As shown in Table 3.18-15, the six Build Alternatives would contribute a relatively small (0.1 percent) increase in the projected 2040 population for Los Angeles County relative to No Project Alternative projections.

The average number of people per housing unit in Los Angeles County is approximately 2.9 (California Department of Finance 2016). Using this ratio, it follows that the total project-induced population increase of approximately 11,700 people (Table 3.18-15) would require approximately 4,030 housing units. Accordingly, the six Build Alternatives would generate an additional 0.9 percent housing need beyond the No Project Alternative projections, the No Project Alternative anticipates approximately 463,500 new housing units by 2040 in the County. Therefore, while new housing units may be needed to accommodate project-induced population growth, this development would not substantially exceed the housing development and associated land use consumption already projected for the County.

### 4494-9743

The commenter requests the dates during which construction is anticipated to occur. At this time there is no specified date for the start of construction of this project section as additional funding is needed.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9744

The commenter requests additional information regarding the methodology for analyzing impacts associated with regional growth. To capture employment and population growth induced by the Palmdale to Burbank Project Section on both a regional and localized level, the RSA for regional growth is the entirety of Los Angeles County. Within the RSA, consideration is given to those cities and unincorporated areas that intersect with the Palmdale to Burbank Project Section corridor.

As discussed in Section 3.18.6.3, no adverse effect is anticipated to occur from employment growth during construction. Because construction jobs are anticipated to be filled by regional workers, the population within the RSA would not be expected to increase during construction beyond the forecasted regional growth. Therefore, effects on public services and utilities beyond those caused by forecasted growth in the region are not anticipated to occur.

### 4494-9745

The commenter requests further information regarding the advantages of the Build Alternatives as compared to the No Build Alternative. The Palmdale to Burbank Project Section is being proposed, despite significant impacts during construction, based on the benefits identified in Chapter 1, Project Purpose, Need, and Objectives and in Chapter 3, Affected Environment, Environmental Consequences, and Mitigation Measures, and listed in Section 1.2.5. The project would result in transportation and economic/employment benefits for the County and State, as well as the following environmental benefits:

- Supporting the State's transportation goals reflected in Senate Bill 743 by reducing vehicle miles traveled (VMT) and VMT per capita, promoting transit-oriented development, and promoting the reduction of GHG emissions. Projected population growth within Los Angeles County would otherwise cause regional VMT to increase.
- Supporting the State's GHG reduction goals as described in Assembly Bill 32, Senate Bill 32, and the CARB's Scoping Plan (CARB 2017). The HSR has become a key component of the State's strategy for reducing GHG emissions.
- Providing long-term improvements in regional air quality by reducing criteria pollutants and GHGs generated by automobiles, conventional rail, and aircraft. As of 2010, California's transportation sector has been responsible for 40 percent of its GHG emissions and 60 to 80 percent of its particulate emissions from mobile sources (CARB 2010).
- Providing long-term reduction in transportation-related energy requirements. The California HSR System would provide a more energy-efficient mode of travel, using one-third the energy of the equivalent trip by air, and one-fifth the energy of a trip by automobile (California Office of the Governor 2007).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9746

The commenter requests additional information regarding the affordability of HSR for commuters. Based on the information provided, it isn't possible to determine how the commenter derived their estimate of \$15,800 a year for most workers using the train between Palmdale and Burbank.

The Metrolink Antelope Valley Line provides service from Los Angeles Union Station to Palmdale and Lancaster via Burbank and the Santa Clarita Valley. This service will continue once high-speed service is implemented, with Metrolink serving shorter, intra-regional commute trips and high-speed rail serving longer, interregional travel primarily between Southern, Central and Northern California. As described in Section 3.2, Transportation, and under Impact TRA#17: Project Operation Effects on Transit Services, implementation of the Palmdale to Burbank Project Section would add 64 peak hour transit riders to bus and rail services at the Palmdale Station by 2040 for the Refined SR14 and SR14A Build Alternatives. In contrast, the project section would add approximately 430 peak hour transit riders at the Burbank Airport Station. In total, these additional peak hour transit riders are relatively small compared with overall transit ridership in the area.

The pricing structure for HSR fares would be expected to be similar to typical airline fares, but fares would fluctuate based on a variable pricing strategy. As is the case with high-speed rail service around the world today, and is the case with airfares as well, California high-speed rail fares will vary by the following:

- Time of day: Peak vs. off-peak
- Class of service: First class vs. coach
- Travel time: Express/limited-stop vs. "making all stops" service
- Timing: How far in advance tickets are purchased Just as with flying today, high-speed rail travelers with more flexible schedules or limited budgets could save money by booking well in advance or traveling in the middle of the day when trains are less crowded. Travelers who have to make last-minute bookings and need to take express trains or travel during peak periods will typically pay a higher fare.

At this time, the Authority has not determined the method nor begun the procurement/acquisition of the reservation system for HSR. This will occur in adequate advance of the system beginning revenue service.

### 4494-9747

The commenter suggests further detail be supplied regarding effects from project-induced housing needs.

The total number of jobs that would be induced by the California HSR System is estimated to be approximately 5,380, based on the RIMS II Model used to assess project employment effects (please refer to Appendix 3.18-A). As shown in Table 3.18-15, the six Build Alternatives would contribute a relatively small (0.1 percent) increase in the projected 2040 population for Los Angeles County relative to No Project Alternative projections. The average number of people per housing unit in Los Angeles County is approximately 2.9 (California Department of Finance 2016). Using this ratio, it follows that the total project-induced population increase of approximately 11,700 people would require approximately 4,030 housing units (as shown in Table 3.18-15, the project would result in direct and indirect induced growth in Los Angeles County by approximately 1,100 people, and would result in increased accessibility growth by approximately 10,600 people). Accordingly, the six Build Alternatives would generate an additional 0.8 percent housing need beyond the No Project Alternative projections. The No Project Alternative anticipates approximately 495,900 new housing units by 2040 in the County (the discussion under Table 3.18-9, in Section 3.18, Regional Growth, of this Final EIR/EIS, has been revised to reflect the correct housing need projections presented in Table 3.18-9). Therefore, new housing units may be needed to accommodate project-induced population growth.

While the commenter suggests that effects of new housing needs have been ignored, the ability to analyze such impacts for the Palmdale to Burbank Project Section is limited. For example, as described in the Exurban Population Growth subsection under Section 3.18.6.3 of the Draft EIR/EIS, some individuals and their households may choose to relocate to exurban communities such as Palmdale to purchase more affordable housing, especially if the individuals can access convenient affordable HSR train commute services. However, the number, magnitude, and distribution of households that may make this decision are difficult to estimate and involve many economic factors and individual preferences. Such households would likely relocate to these exurban communities over time, starting during construction, just prior to operations, or after HSR operations have been proven to be fast, reliable, and affordable. Therefore, it is not possible to estimate the number of houses needed in

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9747

each area with meaningful accuracy. The Impacts of Long-Term Land Use Consumption subsection under Section 3.18.6.3 of the Draft EIR/EIS also states that "Operation of the Palmdale to Burbank Project Section would induce some population growth, which would increase the demand for housing, although it would be speculative to predict where such growth would occur." Local governments may take steps to accommodate population growth and the increased demand for housing by updating their general plan policies, transit plans, zoning, and building codes. No additional analysis can be conducted with the level of detail that can currently be known related to increases in housing demand and the need for new housing units emanating from the proposed project.

### 4494-9748

The commenter asks why the U.S. Department of Transportation should approve the HSR Palmdale to Burbank Project Section, given that there exist other alternatives that were eliminated from consideration. The U.S. Department of Transportation assigned its NEPA obligations to the Authority under 23 U.S.C. 327. Therefore, the Authority will decide among the alternatives. For additional information about the Authority's process in selecting alternatives to evaluate in the Draft EIR/EIS, please refer to PB-Response-ALT-1: Alternatives Selection and Evaluation Process. As documented in the preliminary Section 4(f) evaluation, the project would not result in a use of any protected Section 4(f) property.

Therefore, an avoidance alternative and least harm analysis is not required under Section 4(f). If the Authority had chosen an alternative that would have resulted in a constructive use, it may have consulted with the Federal Railroad Administration in the U.S. Department of Transportation. Here, however, no alternatives will require any U.S. Department of Transportation consultation.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9749

The commenter asks what is considered a de minimis finding and questions the de minimis findings of 4(f) resources. Of course, the Authority uses federal guidelines in 23 C.F.R. §774.17 and not the Illinois Department of Transportation definitions.

As documented in the Section 4(f) evaluation in Chapter 4 of the Draft EIR/EIS, the project would not result in a use of any protected Section 4(f) properties. Therefore, an avoidance alternative and least harm analysis is not required under Section 4(f). Section 4(f) analysis examines the net change to a resource after avoidance, minimization, and mitigation measures are considered. As discussed in the preliminary Section 4(f) analysis, the changes to protected resources that would occur as a result of the project would not adversely affect the protected activities, features, or attributes of any 4(f) property. In many situations, the effect on the resource is very minor both in scale and in net change to the setting and purpose of the resource. Please refer to detailed discussions in Chapter 4 for a close examination of how the project would affect each resource and supporting information for de minimis conclusions.

### 4494-9750

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

The commenter asks how the Authority can conclude that there are no feasible or prudent alternatives to avoid the use of Section 4(f) properties when the Authority has considered and rejected numerous alternatives. The commenter also expressed concerns related to seismicity, costs of the project, and cumulative impacts. The commenter also questions why the EIR/EIS did not consider alternatives that would follow existing freeways.

As documented in Chapter 4 of the Final EIR/EIS, most uses of Section 4(f) parks, recreation facilities, and/or wildlife and waterfowl refuges would result in a de minimis impact, with two exceptions: Lang Station Open Space and Rim of the Valley Trail (Proposed Extension). As discussed in Section 4.6.1.1 of the Final EIR/EIS, if the Rim of the Valley Trail extension has not been constructed prior to implementation of the Refined SR14, SR14A, E2, and E2A Build Alternatives, no potential use would occur because the Build Alternatives would not preclude future extension of the trail.

The Refined SR14, SR14A, E2, and E2A Build Alternatives would result in temporary occupancy of land along the proposed Rim of the Valley Trail during construction. This determination is based on written concurrence from the official with jurisdiction (OWJ) (the NPS [U.S. Department of the Interior]) dated January 22, 2024.

The Authority has concluded that the Refined SR14 and SR14A Build Alternatives would result in a permanent use at the Lang Station Open Space. The Refined SR14 and SR14A Build Alternatives would require the permanent acquisition of 85.3 acres, including 56.0 acres of permanent footprint that would be fenced off from the public, as well as 29.3 acres that would be permanently inaccessible from the remainder of the property due to the permanent footprint dividing the property.

Regardless, the Authority has determined there is not enough evidence to support a determination that Lang Station Open Space is a Section 4(f) property, because there is not sufficient documentation to support a 4(f) multiple-use of the trails within Lang

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9750

Station Open Space as they remain undocumented and unplanned by the City. Moreover, there is not enough evidence to establish Lang Station Open Space as a wildlife or waterfowl refuge because it is not officially designated as a wildlife or waterfowl refuge by the City nor has the City prepared planning documents declaring the site's purpose as a wildlife or waterfowl refuge. Nevertheless, Lang Station Open Space, inclusive of the trails and trailhead, has been evaluated as a Section 4(f) resource in Chapter 4 of the Final EIR/EIS.

In response to comments received on the Draft EIR/EIS, the Authority conducted an assessment of the feasibility of tunneling under Bee Canyon (including the Lang Station Open Space) to potentially reduce impacts to suitable habitat for special-status species and minimize the project footprint. The Authority examined a total of five options to underground the alignment or minimize the impact of the at-grade section in Bee Canyon. The five options are discussed in more detail in Appendix 4-B of this Final EIR/EIS.

As part of the feasibility analysis, the Authority considered two tunneling options, the first of which would be entirely within a tunnel under the Lang Station Open Space and the Santa Clara River (Option 1). The second option would tunnel under the northern portion of the Lang Station Open Space and emerge from the tunnel to cross over the Santa Clara River on viaduct (Option 3). The Authority concluded that both tunneling options conflict with engineering design requirements such that they are not feasible.

Construction of Option 1 (a tunnel in the Bee Canyon area and under the Santa Clara River) is not feasible because it would require a vertical profile for the HSR alignment that exceeds the maximum allowable grade of 2.5 percent as defined in the Authority's Technical Memorandum (TM) 2.1.2, Section 3.3.1. Constructing Option 3 (the HSR alignment in a tunnel in the northern portion of the Lang Station Open Space and then emerging from the tunnel to cross over the Santa Clara River on viaduct) would also not be feasible because HSR alignment requirements and the topography of the area would not allow for maintaining the minimum vertical clearance of the HSR viaduct over Soledad Canyon Road. Additionally, Option 1 would increase project costs by \$230 million while Option 3 would increase project costs by \$165 million.

Given the physical constraints of the area, the conflict with engineering design

### 4494-9750

requirements (i.e., a grade greater than 2.5 percent), the clearance requirements at Soledad Canyon Road, and the extraordinary magnitude of the costs of an underground alternative, it would not be prudent to avoid Lang Station Open Space under the Refined SR14 and SR14A Build Alternatives. Therefore, there are no reasonable and prudent alternatives to the Section 4(f) permanent use under the Refined SR14 and SR14A Build Alternatives. Consistent with 23 C.F.R. 774.17, the Authority has considered all reasonable design modifications to minimize harm in the Lang Station Open Space from the Refined SR14 and SR14A Build Alternatives.

Regarding the comment about the safety and engineering challenges to tunneling, in the Draft EIR/EIS the Authority includes the analyses and evaluation of the area's geology and geologic hazards (i.e., slope stability, volcanic, karst, expansive soil, subsidence, soil conditions, and paleontology), seismic hazards (i.e., fault rupture, ground motion, liquefaction, lateral spreading, ground lurching, tsunamis, seiches, and seismically induced landslides and dam failures) and effects on, or caused by, geologic resources (i.e., mineral resources, mines, oil and gas, and geothermal resources). The evaluations demonstrate that the project Build Alternatives described in the Draft EIR/EIS are feasible. However, additional investigations will be conducted during the project's design phase to further address recognized impacts and any required mitigation. The Authority has sufficiently studied the issues of crossing multiple faults and the risks of doing so and concludes the project to be feasible. Refer also to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events. Please also refer to Responses to Comments #10528 and #10532, which address train derailment as well as the function of the EEDS to prevent derailment. Refer also to Response to Comment #10529, which addresses the EEDS function when trains are in a tunnel. Responses to Comments #10528 and #10532 address comparisons to seismicity and HSR operation in Japan. Response to Comment #10536 addresses tunneling feasibility.

For additional information about the Authority's process in selecting alternatives to evaluate in the Draft EIR/EIS, please refer to PB-Response-ALT-1: Alternatives Selection and Evaluation Process. Early alternatives developed focused on routes following the SR 14 freeway corridor from the Antelope Valley to Santa Clarita, and then the Metrolink and the Union Pacific railroad corridor through the San Fernando Valley to Burbank. During scoping in 2014, the Authority received comments regarding impacts

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9750

on communities along the Metrolink corridor in the San Fernando Valley, along with requests for the Authority to consider alternatives to avoid or reduce these effects. The Authority also received requests to evaluate alignments that included tunnels through/near Acton and Santa Clarita. The use of tunnels in this area would avoid a recently approved job creation center, existing neighborhoods, and two elementary schools located close to the SR 14 alignment at that time. In order to avoid these community facilities, the Authority evaluated alternatives that would cross the San Gabriel Mountains. Given the topography of the area, the only feasible option would be the use of tunnels. Based on this analysis and input from associated communities through community meetings, briefings, and presentations for the Palmdale to Burbank Project Section, the Authority decided to proceed with alternatives that deviated from the SR 14 corridor to varying degrees. These alternatives involved the use of tunnels under the San Gabriel Mountains to reduce impacts on communities along the SR 14 freeway and in the northern portion of the San Fernando Valley, while still reaching the Burbank Airport Station.

### 4494-9751

The commenter asks what is a constructive use and then cites the regulation. It asks why certain 4(f) resources do not have constructive use determinations. As described in Chapter 4 of the Draft EIR/EIS, the Authority has not identified any potential constructive use of a 4(f) resource. It has identified several de minimis uses and it is seeking concurrence from local jurisdictions. Please refer to Table 4-1 and Section 4.6 (beginning on page 4-70) of the Draft EIR/EIS for detailed discussions of potential proximity impacts, where applicable, and evaluation of how these impacts would or would not affect the protected activities, features, or attributes of the resource.

### 4494-9752

The commenter asks which 4(f) resources would have constructive uses. As described in Chapter 4 of the Draft EIR/EIS, the Authority has not identified any potential constructive use of a 4(f) resource. Therefore, consultation with FRA to confirm a constructive use is not necessary or appropriate.

### 4494-9753

The commenter asks how the FRA could select any of the six Build Alternatives instead of the No Project Alternative, given that the No Project Alternative is the only alternative that will not harm Section 4(f) resources. A least harm analysis is required only when a use of a 4(f) resource has been identified. As discussed in Chapter 4, no use of a 4(f) property has been identified other than a de minimis use, which does not require a least harm analysis. The text on page 4-4 of the Draft EIR/EIS includes the following, which clarifies when a least harm analysis is required: "After making a Section 4(f) determination and identifying the reasonable measures to minimize harm, if there is more than one alternative that results in the use of a Section 4(f) resource, the FRA must also compare the alternatives to determine which alternative has the potential to cause the least overall harm in light of the preservationist purpose of the statute."

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9754

The commenter inquires as to the Build Alternatives' effects on the portions of the ANF that are protected by Section 4(f). The Section 4(f) analysis in Chapter 4 of the Final EIR/EIS considers project elements that would have potential to adversely affect the protected activities, features, and attributes of Section 4(f) resources. The requirements of 23 CFR 774.11(d) for determining Section 4(f) applicability for the ANF and SGMNM states that Section 4(f) applies only to those portions of such lands which function for, or are designated in the plans of the administering agency as being for, significant park, recreation, or wildlife and waterfowl refuge purposes. As shown in Figure 4-7 in Chapter 4 of the Final EIR/EIS, the Build Alternatives would be entirely underground through the ANF in the areas noted by the commenter. Users of the ANF/SGMNM would not perceive the underground transportation corridor (rail alignment), which would be between 120 and 2,670 feet below the surface in a bored tunnel. Nor would these tunnels affect wildlife at the surface within the ANF. Project improvements at the surface within the ANF would be limited to ancillary and infrastructure facilities, such as power lines, and would not be located in areas of the ANF that are protected by Section 4(f). Through field surveys and coordination with the consulting parties, the Authority determined many of the land uses within the ANF permit a wide range of nonrecreational activities, including communication sites, major transportation corridors, major utility corridors, oil and gas exploration, and forestry. Where these types of uses are permitted, the Authority has determined the land use is not primarily for recreational purposes, and therefore areas within the ANF with this land use designation are not protected under Section 4(f).

The commenter also inquires whether the Build Alternatives could be permitted in the Back Country Non-Motorized and Back Country Motorized Use Restricted zones in the ANF. Section 3.13.10.2 United States Forest Service Resource Analysis, in the Draft EIR/EIS discusses the project's consistency with land use designations in the ANF and SGMNM. If the Authority approves the project and selects a build alternative, the Authority would apply to USFS for a special use authorization for project features in the ANF and the SGMNM. As part of the evaluation of the Authority's application for a Special Use Authorization, USFS would evaluate and determine the Palmdale to Burbank Project Section's consistency with ANF and the SGMNM Land Management Plans.

### 4494-9755

The commenter asks about the validity of the temporary occupancy determination of Section 4(f) resources. The project was evaluated for potential to result in use from temporary occupancy at three resources, one of which is a planned resource that does not yet exist today. The three resources include the following: Rim of the Valley Trail (Proposed Extension), Blum Ranch, and Blum Ranch Farmhouse. A detailed evaluation of temporary occupancy for the Rim of the Valley Trail (Proposed Extension) is provided on pages 4-92 through 4-93 of the Draft EIR/EIS and addresses each of the criteria necessary for determining when a temporary occupancy does not rise to the level of a use under Section 4(f). All six Build Alternatives would require construction activities adjacent to and within small segments of the Rim of the Valley proposed trail extension. However, if the proposed trail extension is not constructed at the start of construction of the refined SR14, SR14A, E2, and E2A Build Alternative, the trail would not be physically affected (no use). Construction of the Build Alternatives would not prevent construction of the proposed Rim of the Valley Trail extension. However, if the Rim of the Valley (Proposed Extension) is constructed prior to the start of construction of the Refined SR14, SR14A, E2, and E2A Build Alternatives, a temporary use would result. A detailed evaluation of Blum Ranch is provided on pages 4-96 through 4-98 of the Draft EIR/EIS. Implementation of the E1, E1A, E2, and E2A Build Alternatives may require permanent acquisition of land from the Blum Ranch property boundary. In the event that temporary or permanent acquisitions are required, the Authority would ensure that acquisitions would not affect contributing features within the historic boundary which qualify the resources for protection under Section 4(f). None of the Build Alternatives would require temporary physical occupation of the Blum Ranch, so there would be no temporary occupancy. A detailed evaluation of Blum Ranch Farmhouse is provided on pages 4-101 through 4-102 of the Draft EIR/EIS. The E1, E1A, E2, and E2A Build Alternatives would not permanently acquire land from the Blum Ranch Farmhouse; therefore, none of the Build Alternatives would result in a permanent use of this historical property. Similarly, none of the Build Alternatives would require temporary physical occupation of the Blum Ranch Farmhouse, so there would be no temporary occupancy. The Authority has determined that the criteria found at 23 CFR 774.13(d) have been met for these three resources and, given the analyses discussed for Blum Ranch and Blum Ranch Farmhouse, and if the Rim of the Valley (Proposed Extension) is not constructed prior to Build Alternative construction initiation, no Section 4(f) use will occur because of the HSR Palmdale to Burbank Project Section.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9756

Refer to Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only).

The commenter expresses concern about the Section 4(f) determination of the Pacific Crest Trail and asks how the introduction of major infrastructure crossing the Pacific Crest Trail is not considered an adverse effect. Section 4(f) requires evaluation of whether a project would use a protected resource. As explained in Section 4.6.1.1 of the Final EIR/EIS, the SR14A, E1, E1A, E2, and E2A Build Alternatives would cross the PCT in a bored tunnel several hundred feet below ground, with no surface impacts on the trail and no discernible effects to recreational users of the PCT, and realignment of the PCT would not be necessary. Construction and operation of these alternatives in a bored tunnel thus would not adversely affect the activities, features, or attributes qualifying the PCT for protection under Section 4(f). Consistent with the Federal Railroad Administration's Section 4(f) regulations (23 CFR Part 774) and guidance in the Federal Highway Administration's Section 4(f) Policy Paper, the Authority has determined that the SR14A, E1, E1A, E2, and E2A Build Alternatives would not result in a use of the PCT because these alternatives would cross in the PCT in a bored tunnel several hundred feet below ground. If, however, these alternatives were found to use land from the PCT, they would result in a de minimis impact on the PCT. Regarding the potential impacts from the Refined SR14 Build Alternative, approximately 3 miles of the trail are within the Refined SR14 Build Alternative RSA. The Refined SR14 Build Alternative alignment would pass over the PCT in two locations on a viaduct, potentially affecting about 0.7 mile of trail. This would require the realignment of the PCT prior to construction. This realignment would represent a permanent change to the trail and would constitute a permanent use of the PCT, through acquisition of right-of-way or a permanent utility easement where the Refined SR14 Build Alternative alignment would intersect the PCT. The Authority has consulted with the USFS regarding trail realignment options and has developed a preliminary realignment for the PCT that would be implemented if Refined SR14 Build Alternative were selected. The PCT would be realigned and cross under the HSR alignment in a perpendicular fashion to move trail users through this area as expeditiously as possible. This realignment has been designed to minimize air quality, visual, and noise impacts on PCT users, including such effects that currently exist associated with the PCT's present alignment in proximity to the SR 14 Freeway, by routing the trail farther away from both the SR 14 freeway and

### 4494-9756

the Refined SR14 Build Alternative. The trail would be shifted as little as possible to achieve the required impact reduction. Realigning the trail away from the SR 14 freeway may result in an overall benefit to trail users because the existing trail runs parallel to the east side of the SR 14 freeway for roughly 0.75 mile before heading further east, which causes potential visual and noise effects from vehicles using this portion of the freeway. Additionally, the viaduct for the Refined SR14 Build Alternative that would pass over the PCT in two locations would be 50-60 feet above users of the trail and therefore would not severely restrict vertical clearance. Please refer to Section 4.6.1.1 of the Final EIR/EIS and Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only) for additional discussion about the effects of the Refined SR14 Build Alternative on the PCT. As explained therein, the Refined SR14 Build Alternative would not adversely affect the protected activities, features, or attributes of the PCT. Therefore, the Refined SR14 Build Alternative would result in a de minimis impact on the PCT.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9757

The commenter inquires as to how the Authority could determine that the effects on the San Gabriel Mountains National Monument could qualify as *de minimis* under Section 4(f), and it speculates that the Authority could reach that conclusion only by comparing the acreage used for the project to the entire SGMNM or entire ANF instead of only the affected parts. The Section 4(f) determinations in the Final EIR/EIS are not solely based on the amount of acreage impacted by the project. The Section 4(f) analysis takes into careful consideration the impacts of the project on the portion of resources that may be immediately affected, including the small areas of larger resources where there would be surface improvements. The analysis then considers how those localized changes would or would not affect the larger resource, evaluating whether the project would adversely affect the protected activities, features, or attributes of the resource. As explained in Section 4.1.3, Section 4(f) Applicability, of the Final EIR/EIS, Section 4(f) applies only to those portions of multiple-use lands (including the Angeles National Forest and the San Gabriel Mountains National Monument) that function for, or are designated in the plans of the administering agency (in this case, the U.S. Forest Service) as being for, significant park, recreation, or wildlife and waterfowl refuge purposes. The Vulcan Mine site within the ANF and the SGMNM does not function for, and is not designated for, park, recreation, or wildlife and waterfowl purposes. Therefore, Section 4(f) does not apply to the Vulcan Mine site. Section 4(f) does apply to other areas of the ANF and the SGMNM, as detailed in Table 4-2 Parks and Recreation Resources Evaluated for Section 4(f) Use, in Section 4.5.1, Parks, Recreation Areas, and Wildlife and Waterfowl Refuges in Chapter 4 of the Final EIR/EIS. The Refined SR14 and SR14A Build Alternatives would be entirely in an underground bored tunnel where they pass through areas of the ANF and the SGMNM that are protected by Section 4(f). To evaluate whether the project's tunnels would be a use under Section 4(f), the Authority considered guidance in the 2012 Federal Highway Administration Section 4(f) Policy Paper, which is also used by the Federal Railroad Administration for projects under its jurisdiction (see 83 Fed. Reg. 54484 (Oct. 29, 2018)). The Policy Paper suggests that "Section 4(f) applies to tunneling only if the tunneling: (1) Disturbs archaeological sites that are on or eligible for the [National Register of Historic Places] which warrant preservation in place; (2) Causes disruption which would permanently harm the purposes for which the park, recreation, wildlife or waterfowl refuge was established; (3) Substantially impairs the historic values of a historic site; or (4) Otherwise does not meet the exception for temporary occupancy." As discussed further

### 4494-9757

in Section 4.1.2.1, Public Park and Recreation Lands, and Wildlife and Waterfowl Refuges, of the Final EIR/EIS, the Authority has determined that these criteria are satisfied for the Refined SR14 and SR14A Build Alternatives with respect to the portions of the ANF and the SGMNM that are protected by Section 4(f).

As explained in Section 4.5.1.1, Central Subsection under the Angeles National Forest/including San Gabriel Mountains National Monument (Map ID 7) heading of the Final EIR/EIS, these Build Alternatives would require construction activities, grading, utility installation and roadway work within the ANF and the SGMNM in the Aliso Canyon area. Construction work would be mainly along existing road and utility corridors, meaning most existing physical features within the resource would remain unchanged, and most views from the resource into the surrounding area would remain unchanged. As shown in Table 4-6, Parks and Recreation: Summary of Preliminary Section 4(f) Use Determinations of the Final EIR/EIS, the Authority has concluded that the use would result in a *de minimis* impact because it would not adversely affect the recreational activities, features, and attributes of those areas of the ANF and the SGMNM that are protected by Section 4(f).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9758

The commenter asks if surface infrastructure related to tunneling proposed outside of 4(f)-protected areas is considered by Officials with Jurisdiction in making Section 4(f) use determinations.

As the commenter notes, the surface infrastructure proposed in the ANF has been located to avoid impacts to recreation resources. Project improvements would include tunneling under portions of the ANF that are protected under Section 4(f), but no surface changes would occur and the bored tunnels would not be perceptible to users of this recreation resource. Utility infrastructure and other surface improvements are largely proposed on in-holdings, which are privately owned parcels within a larger public recreation area. These parcels do not qualify for protection under 4(f), are not used for recreation, and the Officials with Jurisdiction over the ANF would not consider project improvements on private land as a potential 4(f) Use. The Authority has considered all related infrastructure when determining whether the Project's impacts qualify as de minimis.

### 4494-9759

The commenter asks about the validity of the Rim of the Valley Trail Extension Section 4(f) determination in relation to temporary occupancy.

The potential encroachments onto this proposed resource would include 1) two temporary construction impact areas of approximately 500 and 250 feet at adit options SR14-A1 and SR14-A2 under the Refined SR14 and SR14A Build Alternatives or 2) a temporary construction impact area of approximately 23 acres at adit option E2-A1 under the E2 and E2A Build Alternatives. There is no scenario in which both would occur. The existing topography, proposed layout of the trail, and vegetation would shield trail users from visual impacts during construction under all six Build Alternatives from most vantage points; trail users would generally only see and hear construction when immediately adjacent to construction areas. Unconstrained use of the trail would be maintained during construction by rerouting the trail around construction areas. In addition, AQ-IAMF#1 would be applied to reduce fugitive dust during project construction. This IAMF would require the contractor to prepare a fugitive dust control plan for each distinct construction segment during construction.

The FHWA 2012 Section 4(f) policy paper provides examples of temporary occupancy such as "right-of-entry, project construction, a temporary easement, or other short-term arrangement involving a Section 4(f) property". Project construction would occur adjacent to and overlapping a portion of the proposed Rim of the Valley Trail Extension. The second criteria for determining that temporary occupancy does not constitute a Section 4(f) use includes "[the] scope of the work must be minor, i.e., both the nature and the magnitude of the changes to the Section 4(f) property are minimal". The trail, if extant when project construction begins, would continue to operate during construction and after construction would be restored to its former condition. Therefore, the magnitude and change to this resource is minimal both during the temporary occupancy and after construction is complete.

Project construction also does not qualify as a constructive use causing noise on the trail because the construction-activity impacts are not permanent. Section 4(f) does not recognize a temporary, constructive use. As discussed in the Draft EIR/EIS on page 4-92, temporary impact areas for construction activities along the proposed Rim of the Valley Trail extension would meet the following five conditions. The duration of

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9759

construction activities in the vicinity of the trail would not exceed the overall construction period for the Build Alternatives. The duration of construction of the adit and use of haul routes would be substantially less than the time needed to construct the entire project.

For the Refined SR14 and SR14A the expected duration of the works in the vicinity of the Rim of the Valley Trail is 4 years and 4 months due to the construction of adit SR14-A2 and the associated staging area, and for the E2 and E2A 5 years and three months due to the construction of adit E2-A2 and the associated staging area. The alignment of the Build Alternatives E1 and E1A when crossing the Rim of the Valley Trail is underground and will not affect the trail.

Regarding the use of Rim of the Valley Trail (proposed extension), construction and operation of the project will not interfere with the qualities, activities or purposes of the resource, on either a temporary or permanent basis (see Section 4.6.1.1, Central Subsection of the Final EIR/EIS). The scope of work is minor and would be limited to temporary impact areas adjacent to permanent improvements.

### 4494-9760

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter asks about the validity of the Hansen Dam Open Space Section 4(f) use determination, considering the taking of 13 acres and impacts on equestrian use. I-210 runs along the northern border of the recreation area, resulting in the intrusion of traffic noise in some areas of the resource. This traffic noise is particularly intrusive to equestrian activities, which are noise sensitive. Therefore, this Hansen Dam Open Space Area provides a variety of recreational opportunities, some of which rely on quiet or natural visual setting and some that do not. The addition of noise from the HSR train would be in the context of the existing noise environment, which includes noise from I-210. Under existing conditions, equestrian activities take place within this resource and would continue to do so with implementation of the project. For additional information related to equestrian uses, please refer to Standard Response PB-N&V-3: Noise Impacts on Domestic Animals/Wildlife. As a matter of clarification, the Refined SR14, SR14A, E1, and E1A Build Alternatives would not result in a Section 4(f) use of the Hansen Dam Open Space Area due to their distance from the resource and that the alignments would be underground. The potential impacts on Hansen Dam Open Space Area raised by the commenter would be limited to the E2 and E2A Build Alternatives, which are not the Authority's preferred alternative. The E2 and E2A Build Alternative alignments would require the placement of approximately 30 support piers/footings within the Hansen Dam Open Space Area within Big Tujunga Wash. The placement of piers/footings would not require the relocation or removal of existing hiking or equestrian trails. The total permanent acquisition area would be approximately 13 acres. This would represent a permanent change to Hansen Dam Open Space Area through incorporation of a 13-acre portion of the 813-acre resource (approximately 1.6 percent). The 13-acre acquisition referenced in the Draft EIR/EIS refers to the easement (change in ownership) that would be required to ensure access to the viaduct structure for repair and maintenance; however, these 13 acres of the Hansen Dam Open Space Area would not be blocked from public use. 800 acres of the resource would remain open and available to the public during construction. After construction, the resource would remain accessible, and trail users would be able to pass under the viaduct to move from one area of the open space to another. In other words, after construction is complete, all 813 acres of the Hansen Dam Open Space Area would be accessible to the public. In

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9760

addition, Mitigation Measure N&V-MM#8 will apply to the Refined SR14, E2, and E2A Build Alternatives as they both pass over Hansen Dam Open Space Area recreation areas that provide equestrian trails and/or equestrian facilities. The following signage would be posted along the Hansen Dam Recreation Area: •A passive warning sign at approximately 1,300 feet or further from the alignment warning of an upcoming train crossing •An active warning sign at 60+ feet of the alignment, warning users of an upcoming train crossing and the approximate time of the crossing (number of minutes) As such, based on this information, the Authority concluded that there would be a de minimis impact on the Hansen Dam Open Space Area associated with the Refined SR14, E2, and E2A Build Alternatives. The Authority's preferred alternative (the SR14A Build Alternative) would not result in a Section 4(f) use of the Hansen Dam Open Space Area.

### 4494-9761

The commenter provided the definitions for minority populations and low-income populations used in the environmental justice analysis, consistent with Section 5.4.3.2, Data Collection and Analysis, in Chapter 5, Environmental Justice of the Draft EIR/EIS. The commenter describes the local and regional policy consistency analysis presented in Chapter 5 of the Draft EIR/EIS.

Section 5.3 in Chapter 5, Environmental Justice, of the Final EIR/EIS, has been revised to reflect the project's consistency with the most recent regional and local plans, including the Palmdale 2045 General Plan, consistent with updates to Appendix 2-H, Regional and Local Policy Consistency Analysis, and the Chapter 3 resource sections of the Final EIR/EIS. The commenter identifies Sylmar, Pacoima, and Sun Valley as communities with the highest minority populations and Lake View Terrace as a community with low-income populations, consistent with what is described in Section 5.4, Affected Environment of the Draft EIR/EIS. The commenter also notes that Census data from 2010-2014 were used for the environmental justice analysis. CEQA Guidelines section 15125(a)(1) specifies that the environmental baseline generally consists of the physical environmental conditions as they exist at the time the notice of preparation for the EIR was published. The baseline year for the analysis of project impacts was established after the Notice of Preparation (NOP) was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis. Therefore, the use of a 2015 (or later, depending) baseline is appropriate under CEQA.

The Authority also reviewed existing conditions data during preparation of the Final EIR/EIS and concluded that the 2015 baseline data continues to be appropriate because it is not substantially different from the latest data available in a way that would change the analysis of environmental effects presented the Draft EIR/EIS. Please see Section 3.1.4.5 and Section 5.4.3.1 of the Final EIR/EIS for further explanation, including citations for the U.S. Census data used in the analysis (the 2010-2014 American Community Survey 5-year estimates) presented in the Final EIR/EIS, and the most recent U.S. Census data available (the 2017-2021 American Community Survey 5-year estimates available at <https://data.census.gov/table>), which the Authority reviewed. Please also refer to response to comment #9580, which also addresses the date of the Census data used in the EIR/EIS. Further, because conditions have not substantially

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9761

changed, use of the most recent Census data would not yield results that would change the findings in the Draft EIR/EIS.

The commenter asserts that the Draft EIR/EIS analyzed "unknown projects" as part of the No Project Alternative. To clarify, Section 5.7.1, No Project Alternative, of the Draft EIR/EIS, takes into account the particular, reasonably foreseeable future projects identified by the Authority as listed in Appendix 3.19-A, Cumulative Projects List, and further evaluated in Section 3.19, Cumulative Impacts. These projects include those that are planned but not yet approved, approved but not yet constructed, approved but only partially constructed, or in any number of other known stages of planning and development. The commenter provides a summary interpretation of the effects determinations provided for each resource topic evaluated in Chapter 5, Environmental Justice of the Draft EIR/EIS. The effects determinations presented in Section 5.7, Environmental Consequences, in Chapter 5, Environmental Justice of the Draft EIR/EIS provides a thorough and evidenced analysis of the project's effects on environmental justice communities, and it concludes that, for most resource topics, there would not be disproportionately high and adverse effects on minority populations or low-income populations for a variety of reasons, including that some of these adverse effects would be borne comparably by environmental justice and non-environmental justice communities in the same region or that mitigation exists to address adverse effects. Nonetheless, the Final EIR/EIS identifies steps to address adverse impacts on environmental justice communities. Table 5-5 in the Final EIR/EIS summarizes the disproportionately high and adverse effects from each Build Alternative on minority populations and low-income populations.

Furthermore, Section 5.4.2 of this Final EIR/EIS describes project impact avoidance and minimization features (IAMFs) that would be incorporated into the project design for the purposes of the environmental impact analysis presented in this EIR/EIS. As noted, the full text of the IAMFs that are applicable to the Palmdale to Burbank Project Section are provided in Appendix 2-E, Impact Avoidance and Minimization Features, and the analysis presented in this Final EIR/EIS considers these IAMFs as part of the project design. Within Section 5.6, each narrative discussion describes how these project features are applicable and, where appropriate, effective at avoiding or minimizing impacts. The commenter states that most business displacements (70-80 percent)

### 4494-9761

would take place in environmental justice communities. This effect is discussed in Section 5.7.2.8 of the Draft EIR/EIS. As described in Section 5.7.2.8 for each Build Alternative, most business displacements (70-80 percent) would indeed take place in environmental justice communities; furthermore, the E2 and E2A Build Alternatives would result in a loss of community cohesion due to residential displacements in Lake View Terrace, which is identified as an environmental justice community. As a result, the Authority has determined that all six Build Alternatives would result in disproportionately high and adverse effects on environmental justice populations related to business displacements (for all six Build Alternatives) and community cohesion (for the E2 and E2A Build Alternatives).

The commenter asserts that permanent adverse aesthetic and visual effects in environmental justice communities and non-environmental justice communities would occur under all Build Alternatives, varying from four for the Refined SR14 Build Alternative, to eight for the E2A Build Alternative. The commenter is correct that all Build Alternatives would have adverse effects related to aesthetics and visual quality, as evaluated in Section 5.7.2.10 of the Draft EIR/EIS. However, the SR14A Build Alternatives would result in permanent adverse effects on two key viewpoints, one of which is located within an environmental justice community. Even after the implementation of IAMFs and mitigation measures, there would be adverse visual effects from HSR-related structures; however, given that both environmental justice and non-environmental justice populations would comparably experience adverse visual effects, and the magnitude of such effects would be similar in both environmental justice and non-environmental justice communities, this effect would not be disproportionately high and adverse to environmental justice populations.

The commenter asserts there would be adverse cumulative transportation effects from spoils hauling for each Build Alternative. As discussed in Section 5.7.3 of the Draft EIR/EIS, the adverse transportation effects from spoils hauling during construction would represent contributions to adverse cumulative effects on environmental justice populations. The commenter summarizes measures to mitigate adverse effects or to provide benefits to offset adverse effects on environmental justice communities. Section 5.8.3 of the Draft EIR/EIS describes benefits that offset the adverse effects on environmental justice communities, including a Community Benefits Agreement, through

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9761

which the Authority would require each prime contractor of an awarded construction package to commit 30 percent of all construction dollars to hiring small businesses, including separate goals for the hiring of disadvantaged and disabled veterans' businesses.

Effects on environmental justice populations would be reduced with implementation of the mitigation measures listed in Section 5.8.1 and discussed in Section 3.2, Transportation; Section 3.3, Air Quality and Global Climate Change; Section 3.4, Noise and Vibration; Section 3.5, Electromagnetic Interference and Electromagnetic Fields; Section 3.8, Hydrology and Water Resources; Section 3.10, Hazardous Materials and Wastes; Section 3.11, Safety and Security; Section 3.12, Socioeconomics and Communities; Section 3.15, Parks, Recreation, and Open Space; Section 3.16, Aesthetics and Visual Quality; and Section 3.17, Cultural Resources. It is assumed that the mitigation measures outlined will be applied to populations that are low-income, minority, or otherwise, based on the extent of the project effects.

More recently, during November 2023, December of 2023 and January 2024 the Authority conducted listening sessions with EJ communities in Pacoima and Sun Valley to seek feedback on potential additional measures that would avoid, minimize, and mitigate project impacts in EJ communities and would address concerns of EJ communities about the project's adverse effects. The Authority has developed additional measures to respond to concerns from environmental justice (EJ) communities, which are listed in Section 5.4.2 in Chapter 5, Environmental Justice, and described in Appendix 2-E, Impact Avoidance and Minimization Features of this Final EIR/EIS. The Authority has also developed offsetting mitigation measures (OMM) to offset disproportionately high and adverse effects (DHAE) on minority and low-income populations. See Section 5.8, in Chapter 5, Environmental Justice of this Final EIR/EIS, along with Appendix 5-B for additional information on IAMFs and OMM EJ Community Benefits (e.g., street safety improvements, workforce development programs, school communication and community connectivity). The new measures require the Authority to create an ombudsman position (liaison) to address the needs of adversely affected EJ communities prior to final design, including the communities of Pacoima and Sun Valley. The ombudsman shall be a bilingual single point-of-contact for the EJ communities adversely affected by the project. The scope of the EJ ombudsman's responsibilities and

### 4494-9761

duties include those articulated in the other EJ-related IAMFs and OMMs. These responsibilities include implementing programs (e.g., Pacoima and Sun Valley Workforce Development Program, community air quality monitoring) and holding community roundtables to obtain ideas for business spotlighting (minimize any potential access disruptions or inconveniences to businesses), aesthetic treatments, as-applicable noise treatments, and intersection and/or safety improvements. The EJ ombudsman shall prepare a report (quarterly, at a minimum) of all concerns and complaints received from EJ communities and measures taken by the Authority to address those concerns and complaints.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9762

Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS.

The commenter quoted page 5-14 of the Draft EIR/EIS and inquired about the process for making final environmental justice determinations and how more input can be provided. The Authority has now received comments on the Draft EIR/EIS, and the Authority has updated Section 5.4.3.2 of the Final EIR/EIS to better reflect the methodology used. Please refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS, which outlines the public review and comment process on the Palmdale to Burbank Project Section Draft EIR/EIS. The Authority has considered all comments received on the Draft EIR/EIS and has revised the Final EIR/EIS as appropriate based on the comments received, in accordance with CEQA and NEPA requirements. The final environmental justice determinations will be made in the Record of Decision. Refer to Section S.14.1 in the Final EIR/EIS for further discussion of the Authority's future decision-making processes. Even after the Authority issues a Record of Decision, the Authority will continue engagement with environmental justice communities during final design and construction of the project. In November 2023, December 2023, and January 2024, the Authority conducted listening sessions with EJ communities in Pacoima and Sun Valley to seek feedback on potential additional measures that would avoid, minimize, and mitigate project impacts in EJ communities and would address concerns of EJ communities about the project's adverse effects. The Authority has developed additional measures to respond to concerns from environmental justice (EJ) communities, which are listed in Section 5.4.2 in Chapter 5, Environmental Justice, and described in Appendix 2-E, Impact Avoidance and Minimization Features of this Final EIR/EIS. The Authority has also developed offsetting mitigation measures (OMM) to offset disproportionately high and adverse effects (DHAE) on minority and low-income populations. See Section 5.8, in Chapter 5, Environmental Justice of this Final EIR/EIS, along with Appendix 5-B for additional information on IAMFs and OMMs. The new measures require the Authority to create an ombudsman position (liaison) to address the needs of adversely affected EJ communities, including the communities of Pacoima and Sun Valley. The ombudsman shall be a bilingual single point of contact for the EJ communities adversely affected by the project. The scope of the EJ ombudsman's responsibilities and duties will include those articulated in the EJ-related IAMFs and OMMs, such as implementing programs

### 4494-9762

(e.g., Pacoima and Sun Valley Workforce Development Program, community air quality monitoring) and holding community roundtables to obtain ideas for business spotlighting, aesthetic treatments, as-applicable noise treatments, and intersection and/or safety improvements.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9763

The commenter requested further information on public meetings and environmental justice community outreach for the project.

The Authority held informal and formal public meetings to help inform the Draft EIR/EIS preparation process. The meetings consisted of open houses, formal presentations, and question and answer sessions in proximity to the project area. EJ-specific outreach for the Palmdale to Burbank Project Section is an ongoing effort that began in 2015. From 2015 to 2022, a total of 40 meetings or events aimed directly at environmental justice populations took place in the cities of Los Angeles, Lancaster, San Fernando, and Burbank; the communities of Pacoima, Sun Valley, Sylmar, and Sunland-Tujunga; and online virtually, attracting over 4,700 attendees.

These included Community Working Groups (CWGs) and Stakeholder Working Group sessions in environmental justice communities that drew more than 250 participants. Invitees and attendees at these meetings included but were not limited to, community members and local residents from the cities mentioned above and representatives or members of local community groups (i.e., faith-based organizations, environmental justice advocacy groups, community advocacy groups, social service groups, social justice advocacy groups, transit advocacy groups, neighborhood councils, town councils and community/homeowner associations, etc). Information and meeting announcements were posted on the Authority's website. In-person meetings have been combined with online webinars to increase participation and engagement. Specifically, the virtual meetings held between 2020 and 2022 drew more than 385 attendees. Virtual meetings were complemented with in-person outreach efforts to target EJ communities throughout the project alignment. A combination of both modalities has proven the best approach to give stakeholders multiple opportunities to stay engaged with the project throughout all phases.

Included in Chapter 9 of the Final EIR/EIS, Public and Agency Involvement, Table 9-5 lists the dates of public meetings that occurred during the development of the Draft EIR/EIS since summer of 2016. The Draft EIR/EIS was made available for a 90-day comment period and the Authority received over 400 submissions which it considered in developing the Final EIR/EIS. All of these EJ outreach activities involved engaging minority and/or low-income populations in the Resource Study Area (RSA) to

### 4494-9763

communicate project information, listening to and responding to community thoughts and concerns, and identifying potential actions to mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority and/or low-income populations. The purpose of these outreach activities is to inform local community members of the California HSR Project and its status and to provide opportunities by which minority and/or low-income communities can effectively take part in the planning process for the project.

In addition, during November 2023, December of 2023, and January 2024, the Authority conducted listening sessions with EJ communities in Pacoima and Sun Valley to seek feedback on potential additional measures that would avoid, minimize, and mitigate project impacts in EJ communities and would address concerns of EJ communities about the project's adverse effects. The Authority has developed additional measures (Offsetting Mitigation Measures [OMM] and Impact Avoidance and Minimization Features [IAMF]) to respond to concerns from EJ communities, which are listed in Section 5.4.2 in Chapter 5, Environmental Justice, and/or described in Appendix 2-E, Impact Avoidance and Minimization Features of this Final EIR/EIS. These include: EJ-OMM#1 (Construction Jobs and Opportunities, Training and Workforce Development), EJ-OMM#2 (Community Connectivity Workshop), EJ-OMM#3 (Montague Street Improvements), EJ-OMM#4 (Intermediate Window (SR14-W2), Conveyor belt usage requirements and school coordination), EJ-IAMF#1 (Authority EJ Ombudsman and Contractor's EJ Liaison), EJ-IAMF#2 (Business Spotighting), EJ-IAMF#3 (EJ Community-Inclusive Development of Aesthetic Treatments and Community Cohesion Enhancements), EJ-IAMF#4 (EJ Business Relocation/Displacement Assistance), EJ-IAMF#5 (EJ Community Post-Construction Communication), EJ-IAMF#6 (Non-Regulatory Supplemental and Informational Monitoring).

The new EJ-related IAMFs require the Authority to create an ombudsman position (liaison) to address the needs of adversely affected EJ communities, including the communities in the San Fernando area. The ombudsman shall be a bilingual single point of contact for the EJ communities adversely affected by the project. The scope of the EJ ombudsman's responsibilities and duties include those articulated in the other EJ-related IAMFs. These responsibilities include implementing programs (e.g., Pacoima and Sun Valley Workforce Development Program, community air quality monitoring) and holding

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9763

community roundtables to obtain ideas for business spotlighting, aesthetic treatments, as-applicable noise treatments, intersection and/or safety improvements, and community-specific feedback on the following plans not typically reviewed by the general public including the Construction Safety Transportation Management Plan (SS-IAMF#1) and Transportation Construction Management Plan (TR-MM#12). The latter will provide the opportunity for EJ communities including those residing in the Pacoima neighborhood to review and provide input on the proposed transportation management plans for the project, to ensure impacts to the roadway network during construction are minimized and/or avoided. The EJ ombudsman shall prepare a report (quarterly, at minimum) of all concerns and complaints received from EJ communities and measures taken by the Authority to address those concerns and complaints

### 4494-9764

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-5: Impacts of Spoils Hauling (Noise), PB-Response-N&V-6: Construction Noise/Truck Impacts.

The commenter questions the analytical basis for the No Project Alternative discussion in Chapter 5 Environmental Justice (EJ). The No Project Alternative analysis is based on existing projections, existing and approved land uses, and other developments rather than supposition. Table 2-2 on page 2-64 in Chapter 2 of the Draft EIR/EIS provides projected population of the project area including the cities of Palmdale, Los Angeles, Burbank, and unincorporated Los Angeles County and notes that population is expected to grow through 2040 (U.S. Census, 2015; SCAG, 2016; DOF, 2016). Table 2-3 on page 2-65 of the Draft EIR/EIS shows that employment is also expected to grow within the same jurisdictions through 2040 (SCAG, 2016). As discussed in Section 5.7.1, No Project Alternative, in Chapter 5, construction and operation of planned and programmed projects have the potential to result in environmental effects on EJ populations. As discussed in Section 5.7.1.3, continued growth and construction activity under the No Project Alternative would result in noise and vibration effects to EJ populations.

For more information regarding noise and vibration effects related to the Build Alternatives, please refer to Section 3.4 of the Draft EIR/EIS and PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors which provides more information regarding operational noise, PB-Response-N&V-5: Impacts of Spoils Hauling (Noise) which provides more information regarding IAMFs designed to reduce the noise impacts from truck traffic along spoils haul routes as well as mitigation measures, and PB-Response-N&V-6: Construction Noise/Truck Impacts which provides more information regarding the IAMFs set forth to reduce noise and vibration impacts from spoils hauling as well as mitigation measures. Please refer to PB-Response-ALT-1: Alternatives Selection and Evaluation Process which addresses why the Preferred Alternative was chosen over the No Project Alternative. The Project would provide an alternative mode to car and airline travel which would decrease transportation-related noise by rerouting and/or reducing traffic that is anticipated from the continued growth under the No Project Alternative, thereby reducing future transportation noise in the project area. Thus, noise levels are expected to increase over time in the RSA with the No Project Alternative.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9765

The commenter requested information on cumulative project impacts on EJ communities under the No Project Alternative.

Cumulative project effects to EJ populations are described in Section 5.7.3, in Chapter 5 of this Final EIR/EIS. Appendix 3.19-A includes a list of cumulative past, present, and foreseeable projects accounted for in this analysis. This appendix identifies and maps recent, present, and foreseeable future land development and transportation projects and plans in each jurisdiction within the Palmdale to Burbank study area. Tables 3.19-A-1 through Table 3.19-A-7 identify regional projects, County of Los Angeles projects, and projects within the cities of Lancaster, Palmdale, Santa Clarita, Los Angeles, and Burbank. These tables include the following information: A map identification number corresponding to the mapped project location, when applicable; the project name and/or identification number (for federal/state transportation improvement projects); a brief project description; project status or timing. Page 3.19-4 of the Draft EIR/EIS describes that for the purpose of this analysis, reasonably foreseeable future projects are defined as those that are likely to occur in the 2040 planning horizon for the Palmdale to Burbank Project Section and that would contribute to the cumulative impact on a particular resource. Projects were identified by reviewing regional transportation plans, regional transportation improvement programs, local long-range transportation plans, local land use, general, and specific plans; interviews with local and regional planning agencies; and reviewing recent environmental documents for other large-scale projects near the Build Alternatives."

The list of cumulative projects compiled for the EIR/EIS were based on plans and recent environmental documents, which would make these projects reasonably foreseeable. As such the projects included in the analysis are not speculative. Under the cumulative condition, ongoing urban development is expected to continue within the cumulative RSA. Such planned projects that are anticipated to be constructed by 2040 include residential, commercial, industrial, recreational, and transportation facilities. Construction of cumulative projects could result in temporary and permanent disruptions to minority and/or low-income populations during temporary construction activities. If the incremental effects of multiple projects were to combine to create disproportionate and adverse effects on low-income populations and minority populations in specific communities, this would be considered a cumulative effect on EJ populations under

### 4494-9765

NEPA. However, these projects are distributed throughout Los Angeles County, which has 18.4 percent low-income populations and 72.8 percent minority populations (EJ populations). Further, a number of these projects would create additional, permanent jobs in the area and would set aside land for future industrial and commercial development, which could increase the economic opportunities available to the EJ populations.

Development of planned projects would likely include the implementation of various forms of mitigation to avoid or minimize temporary and permanent cumulative effects on the population as a whole in the cumulative RSA. Remaining effects would be distributed throughout the region and would occur based on the construction timelines of the planned projects under the cumulative condition.

### 4494-9766

The commenter asked how traffic may be different in the future considering the state's electric vehicle goals from traffic predicted under build alternatives in the EIR/EIS. Future traffic volumes for 2028 and 2040 conditions were based on output from the 2016 SCAG travel demand model, which projects future traffic volumes based on anticipated growth in land uses and change in the transportation network that may shift travelers from automobiles to other modes (such as transit or active transportation). The traffic volume projections do not consider the vehicular fleet mix (they are based on the total number of vehicles, regardless of whether they are electric or gasoline-powered). In addition, the technical analysis, including both operations and vehicle-miles traveled (VMT), does not distinguish between electric and gasoline-powered vehicles as they would both have the same operational and trip-making characteristics. As such, the analysis remains valid.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9767

The commenter requests comparisons for water resources, drainage, erosion, and stormwater run-off between the No Project Alternative and the Build Alternatives. Section 3.8 Hydrology and Water Resources in the Draft EIR/EIS (see Section 3.8.6.2) evaluates the effects of the No Project and concludes that the population in the RSA would continue to grow and that changes and improvements to transportation infrastructure in and near the Palmdale to Burbank area would be implemented by agencies other than the Authority. Overall, development would be focused within the urbanized portions of the Antelope Valley and San Fernando Valley. Between these urban centers, vast areas of the San Gabriel Mountains would likely remain intact and undisturbed because of their protected status as part of the National Forest System. Construction projects could alter surface water drainage patterns, modify watercourse capacity and water-flow height, increase erosion and sedimentation, degrade surface water or groundwater quality, and increase flood risks by altering flood hazard areas. Long-term effects associated with these projects could increase stormwater runoff speed and rates, permanently alter watercourse hydraulic capacity, degrade surface water or groundwater quality, increase flood heights, or decrease groundwater recharge. These potential effects would be similar to effects caused by above ground elements of the Build Alternatives. However, much of each of the Build Alternatives would be underground within the project limits. Where underground the project would not result in direct effect on surface hydrology (altering surface water) or water resources.

### 4494-9768

The commenter queries about the types of hazardous materials could be used for development through 2024 under the No Project Alternative within the resource study area (RSA) for environmental justice. The commenter asks for a comparison between the hazardous materials for construction under the No Project Alternative and the Build Alternatives. The commenter also asks what "lands with environmental concerns" are present within the RSA.

As discussed in Section 3.10.6.2, No Project Alternative, in Section 3.10, Hazardous Materials and Wastes, of the Draft EIR/EIS, "No Project Alternative conditions would result in new urban/suburban development and transportation infrastructure throughout the hazardous materials and wastes RSAs to accommodate population growth. Because development activities would continue within the RSAs, there would be increases in the regional generation of hazardous materials commonly used for construction and operation of urban development, such as fuel, welding materials, petroleum products, lubricants, paints and solvents, and cement products containing strong acidic or basic chemicals. These increases under the No Project Alternative would incrementally contribute to the regional transportation, use, storage, and disposal of hazardous materials during construction and operations. ... Projects anticipated to proceed or continue under the No Project Alternative would encounter similar types of extant hazardous materials and wastes as those expected to be encountered by all six Build Alternatives, including PEC sites, hazardous building materials, residual pesticides, landfill sites, educational facilities, oil/gas infrastructure, and roadway/railway contamination." It is noted that the ultimate limit of the hazardous materials and wastes RSAs is 1 mile from the project alignment centerline on both sides of alignment, and generally encompasses the environmental justice RSA, which extends 0.5 mile beyond the project alignment footprint. For detailed information regarding the types of development that could occur under the No Project Alternative, please refer to Section 2.5.1, No Project Alternative - Planned Improvements, in Chapter 2, Alternatives, of the EIR/EIS. For a complete list of planned land development projects, see Appendix 3.19-A, Cumulative Projects List. The types of hazardous materials that would be used in the construction of development under the No Project Alternative would be similar to the hazardous materials used to construct any of the Build Alternatives. It would be too speculative to quantify the amount of hazardous materials that would be used to construct development in the environmental justice RSA, as it is unknown what

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9768**

development could occur and the timing of such construction. Therefore, a quantitative comparison between the amounts of hazardous materials used for construction under the No Project Alternatives and the Build Alternatives is not feasible.

Regarding the commenter's request for the "lands with existing environmental concerns," please refer to Section 3.10.5, Affected Environment, in Section 3.10, Hazardous Materials and Wastes, of the EIR/EIS, which includes a description of existing hazardous waste and concerns within the hazardous materials and wastes RSAs, including specific potential environmental concern sites.

### **4494-9769**

The commenter asks whether a statement in the Draft EIR/EIS, which identifies that the No Project Alternative would be unlikely to generate a similar quantity of spoils as the Build Alternatives that would require tunneling, would be an argument in favor of the No Project Alternative. Arguments for or against any alternative, including the No Project Alternative, require considering the full breadth of consequences for implementing or not implementing an alternative. For example, while the No Project Alternative would not generate the hazardous spoils associated with tunneling, the hazardous materials found in soils would remain in the ground where they could continue to affect the environment. In contrast, the Build Alternatives requiring tunneling would remediate (to excavate and remove) and properly dispose of these hazardous spoils. Furthermore, the No Project Alternative would not meet the HSR purpose, need, or objectives outlined in Chapter 1, Project Purpose, Need, and Objectives of the EIR/EIS. When selecting the preferred alternative, the Authority balanced functional, technical, economic, and constructability factors, as well as minimized impacts on natural resources and human communities. Refer to Chapter 8, Preferred Alternative for more information regarding the selection of the preferred alternative.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9770

The commenter requested further information on emergency response times under the No Project Alternative. Further information on emergency response times under the No Project Alternative can be found in Section 3.11.6.2, in Section 3.11, Safety and Security, of this Final EIR/EIS. Under the No Project Alternative, the demand for law enforcement, fire, and emergency services would change and coincide with the anticipated population growth and needs of planned industrial, residential, and commercial developments. Existing emergency response plans and procedures would not be negatively affected, and safety conditions related to motor vehicles, pedestrians, and bicyclists would not change. Conditions related to airports, critical facilities, and high-risk facilities in the study area would not change as a result of planned future projects. Emergency responders would continue to experience delays throughout the study area at numerous at-grade crossings of the UPRR, BNSF Railway, and San Joaquin Valley Railroad when trains block crossings.

### 4494-9771

The commenter requests additional information on the occurrence of community division under the No Project Alternative. Under the No Project Alternative, cumulative impacts from past, present, and reasonably foreseeable future projects in the study area would still occur and are discussed further in Section 3.19, Cumulative Impacts, of this Final EIR/EIS. Appendix 3.19-A, Cumulative Project List, includes projects considered for the cumulative impact analysis. Section 3.19.5.2 of this Final EIR/EIS includes discussion of effects from other transportation projects on socioeconomic and communities, which could result in loss of community cohesion and divide established communities.

### 4494-9772

The commenter requests examples of "proposed projects" for the No Project Alternative. As described in Chapter 2, Alternatives, the No Project Alternative assumes that the Palmdale to Burbank Project Section would not be constructed. In assessing future conditions, it was assumed that all currently known, programmed, and funded improvements to the intercity transportation system (highway, rail, and transit) and reasonably foreseeable local development projects (with funding sources already identified) would be developed as planned by 2040. The No Project Alternative is based on a review of all city and county general plans, regional transportation plans for all modes of travel, and agency-provided lists of pending and approved projects within Los Angeles County. For the environmental analysis, the No Project Alternative considers the effects of growth planned for the region, as well as existing and planned improvements to the highway, aviation, conventional passenger rail, and freight rail systems in the Palmdale to Burbank Project Section area through 2040. The scenario is based on future development projects and improvements to the intercity transportation system that are programmed and funded for construction. Projects that could occur with the No Project Alternative can be found in Appendix 3.19-A of the Final EIR/EIS.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9773

The commenter asks about the effect of extra lanes and added truck traffic (presumably from construction trucks) on the roads themselves and what kinds of repairs would be needed as a result of weighted truck traffic. Extra lanes would be installed to improve traffic conditions during operation of the project, pursuant to Mitigation Measure TR-MM#1. Mitigation Measures TR-MM#6 and TR-MM#7 would also widen intersection approaches and add exclusive turn lanes to improve intersection operations. Introducing a new travel lane is unlikely to cause physical deterioration of existing lanes since the increased lane capacity would result in more dispersed traffic flow. (and the commensurate dispersal of any increase in traffic weight) This reduced congestion and load distribution across the lanes would alleviate any project-related wear and tear on the road surface.

During construction, added truck traffic from spoils hauling could damage existing roadways; however, TR-IAMF#2 requires the preparation of a Construction Transportation Plan (CTP), and TR-IAMF#7 requires the construction contractor to deliver equipment and materials on appropriate truck routes and avoid impacts on streets that cannot accommodate truck traffic. This would serve to minimize damage caused by truck traffic. In addition, TR-IAMF#1 would require the Authority to be responsible for the repair of structural damage to public roadways caused by HSR construction, including the addition of new roadways, and returning damaged sections to the equivalent of their original pre-HSR construction structural condition or better. After heavy construction use, necessary repairs to the roadway might involve addressing surface wear, pavement deterioration, subgrade damage, drainage issues, and potential structural damage caused by heavy trucks.

### 4494-9774

The commenter requested further information on transportation, including spoils hauling effects on environmental justice populations from the project as well as the length of time these effects would occur.

As depicted in Tables 5-6 through Table 5-11, project construction associated with each Build Alternative would affect a wide range of roadways throughout the project area. As such construction traffic would occur on roadways in both EJ and non-EJ census block groups (Figure 5-1 through 5-18 depict the EJ and non-EJ communities along each of the Build Alternatives study areas). For example, many areas along the project corridors in the San Fernando Valley are EJ communities. However, there are non-EJ block groups and communities interspersed. Other areas to the north such as areas around Santa Clarita, Acton and south of Palmdale would also experience construction period spoils hauling truck traffic and are not EJ communities. Construction spoils hauling would not necessarily change traffic circulation patterns but could result in additional congestion during certain hours of the day. Implementation of TR-IAMF#2, TR-IAMF#6, TR-IAMF#7 and TRA-MM#12 will require a Construction Transportation Plan and a Construction Management Plan that will limit spoils hauling hours, and establish spoils hauling routes to minimize impacts on the local communities along each route (both EJ and non-EJ communities). The duration of spoils related traffic effects will vary depending on location and type of construction activity. Appendix 2-1 provides the construction assumptions for spoils hauling including information about the duration of construction at each construction site. These durations vary, with many being 1 year or less. Several locations will experience construction spoils hauling for multiple years. For example, for the SR14A Build Alternative, the longer period construction spoils hauling will occur north of the San Fernando Valley in areas that do not comprise EJ communities. In the San Fernando Valley area, most construction durations are around 1 year and much of the spoils generated in the San Fernando Valley area can be conveyed to disposal sites (Boulevard Mine) via conveyor belt, which would reduce the amount of truck traffic through EJ communities in the area.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9775

The purchase of offsets would have minimal effect on the local air quality impacts of the project. However, as noted in Section 3.3.2.3 of the Draft EIR/EIS, the project would adhere to all applicable CARB, AVAQMD, and SCAQMD rules and regulations which would reduce localized emissions. Implementation of AQ-IAMF#1 through AQ-IAMF#6 listed in Section 3.3.4.2 of the Draft EIR/EIS and AQ-MM#1 through AQ-MM#3 listed in Section 3.3.7 of the Draft EIR/EIS will also reduce localized emissions to the extent feasible.

### 4494-9776

Water use for reducing fugitive dust emissions is a common construction practice and would not substantially deplete California's water resources. Often times recycled water is used for dust suppression. AQ-MM#3 describes how the Authority and all project construction contractors shall require that a minimum of 25 percent, with a goal of 100 percent, of all light-duty on-road vehicles (e.g., passenger cars, light-duty trucks) associated with the project (e.g., on-site vehicles, contractor vehicles) use ZE or NZE technology.

The Authority and all project construction contractors shall have the goal that a minimum of 25 percent of all heavy-duty on-road vehicles (e.g., for hauling, material delivery, and soil import/export) associated with the project use ZE or NZE technology.

The Authority and all project construction contractors shall have the goal that a minimum of 10 percent of off-road construction equipment use ZE or NZE vehicles.

If local or state regulations mandate a faster transition to using ZE and/or NZE vehicles at the time of construction, the more stringent regulations will be applied. For example, EO N-79-20, issued by California Governor Newsom September 23, 2020, currently states the following:

- Light duty and passenger car sales be 100 percent ZEV by 2035
- Full transition to ZEV short haul/drayage trucks by 2035
- Full transition to ZEV heavy-duty long-haul trucks, where feasible, by 2045
- Full transition to ZE off-road equipment by 2035, where feasible

The project will have a goal of surpassing the requirements of these or other future regulations as a mitigation measure.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9777

Specific to the analysis of environmental justice and noise and vibration effects, the commenter asked how traffic would be rerouted from residential streets and requested five specific examples for specific locations on how truck traffic will be routed away from residential locations. The commenter also questioned the overall effectiveness of noise and vibration mitigation measures for the project, and asked for specific details about construction impacts and what would be done if the project cannot meet federal and state regulations.

Impact avoidance and minimization feature (IAMF) NV-IAMF#1 requires that the contractor shall prepare and submit to the Authority a noise and vibration technical memorandum documenting how the FTA and FRA guidelines for minimizing construction noise and vibration impacts will be employed when work is being conducted within 1,000 feet of sensitive receivers. As described in the environmental justice noise analysis in Section 5.7.2.3 of the Draft EIR/EIS, "N&V-IAMF#1 would avoid and minimize construction-related noise and vibration effects on sensitive receivers by requiring temporary noise barriers, routing of truck traffic away from residential streets, avoiding pile driving where possible, and other typical construction practices contained in the FTA and FRA guidelines for minimizing construction noise and vibration." Construction management plans, including the Construction Management Plan (CMP) (SOCIO-IAMF#1) and Construction Transportation Plan (CTP) (TR IAMF#2), have not yet been prepared for the Palmdale to Burbank Project Section, and will be prepared by the Contractor once funds for the project are secured, prior to the commencement of construction. At that time, enough detail would be known for the contractor to prepare the technical memorandum with specific strategies for noise reduction. Strategies can include setting haul routes that avoid residential streets. However, this memorandum is not currently drafted and therefore no specific examples of truck traffic being rerouted away from residential streets can be provided at this time.

Regarding the duration of noise from project construction, Table 3.4-24 in Section 3.4, Noise and Vibration of the Draft EIR/EIS, provides the total time duration and residential noise screening distances for proposed project construction activities. As discussed in Section 3.16, Aesthetics and Visual Quality of the Draft EIR/EIS, however, construction activities would occur for only 1 to 2 years at a given location. During peak construction periods, work is envisioned to be under way at several locations along the route, with

### 4494-9777

overlapping construction of various elements of the Build Alternatives.

Worksite safety in California, including construction worksite safety, is regulated by provisions of Title 8 of the Cal. Code Regs. and is overseen by the California Occupational Safety and Health Administration (Cal-OSHA) as noted in section 3.11.2.2 of the Draft EIR/EIS. Title 8 Section 1502 requires compliance with standard procedures to prevent construction worksite accidents and requires a written workplace injury and illness prevention program to be in place. In addition to legal requirements, the contractor will manage potential exposure to workplace hazards through implementation of Construction Safety and Health Plans for each phase of project construction (SS-IAMF#2). Each of these plans will establish the minimum safety and health standards for contractors of, and visitors to, project construction sites. Each of these plans will require the contractor to develop and implement site-specific measures that address regulatory requirements protective of human health and property at each construction site.

Regarding the question about additional analysis under N&V-MM#6, N&V-MM#6 states that "Prior to construction, the contractor will provide the Authority with an HSR operational noise technical report for review and approval. If final design or final vehicle specifications result in changes to the assumptions underlying the existing noise technical report, the Authority will prepare necessary environmental documentation, as required by NEPA and CEQA, to reassess noise impacts and mitigation." As stated in the mitigation measure, this further analysis will evaluate if final design or final vehicle specifications result in changes to the assumptions underlying the existing noise technical report.

Regarding the question of how the contractor will know effectiveness of mitigation, NV-IAMF#1 requires that the contractor shall prepare and submit to the Authority a noise and vibration technical memorandum documenting how the FTA and FRA guidelines for minimizing construction noise and vibration impacts will be employed when work is being conducted within 1,000 feet of sensitive receivers. This would be based on anticipated noise generation. Additionally, Mitigation Measure N&V-MM#1 requires the contractor to prepare a noise-monitoring program describing how the contractor will monitor construction noise including noise from truck traffic to verify compliance with the noise limits, including compliance with all applicable state and federal rules and

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9777

regulations. Therefore, there is a measure in place to verify effectiveness of noise reduction measures. Please refer to Appendix 2-E, Impact Avoidance and Minimization Features, and Appendix 3.1-C, Standardized Mitigation Measures in the Draft EIR/EIS, for the further text describing proposed IAMFs and mitigation measures for the project.

### 4494-9778

The commenter requested further information on safety screening during project operations, including for passengers with medical implants and equipment. As described in Section 3.11.1, in Section 3.11, Safety and Security of this Final EIR/EIS, HSR System operations would follow systemwide safety and security plans developed by the Authority in cooperation with the Federal Railroad Administration (FRA) and the Transportation Security Administration (TSA). The project could include passenger screening akin to airline passenger screening based on the Security Program Plan that will be developed for the project in coordination with FRA and TSA. Impact EMI/EMF#5, in Section 3.5, Electromagnetic Interference and Electromagnetic Fields (EMI/EMF) of this Final EIR/EIS, describes and evaluates effects on people with implanted medical devices and exposure to EMF from the project. For passengers and members of the public, the EMI and EMF exposure levels during operations of the project will remain below the maximum permissible exposure (MPE) threshold determined by the Institute of Electrical and Electronics Engineers (IEEE) (Standard C95.6, Standard for Safety Levels with Respect to Human Exposure to Electromagnetic Fields), and would not interfere with an implanted medical device.

### 4494-9779

The commenter asks the following questions and cites page 5-65 of the Draft EIR/EIS: where groundwater basins will be constructed, whether floodplains have been identified, how many groundwater recharge areas will be provided, and how much water will be used for tunnel construction? Regarding the question about where groundwater basins will be constructed, no "groundwater basins" would be constructed as part of Palmdale to Burbank Project Section. It is unclear what impacts the commenter is asserting should be further addressed. The HSR Palmdale to Burbank Section will be constructed over the four groundwater basins (i.e., Antelope Valley basin, Santa Clara River Valley East Sub-basin, Acton Valley basin, and San Fernando Valley basin) listed in Table 3.8-5 (Groundwater Basins) of Section 3.8.5.5. There are no new groundwater basins being constructed. Section 5.7.2.5 of the Final EIR/EIS has been revised to clarify that the HSR Palmdale to Burbank Section would require HSR development within areas overlying the four groundwater basins. Regarding the question about floodplains, floodplains are discussed and identified in Section 3.8.5.3 of the Draft EIR/EIS. Regarding the question about how many groundwater recharge areas would be constructed, Mitigation Measure HWR-MM#3 indicates that the Authority would provide replacement groundwater recharge areas in the Hansen Spreading Grounds in the vicinity of the existing recharge ponds to allow for no net loss in recharge area or capacity. For more information, please refer to Mitigation Measure HWR-MM#3 in the Draft EIR/EIS. Regarding the comment about water needs for tunnel construction, the amount of water necessary for tunnel construction has been estimated based on the tunnel diameter and method of construction. For cut and cover tunnels, 40,000 gallons per day have been estimated. For tunnel built by a tunnel boring machine (TBM), the water needs vary from 55,000 gallons per day/ (28-foot Internal Diameter TBM) to 105,000 gallons per day (36-foot Internal Diameter TBM).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9780

The commenter asks where hazardous materials will be stored; at what point during construction will hazardous waste be identified; what the State thresholds for hazardous substances are in relation to the Health and Safety Code; and what kinds of hazardous substances could arise during operation.

Regarding the question about storing hazardous materials: hazardous materials will be stored at varying locations throughout the HSR Palmdale to Burbank Project Section alignment, in accordance with HMW-IAMF#10: Hazardous Material Plans (see Section 3.10.4.2 of the Draft EIR/EIS). In general, this IAMF will describe the Authority's commitment to prepare hazardous material monitoring plans prior to operations and maintenance activities.

Regarding the question about the timing of identifying hazardous materials: hazardous wastes will be identified prior to construction in accordance with HMW-IAMF#1: Property Acquisition Phase I and Phase II Environmental Site Assessments and HMW-IAMF#4: Undocumented Contamination (see Section 3.10.4.2 of the Draft EIR/EIS).

Regarding the question about State thresholds: the State includes various regulations related to hazardous materials, which are summarized in Section 3.10.2.2 of the Draft EIR/EIS. The thresholds used to determine the HSR Palmdale to Burbank Project Section's impacts are in Sections 3.10.4.4 and 3.10.4.5 of the Draft EIR/EIS.

Regarding the question about the kind of hazardous substances that could arise during operation: based on historical usage of properties within the Palmdale to Burbank Project Section alignment and available relevant documentation, there is potential for the following, among other substances to be present at hazardous concentrations:

- a. Petroleum hydrocarbons
- b. Volatile organic compounds (VOCs)
- c. Semi-VOCs (SVOCs)
- d. Metals
- e. Pesticides
- f. Asbestos
- g. Poly-Chlorinated Biphenyl's (PCBs)

### 4494-9781

The commenter requested further information on construction worker safety. Within the project scope evaluated in this EIR/EIS, currently, the Authority does not have funding for construction of the project section, and construction has not yet begun. Future funding is being sought for continued progress. Impact S&S#6, in Section 3.11, Safety and Security, of this Final EIR/EIS, evaluates construction site hazards from the project. Construction would increase the risk of exposure to construction equipment and activity hazards that could result in workplace accidents, potentially resulting in accidental injuries and deaths to construction workers and also potentially to the public in the event of a workplace accident, such as a fire or explosion, that resulted in off-site consequences. For example in November 2017, five construction workers working on the project in Fresno were injured, two of which sustained moderated injuries and were hospitalized, due to a tower made of steel rebar falling at the construction site. No construction-related deaths have occurred since commencement of construction of the California HSR system. The Authority will develop and implement an SSMP (SS-IAMF#2), which includes construction worker safety standards, worker safety and health plans, fire and life safety programs, construction on-site security plans, and emergency response and evacuation procedures to maintain the safety of construction workers and the public during HSR construction of the Palmdale to Burbank Project Section. Through the implementation of SS-IAMF#2, which includes safety programs and safety standards, impacts from construction site hazards and accident risks that could compromise the safety or health of workers or nearby community members would be minimized.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9782**

The commenter requested further information on protocol to prevent the potential for exposure to Valley Fever, and the Authority's coordination with local and regional emergency responders during localized natural disasters (wildfire, earthquakes, flooding, and landslides). Valley Fever (coccidioidomycosis or "cocci") is a non-contagious fungal infection caused by inhalation of fungal spores in airborne dust after soil disturbance, such as construction excavation and grading activities, which may be carried by the wind for several miles. The fungus that causes Valley Fever resides in the soil and thrives in the dry dirt and desert-like weather conditions of Los Angeles County and the southern counties of the Central Valley. The project will implement SS-IAMF#2, requiring a project Valley Fever action plan prepared by the construction contractor. The Valley Fever action plan shall address the following components: (1) Information on causes, preventative measures, symptoms, and treatments for Valley Fever to individuals who could potentially be exposed through construction activities (i.e., construction workers, monitors, managers, and support personnel). (2) Continued outreach and coordination with California Department of Public Health. (3) Coordination with county departments of public health to ensure that the above referenced information concerning Valley Fever is readily available to nearby residents, schools, and businesses and to obtain area information about Valley Fever outbreaks and hotspots. (4) Provide a qualified person dedicated to overseeing implementation of the Valley Fever prevention measures to encourage a culture of safety of the contractors and subcontractors. The Valley Fever Health and Safety (VFHS) designee is responsible for ensuring the implementation of measures in coordination with the county Public Health Officer. The VFHS in coordination with the county Public Health Officer will determine what measures will be added to the requirements for the Safety and Security Management Plan regarding preventive measures to avoid Valley Fever exposure. Measures shall include, but are not limited to the following: (1) Train workers and supervisors on how to recognize symptoms of illness and ways to minimize exposure, such as washing hands at the end of shifts; (2) Provide washing facilities nearby for washing at the end of shifts; (3) Provide vehicles with enclosed, air conditioned cabs and make sure workers keep the windows closed; (4) Equip heavy equipment cabs with high efficiency particulate air (HEPA) filters; (5) Make NIOSH approved respiratory protection with particulate filters as recommended by the CDPH available to workers who request them. The Authority will coordinate with local emergency service providers in developing and implementing the project System Safety Program Plan (SSPP) and

### **4494-9782**

Safety and Security Management Plan (SSMP) under SS-IAMF#2, to establish an efficient and coordinated response protocol, systems, and procedures across the multiple agencies that may be involved in responding to an emergency incident, including establishing coordinated procedures for emergency responder access to the HSR access-controlled right-of-way, aerial track, trenches, and tunnels.

### **4494-9783**

The commenter requested further information on compensation procedures for displaced business in environmental justice communities. This topic is discussed in PB-Response-SOCIO-1.

The Authority's acquisition and relocation assistance and advisory services would include, but not be limited to, measures, facilities, or services that may be necessary or appropriate to determine the needs and preferences of each household, business, and nonprofit organization to be displaced. The Authority would provide current information on the availability, purchase prices, and rental costs of comparable replacement residential units. Other benefits and compensation may include payment of residential moving expenses and replacement housing payments, nonresidential moving expenses, and reestablishment expenses. The Authority's acquisition and relocation assistance documents in Appendix 3.12-A of this Final EIR/EIS describe compensation and acquisition procedures in detail. For any properties acquired for the project, the Authority would comply with appropriate provisions of the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (42 U.S. Code 4601 et seq.) (Uniform Act) and implementing regulations (49 C.F.R. Part 24). Property owners whose entire or partial property would be acquired by the Authority would receive compensation for their land and improvements.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9784

The commenter requested further information on the Authority's Community Benefits Agreement and other programs to help displaced workers in environmental justice communities. As discussed in Section 3.18.6.3, in Section 3.18, Regional Growth of the Draft EIR/EIS, the Authority's use of a Community Benefits Agreement is to establish a cooperative partnership and commitment between the Authority, its contractors, and unions. See California High-Speed Rail Authority, Community Benefits Agreement website at: <https://hsr.ca.gov/business-opportunities/general-info/community-benefits-agreement/>. The purpose of a Community Benefits Agreement is to facilitate efficient and timely execution of this project while promoting employment opportunities and careers in the construction industry during the construction of the project, and to remove potential barriers small businesses may encounter in participating in the project.

The Community Benefits Agreement will be implemented in accordance with Federal Railroad Administration guidance and in compliance with federal and state laws and governing regulations, including Title 49 Code of Federal Regulations (CFR) Part 26 "US Department of Transportation DBE Program" and Title VI of the Civil Rights Act of 1964 and related statutes. The Community Benefits Agreement is designed to assist small businesses and employment seekers in finding or obtaining construction contracts, jobs, and training opportunities for residents who reside in economically disadvantaged areas or extremely economically disadvantaged areas, which includes those designated as National Targeted Workers and Disadvantaged Workers (as defined in Article 1 of the Agreement). National Targeted Worker is defined as an individual whose primary place of residence is within an Economically Disadvantaged Area or an Extremely Economically Disadvantaged Area in the United States; or (b) a Disadvantaged Worker. A Disadvantaged Worker is defined as an individual who, prior to commencing work on the Project, resides in an Economically Disadvantaged Area Extremely Economically Disadvantaged Area and faces at least one of the following barriers to employment: (1) being a veteran; (2) being homeless; (3) being a custodial single parent; (4) receiving public assistance; (5) lacking a GED or high school diploma; (6) having a criminal record or other involvement with the criminal justice system; (7) suffering from chronic unemployment; (8) emancipated from the foster care system; or (9) being an apprentice with less than 15% of the apprenticeship hours required to graduate to journey level in an approved apprenticeship program. Article 1 of the Agreement defines "economically disadvantaged area" as "a zip code that includes a census tract or portion thereof in

### 4494-9784

which the median annual household income is between \$32,000 and \$40,000 per year," and "extremely economically disadvantaged areas" as "zip codes that include a census tract or portion thereof in which the median annual household income is less than \$32,000 per year." Thus, the Community Benefits Agreement extends to low-income populations.

As described in Article 7 of the Community Benefits Agreement, local unions with geographic jurisdiction over the work to be performed for the project will make every effort to recruit National Targeted Workers and to refer and utilize National Targeted Workers on the project. In recognition of the Authority's policy to utilize National Targeted Workers, the Unions and Contractor/Subcontractor/Employers (C/S/E) agree that as long as they possess the requisite skills and qualifications, National Targeted Workers shall be first referred for project work, including journey persons and apprentices, and are responsible for ensuring the following Targeted Hiring Requirements are met: (1) a minimum of 30% of all hours of project work shall be performed by National Targeted Workers; and (2) a minimum of 10% of all National Targeted Worker hours shall be performed by Disadvantaged Workers. The C/S/E(s) shall submit written documentation to the Authority on a quarterly basis, or as required by Authority, which sets forth the steps taken by the C/S/E(s) to recruit, refer and utilize qualified National Targeted Workers recruited by the Unions and referred to or utilized on the project. In addition, during November 2023, December 2023 and January 2024 the Authority conducted listening sessions with EJ communities in Pacoima and Sun Valley to seek feedback on potential additional measures that would avoid, minimize, and mitigate project impacts in EJ communities and would address concerns of EJ communities about the project's adverse effects. The Authority has developed additional measures to respond to concerns from environmental justice (EJ) communities, which are listed in Section 5.4.2 in Chapter 5, Environmental Justice, and described in Appendix 2-E, Impact Avoidance and Minimization Features of this Final EIR/EIS. EJ-IAMF#4 will require the Palmdale to Burbank Project Section Relocation Mitigation Plan (pursuant to SOCIO-IAMF#3) to include a subsection dedicated to addressing adverse effects to businesses in the EJ communities of Pacoima and Sun Valley (as identified in Section 5.5 of the Draft EIR/EIS). This subsection shall include a description of measures taken or proposed to offset the adverse effects of business displacements and relocations in the Pacoima, and Sun Valley, and Lake View Terrace EJ communities

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9784

(depending on the alternative selected), including a description of measures to relocate displaced businesses in close proximity to their same community.

The Authority shall hold community roundtable meetings to seek and consider input from affected EJ communities prior to finalizing the Authority's Relocation Mitigation Plan. EJ-Offsetting Mitigation Measure#1 (EJ-OMM#1) will require the Authority's Regional Workforce Development Board, and EJ community liaison (ombudsman) to develop a Construction Pre-Apprentice training program to provide pre-apprenticeship classes and hands-on construction training to primarily to individuals whose job has been directly impacted by a business displacement within the Pacoima, Sun Valley, and Lake View Terrace EJ communities (again, depending on the alternative selected). The program shall also include special recruitment and job set-aside programs for jobs created by the project to offset any impacts to jobs associated with business displacements within those EJ communities. The program(s) shall be developed with feedback, input and suggestions made by those EJ communities during community roundtables held by the EJ ombudsman.

The Authority shall involve Pacoima Beautiful as part of this program to consider support of its Workforce Development and Economic Opportunities Plan, administered through Los Angeles City College (LACC), in cooperation with the Building Trades Council, Plumbers, Cement Masons, Iron Workers, Teamsters, Sheet Metals Workers, Pipefitters, Electricians and Operating Engineers Building Trades Unions. Further, the Authority shall periodically distribute an updated Jobs Fact Sheet and provide press releases that report achieved construction job creation milestones resulting from dispatching workers to build the high-speed rail system. This Jobs Fact Sheet will include the most recent information regarding the National Targeted Hiring Initiative and the total number of disadvantaged workers.

### 4494-9785

The commenter requests additional information on housing for population growth associated with employment growth from the project. As described in Section 3.18.6.3, in Section 3.18, Regional growth, of this Final EIR/EIS, long-term employment gains caused by the Palmdale to Burbank Project Section would result in some degree of population increase due to employment growth. The aggregate total of direct/indirect project-induced O&M employment and employment growth due to increased accessibility from the California HSR System would be approximately 5,380 jobs above the No Project Alternative projections (Table 3.18-14 of this Final EIR/EIS). Accordingly, with implementation of the Palmdale to Burbank Project Section, Los Angeles County would have approximately 5,231,400 jobs in 2040, which is a 0.1 percent increase above the No Project Alternative in 2040. The project-induced additional 0.1 percent contribution to employment growth is not substantially more than the projection for the region in the absence of the California HSR System. Operation of the Palmdale to Burbank Project Section would induce some population growth, which would increase the demand for housing, although it would be speculative to predict where such growth would occur. Population growth would generally not occur within the ANF where land use restrictions generally preclude development. As discussed in Section 3.18.6.3, the Southern California Association of Governments (SCAG) has determined the projected housing need for Los Angeles County and allocated this housing need to each jurisdiction by income category. The Regional Housing Needs Allocation (RHNA) represents the minimum number of housing units each community must provide through land use planning and zoning in order to accommodate projected growth. These allocations are subject to periodic upgrades. RHNA allocations for jurisdictions in the RSA during the most recent planning period are summarized in Table 3.18-11 of this Final EIR/EIS. Jurisdictions within the project study area have adopted housing elements that plan for housing and the associated land use consumption required by their RHNA and would continue to update such plans as RHNA allocations are updated based on SCAG projections.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9786

The commenter requested clarification regarding the trail facilities plan. The Authority will require the design-build contractor to develop a trail facilities plan to address short-term project impacts on existing trails within the construction limits of the project. Among other objectives, that plan would identify trails that would be closed temporarily and detoured during construction, require effective detours to maintain connectivity, require a public awareness and notification, and signs. For more information about the trail facilities plan, see PR-MM#4 in Section 3.15, Parks, Recreation, and Open Space. The commenter questioned if the proposed mitigation measures would be adequate in addressing impacts. As noted in Section 3.15, with the inclusion of applicable impact avoidance and minimization features (IAMF) and implementation of the mitigation measures identified in Section 3.15.7, all six Build Alternatives would avoid, minimize, reduce, or compensate for impacts on these resources. Additionally, the commenter questioned the compensation for land for new parks, if mitigation measures will not fully minimize impacts. Mitigation measures addressing permanent impacts are included in PR-MM#7 through PR-MM#9. These measures will require compensation for land permanently acquired for the Build Alternatives. Compensation typically would be financial based on the value of the affected property; however, compensation could include new park property or enhancements. With incorporation of mitigation measures, impacts on parks, recreation, and open space areas would be reduced to less than significant levels for all Build Alternatives.

### 4494-9787

The commenter provided questions regarding the methodology for determining the degree of physical changes and viewer sensitivities.

As noted in Section 3.16.4.3 of this Final EIR/EIS, viewers are described as neighbors or travelers who can see or would use the proposed project. Viewer sensitivity is an assessment of the concern viewer groups may have regarding changes in the visual character based on two factors: viewer exposure and viewer awareness. For example, viewer sensitivity in established downtown areas can be high due to their exposure (close proximity for a longer duration) and their awareness of a cultural order associated with an identifiable urban core. In these areas viewers would have a greater sensitivity to the cultural order if the project does not fit in scale or mass with existing development. Workers in the workplace are generally considered to have moderate or low sensitivity, because visual quality is not typically a focus or expectation associated with their activity; however, their exposure to the view is high.

The movement of the viewer affects exposure and, therefore, viewer sensitivity. Movement creates dynamic views affecting the sensitivity of travelers, including viewer awareness and exposure, especially of drivers who concentrate on watching the road ahead. The faster a person moves, the smaller the area on which they can focus their attention. At 25 miles per hour (mph), a driver can see a view approximately 100 degrees wide; at 45 mph, the view drops to 65 degrees; and at 65 mph, it drops to a narrow 40 degrees, substantially reducing what is seen.

The degree of visual quality impact is a combination of the change in visual character from the proposed project and how that would change the existing visual quality category (ranging from high to low) and viewer sensitivity to that change. The overall impact conclusion for a landscape unit may differ from impact conclusions at specific key viewpoints (KVPs). A particular KVP may experience an adverse change to visual quality while the Palmdale to Burbank Project Section, taken as a whole throughout the landscape unit, may have a neutral change or even a beneficial change.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9788

Blum Ranch was found eligible for listing in the NRHP and CRHR under Criteria A/1 for its association with the early settlement and development of agriculture in northern Los Angeles County specifically between 1891 and 1924. Within this period of significance, it was established that there were two distinct phases of agricultural development, both of which are associated with the significance of the ranch property: the dry farming of wheat between 1891 and 1908 and the fruit orchard period that began in 1908 with the introduction of the advanced irrigation system. The ranch property (within the established historic property boundary) is important for its association with agricultural development but not specific to the type of produce grown in the orchards. Construction and operations noise and vibration impacts would not impede produce grown on the site.

### 4494-9789

The commenter expresses concern regarding the cumulative impact analysis, suggesting that displacement, visual effects, and loss of community cohesion are localized and not seen in "foreseeable projects," and therefore their importance and severity is discounted.

The commenter has misinterpreted the discussion on page 5-88, which discusses cumulative effects related to Environmental Justice. A "cumulative effect" is one in which a project's effects are considered in conjunction with the effects of other past, present, and reasonably foreseeable projects causing related effects. It is recognized that the project, along with other planned projects, could permanently divide established communities, permanently displace residences and business, and result in permanent changes to visual quality. These are adverse effects regardless of being localized, and such localized impacts are not discounted in the Draft EIR/EIS. Rather, the analysis on page 5-88 is stating that these effects do not combine to contribute to adverse cumulative effects, because the effects are specific to a local area.

### 4494-9790

The commenter asks why disproportionately high and adverse effects to EJ communities could not be addressed further in the published Draft EIR/EIS and whether additional mitigation measures for adverse impacts to EJ communities are possible.

In the Draft EIR/EIS, the Authority analyzed the disproportionately high and adverse effects on environmental justice communities, incorporated impact avoidance and minimization features, and identified mitigation measures. Beginning in 2019, to identify those impacts and to identify those features and measures, the Authority gathered information from the affected communities by reaching out to the community in a broad variety of ways.

EJ outreach involves engaging minority and/or low-income populations in the RSA to communicate project information; listening to and responding to community thoughts and concerns; identifying potential actions to ameliorate and mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority and/or low-income populations; and to provide opportunities by which minority and/or low-income communities can effectively take part in the planning process for the project.

Table 5-4 in Chapter 5, Environmental Justice of the EIR/EIS, summarizes those outreach events by which the Authority sought more information and feedback. In the Draft EIR/EIS, the Authority used the information that it had available at that time to complete that analysis. EJ-specific outreach for the Palmdale to Burbank Project Section is an ongoing effort. The Authority committed to using any additional information it learned between the Draft EIR/EIS and the Final EIR/EIS to further refine the project to further reduce impacts on EJ communities. While the Authority received many comments related to effects on environmental justice communities, these comments have not identified any specific impacts that were not addressed in the Draft EIR/EIS nor has the Authority received any specific recommendations relative to additional mitigation.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9791

The commenter asks how the Authority can predict future transportation needs without knowing and taking into consideration the current Los Angeles City light rail and Metrolink plans for the northeast San Fernando Valley. In developing its ridership forecasting projects, the Authority reviews the metropolitan transportation plans prepared by several agencies provide transit service in the project area, such as LA Metro, Antelope Valley Transit Authority, BurbankBus, Metrolink, Greyhound, and Amtrak. Appendix 3.2-A: Vehicle Miles Traveled Methodology of the Draft EIR/EIS, explains how the developed ridership, revenue, and VMT forecasts were developed based on the 2016 Business Plan. The Authority's forecasts had to be aligned with the required application in business plan and environmental analysis.

As discussed in the 2016 Business Plan, the Authority worked with the Los Angeles County Metropolitan Transportation Authority, the City of Los Angeles, Amtrak and others to integrate high-speed rail at Los Angeles Union Station while strengthening first/last-mile connections to and from downtown LA and surrounding communities (Authority, 2016). Central Valley Rail service, including travel times, frequency of service, and stations served, were also updated in the 2016 Business Plan to reflect the latest conditions and forecasts from the 2013 California State Rail Plan (CSRP), 11 Metropolitan Planning Organization (MPO) forecasts, and the California Statewide Transportation Demand Model (CSTDM). In addition, the Burbank and Palmdale stations are within multiple plan areas, including the City of Burbank General Plan, City of Palmdale General Plan, LA Metro Short Range and Long-Range Transportation Plan, Antelope Valley Transit Authority Long Range Plan, and SCAG's Regional Transportation Plan, (see Table 3.13-1 in Section 3.13.2.3 of the Draft EIR/EIS).

Each of these documents provides goals and policies for maintaining transit operations and planning for new services to meet the needs of its users. The Authority would work with these transit operators and agencies to modify routes and services to provide transit connections to HSR riders. This includes Mitigation Measure TR-MM#9 (Section 3.2.7 of the Draft EIR/EIS), which requires the preparation of a transit coordination plan with the affected transit providers to ensure revisions to services are made to account for the HSR operations. As described in Section 3.2.4.3, the 2012 SCAG RTP was used as a review for regional goals and policies and to identify planned and programmed projects that should be included as part of the future 2028 and 2040 scenarios.

### 4494-9791

Background growth in intersection and roadway volumes was developed for the Palmdale to Burbank Transportation Technical Report using outputs from the 2012 SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) regional travel demand model. Overall, an average growth rate of about 0.4% per year was estimated for the study intersections within the Burbank area and 0.9% per year within the Palmdale area. Applied to the 2014/2015 counts that were used to establish existing conditions, this would equate to a projected increase in traffic volumes of about 3 to 4 percent in Burbank and 7 to 8 percent in Palmdale by 2023. However, based on the recently published Caltrans Traffic Count Baseline Guidance Due to the Coronavirus Disease 2019 (COVID-19) Pandemic (Caltrans 2023b) and LADOT Resumes Normal Traffic Signal Patterns (LADOT 2021), volumes on local roadways and regional freeways substantially decreased in 2020 due to the COVID-19 pandemic and continued to be lower during the following years. However, FHWA has compiled information from across the country and reported that traffic volumes have returned to pre-pandemic levels on local streets during the peak commute periods (FHWA 2019, 2023). Because 2023 actual traffic volumes are likely consistent to those before the COVID-19 pandemic, whereas the SCAG model projected an increase of 3 percent to 8 percent, it can be inferred that current conditions are consistent with the technical analysis conducted for the project and presented in the Transportation Technical Report (Section 3.2.4.3 of the Final EIR/EIS).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9792

The commenter has an interest in learning about the intercity trips that would be reduced by the Project. In general, the Project would allow people to use transit between cities along the alignment with substantially quicker service than the currently available options. For example, the travel time on the Project between Palmdale and Burbank would be significantly shorter than Metrolink service. Currently, the travel time between Palmdale and the Burbank Airport - North Metrolink stations is approximately 1 hour and 35 minutes [see Train Schedules | Metrolink ([metrolinktrains.com](https://www.metrolinktrains.com))], whereas it is projected that HSR service would take about 13 minutes between the Palmdale and Burbank stations (<https://hsr.ca.gov/wp-content/uploads/2022/05/2022-Business-Plan-FINAL-A11Y.pdf>). Similar time savings would also be realized at future HSR stations to the south, such as LA Union Station and ARTIC in Anaheim. Similar travel time savings could be found compared to driving, as driving from Palmdale to downtown Los Angeles typically takes between 1 hour and 2 hours, depending on the time of day (<https://www.google.com/maps>). These travel times savings would also benefit travelers who are not going to locations immediately adjacent to a stop. For example, the travel time between Palmdale and UCLA Medical Center is about 60 to 90 minutes by driving (<https://www.google.com/map>), and about 45 to 60 minutes by HSR. Additionally, as shown in Table 6-33, Table 6-34, Table 6-55, and Table 6-56 of the Transportation Technical Report, operation of the project would not result in any freeway segments operating at an inadequate LOS (LOS F) during peak periods. Operation of the project would not result in an increased volume to capacity ratio of 0.02 or more over the baseline condition.

### 4494-9793

The commenter inquired about the accuracy of ridership estimates for HSR. The data used to estimate ridership is based on data from the Authority's 2018 Business Plan ridership analysis completed for the HSR forecasting model using information from regional transportation planning agencies, Caltrans, and current air and conventional rail schedules. Estimates of ridership using these methods are widely accepted for planning and environmental review purposes for major transportation projects in the United States. Updated ridership forecasts are also in the Authority's updated 2022 Business Plan, available at: <https://hsr.ca.gov/about/high-speed-rail-business-plans/2022-business-plan/>.

Methodology regarding how the ridership forecast data was obtained can be found in the California High-Speed Rail 2020 Business Plan Ridership and Revenue Forecasting technical supporting document, available at: [https://hsr.ca.gov/wp-content/uploads/docs/about/business\\_plans/2020\\_Business\\_Plan\\_Ridership\\_and\\_Revenue\\_Forecasting.pdf](https://hsr.ca.gov/wp-content/uploads/docs/about/business_plans/2020_Business_Plan_Ridership_and_Revenue_Forecasting.pdf).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9794

The commenter requested further information on how environmental justice communities in Sun Valley, especially those being displaced, would benefit from the Burbank Airport Station. The Burbank Airport Station was evaluated as part of both the Palmdale to Burbank Project Section and the Burbank to Los Angeles Project Section. The Final EIR/EIS for the Burbank to Los Angeles Project Section was released on November 5, 2021, and the Authority's Board of Directors approved the Burbank to Los Angeles Project Section Preferred Alternative, including the Burbank Airport Station, on January 20, 2022. For context, as described under Impact SOCIO#4, in Section 3.12, Socioeconomics and Communities of this Draft EIR/EIS, each of the Build Alternatives would result in 5 residential displacements in Sun Valley.

As described in Section 5.7.2.8, in Chapter 5, Environmental Justice of the Draft EIR/EIS, the Refined SR14, SR14A, E1, and E1A Build Alternatives would result in 72 business displacements in Sun Valley, 57 of which would occur in environmental justice communities (census block groups 60371222002, 60371212101, 60371212221, and 60371221223). The E2 and E2A Build Alternatives would result in 54 business displacements in Sun Valley, 52 of which would occur in environmental justice communities (census block groups 60371211023 and 60371222002). Given the number of businesses in Sun Valley that would have to relocate outside of their current communities—and potentially cities—this effect would be adverse. Sun Valley businesses could be relocated within 6 miles to North Hollywood or Burbank. Section 5.8.3 in Chapter 5, Environmental Justice, of the Draft EIR/EIS discusses offsetting benefits of the project to environmental justice communities, and Table 5-25 summarizes the beneficial effects that would be experienced for each environmental topic area.

On a local level, the Burbank Airport Station would revitalize and bring economic benefits to the Burbank subsection, which includes both environmental justice and non-environmental justice communities. Displaced business and residents in Sun Valley relocating to North Hollywood or Burbank in proximity to the Burbank Airport Station would experience these benefits, which are described further below. Induced growth associated with the Burbank Airport Station would accelerate the implementation of local development plans in Burbank and provide an opportunity to achieve transit-oriented development planning goals. Environmental justice census block groups directly to the

### 4494-9794

north and west of the Burbank Airport Station would be likely to experience this economic benefit. These include the Sun Valley census block groups 60371222002, 60371021051, and 60371021052, as indicated in Table 5-24.

Table 5-24 and the discussion above note that census block group 60371222002 would also experience residential and business displacements under all Build Alternatives. The project would have both short-term and long-term employment benefits for the region. As evaluated in Section 3.18.6.3, in Section 3.18, Regional Growth of the Draft EIR/EIS, construction of the Build Alternatives would generate approximately 80,000 to 85,000 direct, indirect, and induced job-years. During operations, the aggregate total of direct/indirect project-induced O&M employment and employment growth due to increased accessibility from the California HSR System would be approximately 5,380 jobs above the No Project Alternative projections. It is thus anticipated that construction, operation, and maintenance of the Burbank Airport Station would provide employment opportunities for local residents including those residing in Sun Valley. Furthermore, the Authority will enter into a Community Benefits Agreement, which would provide cooperative partnerships and commitments between the Authority, contractors, and unions, to assist businesses and employment-seekers in finding or obtaining construction contracts, jobs, and training opportunities for residents who reside in disadvantaged areas and those designated as disadvantaged workers.

Through the Community Benefits Agreement, the Authority would require each prime contractor of an awarded construction package to commit 30 percent of all construction dollars to hiring small businesses (please refer to the Authority's Small Business Program webpage at: <https://hsr.ca.gov/business-opportunities/small-business-program/> which includes further information on the Authority's commitments to hiring small, disadvantaged, and diverse businesses for the project). The Community Benefits Agreement includes separate goals for the hiring of disadvantaged workers (including workers who are lower-income, veterans, single parents, have no high school or General Educational Development diploma, or suffer from chronic unemployment). Please refer to response to comment 9784 for additional information about the Community Benefits Agreement. Thus, the Community Benefits Agreement will extend to low-income workers including those who reside in the Sun Valley neighborhood.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9794

Other non-employment-based benefits would also result from the project. As described in Section 5.8.3, in Chapter 5, Environmental Justice of the Draft EIR/EIS, the Build Alternatives would provide benefits to the regional transportation system by reducing vehicle trips on local freeways through the diversion of intercity trips from road trips to the HSR system. This reduction would be a net benefit to transportation and traffic operations because a reduction in VMT would help maintain or potentially improve the operating conditions of regional roadways. This reduction in future vehicle trips would improve the LOS of the regional roadway system and reduce the overall VMT compared with existing conditions and compared to the No Project Alternative. Reductions in VMT would have the added benefit of reducing emissions and improving air quality. The reduction in traffic congestion as a result of the California HSR System would in turn decrease the occurrence of vehicular, pedestrian, and cycling accidents. Design of the system also would prevent conflicts with other vehicles, pedestrians, and bicyclists. Overall, California HSR System operations would provide VMT, air quality, and safety benefits for travelers in the study area, including residents in Sun Valley as residents of the region.

Most recently, during November 2023, December 2023, and January 2024, the Authority conducted listening sessions with EJ communities in Pacoima and Sun Valley to seek feedback on potential additional measures that would avoid, minimize, and mitigate project impacts in EJ communities and would address concerns of EJ communities about the project's adverse effects. The Authority has developed additional measures to respond to concerns from environmental justice (EJ) communities, which are listed in Section 5.4.2 in Chapter 5, Environmental Justice, and described in Appendix 2-E, Impact Avoidance and Minimization Features of this Final EIR/EIS. EJ-IAMF#4 will require the Palmdale to Burbank Project Section Relocation Mitigation Plan (pursuant to SOCIO-IAMF#3) to include a subsection dedicated to addressing adverse effects to businesses in the EJ communities of Pacoima and Sun Valley (as identified in Section 5.5 of the Draft EIR/EIS). This Relocation Mitigation Plan subsection shall include a description of measures taken or proposed to offset the adverse effects of business displacements and relocations in the Pacoima and Sun Valley EJ communities, including a description of measures to relocate displaced businesses in close proximity to their same community. The Authority shall hold community roundtable meetings to seek and consider input from affected EJ communities prior to finalizing the Authority's

### 4494-9794

Relocation Mitigation Plan.

In addition, EJ Offsetting Mitigation Measure #1 (EJ-OMM#1) will require the Authority's Regional Workforce Development Board, and EJ community liaison (ombudsman) to develop a Construction Pre-Apprentice training program to provide pre-apprenticeship classes and hands-on construction training to primarily to individuals whose job has been directly impacted by a business displacement within the Pacoima and Sun Valley EJ communities. The program shall also include special recruitment and job set-aside programs for jobs created by the project to offset any impacts to jobs associated with business displacements within those EJ communities. The program(s) shall be developed with feedback, input and suggestions made by the Pacoima and Sun Valley EJ communities during community roundtables held by the EJ ombudsman. The Authority shall involve Pacoima Beautiful as part of this program to consider support of its Workforce Development and Economic Opportunities Plan, administered through Los Angeles City College (LACC), in cooperation with the Building Trades Council, Plumbers, Cement Masons, Iron Workers, Teamsters, Sheet Metals Workers, Pipefitters, Electricians and Operating Engineers Building Trades Unions. Further, the Authority shall periodically distribute an updated Jobs Fact Sheet and provide press releases that report achieved construction job creation milestones resulting from dispatching workers to build the high-speed rail system. This Jobs Fact Sheet will include the most recent information regarding the National Targeted Hiring Initiative and the total number of disadvantaged workers.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9795

The commenter requested further information on the nature of construction employment during project construction. As discussed in Section 5.8.3, in Chapter 5, Environmental Justice, of this Final EIR/EIS, through the Authority's Community Benefits Agreement, the Authority has implemented a variety of programs to increase both the number and ability of local workers and firms to compete for available HSR construction jobs. Through this cooperative partnership with skilled craft unions, the Authority is promoting and helping to develop education, pre-apprenticeship, and apprenticeship training programs. These activities in economically disadvantaged communities focus on helping lower-income persons, persons receiving public assistance, single parents, persons with no high school or a General Education Development diploma, and/or those who suffer from chronic unemployment to compete for available jobs. Community organizations have implemented similar programs to get workers trained, retrained, and certified for upcoming construction work. Through the Community Benefits Agreement, the Authority would require each prime contractor of an awarded construction package to commit 30 percent of all construction dollars to hiring small businesses, including separate goals for the hiring of disadvantaged and disabled veterans' businesses. At this time the location for training of workers has not been identified but would be made available to the general public in the future. The duration of each job would vary depending on the type of job.

### 4494-9796

The commenter requested further information on construction packages awarded by the Authority in 2013 and the composition of the workforce. The Authority awarded one construction package (Construction Package 1) in August 2013. Under this construction package, approximately 3,800 jobs have been created (as of January 31, 2023). Information regarding the total construction jobs (e.g., the number of jobs, number of national targeted hiring initiative workers, and number of disadvantaged workers) is available on the Authority's website: <https://hsr.ca.gov/jobs/>. As of January 31, 2023, nearly 11,300 jobs have been generated by Construction Packages 1 through 4. Of these jobs, approximately 6,000 jobs were filled by national targeted hiring initiative workers, 480 were considered disadvantaged workers, and more than 1,400 were apprentice workers. Definitions of each of these terms are also provided on the Authority's website.

### 4494-9797

The commenter asks how long traffic associated with spoils hauling would last during construction of the project. As stated in Section 3.2.6.3, spoils hauling is anticipated to take up to 6.4 years in total, depending on location and the Build Alternative.

No further response is needed, as the comment does not raise any CEQA/NEPA issues or address the adequacy of the EIR/EIS analysis.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9798

The commenter states that "new locations for EJ displaced businesses can't be mitigated."

The Authority interprets this to ask whether the Authority would provide new locations for businesses in EJ communities. The Authority would assist any displaced business in relocating. The commenter also states that "workers from the area are to be trained for jobs." The Authority interprets this comment to ask whether the Authority has committed to train workers from EJ communities.

It is the policy of the Authority to ensure that all reasonable steps should be taken, within the constraints of state and federal laws, to ensure that California communities, small businesses and residents benefit as fully as possible during the construction of the high-speed rail project. In implementing this policy, the Authority and its contractors are directed to adopt and implement programs designed to promote and advance construction employment and training opportunities for all individuals, especially those residing in extremely economically disadvantaged areas and veterans returning from military service. The commenter asks where "former businesses . . . [can] be found." The Authority does not track businesses that it relocates after it completes the process under the Uniform Relocation Act.

Finally, the commenter asks about the location of training for HSR-related jobs. This information can be found in the Authority established Community Benefits Agreement (please refer to <https://hsr.ca.gov/business-opportunities/general-info/community-benefits-agreement/>). Construction of the California HSR System would result in direct, indirect, and induced employment as well as an increase in sales tax revenue, which would be beneficial to the regional economy. The Authority established a Community Benefits Agreement designed to assist small businesses and job seekers in finding or obtaining construction contracts, jobs, and training opportunities for residents who live in economically disadvantaged areas along the HSR alignment (Authority 2013).

### 4494-9799

The commenter requested further information on the implementation of SO-MM#2: Implement Measures to Reduce Impacts Associated with the Division of Communities, including how the Authority would solicit input from residents in Lake View Terrace. The commenter also asks how the mitigation measure would be implemented if communities are divided. In response, the Authority would implement the mitigation measure prior to construction and prior to impacts occurring. As described in Section 3.12, Socioeconomic and Communities, of the Draft EIR/EIS, under SO-MM#2, prior to construction, the Authority will implement an outreach program in communities subject to cohesion impacts by the Preferred Alternative, thereby obtaining input from homeowners, residents, land owners, business owners, community organizations and local officials via workshops held the affected neighborhoods. The workshops are intended to identify design and use options for areas beneath rail guideways that could strengthen community cohesion and provide compatibility with existing community character. To maximize attendance and generate awareness of the workshops, the Authority will work with community organizations or community leaders within the neighborhoods to organize and convene the meetings.

Based on the public feedback provided at these workshops, the Authority will document its work and identify recommendations for reducing impacts through project design and other measures to maintain community cohesion and avoid physical deterioration, such as determining the effectiveness of overpasses and underpasses to encourage pedestrian and bicycle connectivity to community facilities. Please refer to Appendix 3.1-C, Standardized Mitigation Measures, of the Draft EIR/EIS, for full descriptions of project mitigation measures.

Furthermore, as a matter of clarification, the Refined SR14, SR14A (Preferred Alternative), E1, and E1A Build Alternative alignments would avoid Lake View Terrace, thus avoiding community cohesion impacts to this community; only the E2 and E2A Build Alternatives would traverse at-grade and above grade through the Lake View Terrace community, resulting in physical and visual community cohesion impacts at the neighborhood between Jimenez Street and Wheatland Avenue. Access between properties and the local road network would be maintained because the project would provide roadway overcrossings and undercrossings to facilitate pedestrian, bicycle, and vehicular circulation. For example, connectivity between the divided neighborhood

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9799

above would be maintained via Arnwood Road and Foothill Boulevard, both of which would pass underneath the elevated HSR right-of-way for the E2 and E2A Build Alternatives. Please refer to Impact SOCIO#2 in Section 3.12, Socioeconomics and Communities of the Draft EIR/EIS, for further information on project design features and mitigation measures that will be implemented into the project to minimize the potential for community cohesion impacts.

### 4494-9800

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-2: Noise Mitigation and selection of Proposed Sounds Barriers, PB-Response-N&V-5: Impacts of Spoils Hauling (Noise), PB-Response-N&V-6: Construction Noise/Truck Impacts.

The commenter is requesting additional information regarding mitigation for aesthetic impairments (e.g., plants, screening stations, and towers). The commenter specifically wants to know: 1) who will be responsible for preservation and upkeep of plants, 2) what materials would be provided for screening stations and towers, 3) How would the screens be protected from graffiti, and 4) what noise, in particular, would need minimizing.

As discussed in Section 3.16, Aesthetics and Visual Quality, of the Draft EIR/EIS, as part of mitigation measures AVQ-MM#1 and AVQ-MM#5, the Authority will both revegetate areas disturbed by construction, and also replant unused portions of land acquired for project purposes and provide for continuous landscape maintenance with appropriate irrigation systems. The contractor will install the irrigation system within the planting areas. No species listed on the Invasive Species Council of California's list of invasive species would be planted. In addition, and also discussed in Section 3.16 as part of mitigation measure AVQ-MM#6, any graffiti or visual defacement or damage of fencing and walls will be painted over or repaired within a reasonable period as agreed between the Authority and local jurisdiction.

The Authority would be responsible for the maintenance of all project infrastructure, including the maintenance of noise barriers. As discussed in AVQ-MM#1: Minimize Visual Disruption from Construction Activities and AVQ-MM#4: Provide Vegetation Screening Along At-Grade and Elevated Guideways Adjacent to Residential Areas, vegetation, trees, and fencing would be used to screen stations and towers.

To address the comment inquiring about noise from operation and construction-related activities, please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-2: Noise Mitigation and Selection of Proposed Sound Barriers, PB-Response-N&V-5: Impacts of Spoils Hauling (Noise), and PB-Response-N&V-6: Construction Noise/Truck Impacts, which address

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9800

noise impacts.

### 4494-9801

The commenter requested further information on whether adverse, unmitigable effects on both EJ and non-EJ communities suggests that those effects are less adverse. By definition, an adverse effect does not somehow become less adverse by impacting more communities. But determining the adverse effects on different communities can illuminate the proportionate effect on those different communities. If an adverse effect falls on both EJ and non-EJ communities, then it is possible that the effect does not fall disproportionately on the EJ communities. Table 5-24 in Chapter 5 of this EIR/EIS includes a summary of adverse effects and mitigation measures from the project. Under USDOT Order 5610.2C, the purpose of Chapter 5 is to assess each of these adverse effects, and to determine those that would result in disproportionately high and adverse effects on EJ populations relative to non-EJ populations. Mitigation measures and IAMFs will be implemented to minimize both adverse effects affecting both EJ and non-EJ populations, as well as disproportionately high and adverse effects on EJ populations.

### 4494-9802

The commenter asks whether the Draft EIR/EIS should be subject to change due to population changes between the dates used in the Draft EIR/EIS and actual construction.

The baseline year for the analysis of project impacts was established after the Notice of Preparation was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis (see Draft EIR/EIS, pp. S-7, 3.3-23 to 3.3-24). CEQA Guidelines section 15125(a)(1) explicitly supports establishing baseline physical conditions in this manner, and therefore the use of a 2015 baseline is appropriate.

In reviewing more recent census data, the Authority acknowledges that there have been some changes in population. According to the U.S. Census Bureau, the population of the City of Los Angeles was 3.983 million in 2019, before the pandemic while the population of the City was 3.898 million in 2020, which is a decrease of 1 percent after the pandemic.

The analysis in Sections 3.12 and 3.13 evaluates the impacts of the project alternatives based on projected 2040 future conditions, which is the horizon year for analysis of California HSR System operations. Accordingly, the impact discussions in these sections are based on a projected population of 4.6 million in 2040. Population projections are always snapshots, reflecting the historical data available, and the analysis of trends, growth capacities, and growth constraints apparent at the times the projections are prepared. However, more significant than the specific population projection is the recognition and examination of how the HSR system and its project sections would operate in the context of anticipated growth. Updating the document with 2020 data or with more recent population projections for 2040 would not change the impact determinations presented in Section 3.12 and Section 3.13 as the Palmdale to Burbank Project Section is not anticipated to induce substantial unplanned population growth beyond what is planned for in the Resource Study Area.

In addition, the commenter seems to ask whether the Draft EIR/EIS should be subject to change because of "climate changes." Section 3.3, Air Quality and Global Climate Change in the Draft EIR/EIS addresses impacts related to Climate Change, while

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9802**

Section 3.3.5.4 identifies an emissions inventory. Overall, within the context of evaluating this project and specifically the topic of climate change, the project would reduce air quality emissions because many travelers will rely on HSR instead of continuing to travel by single-occupancy vehicles and long-distance aircraft travel, as explained in Impact AQ#13. This climate change analysis does not substantively change with a later construction date.

### **4494-9803**

The commenter asks about the amount of congestion is caused by traffic between Palmdale and Burbank. In general, the Draft EIR/EIS did not evaluate the amount of congestion caused by traffic in this area, as it is not a CEQA analysis requirement. Instead, the methods for evaluating impacts, as documented in Section 3.2.4 for the Draft EIR/EIS, included modeling changes in traffic volumes and operating conditions at specific locations that could potentially be affected by project construction and operations.

I-5 and SR 14 are the primary freeways that connect Palmdale and Burbank. As stated in Section 3.2.5.1, under existing conditions, I-5 carries about 207,000 vehicles per day and SR 14 carries between 71,000 and 84,000 vehicles per day in the study area. Table 3.2-15 presents existing freeway operating conditions in the area between Palmdale and Burbank, including three locations on SR 14 (Map ID AA, BB and CC) and two on I-5 (Map ID FF and II). As shown in the table, these five study locations were determined to operate at LOS D or better during the weekday AM and PM peak hours, indicating that there is not considered to be a high level of congestion in this area.

As this question is related to current conditions and does not raise any CEQA/NEPA issues or address the adequacy of the EIR/EIS analysis, no further response is required.

### **4494-9804**

The commenter quoted the President's Executive Order 12898. The commenter also quoted the Authority's commitment to implement the requirements outlined in Title VI of the Civil Rights Act of 1964, Executive Order 12898, and Executive Order 13166. It also references tables, that provide census figures on various characteristics, and a list of organizations that serve Environmental Justice communities. It references the Authority's Outreach Team the Authority created to coordinate community events, to take notes, and to share feedback. No response is required.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9805

The commenter requested detailed information on EJ community outreach meetings for the project held between 2016 and 2022. From 2015 to 2022, a total of 40 meetings or events aimed directly at low-income and environmental justice populations took place in the cities of Los Angeles, Lancaster, San Fernando, and Burbank; in the communities of Pacoima, Sun Valley, Sylmar, and Sunland-Tujunga; and online virtually, attracting over 4,700 attendees. These included Community Working Groups (CWGs) and Stakeholder Working Group sessions in environmental justice communities that drew more than 250 participants. Invitees and attendees at these meetings included, but were not limited to, community members and local residents from the cities mentioned above and representatives or members of local community groups (i.e., faith-based organizations, environmental justice advocacy groups, community advocacy groups, social service groups, social justice advocacy groups, transit advocacy groups, neighborhood councils, town councils and community/homeowner associations, etc.).

In addition, the Authority participated in neighborhood council meetings, hosted meetings fully in Spanish and attended events such as back-to-school pop-ups, summer reading celebrations and food pantry giveaways. The Authority also collaborated with Pacoima Beautiful to host six community meetings and briefings (with select language opportunities) between 2015 and 2022 that reached more than 75 participants.

The Authority has hosted open houses, information sessions, and virtual updates in these communities at key project milestones in 2015, 2016, 2018, 2020, and 2022. Meetings were publicized via email, social media, media coverage and direct outreach to organizations. In preparation for the release of Draft EIR/EIS, advertisements were placed in 14 newspapers to publicize the in-person information session, open house, and public hearing that were targeted to these communities. These advertisements were also available in Spanish, Armenian, and Arabic. New contacts in attendance at outreach activities were also added to the master Project Section database and became part of the distribution list for project section updates and notifications for future meetings and events. Outreach activities occur during various stages of the project, including before developing and releasing the Draft EIR/EIS. All outreach meetings are conducted by the Authority. Various documents are prepared in support of the project including informative project materials and meeting notification materials.

### 4494-9806

The commenter requested further information on EJ community participants' role in the projects' decision-making process, and further information on tools, training, and resources that the Authority will provide for people with limited English proficiency. As noted in the prior response, the Authority hosted more than 40 events and meetings between 2015 and 2022 that drew more than 4,700 participants. These public meetings allowed stakeholders to stay informed and to offer comments and suggestions throughout each project phase, up to and including the Draft EIR/EIS public comment period on any topic, including air quality. This engagement helped the Authority gather important information for decision-making, and it considered the comments, concerns, and suggestions as it moved forward. For the decision-making process under CEQA, ultimately, after considering the information in the Final EIR/EIS and other information obtained and provided by Authority staff, the Authority Board of Directors will decide which alternative to pursue. Under NEPA, the Board will provide directions to the Authority CEO to make a decision in the Record of Decision.

The Authority announces project information via social media posts, emails, mailers, and newspaper ads to promote project updates, comment periods, and upcoming public meetings. Details on the multiple methods to connect with the Authority are included in all project information. This engagement helps the Authority gather important information for decision-making. Meetings held entirely in Spanish have also been conducted. For training, resources, and if an organization wants to schedule a meeting with the Authority to discuss project-related concerns, they can do so by calling the project information line at (800) 630-1039 or sending an email to [palmdale\\_burbank@hsr.ca.gov](mailto:palmdale_burbank@hsr.ca.gov). Resources such as translated project materials and the Draft EIR/EIS are available and have been available in Spanish, Armenian and Arabic, while translations in additional languages can be requested. Live Spanish interpretation is provided during in-person and virtual meetings and additional languages upon request.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9807**

The commenter asked why the Draft EIR/EIS uses census figures from 2010 to 2014, when census data from 2020 is available.

The baseline year for the analysis of project impacts was established after the Notice of Preparation was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis (see Draft EIR/EIS, pp. S-7, 3.3-23 to 3.3-24). CEQA Guidelines section 15125(a)(1) explicitly supports establishing baseline physical conditions in this manner, and therefore the use of a 2015 baseline is appropriate.

In reviewing more recent census data, the Authority acknowledges that there have been some changes in population. For example, according to the U.S. Census Bureau, the population of the City of Los Angeles was 3.983 million in 2019, before the pandemic while the population of the City was 3.898 million in 2020, which is a decrease of 1 percent after the pandemic.

The analysis in Sections 3.12 and 3.13 evaluates the impacts of the project alternatives based on projected 2040 future conditions, which is the horizon year for analysis of California HSR System operations. Accordingly, the impact discussions in these sections are based on a projected population of 4.6 million in 2040. Population projections are always snapshots, reflecting the historical data available, and the analysis of trends, growth capacities, and growth constraints apparent at the times the projections are prepared. However, more significant than the specific population projection is the recognition and examination of how the HSR system and its project sections would operate in the context of anticipated growth. Updating the document with 2020 data or with more recent population projections for 2040 would not change the impact determinations presented in Section 3.12 and Section 3.13 as the Palmdale to Burbank Project Section is not anticipated to induce substantial unplanned population growth beyond what is planned for in the Resource Study Area.

### **4494-9808**

The commenter requested further information on the limited English proficiency demographics tables for the City of Los Angeles EJ project study areas. For purposes of this analysis, LEP communities are considered to be those communities where five percent or more of the population have limited ability to read, write, speak, or understand English. Statistics related to LEP households are shown for both Los Angeles County, in general, as well as the six cities in the study area listed in Table 5-A-3, in Appendix 5-A, Environmental Justice Outreach Plan, of this Final EIR/EIS. The environmental justice communities in the project study area (near the Build Alternatives) that are within the City of Los Angeles also include the neighborhoods of Pacoima, Sun Valley, Sylmar, and Sunland-Tujunga.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9809

The commenter requested further information on the Authority's protocol for contacting EJ organizations. Organizations included in the master Project Section database are automatically added to the project's notification list, which allows them to receive project updates and invitations to community meetings and events.

If an organization wants to schedule a meeting with the Authority to discuss project-related concerns, they can do so by calling the project information line at (800) 630-1039 or by sending an email to [palmdale\\_burbank@hsr.ca.gov](mailto:palmdale_burbank@hsr.ca.gov). Currently, the Authority does not have funding for construction of this project section. Therefore, more detailed planning efforts at a higher level of design have not begun for this specific stage of the project. Future funding is being sought for continued progress. As funds become available, the Authority will proceed with advanced design and prepare for other pre-construction work. Consistent with other HSR project sections currently in the construction phase, such as the Central Valley, outreach plans, including outreach to EJ organizations, will include a variety of meetings and events to engage communities, residents, and stakeholders in and along the project area. Communities, residents, and stakeholders will receive notification of community meetings and events via various channels, including social media, and email. In addition, to identify additional efforts to help communicate project updates, the Authority will continue to coordinate with key community organizations and neighborhood councils throughout the corridor who have been engaged during project processes.

### 4494-9810

The commenter requested further information on the expectations for future participation and the efficacy of listed EJ advocacy, community, and social justice groups in advocating for EJ communities. Table 5-A-1 lists Regional Household Income Corridor Environmental Justice Advocacy and Community Groups that are targeted for inclusion in the master Project Section database. Once added, these organizations will be part of the project's notification list and receive updates and notifications for future meetings and events. The Authority does not expect, but would appreciate their feedback, questions, comments, suggestions, and other information they would like to provide.

Based on the feedback received throughout the project outreach and the comments during the Draft EIR/EIS period, the Authority understands that environmental justice communities have requested services related to, or have otherwise focused on, noise, air quality, traffic, property acquisition/displacement, community cohesion, and access to jobs and economic development. The Authority also intends to provide EJ communities with services to facilitate communication and engagement with the Authority. The Authority is therefore preparing project information available in multiple languages, including Spanish, Armenian and Arabic, and sharing Statewide program information with the public on Private Property (i.e., Right-of-Way Process, Your Property –Your High-Speed Rail, ROW Permit to Enter Process, Relocation Assistance Program, and Property Acquisition). Additionally, any other language needs can be provided upon request.

Participation from various organizations (including EJ organizations) is essential to effectively engage residents and stakeholders with varying needs/concerns/issues in and along the cities in the study area, and the Authority is committed to engaging with those organizations.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9811

The commenter requested further information on the logistics of EJ community outreach concerning public meetings. Currently, the Authority does not have funding for construction of this project section. Therefore, planning efforts have not begun for this specific stage of the project. Future funding is being sought for continued progress. As funds become available, the Authority will proceed with advanced design and prepare for other pre-construction work. As required by the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA), the Authority will publish information for all community meetings and events in the Authority's project website and directly notify the community, residents, and stakeholders in and along the project area via various channels that may include mailers, social media posts and newspaper ads. Emails will be sent to contacts in the master Project Section database. Meetings will be scheduled to take place in-person and virtually. In-person meetings will be held in community centers or venues easily accessible to residents/community members and stakeholders.

Community meeting attendees and stakeholders, including EJ advocacy groups can participate in the project by staying informed, by offering suggestions, and by submitting comments on the topics outlined for the respective meetings or other events. The Authority will consider that feedback during advanced design and construction phases.

The commenter asks how activities can "be included in the [Draft EIR/EIS] with its current deadline of 12/1/22." The Authority published that document, and it formally accepted comments on it through December 1, 2022. The response to Comment 9805 described some of the Authority's outreach efforts from 2015 to 2022

The outreach is guided by and in compliance with federal and state requirements, including Title VI of the Civil Rights Act of 1964 Executive Order 12898 (February 16, 1994) Executive Order 13166 (August 11, 2000) U.S. Department of Transportation Order 5610.2

Please refer to Section 5.2.1, Federal Laws, Regulations, and Order, in Chapter 5.0 of this Final EIR/EIS for further description of federal policies concerning EJ communities, including EJ programs and outreach.

### 4494-9812

The commenter requested further information on the logistics of EJ outreach meetings for the project as described in the Environmental Justice Outreach Plan in Appendix 5-A of the Draft EIR/EIS.

While Directors would not document attendance at gatherings, the Authority tracks attendance via meeting sign-in sheets. Attendees at meetings who provide their contact information are added to the master Project Section database for subsequent meetings and event notifications via email and other means (see Section 3.36 of Appendix 5-A in the Draft EIR/EIS).

The Authority has not designated a particular percentage of the populace that it considers to be a healthy attendance level but strives to maximize public meeting attendees and involvement. As described in Section 3.3 of Appendix 5-A in the Draft EIR/EIS, part of the outreach will also include ongoing review and development of outreach strategies: "Throughout the duration of the project, the Outreach Team will maintain ongoing review of targeted EJ populations, calendared events, outreach objectives and strategies by EJ population and events, and outreach tracking and metrics. Specific strategies and tactics for EJ outreach are outlined in Attachment A of Appendix 5-A. The ongoing development and implementation of the described tactics will be further informed by higher resolution demographics data as well as insights from EJ advocacy and community groups." Section 3.3 of Appendix 5-A in the Draft EIR/EIS also describes the key strategic objectives of the EJ Outreach Plan, which includes the facilitation of constructive dialogue between key EJ stakeholders and the Authority, and communication with minority and low-income populations regarding how project feedback has been reflected in the process. A list of previous and upcoming community engagement events for the High-Speed Rail Project in California can be found at the following link: <https://hsr.ca.gov/communications-outreach/info-center/events/>.

To-date, community engagement events for the project include EJ organization working groups and meetings, community open houses, neighborhood council briefings, and public hearings, many of which have taken place in EJ communities in the San Fernando Area. The Authority has hosted more than 40 events and meetings between 2015 and 2022 that drew more than 4,700 participants. These public meetings allowed stakeholders to stay informed and to offer comments and suggestions throughout each

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9812

project phase, up to and including the Draft EIR/EIS public comment period on any topic, including air quality.

The number of meetings that occur depends on each community and the needs of the community. Meetings are expected to take place before and during construction to keep the communities informed throughout each milestone. As described in Section 3.3 of Appendix 5-A in the Draft EIR/EIS, throughout the duration of the project, the Authority Outreach Team will maintain ongoing review of targeted EJ populations, calendared events, outreach objectives and strategies by EJ population and events, and outreach tracking and metrics. Specific strategies and tactics are outlined in Attachment A of Appendix 5-A. The ongoing development and implementation of the described tactics will be further informed by higher resolution demographics data, as well as insights from EJ advocacy and community groups. Exact types of locations where meetings may be held are not currently known but could include schools. Community meetings are typically offered as in-person or virtual participation with a call-in option for virtual meetings. Typically, in-person meetings take place in communities within the project area, at facilities that are accessible and centrally located in the community.

As described in Section 3.3 of Appendix 5-A in the Draft EIR/EIS, the Authority has and will continue to evaluate Limited English Proficiency (LEP) needs at a finer population scale for local and regional events to adhere to or exceed LEP guidelines as is sufficient to meet local language needs. Spanish interpretation is provided during meetings as a standard practice, with at least two Spanish interpreters available at each meeting, while interpretation in other languages can be available upon request.

Regarding notice of meetings, stakeholders located near the project section alignments are informed of updates and upcoming meetings and events via a variety of channels, including social media, eblasts and media coverage. In general, two to three weeks advance notice have and will be provided to before each meeting. The Authority strives to share project information with community members, residents, and stakeholders.

As described in Section 1.1 of Appendix 5-A in the Draft EIR/EIS, the Authority collects all comments, concerns, and inquiries to consider during the different stages of the project. Inquiries or comments are generally responded to individually. All project

### 4494-9812

sections follow the Authority's protocol for communications and engagement. Regarding small group meetings, organizations can contact the Authority to request a meeting, and this will allow residents to meet with the Authority in small groups to express opinions.

Generally, the Authority, as needed, will bring appropriate contractors to meetings to address community issues and concerns. Section 3.3.1 of Appendix 5-A also specifies that "At the conclusion of each public meeting, meeting notes summarizing public comments and feedback will be prepared and distributed internally within the Authority for use in further refining project details."

Regarding milestones, the Authority's Staged Project Delivery process creates the framework designating key project milestones. This includes project section milestones such as the approval of project section design, completion of necessary right-of-way acquisition, the completion of necessary utility relocations, and the completion of built structures (for further information on project milestones, please refer to the Authority's Project Update Report, available at: <https://hsr.ca.gov/about/project-update-reports/2023-project-update-report/>).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9813

The commenter requested further information on the efficacy of online webinars for EJ outreach for the project.

The implementation of webinars combined with in-person meetings and events has increased opportunities for all stakeholders to attend outreach meetings and events, resulting in higher participation rates. From 2015 to 2022, a total of 40 in-person and virtual meetings or events aimed directly at low-income and environmental justice populations, attended by over 4,000 attendees, took place in the cities of Los Angeles, San Fernando, and Burbank; the communities of Pacoima, Sun Valley, Sylmar, and Sunland-Tujunga; and online virtually.

In-person meetings have been combined with online webinars to increase participation and engagement. Specifically, the eight separate virtual meetings held between 2020 and 2022 drew more than 385 attendees. The Authority considers this volume of attendance as making the meetings well-attended and successful. Virtual meetings were complemented with in-person outreach efforts to target EJ communities throughout the project alignment. A combination of both modalities has proven the best approach to give stakeholders multiple opportunities to stay engaged with the project throughout all phases.

### 4494-9814

The commenter asks about the Authority's awareness of locations of importance for Native American, in particular near Little Tujunga Road. The Authority obtained a Native American Heritage Commission (NAHC) Sacred Lands File search for the entire archaeological Area of Potential Effects (APE), which is the area of all Project Section Alternatives, which indicated that Native American cultural sites are present in the APE. As stated on page 3.17-20 of the Draft EIR/EIS, the NAHC Sacred Lands File search identified Native American cultural resources within 0.5 mile of the APE. However, no sacred lands have been identified in the archaeological APE. No sites of Native American importance have been identified along or near Little Tujunga Canyon Road. Consultation with the tribes identified by the NAHC has not resulted in the identification of additional resources. FRA and the Authority have consulted extensively with Native American consulting parties and will continue to do so through project construction. Consultation has occurred in tandem with other efforts to identify archaeological resources. As described in Section 3.17.5.2 of the Draft EIR/EIS, FRA and the Authority have searched cultural resources records, have searched NAHC sacred lands files, and have completed archaeological surveys of accessible portions of the Palmdale to Burbank Project Section APE. Additionally, an archaeological sensitivity analysis was conducted for the Palmdale to Burbank Project Section APE. The Authority will continue tribal consultation throughout project planning and development of the Section 106 Memorandum of Agreement (MOA) and associated treatment plans. Specifically, the Archaeological Treatment Plan (ATP) is being prepared in consultation with the tribes to focus on the treatment of known and unknown archaeological resources, and it will require the phased identification, evaluation, and mitigation of impacts to archaeological resources that may be on parcels for which legal access has yet to be granted. The ATP includes provisions that all inaccessible areas would be surveyed prior to the commencement of any ground-disturbing activities. It identifies archaeological monitoring (CUL-IAMF#5) and Native American monitoring as general treatment measures. It also provides requirements for procedures and protocols to be followed in the event of unanticipated discoveries during construction. CUL-MM#5 addresses efforts to develop meaningful mitigation measures for effects on as-of-yet-unidentified Native American archaeological resources that cannot be avoided, which would be negotiated with the tribal consulting parties. Measures that are negotiated among the MOA signatories and tribal consulting parties will be the responsibility of the Authority to implement.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9815

As discussed in Section 3.17.5.3, the Authority will conduct a Worker Environmental Awareness Program. This pre-construction training would be mandatory for all on-site construction personnel to limit the possibility of irreparable damage to important undocumented resources. Training would address archaeological deposit and feature identification, as well as the mandatory procedures to follow should potential cultural resources be exposed during construction activities. Additional details regarding the approach and process for cultural resources worker awareness training are available in Volume 2, Appendix 2-E, Project Impact Avoidance and Minimization Features, of the Draft EIR/EIS. No revision to the Draft EIR/EIS required.

### 4494-9816

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter inquires about the frequency of the Titleholder Working Group Meetings. As described in Section 9.6, Log of Public and Agency Meetings, 107 community and stakeholder working group meetings were held between 2015 and 2021. The Authority is committed to continuing engagement with the agencies and communities in the project area after publication of the Final EIR/EIS; however specific meeting schedules and frequency remain to be determined.

Please also refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations, for additional information about the property acquisition process. The comment does not address technical analysis in the Draft EIR/EIS or suggest edits to the document. No change has been made to the document in response to this comment.

### 4494-9817

The commenter inquired about other examples of how EJ communities were engaged for other portions of the HSR system, such as the Central Valley. For additional information regarding how the EJ engagement was conducted and how impacts to EJ communities were addressed for other project sections of the CAHSR system, please refer to the Environmental Justice and Public and Agency Involvement chapters in the environmental documents for each project section, which are available on the Authority's website: <https://hsr.ca.gov/programs/environmental-planning/project-section-environmental-documents-tier-2/>. The comment does not raise any concerns about the contents of this Draft EIR/EIS. No change has been made to the document in response to this comment.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9818**

The commenter expressed concerns regarding the inconsistent use of estimating methods for capital cost estimates and the most recent 2022 Business Plan Data not being included in the calculation of capital cost estimate. The commenter also expressed concern about the most recent 2022 Business Plan data not being used for calculating the operational and maintenance cost. Additionally, the commenter expressed concern about whether inflation is factored into the cost analysis.

The capital cost estimate presented in Chapter 6 of the Draft EIR/EIS was prepared based on detailed alignment features and preliminary engineering by study alternative described in the EIR/EIS; from recent bid data from large transportation projects in the western United States; and by developing specific, bottom-up unit pricing to reflect common HSR elements and construction methods with an adjustment for regional labor and material costs.

The analysis presented in both the Draft and Final EIR/EIS was initiated using the 2016 Business Plan. Given that there are minimal differences between the Authority's 2016 Business Plan, 2018 Business Plan, and 2020 Business Plan, the costs included in this document rely on the 2016 Business Plan. Following publication of the draft document in February, 2022 and public review, the Authority adopted the 2022 Business Plan in April and submitted it to the Legislature in May, 2022.

As described in the 2022 Business Plan, the document only includes updated estimates for project sections that were environmentally cleared as of publication, which does not include the Palmdale to Burbank Section. As shown in Table 5.0 of the 2022 Business Plan, the Palmdale to Burbank costs are presented expressing capital cost estimates as a range, since the estimates are primarily parametric in nature. The ranges are shown in a Low, Base, and High-cost estimates.

The O&M cost estimate methodology is also consistent with the 2016 Business Plan. Please note that the O&M costs and capital costs provided in Chapter 6, Project Costs and Operations, of the Draft EIR/EIS, are presented in 2015\$ and does not include cost estimates in YOES\$.

For information about cost estimates, refer to Chapter 6 of this Final EIR/EIS and to the

### **4494-9818**

Authority's Business Plans, which can be found at the Authority's website, [www.hsr.ca.gov](http://www.hsr.ca.gov).

As for concerns regarding whether inflation is factored into the calculation, both current year dollars and year of expenditure dollars are shown in the 2022 Business Plan. Year of expenditure dollars illustrates the effect of projected inflation on cost estimates over the duration of a project delivery schedule. For more information about the methodology used to calculate capital cost estimates, please refer to the Capital Cost Basis of Estimate Report. An updated Capital Cost Basis of Estimate Report has been prepared for the 2022 Business Plan. These cost changes are an interim update and were not incorporated into the O&M, Life Cycle, or Breakeven analyses at this time. All other technical methodologies, assumptions, and results remain unchanged. Future legislative reports will continue to progressively update cost estimates as the remaining environmental Records of Decision are approved. These cost updates will then be incorporated into future forecast and estimate analyses.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9819

The commenter inquires why finance charges, equipment yards, shops, and administration buildings are excluded from the cost estimate, and questions if the project cost in the 2022 Business Plan is understated. Additionally, the commenter inquires about what costs are excluded from project sections and included in other budgets, and if any other items were excluded.

As stated in footnote 3 of Table 6-1 in Chapter 6 of the EIR/EIS, the Palmdale to Burbank Project Section cost information does not include support facilities, such as rail yards, shops, and administrative buildings associated with the project, because of the limited level of design information available for these project features. However, as the Authority moves forward with advanced design work, the Authority will continue to refine the estimates and evaluate ways to deliver the project as efficiently as possible. Additionally, to address the topic of future finance charges, Table 6-1 of the EIR/EIS, specifies that an estimate will be developed prior to project construction. For further discussion on what the operation and maintenance costs estimates include, see Section 6.3.3, Development of Operations and Maintenance Costs. The methodology used for generating capital cost estimates has been consistent with FRA guidelines for estimating capital costs.

As described in Section 2.3 in Appendix 6.0-B, PEPD Set Capital Cost Estimate Report, in Volume II of this Final EIR/EIS, the heart of the FRA capital cost estimating guidance is the Standard Cost Category (SCC), which enables FRA-funded projects to develop budget baselines that summarize the SCC. This cost structure is used for capital cost detail and summary sheets. Where the level of design does not support quantity measurements, parametric estimating techniques were utilized.

### 4494-9820

The commenter expressed concern regarding the most recent data from the 2022 Business Plan not being included in the analysis. Additionally, the commenter expressed concern about consistency in the use of base years.

The capital cost estimate presented in Chapter 6 of the Draft EIR/EIS was prepared based on detailed alignment features and preliminary engineering by study alternative described in the EIR/EIS; from recent bid data from large transportation projects in the western United States; and by developing specific, bottom-up unit pricing to reflect common HSR elements and construction methods with an adjustment for regional labor and material costs.

The analysis presented in both the Draft and Final EIR/EIS was initiated using the 2016 Business Plan. Given that there are minimal differences between the Authority's 2016 Business Plan, 2018 Business Plan, and 2020 Business Plan, the costs included in this document rely on the 2016 Business Plan. Following publication of the draft document in February, 2022 and public review, the Authority adopted the 2022 Business Plan in April and submitted it to the Legislature in May, 2022.

As described in the 2022 Business Plan, the document only includes updated estimates for project sections that were environmentally cleared as of publication, which does not include the Palmdale to Burbank Section. As shown in Table 5.0 of the 2022 Business Plan, the Palmdale to Burbank costs are presented expressing capital cost estimates as a range, since the estimates are primarily parametric in nature. The ranges are shown in a Low, Base, and High-cost estimates.

The O&M cost estimate methodology is also consistent with the 2016 Business Plan. Please note that the O&M costs provided in Chapter 6, Project Costs and Operations, of the Draft EIR/EIS, are presented in 2015\$ and does not include cost estimates in YOES.

For information about cost estimates, refer to Chapter 6 of this Final EIR/EIS and to the Authority's Business Plans, which can be found at the Authority's website, [www.hsr.ca.gov](http://www.hsr.ca.gov).

As for the commenter's consistency question regarding use of operational base years,

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9820

the Authority periodically updates its service plan assumptions as part of its Business Plan updates. Refer to the 2020 Business Plan Service Planning Methodology (available: [https://hsr.ca.gov/wp-content/uploads/docs/about/business\\_plans/2020\\_Business\\_Plan\\_Service\\_Planning\\_Methodology.pdf](https://hsr.ca.gov/wp-content/uploads/docs/about/business_plans/2020_Business_Plan_Service_Planning_Methodology.pdf)) for additional information regarding the development of the HSR service plans and the latest information regarding projected opening years for various service lines.

### 4494-9821

The commenter inquires about the accuracy of data in Appendix 6-A of the Draft EIR/EIS and expresses concern regarding the use of older from the Authority's 2016 Business Plan.

As noted in Chapter 6, Project Costs and Operations, of the Draft EIR/EIS, the analysis presented in the Draft EIR/EIS was initiated using the 2016 Business Plan. Although the Authority updates its Business Plan every two years, the Revised 2020 and 2022 Business Plan forecasts were developed using the same travel forecasting model but using updated population and employment data.

The Authority's 2018 Business Plan, adopted in June 2018, includes updated O&M costs. It states that "operations and maintenance costs in all scenarios are minimally impacted by the changes made since the 2016 Business Plan."

As shown in Table 5.0 of the 2022 Business Plan, the full Phase 1 program cost estimate remains the same as described in the 2020 document. Also note that O&M costs cited in Section 6.3.3 of the Draft EIR/EIS are described in 2015 dollars, the same as shown in Appendix 6-A, High-Speed Rail Operating and Maintenance Costs for Use in EIR/EIS Project-Level Analysis. The Authority intends for the HSR system to be financially self supporting, achieving a balance between O&M costs and projected farebox revenue required by Proposition 1A, passed by California voters in November 2008.

### 4494-9822

Please see the response to Comment #9821.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9823

The commenter inquired why maintenance and operations costs are analyzed together, and inquired about the use of 2015 data in the Draft EIR/EIS. For further discussion on the operation and maintenance costs estimates, see Section 6.3.3, Development of Operations and Maintenance Costs.

The methodology used for generating capital cost estimates has been consistent with FRA guidelines for estimating capital costs (Authority and FRA, 2017). The heart of the FRA guidance is the Standard Cost Categories (SCC), which enables FRA-funded projects to develop budget baselines that summarize the SCC. This cost structure is used for capital cost detail and summary sheets and is described below. Where the level of design does not support quantity measurements, parametric estimating techniques were utilized. As noted in Chapter 6, Project Costs and Operations of the Final EIR/EIS, the analysis presented in the draft EIR/EIS was initiated using the 2016 Business Plan. Given that there are minimal differences between the Authority's 2016 Business Plan, 2018 Business Plan, and 2020 Business Plan, the costs included in this document rely on the 2016 Business Plan. The Revised 2020 Business Plan forecasts were developed using the same travel forecasting model as the 2016 and 2018 Business Plans, updated for population and employment forecasts. The Authority's 2018 Business Plan, adopted in June 2018, includes updated O&M costs. It states that "operations and maintenance costs in all scenarios are minimally impacted by the changes made since the 2016 Business Plan". As described in the 2022 Business Plan, the 2022 Business Plan only includes updated estimates for project sections that were environmentally cleared, which does not include the Palmdale to Burbank Project Section. As shown in Table 5.0 of the 2022 Business Plan, the full phase 1 program cost estimate remains the same.

### 4494-9824

The commenter inquired why the Authority included cost estimates for operations, dispatching, maintenance of equipment, station and train cleaning, and inquired if the costs would be the train operator's responsibility as operating costs. Additionally, the commenter inquired if the project would be similar to the Amtrak business model and inquired about other business methods.

The Authority may choose to operate the service directly through the use of its own employees or, alternatively, hire an operator who would still incur operation and maintenance costs. The Authority has the obligation to include information on project costs, including operation costs, in the EIR/EIS, for the purposes of disclosure under NEPA. As a result, information on project costs, including operation costs, is included within Chapter 6 of the Draft EIR/EIS. In addition, under Proposition 1A, adopted by California voters in November 2008, the operation and maintenance of the California HSR System is to be self supporting and is not to include a public subsidy.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9825**

Refer to Standard Response PB-Response-AQ-1: Construction-Period Emissions, PB-Response-AQ-3: Construction Air Quality/Truck Impacts, PB-Response-GSSP-2: Impacts on Paleontological Resources, PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter summarizes information from Chapter 7, Other CEQA/NEPA Considerations of the Draft EIR/EIS, including unavoidable adverse environmental effects (nitric oxide, carbon monoxide, particulate matter, excessive operational train noise, paleontological destruction, visual aesthetics, and historic built resources) and project benefits (decreased air pollutants from train operation, job creation, and improvements to local transit). The commenter also notes the short-term uses of the environment (investment of materials, consumption of fossil fuels, and conversion of land necessary for construction) and long-term productivity (greenhouse gas reductions and more construction for workers to provide new services and housing). The commenter also identifies irreversible environmental changes (procurement of land, materials, and fossil fuels both above and below ground). The commenter asks how the same environmental factors can be both adverse and beneficial. The commenter correctly notes that the Authority identifies that certain environmental factors (i.e., air quality and greenhouse gas emissions) were found to be both adverse and beneficial, which reflects short-term construction-related effects versus long-term benefits of project operation. In the short-term, construction of the HSR Palmdale to Burbank Project Section would generate air quality and greenhouse gas emissions that would adversely affect localized air quality during construction; however, in the long-term, operation of the HSR Palmdale to Burbank Project Section would reduce air quality and greenhouse gas emissions because it is anticipated that people would shift from using on-road vehicles and planes to the California HSR system, which is less emissions intensive than other transportation modes. Similarly, construction of the HSR system would require the permanent acquisition and conversion of existing land uses; however, the operation of the HSR system would result in long-term improvements in connectivity and accessibility and the HSR stations would provide an opportunity for transit-oriented development and infill development near station areas, both of which have the potential to result in new housing development. This comment does not require any revisions to the EIR/EIS.

### **4494-9826**

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process.

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process. The commenter notes that Chapter 7 of the Draft EIR/EIS identifies land encroachments, destruction of natural resources, and damage to people's quality of life. The commenter also asks whether travel convenience is superior to environmental destruction. Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process which discusses the development of both the statewide HSR system as well as the alternatives studied for the Palmdale to Burbank Project Section. This standard response also discusses factors considered by the Authority in evaluating various alternatives which have included balancing effects on natural resources and communities.

### **4494-9827**

Refer to Standard Response PB-Response-AQ-4: Greenhouse Gas Emissions, PB-Response-GEN-4: General Opinions, Opposition or Support.

The commenter raises general concerns and opposition to the project based on the project achieving the ridership projected in the Business Plan and its activity during construction, and thus achieve its greenhouse gas emission projections. Please see standard response PB-Response-GEN-4: General Opposition or Support, and Standard Response PB-AQ-4: Greenhouse Gas Emissions.

### 4494-9828

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-GEN-4: General Opinions, Opposition or Support.

In general, the commenter raises concerns regarding high-speed rail usage based on the cost compared to other modes of transportation, and the ability to reduce greenhouse gases. More specifically, the commenter asserts that the “high-speed train is an expensive and therefore infeasible choice for commuters.” In response, the Authority believes that rail riders will make trade-offs between trip time, frequency of service, the need to transfer, convenience of travel, and trip cost.

As discussed in Section 1.1.2, Decision to Develop a Statewide High-Speed Rail System, in the Draft EIR/EIS, the Authority Final Program Environmental Impact Report/Environmental Impact Statement (EIR/EIS) for the Proposed California High-Speed Train System (Statewide Program EIR/EIS) (Authority and FRA 2005) provided a programmatic analysis of implementing the California HSR System across the state and compared it to the impacts of a No Project Alternative and a modal alternative that involved expanding airports, freeways, and conventional rail to meet the state’s future transportation needs. It also evaluated an HSR alternative, which included consideration of different train technologies and vehicle types, as well as potential corridor and station locations. Following the Statewide Program EIR/EIS, the Authority selected the HSR Alternative over the Modal Alternative (expanded airports and freeways) and the No Project Alternative (no action) to serve California’s growing transportation needs. Refer to Chapter 1, Purpose and Need, in the Draft EIR/EIS and Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, for further discussion of the Authority’s tiered environmental review and decision-making process.

Although more employers have been offering broader telecommuting arrangements in certain employment sectors, the persistence of this trend is uncertain. Recent reporting suggests that many private sector companies and government agencies anticipate a return to in-office work for their employees in whole or in part. It would be speculative to assume changes in ridership at this time based on remote work trends. Therefore, the ridership projections used by the Authority remain valid for the Purpose and Need of the project and the analysis of the project’s anticipated impacts and benefits, and it would be speculative to revise the projections used for purposes of the Draft EIR/EIS analysis

### 4494-9828

based on recent near-term employment trends.

This is supported by the increases in ridership reported by transit operators in Southern California. According to data compiled by SCAG in its July 6, 2023 Transit Ridership Update state report (see: [https://scag.ca.gov/sites/main/files/file-attachments/printout-3735\\_transit\\_ridership\\_update\\_7.6.23.pdf?1690420883](https://scag.ca.gov/sites/main/files/file-attachments/printout-3735_transit_ridership_update_7.6.23.pdf?1690420883)), all Southern California transit operators have experienced gains in transit ridership over the last year (between 7% and 30% increases). Although ridership levels are lower than pre-pandemic, the trends are better than the previous years. For example, LA Metro bus ridership was up by almost 13% in April 2023 compared to April 2022.

When comparing travel time savings, it is important to understand that non-auto modes allow the user to utilize in-vehicle trip time for other purposes instead of having to operate a personal vehicle. If travelers focus their decisions primarily on the cost of their travel, it is expected that there should be relatively few commuters utilizing the service, as the trip time is slightly longer between Palmdale and Burbank and more expensive if only considering the cost of fuel for travel as described in the commenter’s travel example. Additionally, as described in Section 1.1 of the Draft EIR/EIS, commuter rail is not the purpose of the project. The purpose of Phase 1 of the California HSR project is to provide intercity passenger rail service from the San Francisco Bay Area and Central Valley to Southern California. The Palmdale to Burbank Project Section would provide access to a new transportation mode and contribute to increased mobility throughout California. The Palmdale to Burbank Project Section would connect to both the Bakersfield to Palmdale and Burbank to Los Angeles Project Sections.

Because the California HSR System would also replace air trips, trends in air travel are also relevant. Recent trends in air travel indicate that passenger totals have steadily increased since the Covid-19 pandemic, with significant year-over-year increases between 2020 and 2022 reported by both LAX and the Hollywood Burbank Airport. These values also indicate the recovery of the travel industry and the continued trends in higher usage of long-distance travel modes (see: <https://www.lawa.org/lawa-investor-relations/statistics-for-lax/10-year-summary/passengers> and <https://www.hollywoodburbankairport.com/about-us/airport-statistics/>).

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9828**

In addition, despite the reduction in transit and intercity train travel since March 2020 due to the COVID-19 pandemic, the Authority is confident that the ridership forecasts discussed in the Draft EIR/EIS remain reasonable for environmental analysis purposes due to population growth and the consequent continued increase in traffic congestion and the anticipated recovery of transit and intercity train travel. For example, Amtrak services in California experienced a substantial drop in ridership at the start of the pandemic. Between 2014 and 2019, Amtrak ridership in California increased from about 10.5 million to 11.5 million passengers per year (Rail Passengers Association 2020). This increase included the four national network long-distance trains (California Zephyr, Coast Starlight, Southwest Chief, and Sunset Limited) and the three state-supported routes (Capitol Corridor, Pacific Surfliner, and San Joaquins). However, after the California Covid-19 stay-at-home order was issued, both the long-distance routes through the state and the state-supported routes experienced declines. Overall, the long-distance routes declined by 39 percent and the state-supported routes declined by 49 percent when comparing fiscal year (FY) 2019 and FY 2020 ridership (Railway Age 2020). In 2022, however, Amtrak demand is close to returning to pre-pandemic levels, and showed an 88 percent increase in ridership compared to 2021, and as of July 2022, ridership has already shown 26 percent year-over-year growth, compared to 2022 (see: <https://media.amtrak.com/wp-content/uploads/2022/11/FY22-Year-End-Revenue-and-Ridership.pdf> and <https://www.amtrak.com/content/dam/projects/dotcom/english/public/documents/corporate/monthlyperformancereports/2023/Amtrak-Monthly-Performance-Report-July-2023.pdf>).

According to the Authority's 2022 Business Plan, once operations are expanded beyond the Central Valley, ticket prices will ultimately be set by the train operator contracted to provide that service. For current planning purposes, the Authority has assumed that pricing would be competitive with other modes of travel, including car and airline travel. Generally, future ticket prices are assumed to be roughly 80 percent of the cost of a typical plane ticket. Section 6.3.3 in Chapter 6, Project Costs and Operations of this Final EIR/EIS has been revised to include a footnote to reflect the ticket price assumptions described in the 2022 Business Plan.

Additionally, based on the U.S. Department of Transportation's July 2014 memo entitled

### **4494-9828**

"Revised Departmental Guidance on the Valuation of Travel Time in Economic Analysis" and using data supplied by the commenter when comparing it with high-speed rail, the Authority estimates the following value of time savings per roundtrip per hour saved:

- \$18 for a gasoline powered automobile,
- \$21.93 for using a hybrid auto,
- \$18.93 for Metrolink, and
- \$17.06 for high-speed rail.

As a result, the high-speed rail option provides significant time savings on a roundtrip basis. As shown below in the table, the guidance for intercity travel for other modes of personal purposes is \$17.20 and for air and high-speed rail modes is \$32.60 in 2012 dollars.

USDOT Guidance for Value of Time

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

4494-9828

Recommended Hourly Values of Travel Time Savings (2012 U.S. \$ per person-hour)

Personal	\$12.30	
Business	\$24.10	
All Purposes **	\$12.80	
<b>Intercity Travel -</b>		
Personal	<b>\$17.20</b>	<b>\$32.60</b>
Business	<b>\$24.10</b>	<b>\$60.00</b>
All Purposes **	<b>\$18.70</b>	<b>\$43.70</b>

Truck Drivers	\$25.40
Bus Drivers	\$26.40
Transit Rail Operators	\$45.20
Locomotive engineers	\$37.70
Airline Pilots and Engineers	\$82.30

Source: "Revised Departmental Guidance on the Valuation of Travel Time in Economic Analysis"

More recent guidance from the Federal Railroad Administration entitled "Benefit-Cost Analysis Guidance for Discretionary Grant Programs," (<https://www.transportation.gov/sites/dot.gov/files/2023-01/Benefit%20Cost%20Analysis%20Guidance%202023%20Update.pdf>), January 2023, indicates that for intercity travel for other modes for personal purposes is \$17.00. As shown below in the table, travel for high-speed rail service that would be competitive with air travel should be valued at \$45.30 per hour for personal travel and \$79.30 for business travel.

4494-9828

As a result, the Authority's analysis demonstrates that the large time savings associated with using high-speed rail when compared to existing commuter rail service or travel by auto is indeed cost-effective for travelers, with the resultant value of time around the recommended threshold for conventional surface modes.

Table A-3: Value of Travel Time Savings

Recommended Monetized Value(s) (2021 \$ per person-hour)		References and Notes
Category	Hourly Value	<i>Revised Departmental Guidance on Valuation of Travel Time in Economic Analysis (2016)</i> <a href="https://www.transportation.gov/office-policy/transportation-policy/revised-departmental-guidance-valuation-travel-time-economic">https://www.transportation.gov/office-policy/transportation-policy/revised-departmental-guidance-valuation-travel-time-economic</a>
General Travel Time		
Personal <sup>1</sup>	\$17.00	
Business <sup>2</sup>	\$31.90	
All Purposes <sup>3</sup>	\$18.80	
Walking, Cycling, Waiting, Standing, and Transfer Time <sup>4</sup>	\$34.00	
Commercial Vehicle Operators <sup>5</sup>		
Truck Drivers	\$32.40	
Bus Drivers	\$35.00	
Transit Rail Operators	\$58.40	
Locomotive Engineers	\$57.40	

1) Values for personal travel based on local travel values as described in USDOT's Value of Travel Time guidance. Where applicants also have specific information on the mix of local versus long-distance intercity travel (i.e., trips over 50 miles in length) on a facility, then the local travel values of time may be blended with the long-distance intercity personal travel value of \$23.80 per hour.

2) Weighted average based on a typical distribution of local travel by surface modes (88.2% personal, 11.8% business). Applicants should apply their own distribution of business versus personal travel where such information is available.

3) Note that business travel does not include commuting travel, which should be valued at the personal travel rate. Travel on high-speed rail service that would be competitive with air travel should be valued at \$45.30 per hour for personal travel and \$79.30 for business travel.

4) Should be applied only when actions affect those elements of travel time.

5) Includes only the value of time for the operator, not passengers or freight.

On a separate topic, the commenter states that "The high-speed train can ONLY reduce greenhouse gas IF it REPLACES a normally scheduled vehicle trip, AND the train is full or nearly full." In response, the ridership estimates are based on the diversion of trips from auto, air, intercity bus and conventional rail to high-speed rail service. The high-speed rail mode split shares between the different regions (e.g., Northern, Central and Southern California) are in the Authority's ridership model documentation (please see

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9828

material, for example, posted on the Authority's website at: <https://hsr.ca.gov/about/ridership-revenue-forecasting/>). The greenhouse gas analysis reflects both the diversion from air for longer distance trips as well as the diversion from auto to 100 percent zero-emission high-speed rail trips.

As described in Section 3.6, Public Utilities and Energy, in the EIR/EIS, the Authority will be operating the rail service on renewable energy irrespective of the connections to the established local power companies and their respective energy generation mix. As the system moves forward in completing Phase 1 service between San Francisco and Los Angeles/Anaheim, the Authority will work towards securing renewable energy sources through internal and external sources. As a result, the occupancy of high-speed rail trains does not affect the greenhouse gas benefits of the Phase 1 system.

The Authority's greenhouse analysis was performed based on the following guidance:

- Transit and Intercity Rail Capital Projects guidance by CalSTA (developed with CARB) that reflects the increasing share of electric and hybrid vehicles over time and the increase in share of renewable energy sources that subsequently reduce the GHG benefits as these technologies are being expanded over time.

More information can be found here: <https://ww2.arb.ca.gov/resources/documents/cci-quantification-benefits-and-reporting-materials>; please see section: California State Transportation Agency, Transit and Intercity Rail Capital Projects, New/Expanded Transit Service, System and Efficiency Improvements, Cleaner Vehicles/Tech/Fuels, Fuel Reduction

- CHSRA has also worked with CARB to define the quantification method for GHG benefits for the HSR system.

More information can be found here: <https://ww2.arb.ca.gov/resources/documents/cci-quantification-benefits-and-reporting-materials>; please see section: California High-Speed Rail Authority, High-Speed Rail (HSR) Methodology document: [https://ww2.arb.ca.gov/sites/default/files/auction-proceeds/chsra\\_hsr\\_finalqm.pdf](https://ww2.arb.ca.gov/sites/default/files/auction-proceeds/chsra_hsr_finalqm.pdf)

### 4494-9829

Refer to Standard Response PB-Response-GEN-4: General Opinions, Opposition or Support.

In general, the commenter inquired that if high-speed rail is not a feasible replacement for commuting, pleasure, or business travel, what is the purpose of the project. As noted in Section 1.2.2 of the Final EIR/EIS, Purpose of the Palmdale to Burbank Project Section, the purpose of the proposed project is to implement the Palmdale to Burbank Project Section of the California HSR System: to provide the public with electric-powered HSR service that provides predictable and consistent travel times between major urban centers, and connectivity to airports, mass transit systems, and the highway network in the Antelope Valley and the San Fernando Valley; and to connect the northern and southern portions of the statewide HSR system. The Authority, in accordance with Section 15124 of the CEQA guidelines, has adopted objectives and policies that include various policies such as meeting future intercity travel demand that would be unmet by current transportation systems, increasing capacity for intercity mobility, and maximizing intermodal transportation opportunities by locating stations to connect with local transit, airports, and highways. Please refer to PB-Response-GEN-4: General Opinions, Opposition or Support for additional details. The project would also result in some environmental benefits, such as an eventual net reduction in greenhouse gas emissions.

More specifically, the commenter states the following: ". . . The Palmdale to Burbank Project Section is completely irrelevant to reducing air travel. In fact, an air passenger may decide to utilize the high-speed train from Palmdale for the sole purpose of catching a flight from Burbank Airport." The trip time comparison provided in the comment referring to a trip from Palmdale to San Francisco via Burbank Airport does not reflect the egress time at San Francisco Airport and the 26- to 45-minute trip time on BART or taxi from the airport to downtown San Francisco (i.e., Embarcadero Station). Under this scenario, and based on Table 1 below, using high-speed rail would save a traveler boarding in Palmdale between 74 and 136 minutes if they are using auto or rail access to the Burbank Airport. In addition, the cost savings of a direct high-speed rail trip by either auto or rail access would be \$45 to \$99 per person.

	HSR	HSR - Palmdale - STC	228 min	\$89.00	16	
Auto	Auto - Palmdale - STC	395 min	\$96.20	as needed	167 min	\$7.20

Note: Air fare, auto operating cost and HSR fare based on 2016 ridership and revenue data.  
 Parking cost for Burbank airport is 2023 data.  
 Taxi/TNC cost based on 2023 Uber fare. MetroLink and BART fares are 2023 data.

Source: Authority, Air Travel Trip Comparison between Palmdale and San Francisco, July 2023.

If the air traveler chose high-speed rail as the access mode to the Burbank Airport, the direct high-speed rail trip from Palmdale to San Francisco is still 4 to 8 minutes faster. In addition, the cost of the air trip with high-speed rail access would be \$68 to \$103 more expensive as compared to the direct high-speed rail trip.

The commenter also indicates that “. . . the above chart (see actual comment) assumes 8 hours as headway for an airplane going from Burbank to San Francisco. Four air

**4494-9829**

8 hours as headway for an airplane going from Burbank to San Francisco. Four air carriers provide 23 flights per day, or roughly 1.4 flights every hour. This is counter to what this chart provides. The Palmdale to Burbank Section is completely irrelevant to reducing air travel. In fact, an air passenger may decide to utilize the high-speed train from Palmdale for the sole purpose of catching a flight from Burbank Airport.” The frequency mentioned above likely reflects the airline’s reaction to the diversion of air trips to high-speed rail and the subsequent reduction of frequency to maintain average utilization ratios and cost efficiencies for the airlines.

The data and analysis is based on a study that was prepared in 2012 by Aviation System Consulting, LLC, to define parameters in the aviation market that are applicable to the Authority’s ridership and revenue modeling efforts. The data is included in the Authority’s ridership and revenue forecasting work prepared for the 2012 Business Plan by Cambridge Systematics and is shown starting on page 2-1 and in Appendix B. As shown below in Table 2, based on that reaction of airlines reducing frequency, the modified frequency used for the ridership analysis reflects 2 daily roundtrips.

Source: Authority, Final Technical Memorandum, California High-Speed Rail 2012 Business Plan Ridership and Revenue Forecasting, Appendix B, Table B-1.

The revised frequency due to the airline reaction to diversion of two-thirds of the market reduced the current 6 direct flights to 2 direct flights per day to maintain the same average utilization assuming the same airplane fleet. The 2 roundtrips equate to an 8-hour headway (or 480 minutes, rounded) assuming a 16- or 18-hour operating day.

Please note that the HSR service plan between San Jose and San Francisco is limited to 4 HSR trains per hour and direction per the Project Management and Funding

4494-9829

Agreement for the Peninsula Corridor Electrification Project (PFMA, Section 6.1.1) between The Peninsula Joint Powers Board and CHSRA that define the conditions for the early bookend investment of CHSRA to support the electrification of the Peninsula corridor. In order to provide additional HSR services south of San Jose, additional HSR roundtrips were assumed to start and end in San Jose and connect to Los Angeles and Anaheim. Therefore, the service frequency differs between LA Basin - San Francisco service and LA Basin - San Jose service. As CHSRA continues to work towards the implementation of the HSR system, further refinements to the service plan and the stopping patterns will occur to support a customer-friendly and cost-effective service program.

Please see section A.3.2 of the 2016 Ridership Report that details the service patterns and train frequencies by peak and off-peak periods. [https://hsr.ca.gov/wp-content/uploads/docs/about/business\\_plans/2016\\_Business\\_Plan\\_Ridership\\_Revenue\\_Forecast.pdf](https://hsr.ca.gov/wp-content/uploads/docs/about/business_plans/2016_Business_Plan_Ridership_Revenue_Forecast.pdf)

and section A.3.2 of the 2020 Ridership Report that shows the equivalent information for the 2020 Business Plan. [https://hsr.ca.gov/wp-content/uploads/docs/about/business\\_plans/2020\\_Business\\_Plan\\_CHSR\\_Ridership\\_and\\_d\\_Revenue\\_Model\\_BP\\_Model\\_Ver3\\_Model\\_Doc.pdf](https://hsr.ca.gov/wp-content/uploads/docs/about/business_plans/2020_Business_Plan_CHSR_Ridership_and_d_Revenue_Model_BP_Model_Ver3_Model_Doc.pdf)

Finally, the commenter casts doubt on the "CHSRA's assertion that the high-speed train will displace other modes of transportation." The commenter asks, "Based on the above, if the high-speed train:

- Is not a cost-effective commuter train;
- Is not cost-effective for pleasure trips; and
- Is not the best choice for business travelers who necessitate the shortest travel time,

then what is its unique selling proposition?

With regard to the assertion that high-speed rail is not a cost-effective commuter train or system for pleasure trips, the travel time difference between Palmdale and Burbank Airport using Metrolink versus high-speed rail is 90 minutes (29 minutes on high-speed rail versus 119 minutes on Metrolink). The cost difference is \$23 (\$32 for high-speed rail and \$9 for Metrolink). Commuters typically make trade-offs between time savings and

# Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

**4494-9829**

fare/cost of travel.

A two-way trip between Palmdale and Burbank Airport would save 3 hours a day and cost \$46 more on high-speed rail than using Metrolink. Using the U.S. Department of Transportation guidance titled "Revised Departmental Guidance on Valuation of Travel Time in Economic Analysis," this equates to a value of time savings of \$15.33 per hour (or \$46 divided by 3). As shown in the guidance memo, the recommended hourly value for travel time savings for personal purposes is \$17.20 and for air and high-speed rail travel at \$32.60 (see Table 3 below).

**Table 3: USDOT Guidance for Value of Time**

Recommended Hourly Values of Travel Time Savings (2012 U.S. \$ per person-hour)		
Category	Surface Modes* (except High-Speed Rail)	Air and High-Speed Rail Travel

**4494-9829**

Source: Revised Departmental Guidance on Valuation of Travel Time in Economic Analysis, (July 9, 2014).

This demonstrates that the large travel time savings versus the existing commuter rail service are indeed cost effective for commuters or leisure trips with the resultant value above the recommended thresholds. Expressed a different way, the actual value of the time savings of these users on average will be higher than the implied value based on the fare and time difference calculation.

With respect to high-speed not being the best choice for business travelers who necessitate the shortest travel time, many if not most business travelers are very time sensitive, taking into account their entire door-to-door trip time. As shown in Table 1, high-speed rail service does provide significant time savings when considering the entire trip chain from origin to destination. Trip frequency and flexibility of travel (choice of departure time) is also especially important for business travelers. High-speed rail will provide many more travel options than current air service (e.g., 6 direct flights between Burbank and San Francisco verses 16 planned one-seat-connections to operate on high-speed rail per day). Based on the significant time savings and much higher service frequency, along with other non-quantifiable factors, such as the increasing complexity of navigating an airport and the fact that high-speed rail will deposit business travelers nearer to the City center than plane trips (discussed below), the high-speed rail connections will be valued by many business travelers.

With regard to high-speed rail and its unique selling proposition, high-speed rail will connect city center to city center, eliminating significant access and egress time that is needed to/from airports along with the time for airport processing. In addition, high-speed rail will provide significant time savings compared to long-distance automobile trips. For the Palmdale to San Francisco example, even an auto trip with 5 individuals occupying one vehicle still shows a value of time savings that is below the threshold defined by the U.S. Department of Transportation in its travel time guidance. Table 4 below shows a per-person value of time savings of \$25 per hour saved, which is below the federal guidance of \$32.60 per hour for leisure trips on high-speed rail systems.

Even a fully occupied passenger car traveling between Palmdale and downtown San Francisco would still result in a value of time savings per person that will entice users to

# Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

**4494-9829**

take high-speed rail instead of driving between Palmdale and San Francisco.

**Table 4: Comparison of HSR and Auto Trip Times and Cost Savings for a Palmdale to San Francisco Trip**

Mode	Subitrary	End-to-End Trip Time	End-to-End Trip Cost for 1 Person	Frequency per Day	HSR Trip Time Savings	HSR Cost Savings per Person	Value of HSR Time Savings per Person
HSR	HSR - Palmdale - SFC	226 min	\$89.00	16			
Auto	Auto - Palmdale - SFC	395 min	\$96.20	as needed	167 min	\$7.20	N/A (Cost on HSR is lower)
Groups in Auto	1 Person Occupancy	395 min	\$96.20	as needed	167 min	\$7.20	N/A (Cost on HSR is lower)
	2 Person Occupancy	395 min	\$48.10	as needed	167 min	-\$49.90	\$14.69
	3 Person Occupancy	395 min	\$32.07	as needed	167 min	-\$66.93	\$20.46
	4 Person Occupancy	395 min	\$24.05	as needed	167 min	-\$69.95	\$23.34
	5 Person Occupancy	395 min	\$19.24	as needed	167 min	-\$69.76	\$25.06

Note: A negative value in HSR cost savings per person indicates that the cost per person travelling as a group in a personal vehicle is lower per person than the corresponding fare on HSR.

Source: Authority, Air Travel Trip Comparison between Palmdale and San Francisco, July 2023.

**4494-9830**

The commenter quotes Section 1.1.4 of Appendix 3.2-A, Vehicle Miles Traveled Methodology, which was included as part of Volume 2 of the Palmdale to Burbank Project Section Draft EIR/EIS. The commenter states the HSR system will not displace any air trips from Long Beach Airport and asserts that the diversion of air trips is unrealistic because it includes diversion of trips to the HSR system from airports that are not close to a planned HSR station on an operational HSR corridor in the year modeled. The commenter asks why the Authority included flight reductions for airports serving markets that will not have high-speed rail service and are not within a reasonable distance to an airport that does.

As explained in Appendix 3.2-A, ridership estimates were developed by experts using a travel demand model and best practices to estimate travel behavior with the introduction of HSR as a new travel mode. The model estimates how many automobile trips and air trips would be diverted to HSR trips in 2025 with a Valley to Valley HSR line, in 2029 with a Phase 1 HSR line opening, and in 2040 with the Phase 1 line opening. With each of the scenarios, the ridership model examines the California transportation network from a holistic point of view that includes the statewide transportation system. The model predicts that the majority of HSR riders will be diverted from air travel between Los Angeles and San Francisco markets when the full Phase 1 system between San Francisco and Los Angeles is operational; however, when modeling the statewide transportation network in whole, the model results show that a small number of diverted air travelers from areas such as San Diego and Sacramento, even prior to the Phase 1 system being operational, is reasonable. Travelers will choose whether to use HSR depending on service frequency, proximity to stations, travel cost, and competitive travel time, including access and egress and convenience.

Regarding the commenter's statement that any diversion of Long Beach air trips to HSR is unrealistic, the Authority's disagrees. The FAA defines the Los Angeles market (Market ID: 32575) to include LAX, BUR, ONT, SNA, and LGB airports. Travelers with an origin or destination in the Los Angeles metropolitan area select one of the listed five airports based on choice parameters and therefore, the assumption is reasonable that travelers can also access HSR stations from anywhere in this market. As of July 2023, there are currently four to five daily nonstop flights with Southwest connecting Long Beach to Oakland, San Jose, and Sacramento. Therefore, a diversion of these nonstop air trips to HSR is possible and would result in a reduction of air trips for these airports.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9830

Even air travelers that might use LAX or BUR may make a trade-off to use HSR since the access time from Long Beach to LAX or BUR would need to be considered in terms of travel time, travel cost, and convenience.

The airline industry is expected to respond in two ways to the introduction of HSR as a competitive transportation mode. Commercial airlines would either lower fares or reduce air frequency between select markets to maintain consistent load factors and remain competitive with HSR. The ridership model is therefore reasonable in assuming flight reductions that represent what might be expected in the future.

The most prominent environmental benefits emanating from diversion of travelers from air trips to HSR will materialize when the full Phase 1 system from San Francisco to Anaheim in 2040 is operational.

### 4494-9831

The commenter inquired if the Authority believes that HSR service will result in the reduction of flights between Northern and Southern California. As discussed in Section 1.2.4.1 of Chapter 1, Project Purpose, Need, and Objectives of the Draft EIR/EIS, the HSR system would increase the capacity, connectivity, and efficiency of the current intercity travel system. The California HSR System, including the Palmdale to Burbank Project Section, would interface at hubs with many modes of travel, thereby relieving pressure on the region's transportation system, including travelers using interregional highways and airports for longer distance trips (including trips outside of the SCAG region that are longer than 50 miles).

Current national guidance for benefit-cost analysis of transportation projects irrespective of mode does not reflect secondary inducements of travel in other modes that might diminish the benefits of the investment (see U.S. Department of Transportation Benefit-Cost Guidance for Discretionary Grant Programs, January 2023, or at: <https://www.transportation.gov/sites/dot.gov/files/2023-01/Benefit%20Cost%20Analysis%20Guidance%202023%20Update.pdf>). On page 10, the guidance recommends that ". . . Forecasts should be provided both under the baseline and the improvement alternative. Applicants should take care to ensure that the differences between the two reflect only the proposed project being analyzed in the benefit-cost analysis and not impacts from other planned improvements." For example, an investment in a rail service that diverts vehicle miles traveled from highways to a rail system does not reflect the secondary inducement of new highway trips that could occur if the initial reduction of highway trips resulted in reduced highway congestion. The Authority appropriately follows this U.S. Department of Transportation guidance. Speculation about individual airlines' future business decisions is not required under CEQA or NEPA.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9832**

The commenter presented Table 2.4 in Appendix 3.2-A, Vehicle Miles Traveled Methodology in the Draft EIR/EIS, containing estimated data on HSR ridership diverted from other modes of travel and quoted a disclaimer in the ridership modeling documentation. The commenter suggests the disclaimer means the ridership forecast information is not intended to represent an outcome and asks what it represents. These disclaimers contained in Appendix 3.2-A are standard industry practice for ridership and revenue studies and are meant as disclosure for parties that have financial interests in a given project. The disclosure advises report reviewers that the forecasting team has followed best practice approaches as well as evidence and data sources as they were available at the time the forecasts were made, but that the forecasts also have to rely on assumptions made by the forecasting team or by third parties such as the Department of Finance that provide forecasts of population and employment data for future horizons. These assumptions are drivers of the ridership estimates and therefore the forecasting entity cannot warrant the outcomes of the forecasts or promise a specific outcome because the underlying data is prepared by third parties and outside the control of the forecasters.

The forecasts used in the Draft EIR/EIS are reasonable, having relied on best practices and available data and having been prepared by experts, but the firm preparing this forecast discloses the fact that, if underlying conditions change, the ridership estimates will change as well.

In order to address the potential variability of assumptions, the development of the ridership forecasts included a probability assessment, which was generated through a Monte Carlo simulation to assess the likelihood that a given outcome would occur. For each high-speed rail implementation scenario, the modeling presented high, medium and low ridership forecasts reflecting a range of probabilities. As explained in Chapter 2, Alternatives, Section 2.6, Travel Demand and Ridership Forecasts, the Draft EIR/EIS uses a range of ridership forecasts to provide for a conservative analysis of adverse impacts and benefits. Refer also to Draft EIR/EIS Section 3.1, Introduction, Section 3.1.4.6, Ridership Forecasts and Impacts Analysis, for additional explanation of how the ridership forecasts have been used in the Draft EIR/EIS analysis.

The commenter also questions why passengers would choose to ride HSR trains if

### **4494-9832**

passengers are not saving time and/or money. Riders make very complex choices and trade-offs between modes when choosing a preferred travel option for a given trip. In addition to the fare/trip cost and the door-to-door trip time the parameters that impact this choice are the frequency of travel options, the convenience of travel, and the reliability of travel. See Draft EIR/EIS Chapter 1, Section 1.2.4, describing the capacity constraints, travel delays, and travel unreliability that form a key part of the statewide and regional need for the HSR system.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9833

The commenter expresses their concern of noise during construction and operation exceeding the Federal Railroad Administration (FRA) criteria. The commenter's statements regarding noise levels cannot be confirmed, as there is not sufficient information regarding the noise metrics or distances from the sources of noise provided by the commenter. The commenter has adapted information from Table 3.4-24 in a way that does not take into account the methodology used for the noise analysis. The methodology used for the construction noise assessment is contained in Section 3.4.4.3 of the EIR/EIS and is based on the criteria and methodology in the 2012 FRA HSR noise and vibration guidance manual. The maximum noise levels for individual pieces of equipment are described at 50 feet, as the commenter states. However, the criteria for impact are based on Leq values, which are a cumulative noise level, which takes into account both how loud a piece of equipment is and how much it is used during a particular day. For example, a piece of equipment with a maximum noise level of 90 dBA at 50 feet would not necessarily exceed the FRA criteria of 70 dBA Leq and 80 dBA Leq for nighttime and daytime, respectively, without knowing the distance to a receiver or the duration of the usage of the piece of equipment. Table 3.4-24 in the Draft EIR/EIS provides information on the duration of construction and a summary of the distances within which there would be exceedances of the criteria and the potential for construction noise impacts, based on the phase of the project. In the comment letter, the commenter provided the first three columns of Table 3.4-24 of the Draft EIR/EIS, but did not include the last two columns, which show the distances to the 70 dBA Leq and 80 dBA Leq criteria for each of the construction phases. The commenter's table does not include the total methodology identified by the Authority in the Draft EIR/EIS. The Authority used those screening distances to determine if there could be significant noise impacts. Consistent with this methodology, the Authority found that without mitigation, there would be the potential for construction noise impacts within the distances in those last two columns. However, with the implementation of noise and vibration mitigation measure N&V-MM#1, the extent of construction noise impacts would be reduced, but there would still be unavoidable noise impacts from construction. Tables 3.4-25 and 3.4-26 detail the number of noise sensitive receivers that would be within these distances for each alternative, for both daytime and nighttime construction. With the implementation of noise and vibration mitigation measure N&V-MM1, the extent of construction noise impacts would be reduced, but there would still be unavoidable noise impacts from construction. The commenter also expresses concern related to the Angeles National

### 4494-9833

Forest and the wildlife that will be affected by noise. Startle effects for humans and wildlife have been evaluated in the EIR/EIS for HSR operations. The methodology for both human startle and animal effects are found in Section 3.4.4.3 of the EIR/EIS. For both humans and animals, the startle effects for the maximum HSR speeds on the corridor would occur within approximately 50 feet of the tracks, much of which would be within the HSR right of way. The FRA uses a threshold of 100dBA SEL to determine the potential for effects on animals. Please see Response to Comment #9398 for more discussion on the analysis of noise impacts to special-status-birds.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9834

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter expresses concern related to noise impacts on animals. The commenter's statements regarding noise levels cannot be confirmed, as there is not sufficient information regarding the noise metrics or distances from the sources of noise provided by the commenter. The FRA uses a threshold of 100 dBA SEL to determine the potential for effects on animals, but it is not clear what metric or distance the commenter is referencing for comparison. 100 dBA SEL would occur within 50 feet of the tracks, most of which would be in the HSR right-of-way, which would be fenced and not accessible to wildlife. During peak hours of operation, trains would pass by every 7.5 minutes in each direction. During off-peak hours trains would pass by every 10-12 minutes in each direction. Startle effects for humans and wildlife have been evaluated in the Draft EIR/EIS for HSR operations. The methodology for both human startle and animal effects are found in Section 3.4, Noise and Vibration (Section 3.4.4.3) of the Draft EIR/EIS. For both humans and animals, the startle effects for the maximum HSR speeds on the corridor would occur within approximately 50 feet of the tracks, much of which would be within the HSR right of way, which would be fenced and not accessible to wildlife and the general public.

The commenter also expresses concern related to noise from trains entering the tunnel. As discussed in Impact N&V#5: Operational Annoyance and Startle Effects on Humans of the Draft EIR/EIS, tunnel openings are being designed to eliminate any additional noise effects from the portals. Attenuation of the portal noise is achieved with long, flared portals and low blockage ratios. In-tunnel cross-passages and vents can reduce pressure magnitudes and rates of rise, though passage of these events may generate additional propagating and steepening wave fronts (page 3.4-76 of the Draft EIR/EIS). These tunnel and tunnel portal design features will be used to attenuate any additional noise associated with a train entering or exiting a tunnel.

Please also refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

### 4494-9835

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter expresses concern regarding noise and vibration impacts, and with the Authority's commitment to minimizing construction noise and vibration. The commenter requests mitigation measures for noise and vibration to be specified before construction begins. The commenter also states that the Draft EIR/EIS overlooks the effects of increased noise levels on wildlife, domestic animals, and livestock. The noise and vibration assessment evaluated noise and vibration impacts from temporary construction activities for all the HSR Build Alternatives. The assessment is based on the criteria and methodology contained in the Federal Transit Administration (FTA) and Federal Railroad Administration (FRA) noise and vibration guidance manuals. As discussed in Section 3.4.3 of the Draft EIR/EIS, the Authority is a state agency and therefore is not required to comply with local land use and zoning regulations; however, it has endeavored to design and construct the HSR project so that it is consistent with land use and zoning regulations. For example, the proposed Build Alternatives would incorporate IAMFs that require the contractor to prepare a plan to demonstrate how construction noise and vibration impacts will be maintained below applicable standards. The Authority has also adopted statewide policies that seek to reduce noise and vibration impacts associated with new sources of noise and vibration (Appendix 3.4-C) below applicable standards. The noise and vibration impact assessment completed for the Palmdale to Burbank Project Section is consistent with both FRA and FTA guidance. Please refer to Standard Response N&V-1: Operational Noise and Impacts to Sensitive Receptors, which provides additional information about why HSR has chosen to use the FRA and FTA Guidance. CEQA Guidelines Section 15126.4 (B) states: "...formulation of mitigation measures shall not be deferred until some future time. The specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project's environmental review provided that the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be considered, analyzed, and potentially incorporated in the mitigation measure." The Authority would commit to its mitigation through adoption of a Mitigation Monitoring and

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9835

Reporting Plan; mitigation includes specific performance standards (i.e., specific noise levels that shall be reached); and identifies the actions that can be achieved to meet performance standards (actions are listed in each mitigation; for example, N&V-MM#1 has a bullet list of actions). For these reasons, mitigation for noise and vibration is not deferred. Regarding the comment about noise effects on wildlife, domestic animals, and livestock, please refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which addresses this topic.

### 4494-9836

The commenter states that the Authority concluded that the noise impacts from the construction and operation of the train are "Less Than Significant." The Authority did not reach that conclusion. The noise significance conclusions for both construction noise and vibration and operations noise and vibration are summarized in Table 3.4-50 in the EIR/EIS. This table identifies conclusions before and after mitigation and the significance determination. Some unavoidable adverse noise impacts would result from implementation of the Build Alternatives, as described in the EIR/EIS. At locations where severe noise impacts have been identified, mitigation measures, as described in Section 3.4.7 of the EIR/EIS, will be implemented in accordance with the CA HSR Noise Mitigation Guidelines, which are included as Appendix 3.4-C of the EIR/EIS. In some cases, the mitigation measures may not be fully effective and sound walls would not be feasible in some locations, based on the mitigation guidelines. The CA HSR Noise Mitigation Guidelines outline where noise barriers would be constructed. Barriers would need to achieve between 5 and 15 dB of noise reduction and meet cost thresholds to be considered reasonable and benefit a minimum number of impacted locations. In areas where barriers are not effective or not feasible, sound insulation of buildings could be considered. In some cases, the mitigation measures may not be fully effective, and locations exist where sound walls would not be feasible, based on the mitigation guidelines. For the SR14A Build Alternative (the Authority's Preferred Alternative), much of the alignment would be underground, and when underground there would be no noise effects.

### 4494-9837

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter expresses concern about adverse impacts to domestic animals and wildlife as a result of noise and vibration from operations of the HSR Palmdale to Burbank Project Section. Please refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which addresses this impact.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9838**

The commenter expressed concern over the loss of revenues from displaced businesses and residences and the ability to find replacement housing for displaced residents and businesses. Loss of property tax revenues resulting from the project are described in Impact SOCIO#12 in Section 3.12, Socioeconomics and Communities of this Draft EIR/EIS (Table 3.12-38). Total annual regional property tax revenue loss from the project is estimated to be between \$1.2 million and \$1.6 million (2016 dollars), depending on the Build Alternative. Total annual regional property tax revenue for the 2014-2015 Fiscal Year was approximately \$6.3 billion (2016 dollars), based on Los Angeles County Assessor and Auditor-Controller and California State Controller estimates.

As shown in Table 3.12-38 of the Draft EIR/EIS, the estimated regional property tax loss for all Build Alternatives would be approximately 0.02 percent. Given the small percentage of total revenues that would be lost because of project displacements (i.e., 0.02 percent), the overall effect of these revenue losses would be small. As noted in the Authority's cumulative analysis in Section 3.19.5.12 of the Draft EIR/EIS, the cumulative economic impact from construction of the proposed improvements within the Palmdale to Burbank Project Section, in combination with cumulative projects, is not considered an environmental impact under CEQA because it would not cause a physical change in the environment. Nevertheless, impacts on the local tax base would be offset by additional revenues resulting from indirect local economic activity associated with construction spending. Loss of sales tax revenues resulting from displaced businesses are described in Impact SOCIO#13 in Section 3.12 of the Draft EIR/EIS (Table 3.12-39). The estimated sales tax losses shown in these tables assume a conservative scenario under which none of the displaced businesses would be able to find replacement sites within their current city.

Under this conservative scenario, it is estimated the Refined SR14, SR14A, E1, and E1A Build Alternatives would result in \$3.8 million of sales revenue lost annually; the E2 and E2A Build Alternatives would result in \$2 million of sales revenue lost annually due to business displacements. However, the operation of the Burbank Airport Station would generate new sales tax revenues for the region through annual project spending for operation and maintenance of the station facility.

### **4494-9838**

As stated in Section 3.12.8.2 of the Draft EIR/EIS, residential and business displacements would be direct effects of the Palmdale to Burbank Project Section. In general, there would be enough replacement units available to accommodate displaced residents associated with any of the six Build Alternatives. In areas where there are deficits of available residential units, such as Sun Valley, there would be residential units available in nearby neighborhoods. Implementation of SOCIO-IAMF#2 will provide relocation assistance to all residents displaced by the Build Alternative in compliance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act, and SOCIO-IAMF#3 will establish an appraisal, acquisition, and relocation process in consultation with the affected cities, counties, and property owners. Regarding other taxes noted in the comment (e.g., franchise fees, utility user taxes, etc.), changes in these fees and taxes would not cause a physical change in the environment and are, therefore, not considered impacts under CEQA.

### **4494-9839**

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter requests further information on methods for displaced residents to locate available housing. Please refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations. As noted therein, consistent with the requirements of the Uniform Act and California Relocation Assistance Act, the Authority is committed to working closely and proactively with residents and businesses to help them plan ahead for relocation, find a new home or business site, and solve problems related to the acquisitions and relocation.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9840

Refer to Standard Response PB-Response-SOCIO-2: Property Values.

The commenter requests further information on methods for displaced businesses to locate available properties of similar characteristics. Please refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations. As noted therein, consistent with the requirements of the Uniform Act and California Relocation Assistance Act, the Authority is committed to working closely and proactively with residents and businesses to help them plan ahead for relocation, find a new home or business site, and solve problems related to the acquisitions and relocation.

### 4494-9841

The commenter asks how CHSRA can guarantee that contractors purchase their supplies in the city of Los Angeles (or any city that had businesses acquired for the project). Assumptions for breakdown of budget spent on taxable goods (e.g., equipment, materials) were based on similar analyses for comparable rail projects and industry literature. Assumptions for capture of spending locally within Los Angeles County were based on preliminary analysis of commodity flows and regional business patterns detailed in the 2017 Commodity Flow Survey conducted by the U.S. Census Bureau and the Bureau of Transportation Statistics. Delineation of construction sales by jurisdiction within Los Angeles County would be speculative, and so values presented within the section are countywide.

### 4494-9842

The comment asks if the project would have effects on the utility users tax (which affects local government revenues) in the cities of Palmdale, San Fernando, Los Angeles, and unincorporated areas of Los Angeles. From a CEQA standpoint, this comment does not relate to the physical impacts of the project. The Authority does not control how local utility fees are set or calculated and the project would have no effect on the utility users tax. The Authority would pay its fair share of any local utility usage.

### 4494-9843

The commenter requests additional information on effects to local and regional sales tax, and property tax, from the project. Temporary effects regarding local and regional sales tax revenues are discussed under Impact SOCIO#8, in Section 3.12, Socioeconomics and Communities, of this Final EIR/EIS. Long-term effects on property and sales tax revenues from operations are discussed under Impact SOCIO#12, in Section 3.12 of this Final EIR/EIS. This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9844

The commenter requested more detail on how inconsistencies between federal, state, regional, and local laws for the Build Alternatives will be resolved. The Authority, as the lead state and federal agency proposing to construct and operate the California HSR system, is required to comply with all federal and state laws and regulations and to secure all applicable federal and state permits prior to initiating construction on the selected Build Alternative. As discussed in Appendix 3.1-B of the Draft EIR/EIS, the project is consistent with the majority of the USFS policy. The project is inconsistent with Policy SD-1, Special Interest Areas, Policy Rec-1, Recreation Opportunity, Policies S9 and S10, related to Scenic Integrity Objectives, and Policy S13 related to critical habitat land use zone. These inconsistencies would be reconciled through mitigation measures discussed throughout Chapter 3, especially Section 3.7, and Biological and Aquatic Resources, Section 3.13, Station Planning and Land Use, and Section 3.16, Aesthetics and Visual. As discussed in Section 3.1, Introduction, the Draft EIR/EIS has been prepared consistent with federal and state statutes and regulations, including the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). In regard to local regulations, the Authority is a state agency and therefore is not required to comply with local land use and zoning regulations; however, it has endeavored to design and construct the HSR project so that it is consistent with land use and zoning regulations. See Appendix 2-H, Regional and Local Policy Consistency Analysis, in the Draft EIR/EIS which shows that the Project is consistent with most of the local land use regulations. For policies that are inconsistent, the Authority will implement mitigation measures and impact avoidance and minimization features to minimize or avoid adverse impacts to resources. For those environmental impacts that cannot be mitigated, under the CEQA statute, the impacts have been deemed significant and unavoidable.

### 4494-9845

The commenter requests details regarding the Construction Management Plan (CMP), which are provided below.

The development of a Construction Management Plan (CMP) is a requirement of several IAMFs and will cover a range of topics addressing geological conditions, disturbance of undocumented contamination, spill prevention, and construction period, address effects on low-income and minority populations as well as traffic handling to name a few. For example, the CMP will address groundwater withdrawal, unstable soils, subsidence, water and wind erosion, soils with shrink-swell potential, and soils with corrosive potential. The CMP will outline how HSR engineering design appropriately addresses these geologic constraints. The CMP will address procedures for disturbing undocumented contaminated soil. The Contractor would work closely with state and local agencies to resolve any such encounters and address necessary clean-up or disposal. The CMP would also include a construction period spill prevention plan. The plan would identify construction best management procedures designed to contain and prevent accidental spills, including procedures to clean up any accidental hazardous material release.

The CMP also includes addressing effects on low-income and minority populations by requiring the Contractor to prepare a CMP that will include actions pertaining to communications, visual protection, air quality, safety controls, noise controls, and traffic controls to minimize impacts on low-income households and minority populations. The plan will verify that property access is maintained for local businesses, residences, and emergency services. This plan will include maintaining customer and vendor access to local businesses throughout construction by using signs to instruct customers about access to businesses during construction. In addition, the plan will include efforts to consult with local transit providers to minimize impacts on local and regional bus routes in affected communities.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9846

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-GEN-4: General Opinions, Opposition or Support. The commenter inquires as to why there is no build alternative that avoids the Angeles National Forest. Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process which discusses why the Build Alternatives were selected. The commenter expresses a preference for the No Project Alternative. The commenters support for the No Project Alternative is acknowledged. Refer to Standard Response PB-Response-GEN-4: General Opinions, Opposition or Support. This comment does not address the sufficiency of the draft EIR/EIS nor does it suggest edits to the document. As a result, no change has been made to the document in response to this comment.

### 4494-9847

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter questions how many acres of ANF land would be permanently acquisitioned under the project, and if residents would be compensated for the federal land acquisition. See Table 3.13-17, in Section 3.13, Station Planning, Land Use, and Development of the Final EIR/EIS, for the acreage of areas temporarily impacted during construction activities, and permanently impacted by project operation. Based on the nature of impacts, the Authority determined where a full acquisition, partial acquisition, permanent easement (surface, subterranean, or aerial), temporary easement, or some combination of these would be required. These decisions were based on experience acquiring properties affected by other regional transportation projects. Generally, full acquisitions were designated where a significant portion of the structure or structures comprising the property's principal dwelling or business facility would be within the area to be acquired for the HSR right-of-way or for an extended period during construction. Similarly, where a property's structures would not be affected, but any physical component critical to a property's intended use (such as parking, access, or open space used for storage of goods or equipment) would be acquired, the acquisition would be considered a full acquisition. Of the six Build Alternatives, only the E1 and E1A Build Alternatives would result in residential displacements within the ANF. Only one of two adit options (E1-A1 or E1-A2) would be selected and constructed. Construction of E1-A1 would require the displacement of three residences, and E1-A2 would displace one residence; each of these residential displacements would occur within in-holdings which are private property within the ANF. Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations for a discussion of how property owners would be compensated.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9848

The commenter requests an estimate of gallons of water that would be removed from the aquifers within the Angeles National Forest for each build alternative during the construction phase, and what impacts this removal would have on humans, animals, and plants.

The project is not proposing to remove water from the aquifers within the Angeles National Forest. As discussed in Section 3.8, Hydrology and Water Resources, impact HWR#5, changes in hydrologic conditions associated with tunnel construction beneath the ANF, the project will implement several IAMFs specifically intended to avoid or reduce groundwater from entering tunnels during construction. HYD-IAMF#5: Tunnel Boring Machine Design Features, HYD-IAMF#6: Tunnel Lining Systems, and HYD-IAMF#7: Grouting, would be implemented and intended to prevent or reduce the potential for groundwater to enter tunnel construction. Notwithstanding these IAMFs, the Authority will also implement an Adaptive Management and Monitoring Plan (AMMP) pursuant to mitigation measures HYD-MM#4 and BIO-MM#93 to detect and address adverse changes to subsurface and surface water resources within the Angeles National Forest (ANF), including the San Gabriel Mountains National Monument (SGMNM), that could occur during construction of the High Speed Rail (HSR) tunnels for the Preferred Alternative. The AMMP would provide for timely detection of hydrological changes and implementation of appropriate remediation, if necessary. The Supplemental Water Demand Analysis (Appendix 3.8-D) discusses the options, logistics, and feasibility of implementing the response actions that may be implemented in accordance with the AMMP. Specifically, the analysis describes the methodology used to estimate potential remedial water needs and discusses various scenarios that would necessitate that supplemental water, the potential sources of that supplemental water, and the logistical considerations regarding the conveyance and delivery of that supplemental water.

### 4494-9849

The commenter requests for each Build Alternative the acreage temporarily and permanently impacted within the Angeles National Forest (ANF). Table 2-37 in Section 2.9.4.1, Operational Right-of-Way, of the Draft EIR/EIS provides a list of the construction staging areas for each Build Alternative that are assumed in this analysis within the ANF. The Refined SR14 and SR14A Build Alternatives will temporarily occupy 32.8 acres. The E1 and E1A Build Alternatives will temporarily occupy 60.8 acres. The E2 and E2A Build Alternatives will temporarily occupy 267.9 acres. Long term impacts are discussed under the header "Potential Permanent Facilities" in Tables 2-30 through 2-32 of Section 2.5.4 of the Draft EIR/EIS. All six Build Alternatives would include a mid-tunnel ventilation building at the adit site that would be approximately 50 feet wide by 50 feet long by 18 feet high, occupying approximately 20,000 square feet. Additionally, each of the Build Alternatives would require powerlines that would require approximately 6.2-33.3 acres depending on the Build Alternative.

### 4494-9850

The commenter requested further detail regarding electrification equipment and infrastructure that would be built in the Angeles National Forest (ANF) due to construction of the Palmdale to Burbank Project Section.

The project does not define permanent equipment for electrification or infrastructure inside the ANF, except for an entrance to an adit that would be used during construction as an intermediate access to the tunnel, and as emergency and maintenance access during operation. The architectural form for the entrance is yet to be defined, but there are also other alternatives being considered for this access that are located outside of the ANF, and therefore, an adit within the ANF might not even be built.

Any electrical infrastructure installed within the ANF as part of the project will follow existing utility (electrical line) corridors and existing roads (e.g., Little Tujunga Canyon Road) within the forest. Within the existing utility corridor, the addition of this electrical infrastructure would be of similar scale (height), and not substantially alter the existing visual and scenic qualities of the ANF.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9851**

The commenter inquired how many miles of access roads will be built in the Angeles National Forest. Refer to Section 2.5.4, High-Speed Rail Build Alternatives - Description of Facilities within the ANF, of the Draft EIR/EIS, including SGMNM, for the exact mileage of access roads which would be built under each Build Alternative, respectively. For the SR14A Build Alternative, the Preferred Alternative, within the ANF, including the SGMNM, approximately 0.6 acre would be used for access roadways.

### **4494-9852**

The commenter inquired if there will be helicopter access points that will be built within the Angeles National Forest for each Build Alternative. No helicopter landing points have been identified as being needed for project construction within the ANF. Detailed access plans for each site would be determined based on the location of the selected candidate sites as well as the means and methods that best protect the surrounding environment.

### **4494-9853**

The commenter asks whether an updated biological study will be performed prior to the final selection of a Build Alternative. All six Build Alternatives have been comprehensively analyzed in the EIR/EIS such that no further study is required for the purposes of NEPA and CEQA. No additional biological studies are planned prior to the Authority issuing a decision. Prior to construction, additional studies, surveys, and other actions would be implemented consistent with the mitigation measures outlined in the Final EIR/EIS.

### **4494-9854**

The commenter requests an updated cost-benefit analysis that reflects changes in population as well as ridership due to more people working from home. There is no requirement in CEQA or NEPA for a cost-benefit analysis to be included in an EIR/EIS. The Authority publishes ridership and revenue forecasts in its business plans on a biannual basis, but this mandate does not require further efforts for the purpose of environmental disclosure in an EIR/EIS.

The analysis presented in the Draft EIR/EIS was initiated using the Authority's 2016 Business Plan. The Authority released a Draft 2022 Business Plan in February 2022 for public review and comment. The Authority's Board of Directors adopted the 2022 Business Plan in April 2022, and the plan was submitted to the Legislature on May 6, 2022. Given that there are minimal differences between the: 2016 Business Plan, 2018 Business Plan, 2020 Business Plan, and 2022 Business Plan, the costs included in the Draft EIR/EIS rely on the 2016 Business Plan.

As described in Chapter 2, Alternatives, Section 2.6 Travel Demand and Ridership Forecasts, the Final EIR/EIS uses ridership estimates developed for the Authority's 2016 Business Plan. The Final EIR/EIS also explains that the latest ridership forecasts prepared by the Authority were documented in the 2022 Business Plan. On a systemwide basis, the 2022 Business Plan had a lower total forecast of HSR ridership than the 2016 Business Plan. Based on this data, it is anticipated that boardings and alightings at individual stations would also have lower ridership than previously estimated. Specifically, the 2016 Business Plan forecasted 42.8 to 56.8 million riders by 2040 for the medium and high forecasts, whereas the 2022 Business Plan forecasted 38.6 to 50.0 million riders by 2040 for the medium and high forecasts. As a result, the activity levels at the Palmdale and Burbank stations and attendant adverse impacts would be less. The Final EIR/EIS explains that project benefits would be less using 2022 ridership forecasts, however, the benefits would continue to accrue over time and eventually reach levels discussed in the Final EIR/EIS for the Phase 1 system.

In addition, despite the reduction in transit, intercity train travel, and air travel trips since March 2020 due to the COVID-19 pandemic, the ridership forecasts discussed in the Final EIR/EIS remain reasonable for environmental analysis purposes due to population growth and the consequent continued increase in traffic congestion and the anticipated

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### **4494-9854**

recovery of transit, intercity train, and air travel. Section 6.3.3 in Chapter 6, Project Costs and Operations of this Final EIR/EIS has been revised to include a footnote referring to adjustments to the Authority's operations and management model assumptions. Those adjustments were based on several factors including full operation of Silicon Valley to Central Valley and Phase 1 services, and updated revenue collection costs described in the 2022 Business Plan. According to data compiled by SCAG in its July 6, 2023, Transit Ridership Update state report (see: [https://scag.ca.gov/sites/main/files/file-attachments/printout-3735\\_transit\\_ridership\\_update\\_7.6.23.pdf?1690420883](https://scag.ca.gov/sites/main/files/file-attachments/printout-3735_transit_ridership_update_7.6.23.pdf?1690420883)), all Southern California transit operators have experienced gains in transit ridership over the last year (between 7 percent and 30 percent increases).

Although ridership levels are lower than pre-pandemic, the trends are improved over the previous years. For example, LA Metro bus ridership was up by almost 13 percent in April 2023 compared to April 2022. Amtrak services in California experienced a substantial drop in ridership at the start of the pandemic. Between 2014 and 2019, Amtrak ridership in California increased from about 10.5 million to 11.5 million passengers per year (Rail Passengers Association 2020). This increase included the four national network long-distance trains (California Zephyr, Coast Starlight, Southwest Chief, and Sunset Limited) and the three state-supported routes (Capitol Corridor, Pacific Surfliner, and San Joaquins). After the California COVID-19 stay-at-home order was issued, both the long-distance routes through the state and the state-supported routes experienced declines. Overall, the long-distance routes declined by 39 percent and the state-supported routes declined by 49 percent when comparing fiscal year (FY) 2019 and FY 2020 ridership (Railway Age 2020). In 2022, however, Amtrak demand was close to returning to pre-pandemic levels, and showed an 88 percent increase in ridership compared to 2021, and as of July 2023, ridership has already shown 26 percent year-over-year growth, compared to 2022 (see: <https://media.amtrak.com/wp-content/uploads/2022/11/FY22-Year-End-Revenue-and-Ridership.pdf> and <https://www.amtrak.com/content/dam/projects/dotcom/english/public/documents/corporate/monthlyperformancereports/2023/Amtrak-Monthly-Performance-Report-July-2023.pdf>).

Because the California HSR System would also replace air travel trips, trends in air travel are also relevant. Recent trends in air travel indicate that passenger totals have

### **4494-9854**

steadily increased since the COVID-19 pandemic, with significant year-over-year increases between 2020 and 2022 reported by both Los Angeles International Airport and Hollywood Burbank Airport. These values also indicate the recovery of the travel industry and the continued trends in higher usage of long-distance travel modes (see: <https://www.lawa.org/lawa-investor-relations/statistics-for-lax/10-year-summary/passengers> and <https://www.hollywoodburbankairport.com/about-us/airport-statistics/>). While employers offered broad telecommuting arrangements in certain sectors during the pandemic, the long-term persistence of this trend is uncertain. Recent reporting suggests that many private sector companies and government agencies anticipate a return to in-office work for their employees in whole or in part. Therefore, it would be speculative to assume an overall reduction in ridership at this time based on this recent pandemic-induced trend of working from home.

The Authority does not anticipate that the work-from-home trend will significantly affect the need for, or travel demand associated with, the HSR system. With severe constraints for expansion of the existing transportation system, the demand for HSR train service will remain in the long-term despite the near-term effects of the COVID-19 pandemic and the work-from-home trend on the transportation system. Therefore, the ridership projections used by the Authority remain reasonable for the Purpose and Need of the project and the analysis of the project's anticipated impacts and benefits.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9855

The commenter asks how much power per day and per year each Build Alternative would consume, and how this demand would impact residents and businesses. Please refer to Impact PUE#11 Permanent Operations Energy Demand in Section 3.6 of the Draft EIR/EIS. The operational energy analysis uses a dual baseline approach, which means that the Palmdale to Burbank Project Section operational energy impacts are evaluated against existing conditions and expected 2040 background (No Project) conditions, with additional consideration of impacts in the HSR opening year. The Authority calculated operational energy consumption for medium and high ridership scenarios; ridership scenarios do not differ by Build Alternative. The medium and high ridership scenarios are based on the level of ridership as presented in the Authority's 2016 Business Plan. The complete statewide analysis is included in Appendix 3.6-A to the Draft EIR/EIS, with detailed calculations on the reduction in energy consumption from transportation. Project energy demand results for these ridership scenarios are shown in Table 3.6-26.

Regarding potential impacts to residents and business who already encounter problems due to excessive energy demand, please note that the Authority has coordinated with Pacific Gas and Electric Company and SCE and determined that network upgrades would be required to meet the projected power demands of the Palmdale to Burbank Project Section within the two utilities' respective service territories. Detailed engineering of electrical interconnections and network upgrade components has not been undertaken and would be completed closer to the time of construction. Utility upgrades could include modifications to existing infrastructure such as expansion of existing substations and reconductoring of existing electrical lines (i.e., replacement of power structures [poles and lattice steel towers] and electrical conductors with taller structures and more efficient electrical wires or new electrical lines). Anticipated utility upgrades are included in the Build Alternative footprint and would be implemented pursuant to California Public Utilities Commission General Order 131-D. The upgrades will be designed to ensure that there are no effects on the utility's ability to meet existing and projected electrical demand.

### 4494-9856

The commenter requested further information on project train emergency protocol in the case of high wind events that would increase the likelihood of wildfire. Application of SS-IAMF#1 and SS-IAMF#2 will require the development and incorporation of a fire and life safety program into the design and construction of the Palmdale to Burbank Project Section. The fire and life safety program is coordinated with local emergency response organizations to provide them with an understanding of the rail system, facilities, and operations, and to obtain their input for modifications to emergency response operations and facilities. Fire risks would also be reduced by the Authority's formation of a statewide Fire and Life Safety and Security Committee (FLSSC) through implementation of SS-IAMF#2, which will be composed of representatives from fire, police, and local building code agencies. The purpose of the FLSSC will be to review issues that are critical to fire and life safety and security; acquire input and concurrence from the state and local authorities having jurisdiction over the proposed designs to meet code requirements; and to comply with state and local fire code standards or fire and life safety hazard programs during the design phase of the project, including emergency response operations and protocol such as operational power shut down to prevent wildfires under certain environmental conditions that could exacerbate the potential for wildfire.

## Response to Submission 4494 (Kelly Erin Decker, S.A.F.E. Coalition (Save Angeles Forest for Everyone), December 1, 2022) - Continued

### 4494-9857

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding, PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, PB-Response-S&S-1: Wildfire.

The commenter identifies risks and impacts associated with the Build Alternatives (including seismicity, wildfire, loss of water resources, impacts on habitat, construction in a national forest and national monument, greenhouse gas emissions from construction, deferral of design considerations, and the 15/85 design model) and states that based on those risks, the only route that can be considered is the No Project Alternative. The commenter also expresses that the benefits of the project are based on speculation and that the ridership projects are flawed. The commenter also expresses that it is speculative that the project will recoup its cost.

This comment is a summary conclusion, referencing the earlier comments in its letter. The Authority has provided a response to every individual comment raised by the commenter (see Response to Comments #9174 through #9586).

The Authority acknowledges that there are potential impacts related to seismicity, wildfire, water resources, habitat, construction in a national forest and national monument, and greenhouse gas emissions from project construction and operation. These impacts are addressed throughout the Draft EIR/EIS. Impact Avoidance and Minimization Features (IAMFs) and mitigation measures have been developed, as appropriate, to reduce and avoid impacts on these resources.

For impacts related to:

- Seismicity, please refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.
- Wildfire, please refer to Standard Response PB-Response-S&S-1: Wildfire.
- Loss of water resources, please refer to the Draft EIR/EIS, including Section 3.8, Hydrology and Water Resources, which addresses impacts related to water quality and Section 3.6, Public Utilities and Energy, which addresses impacts related to water supply.
- Impacts on habitat, please refer to Section 3.7, Biological and Aquatic Resources, which identifies the mitigation that would be implemented to mitigate for loss of habitat.

### 4494-9857

The commenter does not raise any specific issues related to construction within a national forest and national monument. The Authority analyzes potential impacts to the Angeles National Forest and San Gabriel Mountains National Monument throughout the document, including in Appendix 3.1-B, USFS Policy Consistency Analysis.

Regarding the impacts from emitting GHG emissions during construction, the Authority acknowledges in its Draft EIR/EIS that there would be GHG emissions generated during construction but that these emissions would be almost fully offset after 4 to 6 months of operations (depending on the ridership scenario and Build Alternative) (see page 3.3-126 in Section 3.3, Air Quality and Global Climate Change of the Draft EIR/EIS).

Regarding the comment that the logistical and technical burdens of serious design considerations would be pushed onto contractors with no specified amount of oversight, the commenter raised this issue in earlier comments. Please refer to previous responses to these concerns in Response to Comments #9177, #9180, and #9208.

Regarding the commenter's concern about the 15/85 design build model, the commenter raised this concern in an earlier comment. Please refer to the previous response in Response to Comment #9507.

Regarding the comment that the project benefits are speculative due to flaws in ridership projections, the commenter does not provide any specific evidence to support their assertion that the ridership projections are flawed. Please refer to the Authority's Technical Supporting Document for the California High-Speed Rail 2020 Business Plan Ridership and Revenue Forecasting, which includes additional information about how the ridership was estimated.

Regarding the comment about recouping the cost, please refer to Standard Response PB-Response-GEN-2: Project Costs and Funding.

Regarding the commenter's support for the No Build Alternative. This comment presents an opinion on the HSR Palmdale to Burbank Project Section. The No Build Alternative would not meet the HSR purpose, need, or objectives outlined in Chapter 1, Project Purpose, Need, and Objectives of the EIR/EIS. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)).

## Submission 4496 (Leo Grillo, DELTA Rescue, December 5, 2022)

**Stakeholder Comments/Issues :**

4496-8465

We are in Arrastre Canyon, Acton. Our water wells are in the headwater to the Santa Clara river. Your project is an environmental disaster in total, but worse ever if it cuts close to Arrastre Canyon. If we lose our water our 1500 animals will perish. Our sanctuary will perish. Our lawyers will seek an injunction to stop you in your tracks if you announce that you have chosen Arrastre Canyon near which to tunnel. We won one of the few injunctions against LA County for much less an infringement. Consider this in your decision making.

If you run along the 14 freeway we will not have standing to sue you but it will still be an environmental disaster. Why? To melt the ice cube of federal funding?

Good luck.

Leo Grillo

## Response to Submission 4496 (Leo Grillo, DELTA Rescue, December 5, 2022)

### 4496-8465

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding, PB-Response-GEN-4: General Opinions, Opposition or Support, PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF.

The commenter states the project will be an environmental disaster and particularly so if it goes close to Arrastre Canyon. The commenter expresses concern over a scenario of impacts on their wells and the ability to provide water to animals. They state an alignment along the SR 14 would also be an environmental disaster and also refer to federal funding. Please refer to Standard Response PB-Response-GEN-4: General Opinions, Opposition or Support. The commenter's opposition to the HSR project is acknowledged and included in the record for consideration by decisionmakers. Note that the alignments of the preferred alternative (SR14A Build Alternative), as well as Refined SR14 Build Alternative, do not go through Arrastre Canyon. The E1, E1A, E2, E2A Build Alternatives would traverse Arrastre Canyon, mostly in a tunnel but with a small portion of cut and cover. The alignments can be seen on the interactive map available at <https://geografika.maps.arcgis.com/apps/MapJournal/index.html?appid=ccac46af003e4a2da4528b2a7595141b>. A portion of Arrastre Canyon is within the Angeles National Forest (ANF) and part of it is outside the ANF.

Pursuant to the Authority's 2019 Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest and 2019 Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest (referenced in Section 3.8 of the EIR/EIS), based on observed impacts on groundwater from past tunnel projects, no impacts to wells are expected to occur outside the tunnel construction resource study area (more than 1 mile from the centerline of each Build Alternative). Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail the options that the Authority would

### 4496-8465

consider to address impacts to private water supply wells outside the ANF, including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. For wells within the ANF that are determined through modeling and monitoring to be adversely affected by groundwater reductions caused by the HSR, the Adaptive Management and Monitoring Plan (AMMP) included in Mitigation Measure HWR-MM#4 requires modifications to the affected wells or by providing supplemental water. Supplemental water would only be provided if monitoring indicates that the HSR construction caused groundwater impacts. However, the Authority has identified several IAMFs to avoid and minimize the potential for impacts to water supply wells and the need for supplemental water. HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 require design features and construction methods to address potential groundwater intrusion, including the installation of a tunnel liner(s) capable of effectively controlling inflows into the tunnels. As such, groundwater inflow during construction would likely be minimal and temporary. Please refer to both Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest and Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest for additional information regarding impacts to wells and correlating mitigation measures and IAMFs.

It is unclear to the Authority about what the commenter means by "to melt the ice cube of federal funding," and therefore cannot respond to that part of the comment. However, as to the overall purpose of the project, refer to EIR/EIS Chapter 1: Project Purpose, Need, and Objectives. As to funding sources, refer to Standard Response PB-Response-GEN-2: Project Costs and Funding.

Correspondence Secretary

## ANALYSIS OF THE "HYDROLOGY AND WATER RESOURCES" SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT.

### 1.0 INTRODUCTION

The "Hydrology and Water Resources" impact assessment presented in Chapter 3.8 of the Draft Environmental Impact Report/Environmental Impact Statement (hereafter referred to as "the Draft") that was prepared by the California High Speed Rail Authority for the Palmdale-Burbank Segment of the High Speed Rail Project ("Project") has been evaluated and numerous factual errors and material deficiencies have been identified. These errors and deficiencies are set forth in the comments presented below; they demonstrate that the Draft does not comply with either the California Environmental Quality Act ("CEQA") or the National Environmental Protection Act ("NEPA"). Please note: These comments were prepared by a competent engineer with more than 35 years of environmental engineering experience and they present expert opinion supported by facts pertaining to the significant environmental effects that will be caused by the Project and which must be mitigated. Accordingly, the comments provided herein constitute "substantial evidence" as that term is defined by the CEQA Statute [California Public Resources Code §21080(e)(1)] and Guidelines [California Code of Regulations Section 15064(f)(5)]. These comments also demonstrate that CHSRA/FRA have failed to conduct a substantive 'hard look' review of the Project's environmental impacts as required by NEPA.

### 2.0 MAJOR DEFICIENCIES NOTED IN THE DRAFT.

#### 2.1 The "Best Management Practices" That Will be Used for Project Construction Will Result in Significant Erosion and Alter Flow Characteristics Downstream of Project Construction Sites.

Section 3.8 of the Draft concludes that the Project will have a "less than significant impact" on hydrology because it will employ "Impact Avoidance and Minimization Features" ("IAMFs") and utilize standard "Best Management Practices" ("BMP") and implement "Stormwater Pollution Prevention Plans" to control and direct stormwater runoff from project construction sites and thereby not alter surface drainage patterns [Page 3.8-39]. The Draft is very much mistaken. The BMPs and SWPPP elements that are enumerated in the Draft were developed for urban areas where the land surface is almost entirely impervious and where extensive infrastructure (concrete drainage infrastructure, culverts, impervious ditches, channelized facilities, etc.) capture and divert stormwater to either the ocean or detention (dam) facilities or large "spreading grounds"; these BMPs and SWPPS are entirely inappropriate in rural areas that have dirt roads, few impervious areas and no drainage infrastructure and where natural drainage patterns have been maintained and preserved for hundreds of years. For example, a primary purpose of the BMPs and SWPPPs is to control sediment flows and eliminate sediment from stormwater discharges (see pages 3.8-76 and 3.6-78<sup>1</sup>); this is important in urban areas because sediment impairs the operation of stormwater capture and conveyance infrastructure.

<sup>1</sup> According to pages 3.8-76 and 3.6-78, the Project will employ IAMFs to control sediment and BMPs will minimize discharges of sediment in stormwater released from construction sites.

Submission 4516 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4516-8738

by accumulating in conveyance channels and detention basins reducing system capacity. However, rural areas like Acton and Agua Dulce have no stormwater capture or conveyance infrastructure; so, sedimentation is not a problem. In fact, if the Project does remove sediment from stormwater flows in Acton and Agua Dulce, it will cause tremendous erosion problems on all downstream areas because the “sediment free” stormwater discharged from the construction site into natural drainage courses will pick up sediment as it gains speed on its path toward the Santa Clara River<sup>2</sup>. And, where it picks up sediment as it flows across downstream properties, it causes significant erosion. This is not conjecture; it is fact. The Forecast subdivision between McEnery Canyon Road and Desert Road in Acton installed stormwater capture and sediment removal facilities (including debris basins and detention basins) that discharged sediment-free water to the natural drainage courses downhill from the subdivision, and when it rained, the “sediment free” water picked up significant amounts of sediment as it flowed across downhill properties the resulted in significant erosion; some downhill properties lost large areas of their back yards. Therefore, IAMFs, BMPs and SWPPs that result in “sediment free” stormwater discharges will cause significantly adverse erosion impacts in Acton and Agua Dulce.

The problem with employing standard IAMFs, BMPs and SWPPP measures at construction sites in Acton and Agua Dulce can perhaps best be illustrated by analyzing a statement found on page 3.8-37 which asserts “Drainage facilities would be specifically designed to convey stormwater runoff, which would result in minimal direct drainage impacts related to these facilities”. According to this statement, the Project will not cause drainage impacts because the Project will be designed to “convey stormwater runoff”; the problem is, neither Acton nor Agua Dulce have stormwater infrastructure to accept the “storm water runoff” that the Project “conveys”. Neither Acton nor Agua Dulce have stormwater culverts or concrete drainage facilities or stormwater capture infrastructure or channelized flow areas, so the “stormwater runoff” that is “conveyed” by the Project *has nowhere to go*. And, if it is just dumped into the natural drainage courses in these communities, it will cause extensive erosion (as discussed above). To be clear, stormwater runoff is *never* “conveyed” in Acton or Agua Dulce; instead, stormwater merely flows to the Santa Clara River along natural drainage courses that have remained unchanged for millennia. The fundamental premise which underlies the Draft’s conclusions that hydrologic impacts will be less than significant because the Project includes BMPs and SWPPs to ensure “drainage facilities would be specifically designed to convey stormwater runoff” is only reasonable in urban/suburban areas where there is channelized drainage infrastructure to accept the conveyed stormwater; it is entirely unreasonable and inapplicable to Acton and Agua Dulce. Accordingly, the Draft is patently incorrect to conclude that the Project will have “less than significant” hydrologic impacts in Acton and Agua Dulce.

It is important for CHSRA to understand that natural drainage patterns have generally dictated the location and configuration of all development in Acton and Agua Dulce over the last 150 years; thus, it is critical that drainage patterns and characteristics in these communities remain preserved and unchanged to protect existing developments. Other than an earthquake, the only activity that can alter drainage patterns in Acton and Agua Dulce is development involving stormwater capture, sediment removal, and stormwater control; this is why such developments are precluded in Acton and why all the IAMPFs, BMPs, and SWPPS that are identified in the

<sup>2</sup> This is the principal characteristic of “two phase flow” conditions: clean water flowing over a natural surface will pick up sediment from the surface until an equilibrium is reached; the equilibrium is a measure of the sediment transport capacity of the flow.

4516-8738

Draft are completely inappropriate for Acton. To better understand how the natural drainage patterns are preserved in Acton and Agua Dulce, the following description is offered:

- Most roads in Acton are dirt and have no stormwater capture or diversion infrastructure; they are maintained by the residents. This does make the roads occasionally impassable during inclement weather, but residents quickly repair the roads and restore access.
- There are culverts under a few paved roads in Acton (the 14 Freeway, Escondido Canyon Road, Sierra Highway, and Soledad Canyon Road) but these culverts are located where natural flows occurred before the roads were built *and they do not have sediment removal facilities*; they simply carry sediment laden flows from one side of the road to the other and do not alter flow patterns or cause erosion on downstream properties.
- Every new residential development complies with applicable stormwater regulations by constructing a natural bioswale on site which is appropriately sized to capture and retain sufficient water to offset the impervious surface area that the development creates; no impervious stormwater capture facilities or sediment removal basins are constructed.

Concerns regarding the use of standard IAMFs, BMPs, and SWPPP measures are particularly acute at the “Acton Window” location which lies immediately adjacent to, and uphill from, an entire residential neighborhood. As indicated in the drainage map that is provided in Attachment 1, there are several natural drainage courses across the “Acton Window” parcel; some of these drainage courses are very near homes that are south of, and just downhill from, the “Acton Window” site. As shown in the figures below, sediment-laden stormwater flows off the “Acton Window” parcel via the natural drainages and passed the homes without eroding or flooding the homes. If the Project employs the BMPs and SWPPPs that are described in the Draft at this location, then significant downhill erosion will occur and the homes will be substantially damaged. It should be noted that, at one time, a residential subdivision was proposed for the large parcel that will be used for the “Acton Window”; the subdivision was configured to connect to Antelope Woods Road at the same location and in the same manner as what is now proposed for the SR14A Alternative. The developer had proposed the use of “Conspan” arch bridges to traverse the unique onsite drainage courses that emanate from under the 14 Freeway in a manner that would not alter any characteristics of runoff from the property. A copy of the subdivider’s “post-development” plan is provided in Attachment 2. The efficacy of the developer’s proposal to utilize arch bridges to prevent alterations to existing drainage characteristics and patterns was never fully vetted because the subdivision map was withdrawn; however, the information provided in Attachment 2 demonstrates just how essential it is for CHSRA to ensure that Project construction and operation at the “Acton Window” does not modify drainage characteristics or drainage locations at the Acton Window site.

Taken together, the abovementioned facts demonstrate that implementation of the BMPs and SWPPP measures that are identified in the Draft within the Communities of Acton and Agua Dulce will not reduce impacts from alterations of surface drainage patterns to a level that is less than significant; to the contrary, they will amplify and exacerbate such impacts. Thus, it is particularly important that the Final EIR clearly assert that the Project *will not* adopt standard BMPs and SWPP measures in rural communities like Acton and Agua Dulce because they are only applicable to urban/suburban areas where there are extensive impervious surfaces and

Submission 4516 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4516-8738

Photos of sediment laden stormwater flowing off the “Acton Window” property.

sufficient stormwater conveyance facilities to accommodate them. It is also critical that the Final EIR identify and describe the rural-appropriate IAMFs, BMPs, and SWPPP measures that will be utilized to ensure that the Project does not modify existing stormwater runoff patterns or alter the location of, or the flowrate in, or the sediment characteristics of, any natural watercourses in Acton and Agua Dulce.

**2.2 The Draft Improperly Conflates Stormwater Treatment with Wastewater Treatment and Fails to Address the Impacts of Wastewater Pollutants on Water Resources.**

Section 3.8 of the Draft provides extensive discussions regarding the stormwater treatment infrastructure will be employed to protect water resources at all the Project’s tunnel portal sites; however, it fails to discuss the wastewater treatment infrastructure that will be employed to address the significant volumes of wastewater that will be generated every day during tunnel construction. It also does not identify any measures that will be used to protect groundwater resources from wastewater contamination. In fact, the word “wastewater” appears only three times in Section 3.8! Wastewater concerns are mentioned briefly in Section 3.6 of the Draft, but the wastewater treatment approach it describes is lacking because it relies on the Project’s stormwater treatment facilities to clean up process wastewater resulting from tunnel construction<sup>3</sup>. In other words, the Draft improperly conflates *wastewater treatment* with *stormwater treatment*. The Project’s stormwater facilities will operate only during rare rain events, and in rural communities like Acton and Agua Dulce, stormwater facilities are not particularly complex because stormwater runoff is generally clean with few contaminants (though stormwater does contain sediment which, as discussed above, is naturally occurring and

<sup>3</sup> Pages 3.6-78 – 3.6-79 concludes that wastewater impacts will be less than significant because of the BMPs and SWPPP measures that will be implemented for the Project’s stormwater treatment program.

4516-8738

not a “contaminant”). In contrast, the Project’s wastewater treatment facilities will have to be substantially more robust than stormwater treatment facilities because every day, the Project will generate more than one hundred thirty thousand<sup>4</sup> gallons of process wastewater contaminated with the constituents that are released by operations of the tunnel boring machines (“TBM”)<sup>5</sup>. None of this is discussed in the Draft. It is essential that the Final EIR/EIS correct this deficiency and include language which ensures that the Project’s wastewater treatment program will be properly configured to clean the wastewater and maintain existing drainage patterns, characteristics, and sediment discharge profiles in Acton and Agua Dulce and thus avoid downstream erosion and the other runoff problems described above.

**2.3 The Draft Fails to Address the Project’s Significant Adverse Impacts on Local Water Resources and Drinking Wells in Acton and Agua Dulce.**

Section 3.8 of the Draft is supposed to analyze the Project’s impacts on water resources; however, it does not properly address impacts to local water resources and well systems that will result from tunnel construction. In fact, the Project threatens local water resources and drinking water wells in Acton and Agua Dulce in several ways; yet, the Draft fails to address any of them. For instance, tunneling (whether done with TBMs or “traditional methods”) will destroy all well facilities that lie in the tunnel path; residences that rely on these well facilities will have their water source immediately curtailed. According to the tunnel route maps, all the routes travel under homes in rural areas that rely on domestic residential wells; yet the Draft does not address the impacts to these homes that would result if a TBM bored through a resident’s well. This impact must be addressed and a mitigation measure must be offered in which CHSRA drills a new well that meets all local health department standards or connects the property to municipal water.

Another water resource impact that is not addressed in the Draft pertains to groundwater levels and how they will be affected by tunnel construction. Specifically, Section 3.6 asserts that tunnel construction will rely on water resources provided by the “Antelope Valley-East Kern” Water Agency (“AVEK”), but it also states that non-potable water (i.e., groundwater or partially treated sewage) will also be used to the extent feasible; this means that, in Acton and Agua Dulce, both AVEK resources and local groundwater will be used for tunnel construction (because there are no municipal sewage treatment facilities in Acton or Agua Dulce). However, the Draft fails to address or even mention the significant impacts that will result from extracting more groundwater from the already scant local groundwater supplies in Acton and Agua Dulce. Recently, these concerns were substantially elevated when CHSRA announced at a public meeting on November 4, 2022, that AVEK resources *will not* be used for tunnel construction and that the Project will instead rely entirely on local groundwater resources in Acton and Agua Dulce; this news was shocking. If groundwater resources for tunnel construction are used instead of AVEK resources, then each tunnel portal site will require the extraction of more than

<sup>4</sup> Two TBMs will be operating from each portal and, according to page 3.6-78, each TBM will require 366 acre-feet per year; this will result in 653,500 gallons per day used at each portal. According to page 12 of Appendix 3.8-D, at least 20 percent of this water (or 130,700 gallons per day) will flow back and require treatment as contaminated wastewater.

<sup>5</sup> According to Page 3.8-41, the water in the tunnels could be contaminated with drilling muds, sediments, and lubricants.

Submission 4516 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4516-8738

650,000 gallons *per day*<sup>6</sup>. The Project will also require the construction of new and extensive groundwater extraction facilities. It will also substantially increase groundwater extraction rates in Acton and Agua Dulce which will introduce new and significant stresses on local groundwater supplies that are already stretched thin due to recent drought conditions. This in turn will directly affect local well yields, cause residential wells to “dry up”, and drive people from their homes. Because the Draft fails to analyze or even mention these impacts, it substantially violates both CEQA and NEPA deficiencies. More extensive remarks regarding the significantly adverse environmental impact that will result from using local groundwater resources rather than AVEK resources for tunnel construction are provided in the comments that have been submitted pursuant to Section 3.6; those comments are incorporated herein by reference. The only way to avoid these significant environmental impacts is to preclude the use of groundwater resources for tunnel construction in Acton and Agua Dulce and mandate that AVEK resources be utilized instead.

Another impact that is not properly addressed by the Draft is the significant environmental effects on residential wells in Acton and Agua Dulce that will result from subterranean alterations caused by tunnel construction. Specifically, and as expressed in comments submitted by hundreds of residents of Acton and Agua Dulce before, during, and after Project Scoping, tunnel construction can impact groundwater and perched water resources and thus permanently interrupt domestic water supplies. These concerns are supposed to be addressed as part of “Impact HWR#4”, but the analysis of “Impact HWR #4” is superficial, incoherent, and internally inconsistent. For instance, pages 8.6-47-8.6-49 assert: 1) “when tunnel depths are above the known groundwater table, effects on groundwater and groundwater dependent resources would be minimal to none”; 2) “Where tunnel depths may coincide with the groundwater table, there could be impacts”; 3) “tunneling activities required for each of the six Build Alternatives could encounter shallow groundwater south of the California Aqueduct and north of the ANF” [referring to Acton and Agua Dulce] 4) “Not enough groundwater information is available at this time to identify the extent to which the tunnels may be below the water table. There may be perched groundwater or seasonal springs in the vicinity of these tunnels (Figure 3.8-A-21); therefore, local water inflows during portal and tunnel excavations are anticipated in this area”; 5) “Private wells occur within 1 mile of each of the six Build Alternatives outside of the ANF (Figure 3.8-A-21, Figure 3.8-A-22, and Figure 3.8-A-23). Changes in groundwater during tunnel construction could affect water supply to these private supply wells”; 6) “Because of the presence of groundwater, perched groundwater, and seasonal springs, tunneling could provide a conduit for groundwater to drain into the excavation as the advancing tunnel intersects fractures and faults within bedrock or saturated alluvium in groundwater basins”; 7) “For all excavation methods, excessive groundwater pressures might generate some seepage into the tunnel during construction, but additional measures implemented during construction, such as pre-grouting, would help to reduce the flow to manageable values”; 8) “The tunnel lining system would also be important in controlling water flows both during and after construction and would consist of either a single-pass or two-pass lining system, depending on mining methods and groundwater pressure encountered”; 9) “The circumstances under which these approaches would be employed would be guided by site-specific geotechnical and hydrogeological characterizations that would be developed during the preconstruction phase of

<sup>6</sup> Each TBM requires 366 acre-feet of water per year [Page 3.6-78], and each portal site supports two TBMS; this means that each tunnel portal will require more than two acre-feet (or 653,487 gallons) of water per day.

4516-8738

the selected Preferred Alternative”. Coupling this confusing and arguably contradictory accumulation of declarative statements with the assertion offered on Page 3.8-41 that the analysis assumes “all tunnels are below the water table” in the area South of the Aqueduct and north of the ANF (which is where Acton and Agua Dulce are) reveals that CHSRA has no clear picture of where the water table is in Acton and Agua Dulce or where the tunnels are located in relation to the water table. Worse yet, the Draft fails to grasp that the salient issue is not where the tunnels are located in relation to the “water table”, rather it is where the tunnels are located in relation to the groundwater sources that residents pull from to extract their drinking water; the distinction is critical because many domestic wells in Acton and Agua Dulce actually extend well below the “water table” to ensure a reliable water supply despite drought conditions. For example, the domestic wells that serve the residents on Salty Dog Road and Hisey Ranch Road under which the SR14A tunnels run have depths ranging from 500 feet to 900 feet (which means that some wells extract water from zones above the tunnel and others extract water from zones below the tunnel). Inadequacies in the “analysis” of “Impact HWR#4” are substantially magnified by the fact that the Draft mistakenly presumes that there are very few wells in Acton and Agua Dulce<sup>7</sup> when, in reality, these communities have more than a thousand wells.

The Draft fails to provide a coherent analysis of “Impact HWR#4” and instead presents a muddled, incoherent, and uninformed mishmash of words which reveals that CHSRA knows nothing about local groundwater or perched water resources in Acton and Agua Dulce; it knows nothing about local well facilities in Acton and Agua Dulce or where they are or how they are configured; and it knows nothing about how tunneling will impact these water resources and well facilities. Yet, and despite these inadequacies, the Draft concludes on page 3.8-49 that impacts on groundwater outside the ANF will be “less than significant”. This conclusion is not supported by any evidence (let alone “substantial evidence”) and it constitutes the type of speculation that is prohibited by CEQA.

This deficiency must be addressed by revising the Draft to 1) clearly assert that there is insufficient evidence to conclude that the impacts of tunnel construction on groundwater resources in Acton and Agua Dulce will be less than significant; and 2) add a mitigate measure to address the impacts of tunnel construction on private water systems, residential wells, and groundwater resources in Acton and Agua Dulce which includes an “Adaptive Management and Monitoring Plan” (“AMMP”) that establishes protocols to determine baseline conditions of ground water levels at all wells in Acton and Agua Dulce that are located within ½ mile of any tunnel and detects changes in groundwater conditions at these locations which are related to tunnel construction to ensure timely implementation of remedial measures; these remedial measures must include supplying supplemental water to all affected well owners until baseline levels are restored or drilling a new well that complies with all applicable local and state requirements. The Draft already proposes a similar AMMP (identified in Mitigation Measure “HWR-MM#4”) for ANF lands [Pages 3.8-67 to 3.8-69], so incrementally extending this AMMP to protect the rural residents of Acton and Agua Dulce will not be burdensome. Moreover, CEQA requires that CHSRA mitigate all potentially significant impacts to the extent feasible. Given that this AMMP is clearly feasible (since it will be implemented in the ANF) and given that the Draft clearly affirms that tunnel construction will affect groundwater in Acton and Agua

<sup>7</sup> Table 3.8-3 identifies few wells in the area of the Project in Acton and Agua Dulce; additionally, the Draft appendices indicate that Acton has only 5 active wells and Agua Dulce has no active wells (as discussed in more detail below).

## Submission 4516 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4516-8738

Dulce (i.e., “South of the California aqueduct and north of the ANF”) and given that CHSRA does not know how many wells it will affect or where they are located, CEQA requires that this AMMP be included in a mitigation measure developed for Acton and Agua Dulce.

#### 2.4 The Draft Fails to Address the Impacts on Water Resources That Will Result From Using Non Potable Water for Tunnel Construction.

Section 3.8 of the Draft ostensibly pertains to water resource impacts that will result from Project construction and operation, yet it fails to address the potential contamination of groundwater resources that will result from the use of non-potable water to construct the tunnels on all 6 route alternatives. Specifically, and though the Draft asserts in Tables 3.6-11 and 3.6-21 that tunnel construction will be conducted using AVEK resources (which are potable), page 3.6-90 contradicts this assertion by stating that the Project will require the use of non-potable water for tunnel construction to the extent feasible. The Draft fails to identify the sources of non-potable water that will be used, but non-potable water is typically comprised of either partially treated sewage or untreated groundwater. And, given the substantial likelihood that the TBMs will pierce water channels and aquifers that either overlie, or serve as, public and private drinking water sources in Acton and Agua Dulce (as discussed above), tunnel construction with non-potable water will result in the direct injection of potentially unclean water into groundwaters that directly serve as drinking water sources.

As indicated above, CHSRA staff recently announced that only groundwater resources will be used for tunnel construction in Acton and Agua Dulce. This, coupled with the fact that local groundwater in Acton and Agua Dulce is often contaminated with nitrates and arsenic at levels exceeding federal drinking water standards<sup>8</sup>, necessarily implies that tunneling will result in the direct injection of these and other pollutants into all the aquifers, perched water, and other groundwater sources through which the tunnels pass. Yet, the potential contamination of groundwater that is posed by the use of non-potable water for tunnel construction is not addressed anywhere in the Draft. Instead, the Draft simply asserts that “the tunnels are below the water table” [Page 3.8-41] and thus will not contaminate groundwater in Acton and Agua Dulce (a.k.a. “the area south of the California Aqueduct and north of the ANF”). This assertion has no evidentiary support; in fact (as discussed above), CHSRA has insufficient information to draw any specific conclusions regarding where tunnels will be located in relation to either the “water table” or the groundwater sources that Acton and Agua Dulce residents rely on.

The lack of analysis of potential groundwater contamination resulting from the use of non-potable water in Acton and Agua Dulce and the attendant lack of mitigation measures to address this impact renders the Draft materially deficient. Accordingly, the Draft must be revised to address this deficiency and offer mitigation; the revisions must include a clear statement that the principal means to avoid these impacts is to preclude the use of groundwater resources for tunnel construction in Acton and Agua Dulce and instead require the use of AVEK resources.

<sup>8</sup> Nitrate concentrations in groundwater extracted from local municipal wells in Acton are reported in Attachment 3. Additionally, arsenic is found in the groundwater within Agua Dulce; in fact, “Agua Dulce” (or “sweet water” in Spanish) is an historic term for water contaminated with arsenic. A study conducted 10 years ago by the Los Angeles County Health Department indicates that many wells in Agua Dulce have detectable levels of arsenic and in some areas, arsenic exceeds the MCL of 10 ppb [<http://file.lacounty.gov/SDSInter/bos/supdocs/65110.pdf>].

4516-8738

### 3.0 ADDITIONAL DEFICIENCIES NOTED IN THE DRAFT

For simplicity and to facilitate review, additional deficiencies and factual errors noted in the Draft are presented sequentially by page number below.

Page 3.8-10 states “The Authority is a state agency and therefore is not required to comply with local land use and zoning regulations”; while it is true that CHSRA is not required to comply with local land use and zoning regulations, CEQA does require CHSRA to identify Project elements that conflict with local land use plans and policies; it also requires CHSRA to mitigate conflicts with any plan or policy or regulation adopted for the purpose of avoiding or mitigating an environmental effect if such conflicts will result in a significant environmental impact. So, while the Project is not required to *conform* with local land use and zoning policies, it must nevertheless mitigate the significant environmental impacts that arise from non-conformance with local land use and zoning policies.

Page 3.8-10 addresses the consistencies of the Project’s hydrology and water resource characteristics with applicable planning documents adopted by local agencies and it defers to an analysis presented in Appendix 2-H. It also states “Each of the six Build Alternatives are consistent with the majority of policies reviewed but are potentially inconsistent with 2 policies. These are Policy S 2.2 of the Los Angeles County General Plan, which discourages development from locating downslope from aqueducts, and Policy I.U 3.3 of the Los Angeles County Ordinances, which limits the amount of development in Flood Zones designated by FEMA.” This consistency analysis does not comply with CEQA. Specifically, CEQA requires that CHSRA ascertain whether the Project is inconsistent with any policies that were adopted for the purpose of avoiding or mitigating an environmental effect and whether these inconsistencies will result in significant environmental impacts; if so, mitigation must be offered<sup>9</sup>. Unfortunately, the Draft does not meet this standard because it offers no mitigation measures to address the inconsistencies that are identified. Equally important, the consistency analysis presented in Appendix 2-H is incomplete and arguably erroneous. For example, Appendix H-2 states on page 2.0-H-27 that the Project is consistent with Los Angeles County General Plan Policy C/NR 5.6 (Minimize point and nonpoint-source water pollution) because CHSRA will prepare a stormwater management and treatment plan and a Stormwater Pollution Prevention Plan (SWPPP) to manage stormwater runoff for all six Build Alternatives; however, stormwater management plans and SWPPs configured to address stormwater runoff are not appropriate for addressing the wastewater generated at each portal location (as discussed above). Moreover, using stormwater facilities or SWPPP measures to treat wastewater will not “minimize water pollution” as required by Policy C/NR 5.6 because “stormwater” and “wastewater” are two very different streams that require different treatment methodologies (as discussed above); this is particularly true in Acton and Agua Dulce where stormwater runoff requires little (if any) treatment. The consistency analysis presented for Policy C/NR 5.6 in Appendix H-2 is inadequate and must be revised to recognize these facts. Another concern is that Appendix H-2 fails to address the water pollution that will result from CHSRA’s plan to use non-potable water to operate the TBMs (as discussed above). Furthermore, Appendix H-2 does not address Goal C/NR 6 to achieve “Protected and usable local groundwater resources”. Goal C/NR 6 was clearly adopted “for the purpose of avoiding or mitigating an environmental effect”; therefore, CEQA

<sup>9</sup> California Code of Regulation, Title 14, Chapter 3, Appendix G.

Submission 4516 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4516-8738

requires that the Final EIR 1) address the manner in which the Project substantially conflicts with this Goal by requiring groundwater resources to be used for tunnel construction in Acton and Agua Dulce; and 2) provide mitigation for the significant impacts to local groundwater levels that will arise from this conflict. The only feasible mitigation measure that will ensure the Project does not conflict with either Goal C/NR 6 or Policy C/NR 5.6 is to preclude the use of local groundwater for tunnel construction in Acton and Agua Dulce and mandate that only AVEK resources will be used. Finally, Appendix H-2 fails to identify the Antelope Valley Area Plan (AV Plan) or discuss its relevance to the Project. Policy COS 2.7 from the AV Plan pertains to protected and usable local groundwater resources and it is particularly relevant given that the Project may substantially impact local groundwater resources. Additionally, AV Plan Policy COS 3.5 pertaining to the protection of water supplies from pollution is also relevant given that CHSRA proposes to use non-potable water for TBM operation. In summary: Page 3.8-10 and Appendix H-2 must be revised to 1) address the Project's conflicts with Goal C/NR 6, Policy C/NR 5.6, Policy COS 2.7 and Policy COS 3 (all of which were adopted "for the purpose of avoiding or mitigating an environmental effect"); 2) establish the significant environmental impacts resulting from these conflicts; and 3) and provide appropriate mitigation measures to reduce these environmental impacts. Recommended mitigation measures include the development of properly robust wastewater treatment facilities and a commitment to use only potable water supplied by the Antelope Valley-East Kern (AVEK) Water Agency for constructing the tunnels in Acton and Agua Dulce.

Pages 3.8-21 through 3.8-22 pertain to surface water conditions and according to Table 3.8-3, these pages are supposed to address well issues, but they do not. Worse yet, Table 3.8-3 asserts (wrongly) that there are almost no active wells present throughout any of the route alternatives! Table 3.8-3 was ostensibly compiled based on data provided in Appendix 3.8-A, but Appendix 3.8-A fails to identify nearly every single well in Acton and Agua Dulce (for instance, page 3.8-A-21 reports that the entire Community of Acton only has 5 active wells and page 3.8-A-22 reports that there are no active wells in Agua Dulce). For the record, most Acton and Agua Dulce residents are *not* served by Waterworks District #37 so they rely on small domestic wells and local groundwater for their water supply; this means that there are at least a thousand active wells in Acton and Agua Dulce, yet none of them are reflected anywhere in Section 3.8 or in Appendix 3.8-A. For more than 10 years, the residents of Acton and Agua Dulce have expressed concerns that the Project would adversely impact their domestic residential wells; yet, and as discussed above, these concerns have not been properly addressed. Instead, the Draft reports (incorrectly) that there are virtually no active wells in any areas affected by the Project. These appalling material deficiencies must be rectified. CHSRA can easily identify the general area of residential wells in Acton by simply assuming that every house which is not served by Waterworks District 37 has a nearby well. Such an analysis must be conducted and incorporated in the Final EIR/EIS along with the AMMP discussed above to mitigate Project impacts on residential wells in Acton and Agua Dulce; an adverse impact to a single well should be established as the CEQA "threshold of significance" for this analysis.

Pages 3.8-25 through 3.8-26 address affected groundwater basins and Table 3.8-5 asserts that all route alternatives other than E1A and E2A are located within the "Acton Valley" groundwater basin. This is incorrect. In fact, according to Figures 3.8-A-21 and 3.8-A-22 of Appendix 3.8-A, the only Project element lying within the "Acton Valley" Basin is a utility line serving the SR14A route; no tracks or tunnels will be located in the "Acton Valley" water basin. It is a common

4516-8738

misconception that the "Acton Valley" groundwater basin is located in Acton; however, it is not<sup>10</sup>.

Page 3.8-27 States that Figure 3.8-A-21 through Figure 3.8-A-23 depict the groundwater wells within the groundwater "Resource Study Area". This is incorrect. Figure 3.8-A-21 through Figure 3.8-A-23 fail to identify the thousand+ existing wells in Acton and Agua Dulce. Page 3.8-27 also states that there are only 30 active wells in the Refined SR14 and SR4A RSAs and only 24 or fewer active wells in the E1/E1A/E2/E2A RSAs; this statement is also incorrect. The route maps provided with the Draft indicate that the routes traverse many areas where there are hundreds of wells, including Peaceful Valley, Kentucky Springs, Aliso Canyon, Arrastre Canyon, Red Rover Mine, Escondido, Hisey Ranch, Hubbard, etc. These errors must be corrected by revising the Draft to include a complete and thorough survey of all the wells located in the vicinity of the preferred Alternative Route and provide mitigation measures to reduce impacts on these wells to a level that is less than significant.

Page 3.8-28 asserts that CHSRA mapped the "water wells within 1 mile" of all the route alignment alternatives, however it does not clarify where these maps are or how the public can view them to confirm whether they do indeed capture all "water wells within 1 mile" of the alignments. This is a substantial deficiency, particularly given that the residents of Acton and Agua Dulce have a right pursuant to CEQA to know whether CHSRA's impact assessment has properly accounted for their residential well facilities. Moreover, given the mapping errors in Figure 3.8-A-21 through Figure 3.8-A-23 (described above), the public can be relatively confident that CHSRA *did not* map all the "water wells within 1 mile" of all the alignments, and thus the impact analysis presented in the Draft does not account for their well facilities. These errors are compounded by the fact that the Draft offers no measures to mitigate the Project's significant impacts on private domestic wells (including, but not limited to, well destruction by TBM operation). The Draft must be substantially revised to properly identify the significant environmental impacts that the Project poses to domestic residential wells and provide appropriate mitigation measures which include well replacement services and municipal water line connection services.

Page 3.8-36 concludes that ancillary features such as power and utility lines will be "strung from utility poles that could be located outside of surface water features and utility lines would be collocated within existing roadway rights-of-way". This conclusion is problematic for several reasons. First, CHSRA has committed to constructing utilities underground in Los Angeles County to the extent feasible<sup>11</sup>, and since the only locations where undergrounding utilities may be infeasible are either steep hillsides or across seismic faults, most of the Project's electric

<sup>10</sup> In 2016, the Department of Water Resources (DWR) revised "Bulletin 118" to and improperly combine the groundwater basin that underlies Acton with the groundwater basin that underlies the Antelope Valley. Then, DWR compounded the confusion by renaming the groundwater basin that underlies Agua Dulce to "Acton Valley Basin" even though it is not in the Acton Valley. Under the 2016 version of "Bulletin 118", the basin in Acton and the basin in Antelope Valley are considered to be a single basin called "Antelope Valley Basin", and the basin in Agua Dulce is called the "Acton Valley" Basin. This is of course a mistake; the basin under Acton is in the Santa Clara River watershed and drains to the ocean, whereas the basin under Antelope Valley is in the Antelope Valley watershed portion of the "Great Basin" which does not drain to the ocean. The two basins are separated by the San Andreas fault which prevents communication and groundwater transfer between them.

<sup>11</sup> Appendix H-2 Page 12.

## Submission 4516 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4516-8738

utilities in Los Angeles County will be underground and not strung on utility poles. Second, the Communities of Acton and Agua Dulce are located in Very High Fire Hazard Severity Zones (VHFHSZs) where above ground electrical utilities pose a very real and significant fire risk<sup>12</sup>; accordingly, electrical infrastructure in Acton and Agua Dulce must be installed underground for fire-safety reasons. Third, the electrical service provided by above-ground facilities is highly unreliable in Acton and Agua Dulce because such facilities are susceptible to frequent power shutoffs (referred to as “Public Safety Power Shutoffs”) that can last for days and which will cause extensive service interruptions during Project construction and operation. Fourth, according to the “Utility Relocation Plans” prepared for the Project, utility lines are not always “collocated within existing roadway rights of way”; in fact, CHSRA is proposing to construct an entirely new 230 kV transmission line in a completely new right of way corridor that is not within or near an existing road right of way. Taken together, these factors demonstrate that ancillary features such as power lines and utility infrastructure must be placed underground in Acton and Agua Dulce and not “strung from utility poles”; the Draft must be corrected to reflect that all utility installations (including the 230 kV line) will be underground in Acton and Agua Dulce.

Page 3.8-46 states “Each of the Build Alternative footprints in the Antelope Valley Groundwater Basin are within developed suburban land uses and infrastructure. Because these areas are developed, the net increase in impervious surfaces would be relatively low.” These statements are only valid for the portion of the Antelope Valley Groundwater basin that is located in Palmdale, they are not valid for the portion of the Antelope Valley Groundwater basin that is located in Acton. This is because Acton is a rural community with very little impervious surface area; it is not developed with suburban land uses and infrastructure. Accordingly, and contrary to what the Draft asserts, any net increase in impervious surfaces in Acton will be relatively high. Page 3.8-46 also states that, within the Antelope Valley Groundwater Basin, “Each of the build alternatives Stormwater retention and detention BMPs would be implemented to control stormwater runoff while also increasing groundwater recharge”; however (and as discussed above), the use of standard retention and detention BMPs to control stormwater runoff in Acton and Agua Dulce will result in significant erosion problems and therefore cannot be utilized.

Page 3.8-47 states “The E1/E2 Build Alternatives would require footprint in the Acton Valley Groundwater Basin”. This statement is incorrect. As explained above, the “Acton Valley Groundwater Basin” boundaries are located entirely in Agua Dulce and, as shown in Figures 3.8-A-21 and 3.8-A-22, no portion of any of the “E” route alternative comes close to it.

Page 3.8-83 through 3.8-85 present CEQA significance conclusions indicating that the Project will avoid all significant impacts on hydrology and water resources. These conclusions are insupportable because:

- The BMPs and SWPPP measures that the Draft relies upon to conclude that the Project will not impact drainage patterns or runoff characteristics cannot be implemented in rural areas like Acton because they will result in significant erosion and other significantly adverse hydrologic impacts.

<sup>12</sup> Most of the deadly and extensive wildfires that have been sparked since 2017 were caused by “above-ground” electrical lines in VHFHSZs

12

4516-8738

- The Draft fails to provide a proper analysis of the impacts of tunneling on groundwater resources and residential wells in Acton and Agua Dulce (which is referred to as the area “south of the Aqueduct and north of the ANF”) and instead presents a jumble of disjointed and arguably contradictory statements which reveal that CHSRA has no idea of where groundwater resources are in relation to tunnel locations or well infrastructure and that tunnel construction can indeed impact groundwater levels. Then, the Draft simply declares (without evidentiary support) that the Project will not impact groundwater resources or residential wells. All of this substantially violates CEQA and NEPA.
- The Draft conflates stormwater treatment with wastewater treatment and fails to properly articulate the measures that will be used to treat the hundred thousand+ gallons of contaminated wastewater that will be generated daily at each tunnel portal in Acton and Agua Dulce.
- The Draft fails to address or even mention the impacts of using local groundwater resources for tunnel construction rather than AVEK resources; these impacts include depletion of the already scant groundwater resources that Acton and Agua Dulce residents depend on as well as contamination of aquifer, groundwater, and perched water sources.
- The Draft does not comply with CEQA because it does not offer any strategies for minimizing the significant environmental impacts that will occur as a result of inconsistencies between the Project and local plans, policies, and ordinances that were adopted for the purpose of avoiding environmental effects (particularly those policies pertaining to the protection of groundwater resources and groundwater quality).

### 3.0 CONCLUSION

For the reasons set forth above, the Draft Environmental Impact Report prepared for the Palmdale to Burbank section is deficient and does not comply with CEQA or NEPA; these deficiencies must be corrected in the Final EIR which must specifically address the residential well impacts and groundwater impacts of the Project and include appropriate BMPs and SWPPPs for rural areas that guarantee there will be no change in any runoff characteristics (including, but not limited to, volume, location, sediment loading, discharge rate, etc.). Without these corrections, the Final EIR will not comply with CEQA or NEPA.

## ANALYSIS OF THE "HYDROLOGY AND WATER RESOURCES" SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT.

### 1.0 INTRODUCTION

The "Hydrology and Water Resources" impact assessment presented in Chapter 3.8 of the Draft Environmental Impact Report/Environmental Impact Statement (hereafter referred to as "the Draft") that was prepared by the California High Speed Rail Authority for the Palmdale-Burbank Segment of the High Speed Rail Project ("Project") has been evaluated and numerous factual errors and material deficiencies have been identified. These errors and deficiencies are set forth in the comments presented below; they demonstrate that the Draft does not comply with either the California Environmental Quality Act ("CEQA") or the National Environmental Protection Act ("NEPA"). Please note: These comments were prepared by a competent engineer with more than 35 years of environmental engineering experience and they present expert opinion supported by facts pertaining to the significant environmental effects that will be caused by the Project and which must be mitigated. Accordingly, the comments provided herein constitute "substantial evidence" as that term is defined by the CEQA Statute [California Public Resources Code §21080(e)(1)] and Guidelines [California Code of Regulations Section 15064(f)(5)]. These comments also demonstrate that CHSRA/FRA have failed to conduct a substantive 'hard look' review of the Project's environmental impacts as required by NEPA.

### 2.0 MAJOR DEFICIENCIES NOTED IN THE DRAFT.

#### 2.1 The "Best Management Practices" That Will be Used for Project Construction Will Result in Significant Erosion and Alter Flow Characteristics Downstream of Project Construction Sites.

Section 3.8 of the Draft concludes that the Project will have a "less than significant impact" on hydrology because it will employ "Impact Avoidance and Minimization Features" ("IAMFs") and utilize standard "Best Management Practices" ("BMP") and implement "Stormwater Pollution Prevention Plans" to control and direct stormwater runoff from project construction sites and thereby not alter surface drainage patterns [Page 3.8-39]. The Draft is very much mistaken. The BMPs and SWPPP elements that are enumerated in the Draft were developed for urban areas where the land surface is almost entirely impervious and where extensive infrastructure (concrete drainage infrastructure, culverts, impervious ditches, channelized facilities, etc.) capture and divert stormwater to either the ocean or detention (dam) facilities or large "spreading grounds"; these BMPs and SWPPS are entirely inappropriate in rural areas that have dirt roads, few impervious areas and no drainage infrastructure and where natural drainage patterns have been maintained and preserved for hundreds of years. For example, a primary purpose of the BMPs and SWPPPs is to control sediment flows and eliminate sediment from stormwater discharges (see pages 3.8-76 and 3.6-78<sup>1</sup>); this is important in urban areas because sediment impairs the operation of stormwater capture and conveyance infrastructure

<sup>1</sup> According to pages 3.8-76 and 3.6-78, the Project will employ IAMFs to control sediment and BMPs will minimize discharges of sediment in stormwater released from construction sites.

Submission 4517 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4517-10280

by accumulating in conveyance channels and detention basins reducing system capacity. However, rural areas like Acton and Agua Dulce have no stormwater capture or conveyance infrastructure; so, sedimentation is not a problem. In fact, if the Project does remove sediment from stormwater flows in Acton and Agua Dulce, it will cause tremendous erosion problems on all downstream areas because the "sediment free" stormwater discharged from the construction site into natural drainage courses will pick up sediment as it gains speed on its path toward the Santa Clara River<sup>2</sup>. And, where it picks up sediment as it flows across downstream properties, it causes significant erosion. This is not conjecture; it is fact. The Forecast subdivision between McEnnery Canyon Road and Desert Road in Acton installed stormwater capture and sediment removal facilities (including debris basins and detention basins) that discharged sediment-free water to the natural drainage courses downhill from the subdivision, and when it rained, the "sediment free" water picked up significant amounts of sediment as it flowed across downhill properties the resulted in significant erosion; some downhill properties lost large areas of their back yards. Therefore, IAMFs, BMPs and SWPPs that result in "sediment free" stormwater discharges will cause significantly adverse erosion impacts in Acton and Agua Dulce.

The problem with employing standard IAMFs, BMPs and SWPPP measures at construction sites in Acton and Agua Dulce can perhaps best be illustrated by analyzing a statement found on page 3.8-37 which asserts "Drainage facilities would be specifically designed to convey stormwater runoff, which would result in minimal direct drainage impacts related to these facilities". According to this statement, the Project will not cause drainage impacts because the Project will be designed to "convey stormwater runoff"; the problem is, neither Acton nor Agua Dulce have stormwater infrastructure to accept the "storm water runoff" that the Project "conveys". Neither Acton nor Agua Dulce have stormwater culverts or concrete drainage facilities or stormwater capture infrastructure or channelized flow areas, so the "stormwater runoff" that is "conveyed" by the Project *has nowhere to go*. And, if it is just dumped into the natural drainage courses in these communities, it will cause extensive erosion (as discussed above). To be clear, stormwater runoff is *never* "conveyed" in Acton or Agua Dulce; instead, stormwater merely flows to the Santa Clara River along natural drainage courses that have remained unchanged for millennia. The fundamental premise which underlies the Draft's conclusions that hydrologic impacts will be less than significant because the Project includes BMPs and SWPPs to ensure "drainage facilities would be specifically designed to convey stormwater runoff" is only reasonable in urban/suburban areas where there is channelized drainage infrastructure to accept the conveyed stormwater; it is entirely unreasonable and inapplicable to Acton and Agua Dulce. Accordingly, the Draft is patently incorrect to conclude that the Project will have "less than significant" hydrologic impacts in Acton and Agua Dulce.

It is important for CHSRA to understand that natural drainage patterns have generally dictated the location and configuration of all development in Acton and Agua Dulce over the last 150 years; thus, it is critical that drainage patterns and characteristics in these communities remain preserved and unchanged to protect existing developments. Other than an earthquake, the only activity that can alter drainage patterns in Acton and Agua Dulce is development involving stormwater capture, sediment removal, and stormwater control; this is why such developments are precluded in Acton and why all the IAMPFs, BMPs, and SWPPS that are identified in the

<sup>2</sup> This is the principal characteristic of "two phase flow" conditions: clean water flowing over a natural surface will pick up sediment from the surface until an equilibrium is reached; the equilibrium is a measure of the sediment transport capacity of the flow.

2

4517-10280

Draft are completely inappropriate for Acton. To better understand how the natural drainage patterns are preserved in Acton and Agua Dulce, the following description is offered:

- Most roads in Acton are dirt and have no stormwater capture or diversion infrastructure; they are maintained by the residents. This does make the roads occasionally impassable during inclement weather, but residents quickly repair the roads and restore access.
- There are culverts under a few paved roads in Acton (the 14 Freeway, Escondido Canyon Road, Sierra Highway, and Soledad Canyon Road) but these culverts are located where natural flows occurred before the roads were built *and they do not have sediment removal facilities*; they simply carry sediment laden flows from one side of the road to the other and do not alter flow patterns or cause erosion on downstream properties.
- Every new residential development complies with applicable stormwater regulations by constructing a natural bioswale on site which is appropriately sized to capture and retain sufficient water to offset the impervious surface area that the development creates; no impervious stormwater capture facilities or sediment removal basins are constructed.

Concerns regarding the use of standard IAMFs, BMPs, and SWPPP measures are particularly acute at the "Acton Window" location which lies immediately adjacent to, and uphill from, an entire residential neighborhood. As indicated in the drainage map that is provided in Attachment 1, there are several natural drainage courses across the "Acton Window" parcel; some of these drainage courses are very near homes that are south of, and just downhill from, the "Acton Window" site. As shown in the figures below, sediment-laden stormwater flows off the "Acton Window" parcel via the natural drainages and passed the homes without eroding or flooding the homes. If the Project employs the BMPs and SWPPPs that are described in the Draft at this location, then significant downhill erosion will occur and the homes will be substantially damaged. It should be noted that, at one time, a residential subdivision was proposed for the large parcel that will be used for the "Acton Window"; the subdivision was configured to connect to Antelope Woods Road at the same location and in the same manner as what is now proposed for the SR14A Alternative. The developer had proposed the use of "Conspan" arch bridges to traverse the unique onsite drainage courses that emanate from under the 14 Freeway in a manner that would not alter any characteristics of runoff from the property. A copy of the subdivider's "post-development" plan is provided in Attachment 2. The efficacy of the developer's proposal to utilize arch bridges to prevent alterations to existing drainage characteristics and patterns was never fully vetted because the subdivision map was withdrawn; however, the information provided in Attachment 2 demonstrates just how essential it is for CHSRA to ensure that Project construction and operation at the "Acton Window" does not modify drainage characteristics or drainage locations at the Acton Window site.

Taken together, the abovementioned facts demonstrate that implementation of the BMPs and SWPPP measures that are identified in the Draft within the Communities of Acton and Agua Dulce will not reduce impacts from alterations of surface drainage patterns to a level that is less than significant; to the contrary, they will amplify and exacerbate such impacts. Thus, it is particularly important that the Final EIR clearly assert that the Project *will not* adopt standard BMPs and SWPP measures in rural communities like Acton and Agua Dulce because they are only applicable to urban/suburban areas where there are extensive impervious surfaces and

3

Submission 4517 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4517-10280

Photos of sediment laden stormwater flowing off the "Acton Window" property.

sufficient stormwater conveyance facilities to accommodate them. It is also critical that the Final EIR identify and describe the rural-appropriate LAMFs, BMPs, and SWPPP measures that will be utilized to ensure that the Project does not modify existing stormwater runoff patterns or alter the location of, or the flowrate in, or the sediment characteristics of, any natural watercourses in Acton and Agua Dulce.

**2.2 The Draft Improperly Conflates Stormwater Treatment with Wastewater Treatment and Fails to Address the Impacts of Wastewater Pollutants on Water Resources.**

Section 3.8 of the Draft provides extensive discussions regarding the stormwater treatment infrastructure will be employed to protect water resources at all the Project's tunnel portal sites; however, it fails to discuss the wastewater treatment infrastructure that will be employed to address the significant volumes of wastewater that will be generated every day during tunnel construction. It also does not identify any measures that will be used to protect groundwater resources from wastewater contamination. In fact, the word "wastewater" appears only three times in Section 3.8! Wastewater concerns are mentioned briefly in Section 3.6 of the Draft, but the wastewater treatment approach it describes is lacking because it relies on the Project's stormwater treatment facilities to clean up process wastewater resulting from tunnel construction<sup>3</sup>. In other words, the Draft improperly conflates *wastewater treatment* with *stormwater treatment*. The Project's stormwater facilities will operate only during rare rain events, and in rural communities like Acton and Agua Dulce, stormwater facilities are not particularly complex because stormwater runoff is generally clean with few contaminants (though stormwater does contain sediment which, as discussed above, is naturally occurring and

<sup>3</sup> Pages 3.6-78 – 3.6-79 concludes that wastewater impacts will be less than significant because of the BMPs and SWPPP measures that will be implemented for the Project's stormwater treatment program.

4517-10280

not a "contaminant"). In contrast, the Project's wastewater treatment facilities will have to be substantially more robust than stormwater treatment facilities because every day, the Project will generate more than one hundred thirty thousand<sup>4</sup> gallons of process wastewater contaminated with the constituents that are released by operations of the tunnel boring machines ("TBM")<sup>5</sup>. None of this is discussed in the Draft. It is essential that the Final EIR/FIS correct this deficiency and include language which ensures that the Project's wastewater treatment program will be properly configured to clean the wastewater and maintain existing drainage patterns, characteristics, and sediment discharge profiles in Acton and Agua Dulce and thus avoid downstream erosion and the other runoff problems described above.

**2.3 The Draft Fails to Address the Project's Significant Adverse Impacts on Local Water Resources and Drinking Wells in Acton and Agua Dulce.**

Section 3.8 of the Draft is supposed to analyze the Project's impacts on water resources; however, it does not properly address impacts to local water resources and well systems that will result from tunnel construction. In fact, the Project threatens local water resources and drinking water wells in Acton and Agua Dulce in several ways; yet, the Draft fails to address any of them. For instance, tunneling (whether done with TBMs or "traditional methods") will destroy all well facilities that lie in the tunnel path; residences that rely on these well facilities will have their water source immediately curtailed. According to the tunnel route maps, all the routes travel under homes in rural areas that rely on domestic residential wells; yet the Draft does not address the impacts to these homes that would result if a TBM bored through a resident's well. This impact must be addressed and a mitigation measure must be offered in which CHSRA drills a new well that meets all local health department standards or connects the property to municipal water.

Another water resource impact that is not addressed in the Draft pertains to groundwater levels and how they will be affected by tunnel construction. Specifically, Section 3.6 asserts that tunnel construction will rely on water resources provided by the "Antelope Valley-East Kern" Water Agency ("AVEK"), but it also states that non-potable water (i.e., groundwater or partially treated sewage) will also be used to the extent feasible; this means that, in Acton and Agua Dulce, both AVEK resources and local groundwater will be used for tunnel construction (because there are no municipal sewage treatment facilities in Acton or Agua Dulce). However, the Draft fails to address or even mention the significant impacts that will result from extracting more groundwater from the already scant local groundwater supplies in Acton and Agua Dulce. Recently, these concerns were substantially elevated when CHSRA announced at a public meeting on November 4, 2022, that AVEK resources *will not* be used for tunnel construction and that the Project will instead rely entirely on local groundwater resources in Acton and Agua Dulce; this news was shocking. If groundwater resources for tunnel construction are used instead of AVEK resources, then each tunnel portal site will require the extraction of more than

<sup>4</sup> Two TBMs will be operating from each portal and, according to page 3.6-78, each TBM will require 366 acre-feet per year; this will result in 653,500 gallons per day used at each portal. According to page 12 of Appendix 3.8-D, at least 20 percent of this water (or 130,700 gallons per day) will flow back and require treatment as contaminated wastewater.

<sup>5</sup> According to Page 3.8-41, the water in the tunnels could be contaminated with drilling muds, sediments, and lubricants.

Submission 4517 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4517-10280

650,000 gallons *per day*<sup>6</sup>. The Project will also require the construction of new and extensive groundwater extraction facilities. It will also substantially increase groundwater extraction rates in Acton and Agua Dulce which will introduce new and significant stresses on local groundwater supplies that are already stretched thin due to recent drought conditions. This in turn will directly affect local well yields, cause residential wells to “dry up”, and drive people from their homes. Because the Draft fails to analyze or even mention these impacts, it substantially violates both CEQA and NEPA deficiencies. More extensive remarks regarding the significantly adverse environmental impact that will result from using local groundwater resources rather than AVEK resources for tunnel construction are provided in the comments that have been submitted pursuant to Section 3.6; those comments are incorporated herein by reference. The only way to avoid these significant environmental impacts is to preclude the use of groundwater resources for tunnel construction in Acton and Agua Dulce and mandate that AVEK resources be utilized instead.

Another impact that is not properly addressed by the Draft is the significant environmental effects on residential wells in Acton and Agua Dulce that will result from subterranean alterations caused by tunnel construction. Specifically, and as expressed in comments submitted by hundreds of residents of Acton and Agua Dulce before, during, and after Project Scoping, tunnel construction can impact groundwater and perched water resources and thus permanently interrupt domestic water supplies. These concerns are supposed to be addressed as part of “Impact HWR#4”, but the analysis of “Impact HWR #4” is superficial, incoherent, and internally inconsistent. For instance, pages 8.6-47-8.6-49 assert: 1) “when tunnel depths are above the known groundwater table, effects on groundwater and groundwater dependent resources would be minimal to none”; 2) “Where tunnel depths may coincide with the groundwater table, there could be impacts”; 3) “tunneling activities required for each of the six Build Alternatives could encounter shallow groundwater south of the California Aqueduct and north of the ANF” [referring to Acton and Agua Dulce] 4) “Not enough groundwater information is available at this time to identify the extent to which the tunnels may be below the water table. There may be perched groundwater or seasonal springs in the vicinity of these tunnels (Figure 3.8-A-21); therefore, local water inflows during portal and tunnel excavations are anticipated in this area”; 5) “Private wells occur within 1 mile of each of the six Build Alternatives outside of the ANF (Figure 3.8-A-21, Figure 3.8-A-22, and Figure 3.8-A-23). Changes in groundwater during tunnel construction could affect water supply to these private supply wells”; 6) “Because of the presence of groundwater, perched groundwater, and seasonal springs, tunneling could provide a conduit for groundwater to drain into the excavation as the advancing tunnel intersects fractures and faults within bedrock or saturated alluvium in groundwater basins”; 7) “For all excavation methods, excessive groundwater pressures might generate some seepage into the tunnel during construction, but additional measures implemented during construction, such as pre-grouting, would help to reduce the flow to manageable values”; 8) “The tunnel lining system would also be important in controlling water flows both during and after construction and would consist of either a single-pass or two-pass lining system, depending on mining methods and groundwater pressure encountered”; 9) “The circumstances under which these approaches would be employed would be guided by site-specific geotechnical and hydrogeological characterizations that would be developed during the preconstruction phase of

<sup>6</sup> Each TBM requires 366 acre-feet of water per year [Page 3.6-78], and each portal site supports two TBMS; this means that each tunnel portal will require more than two acre-feet (or 653,487 gallons) of water per day.

4517-10280

the selected Preferred Alternative”. Coupling this confusing and arguably contradictory accumulation of declarative statements with the assertion offered on Page 3.8-41 that the analysis assumes “all tunnels are below the water table” in the area South of the Aqueduct and north of the ANF (which is where Acton and Agua Dulce are) reveals that CHSRA has no clear picture of where the water table is in Acton and Agua Dulce or where the tunnels are located in relation to the water table. Worse yet, the Draft fails to grasp that the salient issue is not where the tunnels are located in relation to the “water table”, rather it is where the tunnels are located in relation to the groundwater sources that residents pull from to extract their drinking water; the distinction is critical because many domestic wells in Acton and Agua Dulce actually extend well below the “water table” to ensure a reliable water supply despite drought conditions. For example, the domestic wells that serve the residents on Salty Dog Road and Hisey Ranch Road under which the SR14A tunnels run have depths ranging from 500 feet to 900 feet (which means that some wells extract water from zones above the tunnel and others extract water from zones below the tunnel). Inadequacies in the “analysis” of “Impact HWR#4” are substantially magnified by the fact that the Draft mistakenly presumes that there are very few wells in Acton and Agua Dulce<sup>7</sup> when, in reality, these communities have more than a thousand wells.

The Draft fails to provide a coherent analysis of “Impact HWR#4” and instead presents a muddled, incoherent, and uninformed mishmash of words which reveals that CHSRA knows nothing about local groundwater or perched water resources in Acton and Agua Dulce; it knows nothing about local well facilities in Acton and Agua Dulce or where they are or how they are configured; and it knows nothing about how tunneling will impact these water resources and well facilities. Yet, and despite these inadequacies, the Draft concludes on page 3.8-49 that impacts on groundwater outside the ANF will be “less than significant”. This conclusion is not supported by any evidence (let alone “substantial evidence”) and it constitutes the type of speculation that is prohibited by CEQA.

This deficiency must be addressed by revising the Draft to 1) clearly assert that there is insufficient evidence to conclude that the impacts of tunnel construction on groundwater resources in Acton and Agua Dulce will be less than significant; and 2) add a mitigate measure to address the impacts of tunnel construction on private water systems, residential wells, and groundwater resources in Acton and Agua Dulce which includes an “Adaptive Management and Monitoring Plan” (“AMMP”) that establishes protocols to determine baseline conditions of groundwater levels at all wells in Acton and Agua Dulce that are located within 1/2 mile of any tunnel and detects changes in groundwater conditions at these locations which are related to tunnel construction to ensure timely implementation of remedial measures; these remedial measures must include supplying supplemental water to all affected well owners until baseline levels are restored or drilling a new well that complies with all applicable local and state requirements. The Draft already proposes a similar AMMP (identified in Mitigation Measure “HWR-MM#4”) for ANF lands [Pages 3.8-67 to 3.8-69], so incrementally extending this AMMP to protect the rural residents of Acton and Agua Dulce will not be burdensome. Moreover, CEQA requires that CHSRA mitigate all potentially significant impacts to the extent feasible. Given that this AMMP is clearly feasible (since it will be implemented in the ANF) and given that the Draft clearly affirms that tunnel construction will affect groundwater in Acton and Agua

<sup>7</sup> Table 3.8-3 identifies few wells in the area of the Project in Acton and Agua Dulce; additionally, the Draft appendices indicate that Acton has only 5 active wells and Agua Dulce has no active wells (as discussed in more detail below).

## Submission 4517 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4517-10280

Dulce (i.e., “South of the California aqueduct and north of the ANF”) and given that CHSRA does not know how many wells it will affect or where they are located, CEQA requires that this AMMP be included in a mitigation measure developed for Acton and Agua Dulce.

#### 2.4 The Draft Fails to Address the Impacts on Water Resources That Will Result From Using Non Potable Water for Tunnel Construction.

Section 3.8 of the Draft ostensibly pertains to water resource impacts that will result from Project construction and operation, yet it fails to address the potential contamination of groundwater resources that will result from the use of non-potable water to construct the tunnels on all 6 route alternatives. Specifically, and though the Draft asserts in Tables 3.6-11 and 3.6-21 that tunnel construction will be conducted using AVEK resources (which are potable), page 3.6-90 contradicts this assertion by stating that the Project will require the use of non-potable water for tunnel construction to the extent feasible. The Draft fails to identify the sources of non-potable water that will be used, but non-potable water is typically comprised of either partially treated sewage or untreated groundwater. And, given the substantial likelihood that the TBMs will pierce water channels and aquifers that either overlie, or serve as, public and private drinking water sources in Acton and Agua Dulce (as discussed above), tunnel construction with non-potable water will result in the direct injection of potentially unclean water into groundwaters that directly serve as drinking water sources.

As indicated above, CHSRA staff recently announced that only groundwater resources will be used for tunnel construction in Acton and Agua Dulce. This, coupled with the fact that local groundwater in Acton and Agua Dulce is often contaminated with nitrates and arsenic at levels exceeding federal drinking water standards<sup>8</sup>, necessarily implies that tunneling will result in the direct injection of these and other pollutants into all the aquifers, perched water, and other groundwater sources through which the tunnels pass. Yet, the potential contamination of groundwater that is posed by the use of non-potable water for tunnel construction is not addressed anywhere in the Draft. Instead, the Draft simply asserts that “the tunnels are below the water table” [Page 3.8-41] and thus will not contaminate groundwater in Acton and Agua Dulce (a.k.a. “the area south of the California Aqueduct and north of the ANF”). This assertion has no evidentiary support; in fact (as discussed above), CHSRA has insufficient information to draw any specific conclusions regarding where tunnels will be located in relation to either the “water table” or the groundwater sources that Acton and Agua Dulce residents rely on.

The lack of analysis of potential groundwater contamination resulting from the use of non-potable water in Acton and Agua Dulce and the attendant lack of mitigation measures to address this impact renders the Draft materially deficient. Accordingly, the Draft must be revised to address this deficiency and offer mitigation; the revisions must include a clear statement that the principal means to avoid these impacts is to preclude the use of groundwater resources for tunnel construction in Acton and Agua Dulce and instead require the use of AVEK resources.

<sup>8</sup> Nitrate concentrations in groundwater extracted from local municipal wells in Acton are reported in Attachment 3. Additionally, arsenic is found in the groundwater within Agua Dulce; in fact, “Agua Dulce” (or “sweet water” in Spanish) is an historic term for water contaminated with arsenic. A study conducted 10 years ago by the Los Angeles County Health Department indicates that many wells in Agua Dulce have detectable levels of arsenic and in some areas, arsenic exceeds the MCL of 10 ppb [<http://file.lacounty.gov/SDSInter/bos/supdocs/65110.pdf>].

4517-10280

### 3.0 ADDITIONAL DEFICIENCIES NOTED IN THE DRAFT

For simplicity and to facilitate review, additional deficiencies and factual errors noted in the Draft are presented sequentially by page number below.

Page 3.8-10 states “The Authority is a state agency and therefore is not required to comply with local land use and zoning regulations”; while it is true that CHSRA is not required to comply with local land use and zoning regulations, CEQA does require CHSRA to identify Project elements that conflict with local land use plans and policies; it also requires CHSRA to mitigate conflicts with any plan or policy or regulation adopted for the purpose of avoiding or mitigating an environmental effect if such conflicts will result in a significant environmental impact. So, while the Project is not required to conform with local land use and zoning policies, it must nevertheless mitigate the significant environmental impacts that arise from non-conformance with local land use and zoning policies.

Page 3.8-10 addresses the consistencies of the Project’s hydrology and water resource characteristics with applicable planning documents adopted by local agencies and it defers to an analysis presented in Appendix 2-H. It also states “Each of the six Build Alternatives are consistent with the majority of policies reviewed but are potentially inconsistent with 2 policies. These are Policy S 2.2 of the Los Angeles County General Plan, which discourages development from locating downslope from aqueducts, and Policy LU 3.3 of the Los Angeles County Ordinances, which limits the amount of development in Flood Zones designated by FEMA.” This consistency analysis does not comply with CEQA. Specifically, CEQA requires that CHSRA ascertain whether the Project is inconsistent with any policies that were adopted for the purpose of avoiding or mitigating an environmental effect and whether these inconsistencies will result in significant environmental impacts; if so, mitigation must be offered<sup>9</sup>. Unfortunately, the Draft does not meet this standard because it offers no mitigation measures to address the inconsistencies that are identified. Equally important, the consistency analysis presented in Appendix 2-H is incomplete and arguably erroneous. For example, Appendix H-2 states on page 2.0-H-27 that the Project is consistent with Los Angeles County General Plan Policy C/NR 5.6 (Minimize point and nonpoint-source water pollution) because CHSRA will prepare a stormwater management and treatment plan and a Stormwater Pollution Prevention Plan (SWPPP) to manage stormwater runoff for all six Build Alternatives; however, stormwater management plans and SWPPs configured to address stormwater runoff are not appropriate for addressing the wastewater generated at each portal location (as discussed above). Moreover, using stormwater facilities or SWPPP measures to treat wastewater will not “minimize water pollution” as required by Policy C/NR 5.6 because “stormwater” and “wastewater” are two very different streams that require different treatment methodologies (as discussed above); this is particularly true in Acton and Agua Dulce where stormwater runoff requires little (if any) treatment. The consistency analysis presented for Policy C/NR 5.6 in Appendix H-2 is inadequate and must be revised to recognize these facts. Another concern is that Appendix H-2 fails to address the water pollution that will result from CHSRA’s plan to use non-potable water to operate the TBMs (as discussed above). Furthermore, Appendix H-2 does not address Goal C/NR 6 to achieve “Protected and usable local groundwater resources”. Goal C/NR 6 was clearly adopted “for the purpose of avoiding or mitigating an environmental effect”; therefore, CEQA

<sup>9</sup> California Code of Regulation, Title 14, Chapter 3, Appendix G.

9

Submission 4517 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4517-10280

requires that the Final EIR 1) address the manner in which the Project substantially conflicts with this Goal by requiring groundwater resources to be used for tunnel construction in Acton and Agua Dulce; and 2) provide mitigation for the significant impacts to local groundwater levels that will arise from this conflict. The only feasible mitigation measure that will ensure the Project does not conflict with either Goal C/NR 6 or Policy C/NR 5.6 is to preclude the use of local groundwater for tunnel construction in Acton and Agua Dulce and mandate that only AVEK resources will be used. Finally, Appendix H-2 fails to identify the Antelope Valley Area Plan (AV Plan) or discuss its relevance to the Project. Policy COS 2.7 from the AV Plan pertains to protected and usable local groundwater resources and it is particularly relevant given that the Project may substantially impact local groundwater resources. Additionally, AV Plan Policy COS 3.5 pertaining to the protection of water supplies from pollution is also relevant given that CHSRA proposes to use non-potable water for TBM operation. In summary: Page 3.8-10 and Appendix H-2 must be revised to 1) address the Project's conflicts with Goal C/NR 6, Policy C/NR 5.6, Policy COS 2.7 and Policy COS 3 (all of which were adopted "for the purpose of avoiding or mitigating an environmental effect"); 2) establish the significant environmental impacts resulting from these conflicts; and 3) and provide appropriate mitigation measures to reduce these environmental impacts. Recommended mitigation measures include the development of properly robust wastewater treatment facilities and a commitment to use only potable water supplied by the Antelope Valley-East Kern (AVEK) Water Agency for constructing the tunnels in Acton and Agua Dulce.

Pages 3.8-21 through 3.8-22 pertain to surface water conditions and according to Table 3.8-3, these pages are supposed to address well issues, but they do not. Worse yet, Table 3.8-3 asserts (wrongly) that there are almost no active wells present throughout any of the route alternatives! Table 3.8-3 was ostensibly compiled based on data provided in Appendix 3.8-A, but Appendix 3.8-A fails to identify nearly every single well in Acton and Agua Dulce (for instance, page 3.8-A-21 reports that the entire Community of Acton only has 5 active wells and page 3.8-A-22 reports that there are no active wells in Agua Dulce). For the record, most Acton and Agua Dulce residents are not served by Waterworks District #37 so they rely on small domestic wells and local groundwater for their water supply; this means that there are at least a thousand active wells in Acton and Agua Dulce, yet none of them are reflected anywhere in Section 3.8 or in Appendix 3.8-A. For more than 10 years, the residents of Acton and Agua Dulce have expressed concerns that the Project would adversely impact their domestic residential wells; yet, and as discussed above, these concerns have not been properly addressed. Instead, the Draft reports (incorrectly) that there are virtually no active wells in any areas affected by the Project. These appalling material deficiencies must be rectified. CHSRA can easily identify the general area of residential wells in Acton by simply assuming that every house which is not served by Waterworks District 37 has a nearby well. Such an analysis must be conducted and incorporated in the Final EIR/EIS along with the AMMP discussed above to mitigate Project impacts on residential wells in Acton and Agua Dulce; an adverse impact to a single well should be established as the CEQA "threshold of significance" for this analysis.

Pages 3.8-25 through 3.8-26 address affected groundwater basins and Table 3.8-5 asserts that all route alternatives other than E1A and E2A are located within the "Acton Valley" groundwater basin. This is incorrect. In fact, according to Figures 3.8-A-21 and 3.8-A-22 of Appendix 3.8-A, the only Project element lying within the "Acton Valley" Basin is a utility line serving the SR14A route; no tracks or tunnels will be located in the "Acton Valley" water basin. It is a common

4517-10280

misconception that the "Acton Valley" groundwater basin is located in Acton; however, it is not<sup>10</sup>.

Page 3.8-27 States that Figure 3.8-A-21 through Figure 3.8-A-23 depict the groundwater wells within the groundwater "Resource Study Area". This is incorrect. Figure 3.8-A-21 through Figure 3.8-A-23 fail to identify the thousand+ existing wells in Acton and Agua Dulce. Page 3.8-27 also states that there are only 30 active wells in the Refined SR14 and SR4A RSAs and only 24 or fewer active wells in the E1/E1A/E2/E2A RSAs; this statement is also incorrect. The route maps provided with the Draft indicate that the routes traverse many areas where there are hundreds of wells, including Peaceful Valley, Kentucky Springs, Aliso Canyon, Arrastre Canyon, Red Rover Mine, Escondido, Hisey Ranch, Hubbard, etc. These errors must be corrected by revising the Draft to include a complete and thorough survey of all the wells located in the vicinity of the preferred Alternative Route and provide mitigation measures to reduce impacts on these wells to a level that is less than significant.

Page 3.8-28 asserts that CHSRA mapped the "water wells within 1 mile" of all the route alignment alternatives, however it does not clarify where these maps are or how the public can view them to confirm whether they do indeed capture all "water wells within 1 mile" of the alignments. This is a substantial deficiency, particularly given that the residents of Acton and Agua Dulce have a right pursuant to CEQA to know whether CHSRA's impact assessment has properly accounted for their residential well facilities. Moreover, given the mapping errors in Figure 3.8-A-21 through Figure 3.8-A-23 (described above), the public can be relatively confident that CHSRA did not map all the "water wells within 1 mile" of all the alignments, and thus the impact analysis presented in the Draft does not account for their well facilities. These errors are compounded by the fact that the Draft offers no measures to mitigate the Project's significant impacts on private domestic wells (including, but not limited to, well destruction by TBM operation). The Draft must be substantially revised to properly identify the significant environmental impacts that the Project poses to domestic residential wells and provide appropriate mitigation measures which include well replacement services and municipal water line connection services.

Page 3.8-36 concludes that ancillary features such as power and utility lines will be "strung from utility poles that could be located outside of surface water features and utility lines would be collocated within existing roadway rights-of-way". This conclusion is problematic for several reasons. First, CHSRA has committed to constructing utilities underground in Los Angeles County to the extent feasible<sup>11</sup>, and since the only locations where undergrounding utilities may be infeasible are either steep hillsides or across seismic faults, most of the Project's electric

<sup>10</sup> In 2016, the Department of Water Resources (DWR) revised "Bulletin 118" to and improperly combine the groundwater basin that underlies Acton with the groundwater basin that underlies the Antelope Valley. Then, DWR compounded the confusion by renaming the groundwater basin that underlies Agua Dulce to "Acton Valley Basin" even though it is not in the Acton Valley. Under the 2016 version of "Bulletin 118", the basin in Acton and the basin in Antelope Valley are considered to be a single basin called "Antelope Valley Basin", and the basin in Agua Dulce is called the "Acton Valley" Basin. This is of course a mistake; the basin under Acton is in the Santa Clara River watershed and drains to the ocean, whereas the basin under Antelope Valley is in the Antelope Valley watershed portion of the "Great Basin" which does not drain to the ocean. The two basins are separated by the San Andreas fault which prevents communication and groundwater transfer between them.

<sup>11</sup> Appendix H-2 Page 12.

Submission 4517 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4517-10280

utilities in Los Angeles County will be underground and not strung on utility poles. Second, the Communities of Acton and Agua Dulce are located in Very High Fire Hazard Severity Zones (VHFHSZs) where above ground electrical utilities pose a very real and significant fire risk<sup>12</sup>; accordingly, electrical infrastructure in Acton and Agua Dulce must be installed underground for fire-safety reasons. Third, the electrical service provided by above-ground facilities is highly unreliable in Acton and Agua Dulce because such facilities are susceptible to frequent power shutoffs (referred to as “Public Safety Power Shutoffs”) that can last for days and which will cause extensive service interruptions during Project construction and operation. Fourth, according to the “Utility Relocation Plans” prepared for the Project, utility lines are not always “collocated within existing roadway rights of way”; in fact, CHSRA is proposing to construct an entirely new 230 kV transmission line in a completely new right of way corridor that is not within or near an existing road right of way. Taken together, these factors demonstrate that ancillary features such as power lines and utility infrastructure must be placed underground in Acton and Agua Dulce and not “strung from utility poles”; the Draft must be corrected to reflect that all utility installations (including the 230 kV line) will be underground in Acton and Agua Dulce.

Page 3.8-46 states “Each of the Build Alternative footprints in the Antelope Valley Groundwater Basin are within developed suburban land uses and infrastructure. Because these areas are developed, the net increase in impervious surfaces would be relatively low.” These statements are only valid for the portion of the Antelope Valley Groundwater basin that is located in Palmdale, they are not valid for the portion of the Antelope Valley Groundwater basin that is located in Acton. This is because Acton is a rural community with very little impervious surface area; it is not developed with suburban land uses and infrastructure. Accordingly, and contrary to what the Draft asserts, any net increase in impervious surfaces in Acton will be relatively high. Page 3.8-46 also states that, within the Antelope Valley Groundwater Basin, “Each of the build alternatives Stormwater retention and detention BMPs would be implemented to control stormwater runoff while also increasing groundwater recharge”; however (and as discussed above), the use of standard retention and detention BMPs to control stormwater runoff in Acton and Agua Dulce will result in significant erosion problems and therefore cannot be utilized.

Page 3.8-47 states “The E1/E2 Build Alternatives would require footprint in the Acton Valley Groundwater Basin”. This statement is incorrect. As explained above, the “Acton Valley Groundwater Basin” boundaries are located entirely in Agua Dulce and, as shown in Figures 3.8-A-21 and 3.8-A-22, no portion of any of the “E” route alternative comes close to it.

Page 3.8-83 through 3.8-85 present CEQA significance conclusions indicating that the Project will avoid all significant impacts on hydrology and water resources. These conclusions are insupportable because:

- The BMPs and SWPPP measures that the Draft relies upon to conclude that the Project will not impact drainage patterns or runoff characteristics cannot be implemented in rural areas like Acton because they will result in significant erosion and other significantly adverse hydrologic impacts.

<sup>12</sup> Most of the deadly and extensive wildfires that have been sparked since 2017 were caused by “above-ground” electrical lines in VHFHSZs

4517-10280

- The Draft fails to provide a proper analysis of the impacts of tunneling on groundwater resources and residential wells in Acton and Agua Dulce (which is referred to as the area “south of the Aqueduct and north of the ANF”) and instead presents a jumble of disjointed and arguably contradictory statements which reveal that CHSRA has no idea of where groundwater resources are in relation to tunnel locations or well infrastructure and that tunnel construction can indeed impact groundwater levels. Then, the Draft simply declares (without evidentiary support) that the Project will not impact groundwater resources or residential wells. All of this substantially violates CEQA and NEPA.
- The Draft conflates stormwater treatment with wastewater treatment and fails to properly articulate the measures that will be used to treat the hundred thousand+ gallons of contaminated wastewater that will be generated daily at each tunnel portal in Acton and Agua Dulce.
- The Draft fails to address or even mention the impacts of using local groundwater resources for tunnel construction rather than AVEK resources; these impacts include depletion of the already scant groundwater resources that Acton and Agua Dulce residents depend on as well as contamination of aquifer, groundwater, and perched water sources.
- The Draft does not comply with CEQA because it does not offer any strategies for minimizing the significant environmental impacts that will occur as a result of inconsistencies between the Project and local plans, policies, and ordinances that were adopted for the purpose of avoiding environmental effects (particularly those policies pertaining to the protection of groundwater resources and groundwater quality).

**3.0 CONCLUSION**

For the reasons set forth above, the Draft Environmental Impact Report prepared for the Palmdale to Burbank section is deficient and does not comply with CEQA or NEPA; these deficiencies must be corrected in the Final EIR which must specifically address the residential well impacts and groundwater impacts of the Project and include appropriate BMPs and SWPPPs for rural areas that guarantee there will be no change in any runoff characteristics (including, but not limited to, volume, location, sediment loading, discharge rate, etc.). Without these corrections, the Final EIR will not comply with CEQA or NEPA.

## ANALYSIS OF THE "NOISE AND VIBRATION" SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT.

### 1.0 INTRODUCTION

The noise impact assessment presented in Chapter 3.4 of the Draft Environmental Impact Report/Environmental Impact Statement (hereafter referred to as "the Draft") that was prepared by the California High Speed Rail Authority ("CHSRA") for the Palmdale-Burbank Segment of the High Speed Rail Project ("HSR Project" or "Project") has been evaluated and numerous material deficiencies, factual errors and other substantial insufficiencies have been identified. These deficiencies, errors, and insufficiencies are set forth in the comments provided below; they demonstrate that the Draft does not comply with either the California Environmental Quality Act ("CEQA") or the National Environmental Protection Act ("NEPA"). Please note: These comments were prepared by a competent engineer with more than 35 years of environmental engineering experience and they present expert opinion supported by fact pertaining to the significant environmental effects that will be caused by the Project and which must be mitigated. Accordingly, the comments provided herein constitute "substantial evidence" as that term is defined by the CEQA Statute [California Public Resources Code §21080(e)(1)] and Guidelines [California Code of Regulations Section 15064(f)(5)]. These comments also demonstrate that CHSRA/FRA have failed to conduct a substantive 'hard look' review of the Project's environmental impacts as required by NEPA.

### 2.0 MAJOR DEFICIENCIES NOTED IN THE DRAFT

#### 2.1 The Draft Fails to Provide ANY information Regarding Noise Modeling or the Model Inputs and Assumptions or the Model Output or Results.

The noise impact analysis presented in the Draft was prepared in accordance with the directives established by the Federal Railway Administration ("FRA") in the manual titled "High-Speed Ground Transportation Noise and Vibration Impact Assessment" ("FRA Manual"); this manual establishes methodologies for calculating the noise generated by a high speed train as it passes by (referred to as a "passby") at any distance from the track. It also recommends thresholds for evaluating train noise impacts that are based on a parameter referred to as the "Day-Night" noise level (or "L<sub>dn</sub>"); L<sub>dn</sub> does not reflect the actual noise level that occurs during a train "passby" event; instead, it is a calculated value which averages of all the train noise levels experienced at a particular location over a 24 hour period and is "weighted" with a penalty of 10 dBA for noises that occur between 10 PM and 7 AM<sup>1</sup>. This averaging technique effectively "masks" the significant noise created during train "passby" events by simply averaging all the noise insults together; this allows the Lead Agency to conclude that a proposed train project will not result in significant noise impacts even when it generates 86 dBA noise levels hundreds of

<sup>1</sup> L<sub>dn</sub> "may be thought of as a noise exposure, totaled after increasing all nighttime A-Levels (between 10 p.m. and 7 a.m.) by 10 dBA. FRA Manual at 2-4. [https://railroads.dot.gov/sites/fra.dot.gov/files/fra\\_net/2680/20120220\\_FRA\\_HSR\\_NV\\_Manual\\_FIN\\_AL\\_102412.pdf](https://railroads.dot.gov/sites/fra.dot.gov/files/fra_net/2680/20120220_FRA_HSR_NV_Manual_FIN_AL_102412.pdf)

Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

times a day at a residential location. Moreover, the “Noise Impact Criteria” established by the FRA Manual are relatively lenient because they permit significant  $L_{dn}$  increases before the noise impacts of a train project are deemed to be “severe”. For example, a relatively quiet area that has an existing average noise level of 55 dBA is not deemed to be severely affected by train noise until the  $L_{dn}$  resulting from train operations increases to 61.1 dB (which represents a 50% increase over the existing 55 dBA ambient noise levels).

While the Draft describes FRA calculation methodologies used to derive train noise  $L_{dn}$  values, it does not provide any specific information pertaining to the noise calculations performed for the Project itself. Presumably, CHSRA relied on a noise modeling program to prepare the noise impact results presented in the Draft; however, the Draft fails to disclose any of the assumptions and data that were input to the model. These are critical omissions and without them, the efficacy of the noise impact results cannot be assessed<sup>2</sup>. Worse yet, the Draft provides no information whatsoever regarding the results from the model or the noise levels that the project will generate; instead, the Draft merely identifies a handful of vaguely described locations where various number of residences are identified as having either “severe” or “moderate” noise impacts [Tables 3.4-31 and 3.4-32]. At the very least, the paltry results presented by the Draft violate FRA Manual directives to provide noise contour results and other data. Specifically, the FRA Manual states:

*“Illustrate the areas of Impact and Severe Impact on maps or aerial photographs. This illustration could consist of noise impact contours on the maps or aerial photographs, along with the impact areas highlighted. This is done by delineating two impact lines: one between the areas of No Impact and Impact and the second between Impact and Severe Impact. To conform with the practices of other agencies (e.g., FHWA, U.S. Federal Aviation Administration (FAA)), include several contour lines of constant project noise, such as  $L_{dn}$  65,  $L_{dn}$  70, and  $L_{dn}$  75.”*

As discussed in more detail below, some locations in Acton are so quiet that they will experience “severe” noise impacts if the  $L_{dn}$  level generated by the Project is only 61 dBA; therefore, and in accordance with the directives issued by the FRA Manual, the Draft should have provided noise contours with  $L_{dn}$  values that are as small as 55 dBA. Yet, the Draft provides no noise contours at all<sup>3</sup>. Apparently, CHSRA simply expects the public to “take it on faith” that the modeling was done correctly, that the assumptions upon which the modeling was done are reasonable, and that the modeling results themselves are unassailably accurate. However, this is not permissible under either CEQA or NEPA; CHSRA is reminded that CEQA Guidelines Section 15147

<sup>2</sup> For example, sound propagation and attenuation characteristics are dictated by a number of factors (geography, development densities, vegetation characteristics, etc.); therefore, sound propagation and attenuation characteristics in Acton differ substantially from urban and suburban areas. Because the Draft fails to provide any information pertaining to sound propagation and attenuation assumptions (or any other assumptions) that were used to calculate noise impacts, it is impossible to assess the efficacy of CHSRA’s noise modeling results.

<sup>3</sup> Page of the Draft states on page 3.4-38 that “detailed mapping of noise effect locations is provided in Appendix E of the Noise and Vibration Technical Report” however, no noise contour maps are provided in Appendix E. In fact, the “maps” provided in Appendix E of the “Noise and Vibration Technical Report” appear to be the same as the maps provided in the Draft (specifically, Figures 3.4-17 to 3.4-35).

4518-10278

mandates EIRs provide sufficient technical information to “permit full assessment of significant environmental impacts by reviewing agencies and members of the public” and that Section 1502.23 of the NEPA regulations requires that agencies “identify any methodologies used and shall make explicit reference to the scientific and other sources relied upon for conclusions in the [Environmental Impact] Statement”. The Draft does not comply with these requirements because it does not provide sufficient technical detail to “permit full assessment” of the Draft’s conclusions regarding significant Project noise impacts and it does refer to the sources or data that were relied upon to derive these conclusions. Finally, an independent assessment of noise impacts that will be experienced by “receptor sites” (aka residences) in Acton which have an unobstructed “line of sight” view to the train tracks is provided in Attachment 1<sup>4</sup> and it reveals that noise impacts in the Community of Acton will be much more substantial and far-reaching than what is reported in the Draft (as discussed in more detail below). Taken together, these factors demonstrate that the noise analysis presented in the Draft is deficient and will not withstand judicial review; these deficiencies can only be overcome by revising the draft to 1) provide all relevant modeling information (including inputs, outputs and assumptions) and in particular, data regarding “shielding” and noise attenuation assumptions that were made for the Community of Acton; and 2) provide noise impact contours down to 55 dBA in areas like the Community of Acton where existing noise levels are substantially low compared to urban and suburban areas. Another alternative is select the SR14A Route Alternative and forego all the others.

**2.2 The Draft Fails to Identify Numerous Acton Residences that will Experience Severe Noise Impacts.**

The Draft asserts that “existing”  $L_{dn}$  noise levels are 60 dBA in the area surrounding Red Rover Mine Road where the Refined SR 14 route crosses the 14 Freeway on elevated tracks [Table 3.4-16]. Accordingly, and consistent with page 3-4 of the FRA Manual, all residences that experience an  $L_{dn}$  noise level of 63.3 dBA along the Refined SR 14 route are deemed to be “severely impacted”. The Draft only considers noise impacts on residences located within 1,800 feet of the tracks [page 3.4-38], so only residences within this narrow envelope were evaluated for noise impacts. However, and according to the noise analyses provided in Attachment 1, residences located within 3,600 feet of the elevated tracks that have an unobstructed “line of sight” view of the tracks over the 14 freeway will experience “severe” noise levels with an  $L_{dn}$  that exceeds 63 dBA; this represents a large portion of the Crown Valley area of Acton where many homes have a “line of sight” to the elevated track location. Yet, the Draft reports that only 11 residences in Acton will be severely affected by the Revised SR14 Route [Page 3.4-78]. The discrepancies between these results cannot be reconciled because the Draft fails to provide any quantitative information regarding the noise analysis upon which its results are based.

<sup>4</sup> The noise analyses were prepared in accordance with calculation procedures set forth in Chapter 5 and Appendix C of the FRA Manual and based on the train configuration data provided on Page 3.4-23 of the Draft. These calculations assume 1) The train operates at 220 mph at ground level; 2) the receptor has an unobstructed view of the tracks and there is no “shielding” (which is appropriate to Acton’s geography and sparse development profile); 3) the ground is acoustically “hard” (which accurately represents the rock and hardpack clay of Acton’s geology and the fact that there is little vegetation because of Acton’s arid environment); and 4) there is no ground attenuation for trains traveling in the aerodynamic regime (FRA Manual at 5-13). The calculations presented in Attachment 1 are consistent with information published by CHSRA in 2018 which is provided in Attachment 2 indicating that the noise generated by a high speed train at a location 100 feet from the tracks is 98 dBA.

## Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

A similar discrepancy is noted in the Draft's noise impact analysis of the "E" routes in the Aliso Canyon area of Acton where, according to Table 3.4-17 of the Draft, the existing  $L_{dn}$  level is 57 dBA (which means the "severe" noise impact threshold is 61.9 dBA per the FRA Manual [Page 3-4]). Nonetheless, the Draft concludes that no Acton residences in Aliso Canyon will experience severe noise impacts even though the tracks that cross Aliso Canyon Road on aerial structures at that location [Figure 3.4-25] are visible from Acton residences. This conclusion is contradicted by the results presented in Attachment 1 showing that residences located within 5,300 feet of, and which have an unobstructed "line of sight" to, the elevated tracks will experience  $L_{dn}$  levels exceeding 62 dBA. Several residences are located within 5,300 feet of the "E" tracks and have a "line of sight" to the aerial structure locations (including the historic "Blum Ranch"). Yet, for reasons that remain inscrutable, the Draft concludes that Acton residences in the Aliso Canyon area will not experience any noise impacts from any of the "E" Route alternatives all.

A deficiency that has been noted (which may explain the discrepancies observed above) is that the Draft does not properly report "severe" impact thresholds established by the FRA Manual. For example, in areas where the existing  $L_{dn}$  noise level is 60 dBA, the Draft asserts that the  $L_{dn}$  noise threshold for "severe" impacts to residential properties is 64 dBA [Page 3.4-78]; this is incorrect. The FRA Manual clearly establishes at Page 3-4 that the noise threshold for severe impacts is 63.3 at residential locations where existing  $L_{dn}$  values are 60 dBA. Another possible reason for the discrepancies noted above is that the Draft's noise analysis generally only considers "noise receptors" within 1,200 feet of the tracks [Page 3.4-38]; thus, the Draft did not evaluate noise levels out to 5,200 feet or even 3,600 feet. In fact, the Draft concludes that, beyond 1,800 feet "noise impacts were no longer detected" at any location along any of the route alternatives [Page 3.4-38]. The noise analysis results presented in Attachment 1 contradict this conclusion because they show that noise levels at receptor sites that have an unobstructed "line of sight" to the train at 1,800 feet from the tracks will experience  $L_{dn}$  levels of 66.74 which exceed FRA's "severe" noise impact thresholds for areas like Acton where existing  $L_{dn}$  levels are 60 dBA or less. Another possible reason for the discrepancies is that the Draft's noise analysis may have failed to properly account for the lack of vegetation and sparse development profile in Acton and therefore assumed incorrect noise attenuation parameters. This is important; sound propagates with little attenuation in Acton because of the low density development and the lack of vegetation and "hard ground" (i.e., rock and packed clay) characteristics in the Community. In any event, the discrepancies noted above cannot be reconciled because the Draft fails to provide any technical data pertaining to its noise analyses that it presents; this is a substantial deficiency because it prevents the public from properly assessing the efficacy of the Draft's conclusions regarding significant noise impacts and offering substantial evidence pertaining to deficiencies in the Draft's analyses.

Notably, the noise analyses presented in Attachment 1 are very conservative because they do not factor in the incrementally higher noise levels attributed to elevated tracks compared to "at grade" tracks on the ground. Specifically, the calculations presented in Attachment 1 understate the actual noise levels by at least 2 dBA because they assume that the train tracks are on the ground and not elevated in the vicinity of Red Rover Mine Road (for the Refined SR14 alternative) or Aliso Canyon Road (for the "E" routes)<sup>5</sup>. Thus, the actual noise levels will be at least 2 dBA louder than what the calculated results in Attachment 1 indicate.

<sup>5</sup> Trains on aerial tracks are 2 dBA louder than trains "at grade". FRA Manual at 4-10.

4518-10278

### 2.3 The Draft Suppresses Noise Impact Results for Neighborhoods in Acton

Another substantial deficiency of the Draft's Noise analysis is that it suppresses noise impact results for neighborhoods in Acton. For example, according to the Technical Report titled "Noise and Vibration Technical Report" that was obtained via an information request submitted pursuant to the California Public Records Act ("CPRA"), CHSRA collected baseline noise measurements over three one-hour periods at the intersection of Y-8 and Aliso Canyon in Acton (which is referred to as location "N8" on the data sheets provided on pages D-48 through D-50); these results indicate that existing  $L_{dn}$  levels at this location are 54.7 dBA<sup>6</sup>. Thus, according to Page 3-4 of the FRA Manual, residences at this location are deemed to experience "severe" noise impacts by rail Projects that generate  $L_{dn}$  levels at or above 61 dBA. The intersection of Aliso Canyon Road and Avenue Y-8 is adjacent to the historic Blum Ranch in Acton and has a "line of sight" view of the tracks for all the "E" Route alternatives where they cross over Aliso Canyon Road on aerial structures approximately 2,200 feet away. As indicated in the noise calculation results presented in Attachment 1, Project  $L_{dn}$  levels at this location will be almost 66 dBA; therefore, residences in these areas (including Blum Ranch) will experience severe noise impacts if CHSRA selects any of the "E" route alternatives for the project. Yet, the Draft fails to even identify location N8 or the baseline noise data collected for location N8<sup>7</sup> and it does not report the significant noise impacts that Project operations pose to Blum Ranch and nearby homes. This constitutes a significant deficiency that must be addressed in the Final EIR; or, in the alternative, CHSRA can simply approve the Route SR14A (in which case, noise impacts to Blum Ranch and other areas of Acton become moot).

### 2.4 The Methodology Adopted by the Draft to Assess Project Noise Impacts Does Not Comply with CEQA or NEPA.

The Noise Analysis presented in the Draft does not comply with CEQA or NEPA in a number of ways. First, both CEQA and NEPA require the Lead Agency to provide details regarding how a project will alter the existing environment<sup>8</sup>; with respect to noise impacts, these CEQA and NEPA provisions necessarily require CHSRA to provide some indication of what the Project's noise levels will be within the affected environment. Unfortunately, the Draft does not comply with this requirement because it does not provide any indication of how the Project will alter the existing noise environment. The Draft does not provide "noise contour" data or give any indication of what noise levels will be when the trains are operating. It does not explain that the Project will cause noise levels exceeding 80 dBA more than 400 times per day at residences that are in view of, and located within a mile of, the elevated tracks. It does not explain that the equestrian trails in Acton which are directly under elevated tracks will experience noise insults exceeding 100 dBA which will make it too dangerous for horses to use. It does not explain that

<sup>6</sup> The three one-hour sets of noise measurements were ostensibly collected in the morning, in the afternoon, and very late at night, and the average results for each of the three time intervals were 46.2, 47.6, and 49.7 dBA. Using these three numbers to represent baseline conditions during the morning, afternoon, and nighttime intervals in the  $L_{dn}$  calculation methodology yields an  $L_{dn}$  value of 54.7.

<sup>7</sup> Tables 3.4-15 and 3.4-16 in the Draft.

<sup>8</sup> CEQA requires that the EIR "include relevant specifics" of "physical changes" that will result from the Project [Guidelines 15126.2(a)] and NEPA requires that the EIS "Identify environmental effects and values in adequate detail so the decision maker can appropriately consider such effects" [1501.2(b)(2)].

Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

the noise level that will be experienced at Vasquez High School with every “passby” event on the Refined SR14 route will exceed 85 dBA and that, to comply with adopted safety requirements, teachers and staff will have to wear hearing protection when outdoors<sup>9</sup>. In fact, the only “noise impact” information that the Draft provides is a vaguely described list of areas where “severe” noise impacts are projected to occur and a number indicating what the 24-hour weighted average noise level is projected to be in that area; the Draft does not report any *actual* noise levels that will result when an *actual* “passby” events occur, so no *actual* noise impacts are reported. Nothing in the Drafts’ noise impact analysis comports with CEQA’s requirement to “include relative specifics” of “physical changes” that will result from the Project; in fact, the Draft deliberately omits any “specifics” regarding how existing noise levels will be altered by the Project. Nothing in the Draft’s noise impact analysis comports with NEPA’s requirement to “Identify environmental effects and values in adequate detail”; in fact, the Draft specifically omits all details regarding the Project’s actual noise effects on the environment.

Second, the Draft fails to analyze the noise effects of Project operations as required by CEQA and NEPA. Specifically, both CEQA and NEPA require that the EIR/EIS clearly identify the “effects” that a Project will have on the environment and both CEQA and NEPA define “effects” to include “direct effects” which are caused by the action and occur “at the same time and place” as the action<sup>10</sup>. To comply with these definitions, an EIR/EIS noise analysis is required to report noise effects “at the same time and place” they occur. The Draft fails to comply with this requirement because it does not report Project noise effects “at the same time and place” they occur; instead, the Draft averages all the noise effects together and reports a single “cumulative” value that does not in any way represent the *actual* “direct” noise effects of the Project which occurs at the time and place of a “passby” event. In other words, the “cumulative”  $L_{dn}$  values that are calculated and reported in the Draft for a few vaguely described locations in Table 3.4-31 through 3.4-33 do not represent the “direct” noise effects of the Project that occur “at the same time and place” as required by CEQA and NEPA. This is a substantial deficiency that can only be corrected by revising the Draft to include noise contour maps indicating what the *actual* Project noise levels (referred to as the “Sound Exposure Levels” or “SELs”) will be in all areas where Project operations will alter existing noise profiles. For the Community of Acton, it is recommended that SEL noise contours maps be prepared in 5 dBA increments starting at 100 dBA and extending down to 65 dBA. It must be pointed out that these CEQA/NEPA compliance concerns have been raised several times in comments submitted over the last 7 years both verbally and in writing; it seems that these comments were ultimately ignored. Fortunately, the entire issue will be rendered moot if CHSRA selects the SR14A Route Alternative because this would eliminate all “direct” noise effects from Project operations in Acton.

<sup>9</sup> Vasquez High School is located 1,600 feet from the elevated tracks that will be constructed under the Refined SR14 route alternative. Thus, and as indicated in Attachment 1, each train “passby” event will generate a Sound Exposure Level of at least 86.8 dBA; this will occur more than 400 times per day. Because the Federal Occupational Safety and Health Administration requires hearing protection in work areas where noise levels exceed 85 dBA [Draft at Page 3.4-8], teachers and staff will be required to wear hearing protection whenever they are outside to protect their ears from the noise insults created by Project operations.

<sup>10</sup> NEPA Section 1508.1(g)(1) defines effects to include “Direct effects, which are caused by the action and occur at the same time and place”. CEQA Guidelines Section 15358 defines effects to include “Direct or primary effects which are caused by the project and occur at the same time and place”.

4518-10278

Finally, both CEQA and NEPA require CHSRA to evaluate indirect impacts, which are defined as effects caused by the action and are later in time or farther removed in distance<sup>11</sup>. Because the  $L_{dn}$  results reported in the Draft are derived from cumulative noise levels averaged over a 24 hour interval, it could be argued that  $L_{dn}$  values reasonably represent the indirect noise impacts that will result from Project operations. However, and as discussed above,  $L_{dn}$  does not provide an adequate basis for assessing the direct noise impacts resulting from the Project.

**2.5 The Model Used by CHSRA to Derive Project Noise Impacts Is Not Shown To Be Properly Validated.**

The Draft asserts on page 3.2-24 that a “Benchmark test” was used to validate the model that was relied upon to derive the noise impact results, and that details regarding the benchmark test are provided in a “Technical Report” that has been withheld from the public. When a copy of this “Technical Report” was procured pursuant to a CPRA record request, it revealed that the “benchmark test” was not particularly rigorous: “The environmental program manager for the Authority distributed a series of input parameters and output results against which the noise model could be compared for accuracy.” However, nothing about this procedure establishes the accuracy of the model or materially “validates” the model results:

- The proper way to “validate” a model and assess its accuracy is to compare the output from the model (in this case, the “Sound Exposure Levels” calculated for a train “passby”) to actual physical measurements that are collected under the conditions that are modeled. The “benchmark” test did not utilize physical noise measurements or compare modeled SEL values to measured SEL values; thus, it cannot be concluded that the “benchmark” test demonstrates that the model is either accurate or valid.
- There is no provenance or background information regarding the “output results” that were provided by the “environmental program manager for the Authority” and used to compare the model results for accuracy, so there is no basis to conclude that such “output results” are an appropriate standard by which to validate CHSRA’s noise model. In other words, there is no information explaining where these “output results” came from or how they were derived or why the public and the decisionmakers should accept them as the appropriate “standard” for validating the noise model; so, they prove nothing. It is certain that they were not derived from physical measurements taken from actual trainsets because the configurations they represent are not typical and in fact some configurations are completely implausible (as discussed below); accordingly, the “benchmark” test does not constitute evidence that the noise model is either valid or accurate.
- The “output results” that were provided by the “environmental program manager for the Authority” assume unrealistic conditions and are therefore facially invalid. For example, the configuration assumed in the “output results” for elevated structures are particularly unrealistic because they all include the placement of a 63 foot high noise barrier just

<sup>11</sup> NEPA Section 1508.1(g)(2) establishes that indirect effects “are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable”. CEQA Guidelines Section 15358 defines indirect or secondary effects” as those effects “which are caused by the project and are later in time or farther removed in distance, but are still reasonably foreseeable”.

## Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

15.5 feet from the track; this configuration is implausible. CHSRA would never install 63 foot high barriers adjacent to an elevated tracks because the purpose of elevating tracks by 63 feet is to cross over a large physical impediment (such as a river or freeway or seismic fault area); so, installing a 63 foot high wall adjacent to the tracks would defeat the whole purpose for elevating the tracks. As another example, all of the “output results” assume the presence of noise barriers (see Tables 4-2 and 4-3) however noise barriers will generally not be used for the Project<sup>12</sup>. The defects in this analysis are of particular concern to the Community of Acton because all the route alternatives except SR14A require the construction of elevated structures in Acton, and since high speed trains traveling on elevated structures are much louder than trains traveling on the ground<sup>13</sup>, it is critical to Acton’s future that the Project noise analysis accurately and realistically portray the actual noise insults that Acton will experience if any alternative other than SR14A is selected. The “Benchmark test” does not demonstrate that CHSRA’s models are either accurate or realistic because they reflect configurations that are at best, not useful, and at worst, completely implausible.

- The results provided in Attachment 1 indicate that the modeled results upon which the Draft’s noise impact analysis is based may not be accurate because they show that significant noise impacts in Acton will extend beyond 1,800 feet and will be much more significant than what is predicted by CHSRA’s model.

It is essential that both the public and the CHSRA Board have confidence that the noise analyses and the noise impact results presented in the EIR/EIS are accurate and reliable, and that they realistically reflect the actual noise impacts that Acton residents will experience if any route other than SR14A is selected. For the reasons set forth above, the public has no such confidence and the Board has no substantive basis to conclude that the noise analysis and noise impact results reported in the Draft are either accurate or reliable, or realistic. Accordingly, CHSRA cannot certify or adopt an EIR for the Project, and FRA cannot issue a Record of Decision for the Project until the significant deficiencies noted above are corrected.

### 2.6 Key Reports That Were Relied Upon to Prepare the Draft Were Not Made Accessible to the Public.

The Draft frequently cites various “technical reports” which provide all the fundamental technical information upon which the Draft’s conclusions regarding the “significance” of all environmental impacts are based (see for example pages 3.4-1, 3.4-2, 3.4-14, 3.4-24, 3, etc.). However, none of these reports were made available to the public: they were not posted on the CHSRA website with the Draft and they were not included in the copies of the Draft that were provided for the public to review and they were not filed with the State Clearinghouse as required by CEQA<sup>14</sup>. These documents can only be accessed by submitting a record request pursuant to the California Public Records Act (“CPRA”). All of this is utterly contrary to the open and public processes that are intended by both CEQA and NEPA.

<sup>12</sup> Only two noise barriers are proposed for the Refined SR14 route, only one is proposed for the SR14A route, and only three or fewer barriers are proposed for the “E” routes. Page 3.4-148.

<sup>14</sup> <https://ceqa.net.epr.ca.gov/2014071074/2>

8

4518-10278

### 3.0 ADDITIONAL SUBSTANTIVE DEFICIENCIES NOTED IN THE DRAFT

To facilitate review, additional deficiencies noted in the Draft are presented sequentially below.

Page 3.4-8 discusses Federal Noise Standards that apply to interstate rail carriers, and it asserts that these standards will not be met by the Project; it further indicates that CHSRA’s position is that Federal Noise Standards will not be addressed and instead CHSRA will apply European Noise Standards to its environmental analysis. CHSRA’s position is not only legally untenable, it makes no sense. First, CHSRA cannot simply ignore federal noise standards or replace them with standards developed by European lawmakers and bureaucrats over which American voters have no control; all high speed rail projects will have to comply with Federal Noise Standards the instant they initiate any operation that is subject to such standards. Second, even if CHSRA were permitted to ignore Federal Noise Standards and instead comply with European noise standards, the Draft is still deficient because it fails to identify what the European Standards are and it certainly does not demonstrate how the Project will meet these standards. Third, the European Noise Standard is based on trainset speeds; in fact, the “Technical Specification for Interoperability” (“TSI”) pertaining to noise that was adopted by the European Union limits train speeds to 320 kilometers per hour<sup>15</sup> (or 190 miles per hour). This means that Project operations will not comply with the European Noise Standard because CHSRA’s trainsets will operate at 220 miles per hour, not 190 miles per hour. Fourth, it is patently false to conclude that California high speed rail trainsets cannot comply with Federal Noise Standards; these Standards are easily be met by limiting trainset speeds to less than 190 miles per hour because this restriction will eliminate primary aerodynamic noise sources and thereby maintains compliance with Federal Noise Standards<sup>16</sup>. In other words, by limiting trainset speeds, project operations will comply with both Federal and European Noise Standards. Finally, according to a recent publication by the Federal Railway Administration, noise measurements taken for a variety of trains operating throughout Europe demonstrate that *the Federal Noise Standard is achievable through speed control*<sup>17</sup>; therefore, Project operations can comply with Federal Noise Standards despite the Draft’s statements to the contrary. Furthermore, there is nothing to prevent CHSRA from operating the Project at 190 mph once construction is completed because Proposition 1A does not require the Project to operate at 220 mph; to the contrary, it merely requires CHSRA to prioritize corridors based on criteria that includes “the need to test and certify trains operating at speeds of 220 miles per hour<sup>18</sup>”.

<sup>15</sup> Page 34 of “High Speed Rail Noise Standards and Regulations” issued by the Federal Railway Administration February, 2021 states “The introduction of normalized noise limit values was introduced to consolidate the TSI Noise regulations to one document. The increase in train speed is not a key reason for this consolidation since the current TSI also limits train speeds to 320 km/hr” (emphasis added). <https://railroads.dot.gov/sites/fra.dot.gov/files/2021-02/HSR%20Noise%20Standards%20and%20Regulations.pdf>

<sup>16</sup> Aerodynamic noise does not become significant until the train reaches 180 miles per hour. Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

Page 3.4-12 mentions the Los Angeles County General Plan ("Plan"), but it fails to articulate the policies or goals of the Plan. CEQA demands that Plan goals and associated policies and relevant factors be identified and discussed in the EIR because CEQA requires CHSRA to identify all instances in which the Project is inconsistent with adopted planning documents. For instance, the Plan asserts that there is a 30% probability that people will be awakened by a peak noise level of 70 dBA, and therefore establishes that a primary goal is to reduce excessive noise impacts in unincorporated areas [Goal N 1 and Page 191]; the Project will not meet this Goal because all routes except the SR14A will result in peak noise levels that substantially exceed 70 at all locations in Acton that are within two miles of, and have an unobstructed "line of sight" to, the tracks. This fact is demonstrated by the noise analyses presented in Attachment 1 which reports that, even two miles away, peak noise levels (referred to as "Cumulative Sound Exposure Level" or "Cumulative SEL") exceed 75 dBA during a train "passby". Since all the trucks are elevated in Acton for all the routes other than the SR14A alternative, many Acton residents will have a "line of site" to the tracks and will therefore experience noise levels exceeding the Plan's 70 dBA objective more than 460 times per day<sup>19</sup>. Moreover, 56 trains will traverse Acton between 10 PM and 7 AM, which means that many Acton residents will not get any sleep because they will experience a noise event exceeding 70 dBA with every nighttime train "passby". And, if the Refined SR14 A alternative is selected, students at Vasquez High School will constantly experience 86 dBA noise events throughout the school day<sup>20</sup>. It is clear that, other than the SR14A alternative, all of the Project route alternatives are inconsistent with, and will substantially interfere with, the Los Angeles County General Plan goal of "reducing excessive noise impacts" in the Community of Acton; yet, the Draft fails to mention any of this. The Draft must be substantially revised to quantitatively show the extent to which the Project will interfere with the County's objective of reducing excessive noise impacts; this concern will be eliminated if CHSRA approves Route SR14A.

Page 3.4-12 "The Los Angeles County General Plan 2035 refers to the Los Angeles County Municipal Code for direction on and definition of specific noise criteria". This statement is incorrect. Consistent with Government Code Section 65302(f), the Noise Element of the Plan includes implementation measures and solutions to address existing and foreseeable noise problems; the purpose of the Municipal Code is to implement these measures established by the Plan. In other words, the Plan drives the Municipal Code, not the other way round.

Page 3.4-13 states "The Authority is a state agency and therefore is not required to comply with local land use and zoning regulations". While it is true that CHSRA is not required to comply with local land use and zoning regulations, CEQA requires that CHSRA ascertain whether the Project is inconsistent with any general plan policies that were adopted for the purpose of avoiding or mitigating an environmental effect and whether these inconsistencies will result in significant environmental impacts; if so, mitigation must be offered<sup>21</sup>. Accordingly, while the

<sup>19</sup> The Project will result in 189 trains per day in each direction during the daytime hours, 28 trains per day in each direction during the nighttime hours, and 14 trains in each direction during the peak hours. Page 3.4-23.

<sup>20</sup> The aerial structure required by the Refined SR14A Alternative will be located within 1,600 feet of Vasquez High School, and as shown in the analyses provided in Attachment 1, each train "passby" will generate a sound level exceeding 86 dBA on the Vasquez campus.

<sup>21</sup> California Code of Regulation, Title 14, Chapter 3, Appendix G.

4518-10278

Project is not required to conform with local land use and zoning policies, CEQA nevertheless requires the Project to mitigate the significant environmental impacts that arise from non-conformance. Because all the noise protection policies set forth in the Plan were adopted for the purpose of mitigating noise effects on the environment, any noise protection policy that is not met by the Project constitutes a potentially significant environmental impact that must be addressed. The Draft fails to even mention that the Project is inconsistent with the Plan's 70 dBA noise objective and it certainly does not address this inconsistency or offer mitigation measures to ameliorate it. Therefore, the Draft does not comply with CEQA.

Page 3.4-13 asserts that CHSRA has "endeavored to design and construct the HSR project so that it is consistent with land use and zoning regulations. For example, the proposed Build Alternatives would incorporate IAMFs that require the contractor to prepare a plan to demonstrate how construction noise and vibration impacts will be maintained below applicable standards. The Authority has also adopted statewide policies that seek to reduce noise and vibration impacts associated with new sources of noise and vibration (Appendix 3.4-C) below applicable standards". While these statements may be true regarding the SR-14A alternative in Acton, they are not true regarding the other alternatives for several reasons. First, it is clear from the noise analyses provided in Attachment 1 that the Project will result in substantial noise impacts on the Community of Acton regardless of whether CHSRA "endeavors" to be consistent with adopted plans or "seeks" ways to reduce noise impacts. Second, it does not matter whether CHSRA endeavors for the Project to be consistent with adopted plans and policies; it only matters if the Project is consistent with adopted plans and policies; as discussed above, the Project's noise profile in Acton will not be consistent the Los Angeles County General Plan for any of the routes except SR14A. This fact should be clearly asserted in the Draft and not buried under a "word salad" of meaningless aspirations. Third, requiring a contractor to develop a plan that will show how the contractor will comply with applicable noise standards is impermissible under CEQA because it defers the development of mitigation measures to reduce significant noise impacts until after the Project is approved. Finally, while CHSRA may assert that its policies seek to reduce noise impacts, the noise mitigation policies provided in Appendix 3.4-C do not actually reduce noise impacts in most areas. For instance, CHSRA only provides noise barriers under certain circumstances and will not deploy them to reduce noise impacts in most areas even though they would be both feasible and effective<sup>22</sup>. Virtually every statement found on page 3.4-13 is either disingenuous or factually incorrect or intended to obscure the facts regarding Project noise impacts and the extent to which they are inconsistent with adopted Plans and standards: other than Alternative SR14A, every single route alternative in Acton fails to comport with adopted County noise policies and standards. The Draft must be revised to present this simple truth.

Page 3.4-13 also presents Table 3.4-2 that identifies numerous noise standards in adopted plans and codes and which states that the construction and operation of all six proposed routes "may not be possible to meet standards" established by the Los Angeles County General Plan (which applies to unincorporated communities like Acton). This characterization is incorrect. Based on the noise calculations provided in Attachment 1, none of the proposed route alternatives except

<sup>22</sup> CHSRA only deploys noise barriers when there are at least 10 receptor sites who will experience significantly adverse noise levels; if 9 or fewer receptor sites will experience significantly adverse noise levels, no noise barriers will be installed, and the people who live and work at these sites will suffer immeasurably. Appendix 3.4-C Noise and Vibration Mitigation Guidelines at c-1.

## Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

SR14A will meet the Los Angeles County General Plan noise standards in Acton; this is particularly true given that no noise mitigation measures are proposed for the elevated tracks that will be constructed in Acton if either the Refined SR14 route or any of the "E" routes are selected. Therefore, Table 3.4-2 must be revised to state that it "will not be possible to meet standards" in the Los Angeles County Plan and further clarify that this constitutes a significant environmental impact. All route alternatives will generate noise levels in unincorporated areas which exceed the Los Angeles County General Plan noise standards; the only way to minimize this significant environmental impact is to select the SR-14A route alternative route which provides the fewest number of miles of above-ground tracks in unincorporated communities.

Page 3.4-14 states "Despite the inconsistencies, the project is consistent with the majority of regional and local policies and plans". The logical fallacy presented by this statement renders it false: The Project is materially inconsistent with 10 of the 12 local and regional plans adopted for the project area [Page 3.4-13]; these inconsistencies are not mitigated away. Therefore, it can only be concluded that the project **is not** consistent with the majority of regional and local policies and plans. The Draft errs substantially in declaring otherwise.

Page 3.4-14 states "Table 3.4-2, IAMFs and mitigation measures would generally minimize noise impacts and would ultimately meet the overall objectives of the local policies". This statement is categorically false. As discussed above, for all alternatives other than SR14A, project operations within the Community of Acton will result in more than 460 noise events per day that exceed 75 dBA in many areas of Acton; these noise events will not be reduced by any IAMFs or mitigation measures. Accordingly, the Project will not meet any objectives of local noise policies applicable to Acton (and on this basis, it could be argued that CEQA prevents the Project from being approved at all). The Draft must be revised to clarify that, even with IAMFs and mitigation measures, the Project will not meet most local policy objectives.

Page 3.4-16 asserts that NV-IAMPF#1 will minimize construction noise, and the Draft implicitly presumes that it will do so. However, NV-IAMPF#1 is nothing more than a statement that the contractor will prepare a "technical memorandum" stating that FTA and FRA guidelines will be utilized to reduce noise impacts on sensitive receptors within 1,000 feet of construction activity. NV-IAMPF#1 is deficient because the 1,000 foot distance is far too short; the noise generated by Project construction will be significant well beyond a 1,000 foot perimeter. This is especially true in Acton near Red Rover Mine Road (at the refined SR 14 construction site) and Aliso Canyon (at the "E" Route construction site) because the construction sites are surrounded by hills where sound reverberates instead of attenuates due to Acton's low density development profile and sparse vegetation. The constant, mind-numbing operation of pile drives and other construction equipment will make living adjacent to the construction site and learning at Vasquez High School impossible. NV-IAMPF#1 is also deficient because the "thresholds of significance" that are established by the Draft for construction noise impacts are based on federal standards that are far too lax (as discussed in detail below); when the draft is revised to incorporate more appropriately restrictive significance thresholds for construction noise impacts, NV-IAMPF#1 will have to include receptors much further away than 1,000 feet from the construction site. Alternatively, CHSRA can simply select alternative SR14A.

Page 3.4-16 asserts "Wildlife and human sensitive receivers could be startled or annoyed by California HSR System passbys, and wildlife communication could be affected by project noise". This is an understatement. There is no uncertainty regarding whether high speed train noise

12

4518-10278

affects wildlife and domesticated animals; the Federal Railway Administration's 2012 "High-Speed Ground Transportation Noise and Vibration Impact Assessment" Manual ("FRA Manual") fully admits to this [Appendix A]. In fact, the FRA Manual not only acknowledges that animal startle and annoyance are real problems, it openly asserts that it has no definitive information upon which to establish a quantitative threshold for determining the significance of these impacts<sup>23</sup>. Astonishingly, after admitting that it has no quantitative basis for establishing significance thresholds for startle impacts, the FRA Manual arbitrarily assigns a 100 dBA sound exposure level (averaged over a 1 second time interval) for startle effects and then, without justification, the Draft simply adopts this as a significance threshold [Page 3.4-34]. This 100 dBA threshold is based purely on speculation and conjecture and is therefore impermissible under CEQA. Because the Draft's threshold for noise impacts on animals is completely unsubstantiated and admittedly indefensible, it will not withstand judicial review. Furthermore, as a rural agricultural community that is surrounded by national forestland, Acton is replete with both domesticated animals and wildlife, and the "lived experiences" of our residents directly contradict the presumption established by the Draft that animal startle and annoyance is not significant until noise levels reach 100 dBA. As has been explained in numerous and extensive public comments submitted to CHSRA, animal startle (whether wild or domesticated) can result from a distant helicopter flyover and even a distant car passby or backfire; all of these noise levels are far less than 100 dBA. Conveniently, the unsubstantiated and arbitrarily high 100 dBA noise threshold that CHSRA establishes for animal impacts allows the Draft to conclude that noise impacts on animals resulting from all the route alternatives are generally "insignificant"; in fact, the only locations where the Draft concludes that potentially significant noise impacts on animals will occur are on the Pacific Crest Trail, in the Vasquez Rocks Natural Area, at the Hansen Dam Recreation Area, and at the Stonehurst Park and Recreation Center because horses are known to be there [page 3.4-107]. CHSRA is reminded that horses, cows, sheep, goats, chickens, llamas, ducks, lions, tigers, and many other types of animals are known to be in Acton (as the public has pointed out many times over the last 10 years); therefore, Acton should be included in this list of locations where potentially significant noise impacts on animals will occur. Furthermore, the Refined SR14 route travels directly over established equestrian trails along Sierra Highway, Red Rover Mine Road, and Escondido Canyon Road (including over the Darrell Readmond trail), and according to Sheet ST-J1009-S14 of the "Bridges and Elevated Structures Plans", the tracks will be less than 40 feet above the trail; this means that noise levels on the trail will actually exceed 102 dBA<sup>24</sup>. Thus, even if the 100 dBA threshold for significant noise impacts on animals were acceptable (which it is not), it is certain that the Project will result in significant animal impacts in the Community of Acton. Furthermore, there is no uncertainty regarding whether humans will be startled or annoyed by Project operations; according to a 2021 study issued by FRA, human startle effects can occur at

<sup>23</sup> The 100 dBA threshold identified in the FRA Manual was based on observed turkey responses to aircraft and Table A-1 of the Manual demonstrates a wide variety of aircraft reaction thresholds for animals. Because there is no data pertaining to high speed trains, and because what little data there is regarding animal responses to aircraft, the FRA Manual lamely states on page A-20 that "Until more definitive information on thresholds can be developed, an interim criterion of SEL = 100 dB will be used for disturbance by high-speed rail operations."

<sup>24</sup> The noise that is generated by a train traveling on aerial structure exceeds 101 dBA at a location 50 feet from the tracks; since the trails along Red Rover, Escondido Canyon Road, and Sierra Highway will be only 39 feet from the tracks, noise levels at these trails will greatly exceed 101 dBA.

13

Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

Noise levels less than 90 dBA<sup>25</sup>. Additionally, a 1974 study by the Federal Department of Transportation demonstrates that human startle impacts can occur at noise levels that are as low as 81 dBA<sup>26</sup>. That high speed train noise will annoy humans is a fact that is demonstrated by the infamous “Schultz Curve” which shows measurable human annoyance occurring at L<sub>dn</sub> levels as low as 60 dBA<sup>27</sup>. Given that all but one of the six Project alternatives will increase L<sub>dn</sub> sound levels in Acton well beyond 60 dBA (see table 3.4-31), it is a certainty that Acton residents will be annoyed by the Project. In other words, the Draft errs substantially in stating that human sensitive receptors *could* be startled or annoyed by HSR operation; it is a certainty that they *will* be startled and annoyed by HSR operation. Startle and annoyance impacts of the proposed project on the community of Acton can only be avoided by selecting the SR14A alternative which eliminates all operational noise impacts. All the deficiencies noted here render the Draft substantially deficient; these deficiencies can only be corrected by substantially revising the Draft to properly address startle effect on animals and startle and annoyance effects on humans.

Pages 3.4-17-3.4-18 describes various sources of noise that may result from Project construction, but it fails to identify or discuss the blasting noise impacts that will occur as a result of using “traditional” tunneling techniques to construct the tunnels in Acton for all the “E” Route alternatives<sup>28</sup> (specifically, in the residential neighborhoods around Foreston Street and Aliso Canyon Road). Blasting techniques are substantially disruptive in rural communities like Acton where a sudden noise can cause horses, livestock, and other domesticated animals to panic and become very difficult and dangerous to handle. The Draft fails to disclose that blasting techniques will be used in the Community of Acton, it fails to consider the adverse impacts of such techniques in the community, and it certainly fails to offer mitigation measures to reduce these impacts. The Draft must be revised to address all of these deficiencies and it must also clarify that these impacts cannot be mitigated to a level that is less than significant and will only be avoided if the none of the “E” Routes are approved.

<sup>25</sup> According to the FRA report issued in February, 2021 and titled “High Speed Rail Noise Standards and Regulations”, startle effects are deemed excessive by the public when a high speed train’s average noise level measured 25 feet from the track centerline is only 90 dBA. This conclusion is based on the following specific facts drawn from the “High Speed Rail Noise Standards and Regulations” report: 1) Page 45 states that “The startle noise of the Thalys trains running at 300 km/h (186 mph) was deemed excessive”; 2) Page 136 that the Thalys train running at 300 km/hr generates a passby noise level L<sub>passby</sub> of 90 dBA; 3) Page 20 states that L<sub>passby</sub> is the average of noise energy a train generates from all cars during the time of the passby of the entire train; and 4) Page 31 states that L<sub>passby</sub> is measured 7.5 meters (approximately 25 feet) from the track centerline. The extent to which the Thalys L<sub>passby</sub> values represent the average noise level during a train passby event is demonstrated in figure 5 from a separate FRA study titled “High Speed Rail: Cost of Compliance for Noise Mitigation Procedures”. Because the Project will expose people and animals to 90 dBA noise levels in Acton within 700 feet of the track (as indicated in Attachment 1), startle effects will be much more prevalent than the Draft suggests.

<sup>26</sup> “Development of an Acoustic Rating Scale for Assessing Annoyance Caused by Wheel/Rail Noise in Urban Mass Transit”. U.S. Department of Transportation Interim Report. 1974. At Table 1.

<sup>27</sup> See page A-12 of the FRA Manual.

<sup>28</sup> At a meeting with CHSRA engineers and staff on October 4, 2022, it was announced that tunnel boring machines would not be used to construct any of the tunnels for the “E” Route alternatives between Palmdale and Arrastre Canyon and that “traditional” tunnelling methods would be used instead.

4518-10278

Page 3.4-19 addresses the “Construction Noise Criteria” applied for assessing project construction noise impacts, and it states that the Draft relies solely upon federal criteria established by the FRA for determining whether the Project’s construction noise impacts are “significant”. This is unacceptable. FRA construction noise standards are substantially lax because they allow a daytime 8-hour average noise level (referred to as “8-hour Leq”) of 80 dBA and a nighttime 8-hour average noise level of 70 dBA; this means that Project construction can continuously create noise levels up to 80 dBA all day and 70 dBA all night in a residential area and such noise impacts would not be considered “significant”. It also means that daytime and nighttime noise levels can be as high as 100 dBA or even higher as long as these high noise events are sufficiently balanced by lower noise events to ensure that the cumulative noise level averaged over an 8 hour interval does not exceed 80 dBA in the daytime or 70 dBA at night. To be clear, an 80 dBA noise insult is quite loud (it is equivalent to an alarm clock<sup>29</sup>), thus it is entirely unreasonable to conclude that residents will not be significantly affected if they are continuously exposed for an entire day to noise levels that are equivalent to an alarm clock. Yet, that is precisely what the federal standard allows for daytime construction activities. Moreover, local noise policies and standards more accurately reflect just how disruptive noise impacts can be in rural communities like Acton (particularly at night). For instance, and as discussed above, the Los Angeles County General Plan affirms that there is a 30% probability that people will be awakened by 70 dBA noise events; this is why the Los Angeles County Code prohibits construction noise disturbances across residential property line that exceed 75 dBA during the day and 60 dBA during the night<sup>30</sup>. The Draft ignores all these material facts, and instead adopts a noise standard which is so lenient that it *guarantees* sleepless nights for many Acton residents because it allows for continuous nighttime noise levels of 70 dBA. It is entirely inappropriate and arguably a CEQA violation for CHSRA to disregard local noise policies in determining the significance of noise generated by Project construction in favor of a federal standard that was developed without regard for rural circumstances or consideration of local conditions. CEQA is very clear: it requires the Lead Agency to 1) exercise careful judgement in making determinations regarding whether a project may have a significant effect on the environment; 2) base such determinations on scientific and factual data; and 3) recognize that an activity which may not be significant in an urban area may be significant in a rural area [CEQA Guidelines 15064(b)(1)]. The Draft fails to comply with these CEQA directives because it simply adopts a federal standard without thought or analysis and despite the fact that it is entirely inappropriate for local conditions. In other words, it is technically unacceptable and legally insupportable under CEQA to adopt “thresholds of significance” which are inappropriate for the rural environmental and are so lenient that a Project is not deemed to pose significant effects even when it causes significant and continuous incursions of noise events that are of sufficient magnitude to substantially interrupt sleep and interfere with living conditions. These are precisely the circumstances presented by the Draft; accordingly, the Draft is deficient and it will not withstand legal challenge. To correct these deficiencies, the Draft must be revised to incorporate restrictions on construction noise within the Community of Acton which are reasonable and appropriate for the rural community of Acton; the construction noise standards adopted by Los Angeles County Code are a good starting point. Alternatively, CHSRA can just approve the SR14 A route alternative and eliminate all construction noise impacts in Acton.

<sup>29</sup> <https://decibelpro.app/blog/decibel-chart-of-common-sound-sources/>

<sup>30</sup> The County Code prohibits residential noise disturbances > 75 dBA from 7:00 a.m. to 8:00 on Monday-Saturday, and ≥60 dBA from 8:00 p.m. to 7:00 a.m. at all other times. [LACC 12.08.440].

## Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

Page 3.4-23 states “For the Palmdale to Burbank Project Section, it is assumed that there would be 189 trains per day in each direction during the daytime hours (7:00 a.m. to 10:00 p.m.), 28 trains per day in each direction during the nighttime hours (10:00 p.m. to 7:00 a.m.), and 14 trains in each direction during the peak hours.” This description is ambiguous. Specifically, it is not clear whether the statement “14 trains in each direction during the peak hours” means that each peak hour will have an additional 14 trains or it mean that the additional 14 trains in each direction will be spread over all the peak hours. The difference is significant; the former implies that there will be 231 daily trains in each direction (189 + 28 + 14) for a total of 462 trains per day and the latter implies there will be 301 daily trains in each direction per day (189 + 28 + (14 x 6 peak hours per day)) for a total of 602 trains per day. This ambiguity should be addressed and the projected train schedule should be clearly identified.

Page 3.4-24 generally discusses noise propagation and the factors that affect sound travel; however, it does not correctly represent material facts that are pertinent to the Project. For example, it states that “If a line of sight exists from a subsurface on the HSR to a noise-sensitive receiver, the ground factor becomes more critical in determining the amount of attenuation over a given distance”. This statement is not accurate and does not represent conditions that will result from Project operations. Specifically, Project train speeds will exceed 200 mph, therefore, aerodynamic noise will tend to dominate the radiated noise levels<sup>31</sup>; therefore, the “ground factor” is not relevant because in the aerodynamic regime, ground absorption has little attenuating effect<sup>32</sup>. Furthermore, in the Community of Acton, “ground factor” will not contribute significantly to sound attenuation because many neighborhoods will have a direct “line of sight” to the train because the tracks are elevated in the Community for all route alternatives except SR14A. Finally, the discussion regarding noise barriers and the extent to which they will attenuate noise gives the false impression that noise barriers will be deployed to protect the public from the Project’s significant noise impacts when in reality, CHSRA is generally disinclined to utilize noise barriers and is only proposing that a few be used to mitigate noise impacts (as discussed above).

Page 3.4-33 addresses “startle effect” in humans and wildlife due to “Rapid Onset Rates” from high speed trains, and it presents a “distance verses speed” chart that was ostensibly developed by FRA to indicate the distances from a high speed rail track where human “startle” effects can occur at various train speeds. According to the chart, an unsuspecting a person walking only 47 feet from a high speed rail track will not be “startled” by an oncoming high speed train unless the train speed exceeds 225 mph. This conclusion is preposterous because a person walking only 47 feet from a train traveling at 220 mph will experience a sudden noise level exceeding 101 dBA (as well as a significant air pressure wave) and will absolutely experience “startle”. Yet, the Draft concludes that no such startle effects would occur because the train is only moving at 220 mph. Given the absurdity of this conclusion, a further review of the FRA figure was conducted. It turns out that the FRA Manual does not explain the “distance verses speed” chart at all; it does not disclose the chart’s origins or cite the technical data that the chart reflects or describe the assumptions that underlie it or articulate the circumstances under which is deemed to apply. Furthermore, the “distance verses speed” chart appears to contradict other information that is provided in the FRA Manual. For instance, the FRA Manual cites an Air Force study that

<sup>31</sup> FRA Manual at 2-11.

<sup>32</sup> Id at 5-13.

4518-10278

indicates startle effect can occur when onset speeds reach 15 dBA/second<sup>33</sup> which (according to Figure 2-5) occurs when the “speed to distance” ration is at approximately 2.5. Reconciling this 2.5 ratio to the Project’s 220 mph velocity envelope indicates that “startle” will occur when a person is actually 88 feet from the tracks (not 47). Surprisingly, and despite the presence of contradictory Air Force data, the FRA Manual “adopts” an onset noise threshold of 30 dBA/second as the basis for “establishing distances within which startle is likely to occur” even though Figure 2-5 presented in the FRA Manual reveals a 30 dBA/second threshold to be entirely implausible because it shows that no high speed trains (including Maglev trains) are even capable of achieving a 30 dBA/second onset rate<sup>34</sup>. Finally, this assessment by FRA’s is contradicted by various studies described above including a 2021 FRA study (indicating that startle effects are deemed excessive by the public when a high speed train’s average noise level measured 25 feet from the track centerline is only 90 dBA) and a 1974 study by the Federal Department of Transportation (demonstrating that human startle impacts can occur at noise levels that are as low as 81 dBA). The discussion of “startle” effects presented in the FRA Manual is arguably contradictory and not supported by technical evidence; thus, and by extension, the Draft’s conclusions regarding “startle” effect are groundless and should be accorded no weight.

Page 3.4-36 explains the methodology that the Draft adopts for assessing the significance of Project operating noise impacts pursuant to CEQA, and it establishes that a noise impact will only be significant if it generates noise levels that exceed Federal Railway Administration/ Federal Transportation Administration standards (which are referred to as “Noise Impact Criteria” and are set forth in Figure 3-1 and on page 3-4 of the FRA Manual). This is categorically unacceptable for the following reasons. First, the FRA “Criteria” are entirely inappropriate in quiet rural communities like Acton because they do not designate a project as having a severe noise impact unless it nearly **doubles** the average ambient noise level. This is clearly depicted in Figure 3-1, which shows that existing areas with average noise levels of 50 dBA are not deemed to be severely impacted unless train operations increase the average ambient noise level by nearly 10 dBA (which is a doubling of noise “loudness”<sup>35</sup>). It is neither reasonable nor appropriate for any Lead Agency to conclude that a project will not have a significant noise impact unless it doubles the ambient noise level in a quiet rural area. Second, the FRA “Criteria” are so lenient that they preclude any project from ever being designated as having a “severe” noise impact unless and until the project noise levels exceed the 55 dBA “outdoor activity” noise threshold which interferes with activities and creates annoyance<sup>36</sup>. This fact is clearly revealed by inspection of Figure 3.4-12 in the Draft which shows that noise levels must exceed 55 dBA before they can be considered “severe”. Another example of the inappropriate leniency that is “built into” the FRA “Criteria” is that it precludes projects from being designated as having a “severe” noise impact even if the project causes ambient noise

<sup>33</sup> FRA Manual at 2-7.

<sup>34</sup> According to Figure 2-5 in the FRA Manual, the maximum onset rate that steel wheel trains can achieve is less than 12 dBA/second; the onset rates achieved by Maglev trains are less than 25 dBA/second.

<sup>35</sup> FRA Manual at A-2.

<sup>36</sup> <https://www.epa.gov/archive/epa/about/epa-identifies-noise-levels-affecting-health-and-welfare.html>

Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

levels to exceed the 65 dBA established by HUD as a “normally unacceptable living environment”<sup>37</sup>. This fact is clearly revealed by inspection of Figure 3.4-12 in the Draft which shows that project noise levels can exceed 65 dBA and still not be considered “severe”. The very notion that a project’s noise impacts are not deemed significant unless they interfere with outdoor activities or create annoyance or result in normally unacceptable living environments is fundamentally contrary to CEQA which requires that significance determinations be based on careful judgment, facts, and technical data. Third, a detailed analysis of the FRA “Criteria” was conducted in 2016 which revealed that they are largely based on urban-based studies (such as the infamous “Schultz” curve) and thus do not incorporate research data pertaining to quiet, rural (non-urban) areas like Acton. This analysis was submitted to CHSRA in comments that were provided in 2016 in response to CHSRA’s request for public input; it is included herein as Attachment 3. Importantly, this analysis demonstrates conclusively that the FRA “Criteria” used by the Draft to assess the significance of Project noise impacts may be applicable to urban environments, but they do not reflect the conditions or circumstances in quiet rural areas like Acton. Accordingly, application of FRA “Criteria” to Acton is utterly contrary to CEQA’s holding that criteria used to determine whether an activity will have a significance effect must be appropriate for the setting in which the activity will occur because “an activity which may not be significant in an urban area may be significant in a rural area” [Guidelines 15064(b)(1)]. Fourth, FRA “Criteria” are based on  $L_{dn}$  levels that are calculated average values and represent only “cumulative noise exposure from all events over a 24-hour period”<sup>38</sup>; therefore, the FRA “criteria” are only useful for assessing the cumulative noise effects of a project and cannot be used to assess the direct noise effects of a project. As discussed above, both CEQA and NEPA require a Lead Agency to assess the significance of a Project’s direct effects; this necessarily requires consideration of the “Sound Exposure Level” (“SEL”) that is experienced by a receptor **during** a “passby” event. Furthermore, a new set of criteria must be developed to assess the significance of these direct effects. Such a “direct effect” analysis would require a determination of whether a resident who lives 2,000 feet from, and has an unobstructed view of, the HSR tracks would be “significantly impacted” when he/she experiences an 86 dBA noise insult more than 400 times per day throughout the day and night (which is equivalent to a jack hammer going off 50 feet away<sup>39</sup>). The FRA “Criteria” are not based on the SEL standard and are thus useless for assessing the significance of direct noise effects of a train project. This reveals an additional deficiency in the Draft: not only does the Draft fail to properly evaluate direct noise impacts, it also fails to identify criteria with which to assess the significance of direct noise impacts. Fifth, the methodology established by the FRA Manual and the manner in which it masks the significance of noise events by averaging them over a 24 hour period render them facially deficient for assessing even indirect noise impacts. For instance, there is no question that a train project poses a “significant” noise impact if it forces a resident living 2,000 feet from the tracks to experience an 86 dBA noise insult (equivalent to a jack hammer going off) more

<sup>37</sup> The U.S. Department of Housing and Urban Development has designated the  $L_{dn}$  value of 65 dBA as the noise level above which a normally unacceptable living environment exists. <https://www.hudexchange.info/programs/environmental-review/noise-abatement-and-control/#:~:text=The%20%22Normally%20%22%20noise%20zone,65%20decibels%20to%2075%20decibels>.

<sup>39</sup> [https://ops.flwz.dot.gov/w7/workshops/accessible/schexnayder\\_nazer.htm](https://ops.flwz.dot.gov/w7/workshops/accessible/schexnayder_nazer.htm)

4518-10278

than 460 times throughout the day and night, and any reasonable person would conclude that this impact is indeed “significant”. Yet, this scenario would not even be captured by the FRA methodologies adopted in the Draft because the Draft only considers “receptor sites” within 1,800 feet of the tracks. There are a number of residents in the Acton Valley who live within 2,000 feet of, and will have an unobstructed “line of sight” to, the elevated tracks that will be constructed under the Refined SR14 route, and they will routinely experience 86 dBA noise events if this route is selected; these residents will also experience a Project  $L_{dn}$  value greater than 66 dBA and as such, should be designated as “severely impacted” according to the FRA Manual [Page 3-4]. However, they are not accounted for in the Draft. In fact, according to Figure 3.4-18, the Draft concludes that only Acton residences located within 1,300 feet of the elevated tracks of the Refined SR14 route will experience “severe” noise impacts. Sixth, the FRA methodology for assessing train noise impacts does not represent the *actual* cumulative noise impact that an area will experience as a result of high speed rail operation because the  $L_{dn}$  value it calculates for train noise only considers train noise events and does not incorporate the area’s existing noise profile (in other words, it assumes a zero noise level during the portions of the 24 hour averaging interval when trains are not operating). This is perhaps one of the most egregious deficiencies of the FRA methodology; it isolates train noise events and calculates an  $L_{dn}$  value based solely on train operation and then merely compares this isolated train  $L_{dn}$  value to the existing cumulative noise profile in a community *thus it does not provide any indication of the actual cumulative (existing + project) noise levels that will occur* in an area once train operations begin. The FRA methodology is somewhat analogous to assessing the impacts of a tsunami at a particular location without regard for tidal influences<sup>40</sup>. This is not an ideal analogy because water waves and sound waves behave differently and because tsunamis typically only strike an area once and not 460+ times a day, but it makes the point that the quantification of cumulative noise levels in a community necessarily involves a calculation which *integrates* projected train noise events with existing ambient noise level and does not merely compare projected train noise levels with existing ambient noise levels. The FRA methodology does not achieve this integration; thus, the cumulative train noise  $L_{dn}$  values calculated per the FRA Manual are biased low. Finally, it is noted that the High Speed Rail Project is a California project funded largely by California taxpayers; thus, it is entirely inappropriate to adopt inapplicable federal criteria to assess the impacts of a state project, particularly given that the federal criteria are not representative of, and have no consideration for, the unique rural environments that will be affected by the Project (as discussed above).

Pages 3.4-60 to 3.4-70 concludes that up to 1,900 residences will experience significant noise impacts during Project construction, and that, despite implementation of mitigation measure N&V-MM#1 (which requires the contractor to prepare a noise-monitoring program describing how the contractor will meet the 80 dBA average daytime and 70 dBA average nighttime noise standards) “some receivers may still experience noise that would exceed acceptable limits”. Unfortunately, this analysis substantially underrepresents the number of residences that will experience significant adverse noise impacts from Project construction because the significance threshold is based on a federal standard which (as discussed above) is entirely too lenient to be sufficient for the purposes of CEQA. The Final EIR/EIS must correct this deficiency by adopting CEQA-compliant thresholds for determining significant construction noise impacts and using these revised thresholds to prepare a more accurate “count” of the number of residences that

<sup>40</sup> Tsunamis are much more damaging if they occur during a high tide interval.

Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

will experience significant construction noise impacts; this will necessarily result in the identification of many more residences that will experience significant construction noise impacts. Another concern is that mitigation measure N&V-MM#1 will not protect Acton residents from significant construction noise impacts because it only requires the construction contractor to comply with the (too) lenient federal construction noise standards. In other words, many Acton residents will experience significant construction noise impacts even if the contractor successfully implements N&V-MM#1 and reduces construction noise in compliance with federal noise standards because the federal standards are absurdly lenient. This deficiency must be corrected by adopting more stringent performance standards for mitigation measure N&V-MM#1 which are applicable to areas like Acton.

Pages 3.4-75 to 3.4-76 address startle and annoyance impacts on humans, and assert that human startle impacts will only occur if train onset rates exceed 30 dBA/second; it is concluded that no startle impacts will occur. This conclusion is defective because it is based on criteria taken from the FRA Manual that are at best insupportable and at worst completely implausible (as discussed above). Because the Draft applies inappropriate and implausible thresholds of significance for startle and annoyance impacts and ignores technical studies showing human startle impacts can occur at noise levels as low as 81 dBA and annoyance impacts can occur at noise levels as low as 73 dBA, it improperly concludes that human startle and annoyance impacts are less than significant. The magnitude of this error becomes apparent when one considers that it means an Acton resident who lives half a mile from the tracks will never be annoyed or startled by any Project operations even though the Project will expose the resident to an 85 dBA noise insult more than 460 times per day; such a conclusion is ridiculous and the Draft is substantially defective for even suggesting it. This deficiency must be corrected by adopting reasonable and technically defensible noise thresholds for assessing human startle and annoyance effects and applying these thresholds to projected noise levels to properly quantify the scope and extent of the Project's startle and annoyance impacts.

Pages 3.4-76 to 3.4-106 address the noise impacts of Project operations, and conclude that relatively few residents will experience significant noise impacts resulting from Project operations. This conclusion is defective because it is based on FRA "criteria" that do not comply with CEQA because they do not reflect local conditions or circumstances in rural communities like Acton (as discussed above). This conclusion is also incomplete because it is based on calculated  $L_{dn}$  values that only addresses "cumulative noise exposure" impacts which are perhaps germane for assessing the Project's indirect noise effects but are not appropriate for assessing the Project's direct noise effects. If the Draft had adopted CEQA-compliant noise impact thresholds, the noise analysis would have extended beyond the 1,300 foot boundary that was analyzed in Acton and far more residences would have been properly identified as receptor sites that will experience significant noise impacts. The Draft utterly fails in this regard, and because it substantially underreports the scope and extent of the Project's noise impacts, it violates CEQA. These deficiencies must be corrected by 1) adopting reasonable and technically defensible noise thresholds for assessing direct noise impacts in rural, suburban, and urban environments; and 2) adopting reasonable and technically defensible noise thresholds for assessing indirect noise impacts in rural areas (because the FRA "Criteria" are only applicable to urban areas); and 3) applying these thresholds to projected noise levels to properly quantify the full scope and extent of the Project's direct and indirect noise impacts.

4518-10278

Pages 3.4-80 and 3.4-08 summarize the noise impact result for all the "E" routes in the central section of the Project and simply assert that "no noise impacts on institutional uses (e.g., schools, libraries, theaters, and churches) were identified". These pages give the impression that no residential properties in the central sections of all the "E" routes will be affected by Project noise; however, this impression is incorrect. A number of residences will experience significant noise impacts in the central sections of all the "E" routes and a number of them are in Acton (see Tables 3.4-32 and 3.4-33). These pages should be revised to properly reflect that all the E routes will result in significant noise impacts on non-institutional uses in the central section of the Project.

Page 3.4-144 through 3.4-149 summarize NEPA impacts of the Project. However, the Draft does not comply with NEPA because it fails to provide noise impact assessment methodologies and significance criteria which properly evaluate the direct noise impacts resulting from Project operations; it also relies on deficient and insupportable analyses pertaining to human and animal startle impacts.

Page 3.4-149 through 3.4-151 present CEQA significance conclusions indicating the Project will result in significant noise impacts. However, the Draft underrepresents the scope and extent of the Project's significant noise impacts and it does not comply with CEQA because the Draft:

- Relies on inappropriately lenient federal standards that are not applicable to rural areas for assessing construction noise impacts.
- Relies on inappropriately lenient federal standards that are not applicable to rural areas for assessing cumulative noise impacts resulting from Project operations.
- Fails to provide noise impact assessment methodologies that properly evaluate the direct noise impacts that will result from Project operations.
- Fails to identify appropriate criteria for assessing the significance of the Project's direct noise impacts.
- Adopts unsubstantiated and insupportable criteria for assessing the impacts of Project operations on domestic animals and wildlife
- Adopts unsubstantiated and insupportable criteria for assessing the startle and annoyance impacts of Project operations on humans.

**4.0 ANECDOTAL EVIDENCE DEMONSTRATES THAT  $L_{dn}$  VALUES ARE USELESS FOR ASSESSING SIGNIFICANT NOISE IMPACTS.**

The Town of Acton was founded in the 1880s based on farming, mining and the railroad, so the residents of Acton have extensive experience with adverse noise impacts of rail operations. Because of the unique geography and geology of our community, coupled with a sparse vegetation profile, rail noises reverberate and do not attenuate in Acton. Residents who have no "line of sight" to the tracks are still awakened at 2 AM by rail traffic (even residents who live 2

# Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4518-10278

miles from the tracks; indoor noise measurements taken during these "passby" events are typically 70 dBA). The anecdotal evidence that has been collected from affected Acton residents demonstrates that *adverse rail noise impacts occur when the train is transiting because that is when activity disruption occurs*. The Draft does not address the noise impacts that will occur in Acton during transit of a high speed train; therefore, the Draft fails to address the very circumstances under which the most significant Project noise impacts will occur. Accordingly, the Draft is utterly deficient.

The Draft reports that Acton's baseline  $L_{dn}$  is 60 dBA or less which (according to the FRA manual) means that Acton has no significant noise issues. However, nothing could be further from the truth because sleep disruption and activity interruption are routine occurrences in Acton because significant adverse noise impacts occur *during* rail "passby" events. This fact alone utterly controverts the premise established by the FRA Manual and adopted by the Draft that a 24-hour average noise value is an appropriate indicator of adverse noise impacts; it is not.

Rail operations in Acton have grown steadily over the years, and as a result, adverse noise impacts have also grown steadily; in fact, some residents have even moved because noise impacts have become too burdensome. At the request of residents, and because noise generated during rail "passby" events have become too disruptive, the Acton Town Council began a campaign nearly 10 years ago to have "quiet zones" installed along the rail corridor in Acton. The fact that the Community of Acton is diligently working to have "quiet zones" installed even though  $L_{dn}$  values in the Community are 60 dBA or less is proof positive that  $L_{dn}$  values are, frankly, useless for determining whether rail noise impacts are significant.

### 5.0 CONCLUSION

For the reasons set forth above, the noise analysis results presented in the Draft EIR/EIS prepared for the Palmdale to Burbank section is deficient and does not comply with CEQA or NEPA; these deficiencies must be corrected in the Final EIR/EIS and in particular, defects noted herein must be addressed. Without these corrections, the Final EIR/EIS will not comply with CEQA or NEPA. Alternatively, CHSRA could simply adopt the SR14A Route Alternative and avoid all noise impacts from Project Operations in the Community of Acton.

## ATTACHMENT 1

Noise analysis results for HSR Operations that were prepared in accordance with calculation procedures set forth in Chapter 5 and Appendix C of the FRA Manual and based on the train configuration data provided on Page 3.4-23 of the Draft. These calculations assume 1) The train operates at 220 mph at ground level; 2) the receptor has an unobstructed view of the tracks (no "shielding"); 3) the ground is acoustically "hard" and there is little vegetation; and 4) there is no ground attenuation for trains traveling in the aerodynamic regime.

**ATTACHMENT 2**

Brochure titled "How Do High-Speed Train Noise Levels Compare to Traditional Trains?"

(Source: California High Speed Rail Authority)

**How Do High-Speed Train Noise Levels Compare to Traditional Trains?**

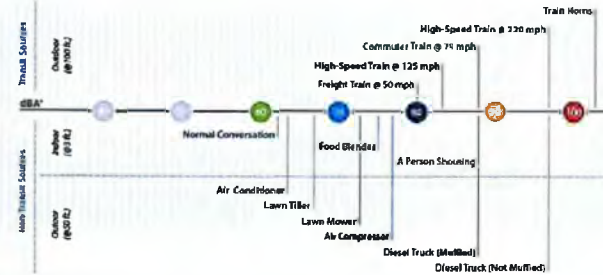

Four major factors make high-speed trains operate at generally quieter levels than conventional passenger and freight rail services.

- 1. Train Speed**  
The duration of noise is brief for high-speed trains when compared to traditional train systems which take longer to pass.
- 2. Electric Trains**  
High-speed trains are powered by an electric propulsion system which, when compared to the more common diesel train engines, generate significantly less noise.
- 3. Auditory Warning Systems**  
Portions of high-speed rail in systems that operate on grade-separated track will not require sounding bells and warning horns that are necessary for traditional at-grade crossings.
- 4. Hours of Operation**  
Unlike some passenger train services and many major freight routes which operate through the night, there will not be any high-speed rail service scheduled between the hours of midnight and 5 a.m. when people are most sensitive to noise.

\*Based on typical train-length and speed capabilities.

**THE SOUND OF HIGH-SPEED TRAIN TRAVEL**  
Typical Maximum Noise Levels Before Mitigation

\*A-weighted decibels (dB(A)) are an expression of the relative loudness of sounds in air as perceived by the human ear.

### ATTACHMENT 3

Excerpts From a Letter Submitted by the Acton Town Council to CHSRA in 2016 Analyzing the Efficacy of FRA “Noise Impact Criteria”.  
(Source: California High Speed Rail Authority)

40

#### FRA’s “Noise Impact Criteria” that will be Used in the Palmdale-Burbank DEIR Fail to Properly Consider Noise Impacts on Rural and other “Non-Urban” Areas.

The HSR “Noise Impact Criteria” which CHSRA intends to implement for the Palmdale-Burbank segment EIR are published in the FRA Manual [Figure 3-1] and they establish three impact categories: “no impact”, “moderate impact”, and “severe impact”. It is understood that CHSRA will not consider project modifications or implement mitigation measures unless HSR noise impacts exceed the “severe” thresholds established by Figure 3-1, therefore, it is necessary to analyze these “severity” thresholds to ensure they properly consider the wide spectrum of existing ambient noise conditions that will be degraded by HSR operations. Because Acton is a relatively quiet rural community that has (on average) low ambient noise levels, the EIR will establish “severe” (aka “significant”) impacts based on what Figure 3-1 identifies as low existing noise exposure levels (reported as 24 hour “average”  $L_{dn}$  noise values) Therefore it is this low noise interval (40-55 dBA) that is considered herein.

First, it is noted that neither CHSRA nor FRA consider it “significant” if the HSR project *triples* the average noise level in a quiet area. This is clearly depicted in Figure 3-1, which shows that a 15 dBA noise increase (or a tripling of noise “loudness”) is not considered a “severe” impact in any quiet area that has an existing average noise level of 43 dBA. Even more surprising, Figure 3-1 establishes that no HSR noise impacts are ever deemed “severe” until they cause outdoor noise to **exceed** the 55 dBA “outdoor activity” protection level established by EPA and others (as discussed in more detail below). In other words, CHSRA and FRA consider it “insignificant” if the outdoor noise environment is degraded to such an extent that it impairs outdoor activities and even speech. Additionally, for rural areas that are currently at the 55 dBA limit for “acceptable” outdoor conditions, Figure 3-1 establishes that no significant degradation occurs even if the noise level increases above 61 dBA (which is higher than what is experienced by most urban dwellers<sup>2</sup>). It is clear that these “Noise Impact Criteria” are not intended to preserve the outdoor environment in quiet communities like Acton. To the contrary, they actively facilitate noise increases to such an extent that they successfully convert quiet rural environments into loud urban environments. To understand why these “Noise Impact Criteria” fail to prevent (or even consider) the degradation of rural outdoor environments, it becomes necessary to study how these criteria were developed.

According to Section A.3 of the FRA Manual, the “Noise Impact Criteria” thresholds were derived from “research” (in the form of the “Schultz Curve” depicted in Figure A-5), EPA findings, and “relevant literature” such as HUD standards and EPA publications. As set forth below, an analysis of these cited references reveals that the

<sup>1</sup> On average, each 10 dBA noise increase doubles the loudness of the noise [FRA Manual page 2-3]. Therefore a 10 dBA increase is generally perceived as doubling the “loudness”, and a 15 dBA increase essentially triples the “loudness.”

<sup>2</sup> See Figure 4 from the EPA “Levels Document” – Condensed version found cited on Page A-13 of the FRA Manual.

41

Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

FRA “Noise Impact Criteria” only reflect circumstances which occur in the urban environment and do not take into account any of the cited research addressing quiet rural (non-urban) areas. In other words, the “research” cited by the FRA Manual *does not support* the application of FRA’s “Noise Impact Criteria” to non-urban areas (like Acton) which have existing ambient noise exposure levels at or below 55 dBA. Indeed, the “research” papers and reports cited in the FRA Manual draw a clear distinction between “significant” noise impacts in “quiet” environments and “significant” noise impacts in “loud” environments. These distinctions are completely obliterated by the FRA “Noise Impact Criteria”, which were derived solely from an “urban platform” and without consideration for the rural environment. These facts are set forth in detail over the following paragraphs, which carefully consider each and every “research” element cited as justification for the FRA “Noise Impact Criteria” in Sections A.2 and A.3 of the FRA Manual.

**The “Schultz Curve”:** The “Schultz Curve” (depicted in Figure A-5) was derived from a technical paper titled “Synthesis of Social Surveys on Annoyance” authored by T.J. Schultz and published in 1978 by the “Journal of the Acoustical Society of America” (“JASA”). The “Schultz Paper” was actually a compilation of 11 urban noise studies that measured human “annoyance” as a function of noise level. It considered noise profiles along urban streets in Paris, London, and elsewhere, and it also considered noise levels in urban areas surrounding airports in England, Switzerland, and various Scandinavian countries. Based on the urban research presented in the Schultz paper, the FRA Manual concludes that “very few people are highly annoyed when the  $L_{dn}$  is 50 dBA” and “an increase in  $L_{dn}$  from 50 to 55 dBA results in an average of 2 percent more people highly annoyed” [See Page A-14; bullet item 3]. These conclusions form the foundation of FRA’s “Noise Impact Criteria” (depicted in Figure 3-1) yet they are entirely unsupported by the Schultz Paper, and are completely erroneous:

- These conclusions are derived from the “low end” of the fitted “Schultz Curve” published in the JASA paper and depicted in Figure A-5 of the FRA Manual. However, the author (T.J. Schultz) himself admits that the “Schultz Curve” does not properly address the data collected “at the low end”, and he suggests various solutions to achieve a better “curve fit” which would (in some cases) be completely arbitrary (see JASA Vol 64 No. 2 page 391). Moreover, Mr. Schultz clearly identifies the 50 dBA  $L_{dn}$  noise level as being “outside the data range” anyway, and he explicitly argues against “extrapolating the fitted curve beyond the range of the given data set” [see page 391, column 1]. Therefore, the author’s own words explicitly contradict FRA’s conclusion that “very few people are highly annoyed when the  $L_{dn}$  is 50 dBA”
- The Schultz paper explicitly demonstrates that more than 10% of urban populations are so significantly disturbed by an average (“ $L_{dn}$ ”) noise level of 55 dBA that it interrupts conversation, disturbs sleep, and interferes with conversation [see Figure 23]. This fact unequivocally controverts FRA’s assertion that “an increase in  $L_{dn}$  from 50 to 55 dBA results in an average of 2 percent more people highly annoyed.” More importantly, there is no doubt that these

substantial adverse impacts on more than 10% of the population constitute a “significant effect on the environment” as that phrase is contemplated in CEQA. Therefore, and according to the Schultz Paper itself, projects which increase ambient noise levels to 55 dBA do indeed create “severe impacts” in every sense of the word. The FRA Manual ignores all of this, and it incorrectly concludes that the Schultz Paper somehow supports a conclusion that increasing noise levels to 55 dBA is not “significant”. This conclusion is abjectly false and is entirely repudiated by very same Schultz “research” that it purports to reflect.

- Figure A-5 shows very clearly that the fitted curve does not accurately represent the data points plotted for noise values below 55 dBA; all but one of the data points lie *well above the curve*. As Figure A-5 shows, four times more people are “highly annoyed” by noise levels approaching 55 dBA than what the “Schultz Curve” predicts. What this means is that the “Schultz Curve” demonstrably under-predicts human “annoyance” at noise levels below 55 dBA and *provides no basis* for FRA’s conclusion that “an increase in  $L_{dn}$  from 50 to 55 dBA results in an average of 2 percent more people highly annoyed”.
- With regard to what constitutes an “acceptable environmental noise exposure”, the Schultz paper explicitly clarifies that achieving and maintaining a Noise Standard of 55 dBA **is the desired condition** [see page 389 column 1]. Under no circumstance does the Schultz paper state (or even suggest) that it is reasonable to exceed the 55 dBA noise standard in areas that already meet the 55 dBA standard, and it certainly does not in any way advocate or support FRA’s contention (embodied in Figure 3-1) that areas which already meet the 55 dBA standard will not be “severely impacted” if ambient noise levels increase significantly and even exceed 61 dBA. Moreover, there is nothing in the Schultz Paper that supports FRA’s contention (reflected in Figure 3-1) that 55 dBA is merely the “lower bound” limit for determining the “significance” of noise impacts; to the contrary, the Schultz Paper affirmatively establishes 55 dBA as the “upper bound” limit for such determinations, and in fact it limits the consideration of increases beyond the 55 dBA standard only in those urban areas where existing conditions already exceed the 55 dBA standard.
- The Schultz Paper is essentially a compilation of urban noise studies addressing the “annoyance” responses of urban residents to different urban noise levels occurring within urban communities (such as Paris, London, Vienna, Copenhagen, Basel, Brussels, and 7 unnamed US cities) and adjacent to large urban airports (such as Heathrow and Munich). The Schultz Paper makes it clear that these studies assessed noise impacts exclusively in the urban environment, and measured human “annoyance” only in urban areas. Therefore, the Schultz Paper is narrowly constrained to consider human noise “reactions” only in urban areas where high noise profiles are already “woven into” the fabric of the community. It does not consider rural environments, and it certainly does not assess human “annoyance” to increased sound levels in essentially quiet areas (like Acton) where ambient  $L_{dn}$  noise levels are less than 50 dBA. The Schultz Paper clearly indicates 1) That its scope is constrained only to urban environments; and 2) That its conclusions regarding increases in “acceptable”

## Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

noise limits beyond 55 dBA ONLY APPLY to urban environments where the 55 dBA noise limit is already exceeded [see page 389]. The FRA Manual **ignores** all of these constraints that are clearly stated in the Schultz paper. Worse yet, the FRA Manual uses the urban data from the Schultz Paper to derive “noise impact criteria” which are applied uniformly to all environments (including rural and wilderness areas). The FRA Manual fails to consider that people living in quiet rural areas respond differently to increased noise levels than people living in urban areas where existing ambient noise levels are already quite high (see for example the “EPA Levels Document” discussed below). Moreover, the FRA Manual fails to cite *any* noise studies that address human noise “annoyance” response in areas where ambient noise levels are 50 dBA or less. Therefore, FRA has absolutely no basis for imposing on rural communities the urban-based “Noise Impact Criteria” that are depicted in Figure 3-1, and it **certainly** lacks any justification for the standard imposed by Figure 3-1 that rural areas with an ambient  $L_{dn}$  noise level of only 43 dBA are not “severely impacted” by a nearly threefold increase in ambient noise to 58 dBA.

- The “annoyance” reactions addressed in the Schultz Paper are demonstrably biased low because (as the paper itself admits) “annoyance” response data were often collected from people located **indoors** who were responding to noise events **outdoors** [page 378] Because these people hardly heard the noise, they provide a “low annoyance” response (which skews the results with a low bias). The Schultz paper found very poor correlation between noise levels and “annoyance” response when the respondents were located indoors with their windows closed. This seems like an obvious thing which should have been accounted for in the studies that were “synthesized” in the Schultz Paper, but apparently it was not. Schultz actually makes the following recommendation: “If one wishes to increase dramatically the correlation between the measured noise and the subjective response of the subjects, one should open the windows so that the official survey microphone and the noise to which the subjects are actually exposed are the same” [page 378]. The author also posits the argument that half of the sample population at each noise exposure who respond below the median may “have simply not heard the noise measured in the survey”. The “biasing” elements of the Schultz study (such as the fact that only indoor annoyance responses were addressed) are even more troubling when they are considered against the urban backdrop where these studies were conducted. Why? Because it renders them even more inapplicable to Acton’s quiet, rural environment where residents spend much of their time “outdoors”. It is flat out **impossible** to infer or predict the extent to which an Acton resident will be “annoyed” by an 85 dBA HSR noise event occurring every 3 minutes based on noise reactions from people sitting indoors who occasionally react to urban street noises outside their windows. Such an idea is absurd, yet, that is precisely what CHSRA and FRA are doing when they assess HSR noise impacts on Acton based on the “Noise Impact Criteria” set forth in Figure 3-1 of the FRA Manual.
- The FRA Manual considers all noise impacts through the “urban lens” of the Schultz Paper, and because it uses this “urban lens” to assess noise impacts on rural areas, it draws conclusions which utterly contradict the Schultz Paper itself.

For instance, the Schultz Paper states categorically that the standard for an “acceptable” environmental noise exposure is 55 dBA ( $L_{dn}$ ), and it does not under any circumstance recommend increasing this 55 dBA “acceptability” limit in any area where it is already met. Yet, **incredibly**, FRA’s “Noise Impact Criteria” deems an increase in ambient noise levels from 55 dBA to 61 dBA to be “insignificant”. In other words, the FRA Manual uses the urban studies considered in the Schultz Paper to shift the “acceptability” baseline from 55 dBA to 61 dBA for all areas (both rural and urban) in a manner that is utterly **contrary** to the foundational principals upon which the entire Schultz Paper is based. Worse yet, the “Noise Impact Criteria” (provided by Figure 3-1 of the FRA Manual and derived from the urban-based Schultz Paper) clearly establish that no area (whether it be a monument, a cemetery, or a wilderness) is considered “severely impacted” by a project unless the project results in ambient noise levels **exceed** the 55 dBA urban baseline!!! Clearly, the “low end of the FRA “Noise Impact Criteria” is utter nonsense because it *contradicts in every way possible* the very same “Schultz paper” that it purports to reflect.

- The Schultz paper designates the 55 dBA noise exposure level as not only an “acceptable” standard, but also a “desirable” standard for areas where existing ambient noise levels do not exceed 55 dBA [see page 389 column 1]. The Schultz Paper also expressly limits its consideration of the circumstances under which the 55 dBA noise standard could be exceeded to only those urban areas where the ambient noise level already exceeds 55 dBA. Yet incredibly, the FRA Manual **flat out ignores** all of Schultz’s research establishing 55 dBA as the acceptable and desirable standard for non-urban areas where ambient noise levels are at or below 55 dBA. Instead, it arbitrarily establishes 61 dBA as the “threshold of significance” for areas that meet the 55 dBA standard, and it declares that project noise levels below this 61 dBA threshold constitute “less than significant” impacts. In other words, the FRA Manual establishes that non-urban areas which already meet the 55 dBA standard (and therefore have an “acceptable environmental noise exposure”) are not “severely impacted” by any project unless noise levels rise above 61 dBA. The FRA “Noise Impact Criteria” essentially turned the Schultz Paper on its head by establishing that projects impacts are not “significant” even if they generate noise levels which exceed Schultz’s “desired and acceptable” 55 dBA standard! Nothing about the Noise Impact Criteria established by the FRA Manual for “quiet” (<55 dBA) areas is supported by the Schultz Paper. Indeed, the manner in which the FRA Manual incrementally increases the “acceptable noise threshold” in areas which meet the 55 dBA standard is entirely inconsistent with, and wholly unsupported by, the very Schultz study it purports to reflect.
- The Schultz Paper was published nearly 40 years ago before “high speed” trains exceeding 180 mph were developed, and it considered historic urban noise profiles predominated by mid- and high-frequency noise sources. It is firmly established that noise profiles of high speed trains traveling in excess of 200 mph differ significantly from slower trains, and that the noise profiles of faster trainsets include substantial low-frequency components [http://www.nic.org/cdrom/2008/11\_werr2008/pdf/S.1.1.4.4.pdf]. The Schultz paper never

## Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

considered low-frequency noise levels introduced into the urban environment by 220 mph HSR trains, and it certainly never accounted for significant low-frequency aerodynamic noise elements introduced by HSR projects into rural areas like Acton. This further repudiates FRA's reliance on the Schulz paper to establish appropriate HSR "Noise Impact Criteria" for rural communities like Acton.

The US EPA "Levels Document" establishes that, to protect the "health and welfare" of farming and residential areas (like Acton) where people spend considerable amounts of time in the outdoors, the average noise levels (both "L<sub>dn</sub>" and "L<sub>eq</sub>") *should remain below 55 dBA* [Table VII in the "EPA Levels Document – Condensed Version" at <https://nepis.epa.gov/>]. This is utterly contradicted by the FRA "noise impact criteria", which *unequivocally* establish that it is "insignificant" if a project causes outdoor noise levels to exceed this 55 dBA "health and welfare" threshold (see FRA Figure 3-1). In fact, Figure 3-1 clearly establishes that FRA deems it acceptable to nearly the double the noise in areas that meet (or nearly meet) EPA's recommended 55 dBA level. Moreover, the FRA "Noise Impact Criteria" also completely ignore the EPA's explicit warning that urban community noise response factors should not be applied to non-urban areas (like Acton) which have a significantly quieter ambient environment [page 21 of "Levels Document" – condensed version]. There is no doubt that applying the urban-based FRA "Noise Impact Criteria" to Acton is utterly contradictory to the EPA's "Levels Document" in every way possible. The only way to render FRA's "Noise Impact Criteria" in a manner that is consistent with the EPA "Levels Document" is to revise the "Severe Impact" curve to intersect the point where the "Existing Noise Level" [x axis] value is 55 dBA and the "Project Noise Exposure" [y axis] is also 55 dBA.

HUD Standards are intended to achieve the goal of providing a suitable living environment. HUD has established that outdoor L<sub>dn</sub> noise levels which exceed 75 dBA provide an unacceptable living environment, and does not authorize HUD development in such areas. HUD has also established that outdoor L<sub>dn</sub> noise levels which exceed 65 dBA provide a *normally* unacceptable living environment, and requires that all new HUD construction in such areas include noise attenuation features to mitigate outdoor noise impacts. Yet, in a number of scenarios, the FRA "Noise Impact Criteria" do not consider project impacts to be "significant" even when they increase noise levels beyond the 65 dBA HUD threshold<sup>3</sup>. In fact, the FRA "Noise Impact Criteria" do not even consider the noise degradation impacts of HSR operation until the ambient noise level is 68 dBA as evidenced by Figure 3-1 (which deems moderate noise increases to be "insignificant" up until existing noise levels reach 68 dBA.) For all these reasons it is clear that FRA's "Noise Impact Criteria" are patently inconsistent with adopted HUD standards.

<sup>3</sup> As clearly shown in Table 3-1 of the FRA Manual, an area with an existing average ambient noise level of 64 is not deemed significantly impacted until the average noise level exceeds 65.5 dBA, and an area with an average noise level of 65 dBA is not deemed significantly impacted until the project noise increase exceeds 66 dBA.

**CHABA Guidelines:** Address the "Health and Welfare" effects of noise in *urban and suburban* environments [page 33 paragraph 2 accessed via <https://nepis.epa.gov/>]. Regarding the "Health and Welfare" effects of noise on *urban/suburban* areas, the CHABA Guidelines advocate a "single indicator" method (page 34 para 2) that is based on the "Schultz Curve", and calculated based on the 1978 Schultz Paper [Page 37 equation 2a]. The "Single Indicator" method recommended by the CHABA Guidelines for urban/suburban environmental is clearly embodied in the FRA "Noise Impact Criteria". **However**, the CHABA Guidelines *do not recommend* the use of the "single indicator" method for assessing noise impacts on rural areas (see page 64 paragraph 2) or where "environmental degradation" can occur due to new noise sources being introduced in quiet areas (like Acton). In fact, the CHABA Guidelines clearly draw a "bright line" distinction between the assessment of noise impacts on urban/suburban areas (addressed in Section 2.2) and the assessment of noise impacts on rural and other areas that will experience "environmental degradation" due to project noise impacts (addressed in Section 2.4). CHSRA *completely ignores this distinction*, and it blindly applies the "single indicator" method to **all** environments by slapping the urban-based "Noise Impact Criteria" depicted in Figure 3-1 onto every single impact assessment that it prepares. For instance, CHSRA does not consider a serenely quiet areas with an existing ambient noise level of only 43 dBA to be "significantly impacted" by a project even if the average noise level is tripled! Equally important, the CHABA Guidelines explicitly identify the 55 dBA threshold as the "point of significant adverse noise effects" (page 31 paragraph 1). **This assertion is completely ignored by the FRA Manual**, which establishes that "significant adverse noise effects" do not occur until noise levels substantially **exceed 55 dBA** [Table 3-1]. There is no doubt that the FRA "Noise Impact Criteria" fail to comport with the CHABA Guidelines and in fact they explicitly contradict these guidelines in the manner in which they address "Environmental Degradation" and noise impacts on quiet rural areas like Acton.

**DOT Report No UMTA-MA-06-0099-79-3:** This document is cited in footnote 74 of the FRA Manual, and it considers urban noise impacts of conventional trainsets traveling through urban and suburban Paris and London, and slightly faster trainsets (126 mph) traveling through various Japanese communities. The urban study portions of this DOT report are not particularly relevant to the matters raised herein (which consider only impacts on rural areas). However, the portions of the DOT report that address the Japanese study are perhaps relevant because they appear to consider receptors outside of an urban environment. The DOT report notes that the receptor "annoyance" is driven by 2 independent factors: the peak noise exposure (SEL) and the train frequency (trips per day). According to the DOT report, the Japanese study indicates that high annoyance occurs even with relatively slow (126 mph) trains and at relatively low peak (SEL) sound levels (less than 75 dBA as shown in Table 1). These results demonstrate that high annoyance will occur at receptors located more than 11,000 feet (or 2 miles) from a 220 mph train traveling on flat ground at grade in areas (like Acton) where there is little ground attenuation and receptors have a "direct line of site" to the HSR tracks (see attached calculation sheet marked Exhibit A). The Japanese data also shows that "startle" occurs even with slow (126 mph) trains and at peak sound levels (SEL) as low as 80 dBA [see Table 1]. These results demonstrate that human "startle" reactions will occur at receptors located more than 5000 feet from a 220 mph train traveling on flat

## Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

ground at grade in areas (like Acton) where there is little ground attenuation and most receptors will have a “direct line of site” to the HSR tracks (see attached calculation sheet marked Exhibit B). Remarkably, none of this information is reflected *anywhere* in the FRA Manual. To the contrary, the FRA Manual categorically refuses to consider receptor noise impacts based on peak (SEL) noise levels, and instead considers only 24 hour “average” (L<sub>avg</sub>) noise levels (see Sections 3, 4 and 5 of the FRA Manual). The FRA Manual also refuses to acknowledge that “startle” effects can and will occur on receptors located more than 50 feet from a high speed train traveling at 220 mph (see Figure 4-2).

**Other Publications:** The FRA Manual cites two additional studies as justification for the “Noise Impact Criteria” that it adopts. One study is a 1991 paper that “updates” the original Schultz paper published in 1978 by the JASA, and the other is a “French High Speed Rail Noise Survey” of the TGV-Atlantique line published in 1993. The latter does not consider noise impacts of train speeds that exceed 180 mph, and merely points out that nighttime noise impacts should be factored into any “noise impact criteria” that are developed. This is not in dispute; therefore, the “French High Speed Rail Noise Survey” is not addressed further. However, the “Shultz Update” paper is foundationally important, and is therefore addressed in detail here. The “Schultz Update” considers 15 additional urban noise studies, and combines data from these additional urban noise studies with the urban noise data presented in the original “Schultz Paper” published in 1978. Like the original “Schultz Paper”, the “Schultz Update” Paper focusses exclusively on urban noise profiles, and it does not controvert any of the points addressed in the “bullet item” discussion presented above. However, the “Schultz Update” Paper does call into substantial question whether the “Original Schultz Curve” accurately represents “annoyance” response at noise levels below 60 dBA. First, the “Schultz Update” paper clarifies that, when a “Revised Schultz Curve” is fitted to the new data, it reveals that “annoyance” on the low-end of the noise range (below 60 dBA) is significantly higher than what was predicted by the “Original Schultz Curve” [see page 229 column 2]. For instance, it is noted that annoyance levels at a 57.5 dBA noise level are nearly twice as high as what is predicted by the “Original Schultz Curve” [See Figure 14]. The “Schultz Update” paper also includes a “95% confidence interval” analysis of the combined datasets [plotted in Figure 15] and the “annoyance response” [tabulated in Table III]. These “95% confidence interval” analyses reveal “considerable uncertainty” regarding “percentages of respondents highly annoyed” [page 231 column 2]. The “Schultz Update” paper does not attempt to reconcile the differences between the “Original Schultz Curve” and the “Revised Schultz Curve”; to the contrary, the “Schultz Update” Paper states categorically that these curves are “simply convenient data fitting functions, devoid of physical meaning” [page 233]. This statement is *simply extraordinary*, given the extent to which FRA and CHSRA have relied on the “Schultz Curve” to determine whether or not California citizens are “severely impacted” by the HSR Project. Not only does the “Schultz Update” Paper abjectly confirm each and every criticism levied previously herein (see the “bullet item” discussion above); but it also invalidates the FRA “Noise Impact Criteria” because it relegates the “Schultz Curve” upon which these criteria are based to nothing more than a “data fitted function” that is “devoid of meaning”! Above all, the “Schultz Update” Paper demonstrates that, in the ambient noise range applicable to quiet rural areas like Acton (<55 dBA) actual human “annoyance” response levels are *significantly higher* than what is predicted by the

urban-based “Schultz Curve”. The exceedingly high “error margin” embodied in the “Schultz Curve” at low ambient noise levels proves beyond the shadow of a doubt that the “Schultz Curve” is entirely unreliable in this “low noise” regime, and that both FRA and CHSRA grievously err in their reliance on the “Schultz Curve” to establish “noise impact criteria” for quiet rural areas like Acton.

All of the shortcomings of FRA’s adopted urban-based “Noise Impact Criteria” can only be corrected by developing Non-Urban “Noise Impact Criteria” based on “annoyance” studies conducted in areas that have ambient noise conditions below 60 dBA. Neither FRA nor CHSRA have taken these simple steps to ensure appropriate noise impact criteria are relied upon in the Palmdale-Burbank Segment EIR. Instead, they intend to (wrongly) apply the urban-based noise impact criteria established in Figure 3-1 of the FRA manual; thereby providing fertile ground for any number of successful CEQA and NEPA lawsuits.

#### FRA’s HSR “Noise Exposure Assessment” Methodology Fails to Correctly Address Rural Community Noise Impacts

To truly understand the extent to which FRA’s high speed rail “noise exposure” assessment methodology fails to properly address rural “community impacts”, it is useful to look at the results derived from FRA’s methodology through the lens of FRA’s “Noise Impact Criteria” set forth in Figure 3-1 of the FRA Manual. This is accomplished by a “scenario” analysis which considers various HSR operations in different “quiet” zones within a rural community like Acton:

**Scenario 1: Existing noise levels is 56 dBA:** A relatively quiet residential area that has an existing average (“L<sub>avg</sub>”) noise level of 56 dBA and is nearly a mile from the train with a “line of sight” view of the tracks will experience an 82 dBA noise event every 2.7 minutes starting at 6 AM according to CHSRA’s proposed operating schedule (Exhibit B). To be clear, an 82 dBA noise event is equivalent to a metro train traveling at 50 mph just 50 feet away. Nonetheless, according to the FRA “Noise Exposure Assessment” methodology, this noise impact is not deemed “significant”. The notion that a project does not pose “significant adverse impacts” on a quiet residential area when it clearly introduces noise levels equivalent to a metro train running by at least three minutes is **absurd on its face**. Yet, that is precisely what FRA’s methodology and “Noise Impact Criteria” conclude.

**Scenario 2: Existing noise levels is 50 dBA:** A very quiet residential area that has an existing average noise level of 50 dBA and is nearly two miles from the HSR train with a “line of sight” view of the tracks will experience a 79 dBA noise event every 2.7 minutes starting at 6 AM (Exhibit D). Though a 79 dBA noise event is louder than a blender operating just 3 feet away, the FRA’s “Noise Exposure Assessment” methodology does not deem this impact to be “significant”. The notion that a project does not pose a

# Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

“significant adverse impact” on a very quiet residential area when it continually introduces noise levels equivalent to a kitchen blender is **absurd on its face**. Yet, that is precisely what FRA’s methodology concludes.

**Scenario 3: Existing noise levels is 45 dBA:** A serenely quiet residential area that has an existing average noise level of 45 dBA and is more than 3 miles from the HSR with a “line of sight” view of the tracks train will experience 77 dBA noise events every 2.7 minutes starting at 6 AM (Exhibit E). A 77 dBA noise event is louder than a kitchen blender, yet this is not deemed to pose any noise impact on this serenely quiet area. The notion that a project does not pose a significant impact on such a quiet place when it clearly introduces noises that are louder than a kitchen blender on at least once every 3 minutes is **absurd on its face**. Yet, that is precisely what FRA’s methodology and “Noise Impact Criteria” conclude.

### **CHSRA has not Developed Technically Credible or Legally Defensible “Noise Impact Criteria” for Assessing HSR Impacts on Animals**

The community of Acton is an equestrian community, but it is also a community that is home to a wide assortment of animal facilities and rescue operations. Animals that are cared for and housed in Acton facilities include llamas, emus, lions, cattle, pigs, ducks, cats, sheep, tigers, dogs, goats, chickens, turkeys, geese, doves, rabbits and donkeys. ALL of the proposed HSR alignments in Acton travel above ground through and over such facilities, and will generate significant low- and mid- frequency sound levels exceeding 100 dBA outside of the HSR “right of way” areas. CHSRA’s treatment of noise impacts across this wide spectrum of animal types is the same: no significant noise impacts are deemed to occur if the noise level in the vicinity of any animal is less than 100 dBA. CHSRA has absolutely no data to support this 100 dBA “animal impact criteria”; as FRA points out: “There are no established criteria relating high-speed train noise and animal behavior” [page 3-2 of the FRA Manual]. In fact, tabulated data provided by the FRA Manual clearly show that animal “disturbance” response thresholds can be as low as 77 dBA [Table A-1 in the FRA Manual]. What is most remarkable is that CHSRA has relied on this “interim” threshold for more than 8 years and has employed it *in every single project EIR/EIS that it has certified*, and in all that time, it has never done any studies or taken any steps to establish the efficacy or assess the reasonableness of this assumption. For all intents and purposes, CHSRA has implemented this “interim” threshold as if it had the full weight and authority of a formally adopted standard, and it has done so with impunity and without regard for whether it is reasonable or appropriate. *This is not acceptable for the Community of Acton, where noise levels exceeding 90 dBA will occur more than 600 feet from the tracks.* Prior to commencing any noise assessment of the Acton area, CHSRA must develop reasoned and defensible “animal response” thresholds that properly address the wide range of animals that call Acton “home”.

The Community of Acton is also home to a number of wild animals (both large and small), and it is the primary linkage between the Sierra Pelona range and the San Gabriel Mountains. Acton’s large wildlife includes mountain lions, coyotes, deer, bobcats, and raptors such as red tailed and cooper’s hawks. Acton is also home to a number of protected species such as the red legged frog and the San Diego coast horned lizard. ALL of the proposed HSR alignments in Acton travel above ground through and over habitat where these species are found, and all of the proposed alignments will create low frequency sound levels exceeding 100 dBA outside the HSR track “right of way”. CHSRA has established a 100 dBA “interim” threshold to evaluate wildlife noise impacts, and has implemented this “interim” threshold for more than 8 years. In all that time, it had never conducted any studies to determine whether it reasonably represents an appropriate noise response indicator for the wide spectrum of wildlife that are present in all of the HSR corridors in Acton. In other words, CHSRA utterly lacks the information necessary to establish the technical credibility or legal sufficiency of this 100 dBA “interim” wildlife impact criteria, therefore it has no basis for relying on this “interim” criteria for assessing wildlife impacts in Acton.

### **CHSRA and FRA are Required to Provide Noise Contour Maps (or Equivalent) of Predicted Sound Exposure Levels in Acton.**

CHSRA’s “Environmental Methodology Guidelines” state (on page 3.4-14) that the EIR “shall conform to the requirements and topics set forth in Section 11.1 (The Technical Report on Noise and Vibration) and Section 11.1.1 (Organization of Technical Report) of the FRA 2012 guidance manual”. Section 11.1.1 of the FRA Manual specifies that the computed noise levels predicted by the noise assessment model must be “tabulated AND illustrated by contours, cross sections, or shaded mapping” [page 11-2]. Despite these clearly stated reporting requirements, neither FRA nor CHSRA have ever provided any noise level illustrations in any of the HSR EIR/EIS documents certified to date. At most, CHSRA has reported a “range of noise levels” applicable to an entire segment, and it has mapped points of “severe” impact and “less than severe” impact without indicating any actual noise levels. Because of this, the public has been unable to analyze CHSRA’s calculated results to confirm their accuracy or completeness. *This is unacceptable.* The DEIR/DEIS that is issued by FRA and CHSRA for the Palmdale Burbank segment must comply with CHSRA’s and FRA’s reporting standards, and include noise contour (or equivalent) illustrations which clearly establish the peak noise levels that Acton residents are projected to experience with and without mitigation. Consistent with DOT’s *Railroad Noise Emission Compliance Regulations*, these illustrations must depict noise levels extending from the 100+ dBA level occurring at the HSR track right-of-way out to either the 73 dBA noise level (if  $L_{max(1st)}$  data are plotted), or out to 73 dBA (if  $L_{max(10w)}$  data are plotted).

## Submission 4518 (Don Henry, Acton Town Council, December 1, 2022) - Continued

Moreover, both CEQA and NEPA demand that actual noise projections be provided in the DEIR/DEIS because both require the environmental document to clearly identify the “effects” of a project on the environment<sup>6</sup> And, both CEQA and NEPA define “effects” to include “direct effects” which “are caused by the project and occur at the same time and place<sup>7</sup>” In other words, the only way that CHSRA and FRA can comply with CEQA and NEPA regulations is to include in the DEIR/DEIS the peak noise levels that will be created within Acton at the time that the HSR passes through Acton. These state- and federally-imposed requirements are not met by simply plotting “L<sub>dn</sub>” values because “L<sub>dn</sub>” values merely reflect “bulk” noise levels averaged over a 24 hour period; they do not in any way reflect actual noise levels occurring “at the time and place” of an HSR passby event. This has been pointed out time and again in writing and verbally at public meetings and stakeholder meetings with CHSRA and FRA staff. It is now pointed out again with this submittal and in a manner which makes clear that all administrative remedies regarding this issue have been exhausted.

**ANALYSIS OF THE "PUBLIC UTILITIES AND ENERGY" SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT.**

**1.0 INTRODUCTION**

The utilities and energy impact assessment presented in Chapter 3.6 of the Draft Environmental Impact Report/Environmental Impact Statement (hereafter referred to as "the Draft") that was prepared by California High Speed Rail Authority ("CHSRA") and the Federal Railway Administration ("FRA") for the Palmdale-Burbank Segment of the High Speed Rail Project ("Project") has been evaluated and numerous material deficiencies, factual errors and other substantial insufficiencies have been identified. These deficiencies, errors, and insufficiencies are set forth in the comments provided below; they demonstrate that the Draft does not comply with either the California Environmental Quality Act ("CEQA") or the National Environmental Protection Act ("NEPA"). Please note: These comments were prepared by a competent engineer with more than 35 years of environmental engineering experience and they present expert opinion supported by fact pertaining to the significant environmental effects that will be caused by the Project and which must be mitigated. Accordingly, the comments provided herein constitute "substantial evidence" as that term is defined by the CEQA Statute [California Public Resources Code §21080(e)(1)] and Guidelines [California Code of Regulations Section 15064(f)(5)]. These comments also demonstrate that CHSRA/FRA have failed to conduct a substantive 'hard look' review of the Project's environmental impacts as required by NEPA.

**2.0 MAJOR DEFICIENCIES NOTED IN THE DRAFT**

**2.1 The Draft Fails to Properly Account for Project Water Sources and Water Supply.**

All of the alternative routes proposed for the Project will involve extensive tunnel construction and require significant volumes of water to cool the drill heads, transport "spoils", and maintain necessary equipment operations. Construction at each tunnel portal will require two Tunnel Boring Machines ("TBMs") operating in parallel to produce the twin tunnels that are necessary to accommodate the 462 train trips per day that are projected to occur between Palmdale and Burbank<sup>1</sup>, and according to Page 3.6-78 of the Draft, each TBM will require 366 acre-feet per year (approximately 1 acre-foot per day). The SR14A and Refined SR14 route alternatives will involve four TBMs operating simultaneously in Acton and Agua Dulce and all the "E-Route" alternatives will involve two TBMs operating simultaneously from Acton<sup>2</sup>; accordingly, Project water demand during construction in Acton and Agua Dulce will be at least 732 acre-feet per year, and could be as much as 1,464 acre-feet per year. Both NEPA and CEQA

<sup>1</sup> Page 3.4-23 states (with emphasis added) "For the Palmdale to Burbank Project Section, it is assumed that there would be 189 trains per day in each direction during the daytime hours (7:00 a.m. to 10:00 p.m.), 28 trains per day in each direction during the nighttime hours (10:00 p.m. to 7:00 a.m.), and 14 trains in each direction during the peak hours"; these data indicate that 231 daily train trips are projected to occur in each direction. Therefore, the Project will result in 462 train trips through Acton each day.

<sup>2</sup> The SR14A alternative and the Refined SR14 alternative will have two TBMS drilling from Acton towards Palmdale and two TBMs drilling from Agua Dulce towards Acton; all the "E-Route" alternatives will have two TBMs drilling from Acton towards Burbank.

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4519-10279

require that CHSRA properly account for all the water resources needed for the Project and address the environmental impacts resulting from obtaining these water resources and distributing them throughout the project area; unfortunately, the Draft does not meet this requirement.

**2.1.1 The Draft Incorrectly Presumes that Sufficient Water Resources will be Available from the State Water Project for Tunnel Construction in Acton and Agua Dulce.**

Table 3.6-21 of the Draft asserts that project construction on the Central section (where the Communities of Acton and Agua Dulce are located) will rely on water resources supplied by the Antelope Valley-East Kern Water Agency ("AVEK") and according to Table 3.6-10, AVEK obtains water allocations from the State Water Project ("SWP") to serve an average annual water demand of 56,400 acre-feet per year. Additionally, Table 3.6-21 asserts that AVEK can supply its customers with 46,750 acre-feet of water under "Single Dry Year" circumstances and 74,350 acre-feet under "Multiple Dry Year" circumstances; these data suggest that it is reasonable to infer that AVEK is capable of supplying all the water required for project construction activities in Acton and Agua Dulce. However, the data presented in Tables 3.6-10 and 3.6-21 are incorrect; in fact, for the last several years, AVEK has only received 7,242 acre feet per year from the SWP, which is only 5% of the allocation it is supposed to receive<sup>3</sup>. Furthermore, the meager allocation that AVEK receives each year is already largely subscribed by the hundreds of thousands of customers in East Kern County and North Los Angeles County that AVEK already serves. In other words, the AVEK water resources which the Draft asserts will be available for Project construction do not actually exist and, contrary to what is presumed in Tables 3.6-10 and 3.6-21, AVEK does not demonstrably have the water resource capacity required to supply the nearly 1,500 acre-feet per year needed to construct the preferred SR14A Alternative.

Page 3.6-77 presents conclusions regarding water supply impacts created by the Project which suggest that CHSRA appears to understand that AVEK does not reliably receive water allocations from the SWP and that AVEK may not have water resources that are sufficient to serve CHSRA's construction needs (particularly during "dry years") because it states "the impact from construction water demand is conservatively assumed to result in a significant impact under CEQA". Unfortunately, the mitigation measure that addresses this significant impact (which is referred to as PUE MM#1 and merely consists of developing a plan after the Project is approved and securing additional water allocations from water agencies<sup>4</sup>) is completely infeasible and therefore deficient. For instance, SWP allocations are restricted by State Law and are based on extant environmental circumstances in the Sacramento Delta; thus, it is impossible for CHSRA to unilaterally obtain additional water supply allocations from the SWP. PUE MM#1

<sup>3</sup> <https://www.avek.org/dwr-announces-5-allocation-for-swp-contractors>. AVEK does not have higher water allocations during "Multiple Dry Years" than "Single Dry Year"; Department of Water Resources cuts water allocations with successive "Dry Years". Accordingly, Table 3.6-21 can be accorded no weight.

<sup>4</sup> PUE MM#1 states "The Authority will prepare an updated water supply analysis for the selected Build Alternative that identifies the detailed water supply needs for construction. Based on the results of this water supply analysis, the Authority would coordinate with relevant water agencies to determine if allocations for additional water supply are needed for construction. In the event that additional water supply is needed from the State Water Project, the Authority shall pay the water agencies its fair share of the State Water Project fees (per acre-foot of their allocations), which are used for constructing and operating the State Water Project conveyance facilities. In addition, the Authority will be required to utilize non-potable water during construction, to the extent feasible." (Page 3.6-90).

2

4519-10279

also presumes without basis that the SWP has excess water resources which will be made immediately available to CHSRA upon request, when in fact nothing could be further from the truth. In other words, CHSRA cannot purchase water allocations that do not exist. Moreover, if CHSRA uses some sort of preemptive power to force water agencies to sell water which is intended for residential and municipal purposes, this will produce profound water shortages on the communities that have had their water "co-opted" for Project construction purposes. In short, implementing mitigation measure PUE-MM#1 by compelling AVEK to provide water for Project construction will result in significant environmental impacts on the municipal water customers who will have their water service cut by AVEK; these impacts are completely ignored by the Draft, therefore PUE-MM#1 is deficient and does not comply with CEQA or NEPA.

PUE-MM#1 also establishes that CHSRA will be **required** to utilize non-potable water for tunnel construction "to the extent feasible"; this means that AVEK water will not be used for tunnel construction in Acton and Agua Dulce. The Draft fails to explain the contradictions this mitigation measure contains (stating on the one hand that AVEK water will be used, and on the other, that groundwater will be used). It also does not describe what these non-potable water sources are and it certainly provides no indication of what factors will be considered in determining the "feasibility" of using non-potable water resources. Non-potable water generally comes from two sources: partially treated municipal (sewage) wastewater or untreated groundwater extracted from local groundwater basins. If the former is used for tunnel construction, it will result in the direct injection of partially treated sewage water into the ground where it will contaminate (and thus have significant adverse impacts on) all the aquifers, perched water, and other groundwater resources that the tunnel passes through. The Draft is substantially deficient because it fails to address the significant environmental impacts that this would have on local groundwater quality and the rural residents with residential wells who rely on these groundwater resources for drinking water. Notably, there are no municipal wastewater facilities located in Acton or Agua Dulce or anywhere else in the vicinity of the 20+ mile long HSR routes proposed between Palmdale and Santa Clarita; so, there are no sources of partially treated municipal wastewater available for most of the Central section of the Project. Accordingly, it can only be concluded that local groundwater resources will be tapped to supply the non-potable water that is referenced in PUE-MM#1 for tunnel construction in Acton and Agua Dulce; this will involve constructing new groundwater extraction facilities and increasing groundwater extraction rates in the communities of Acton and Agua Dulce which, as discussed below, will introduce new and significant stresses on local groundwater supplies and directly affect well yields in rural communities where residents rely on individual domestic wells. Moreover, the groundwater quality in certain areas of Acton and Agua Dulce is highly variable and several areas experience high nitrate and arsenic levels which exceed adopted water quality standards<sup>5</sup>; if groundwater containing high nitrate or arsenic levels is utilized for tunnel construction, then nitrate contamination will occur in all the aquifers, perched water, and other groundwater resources through which the tunnels pass. Furthermore, using local groundwater resources to construct the E1, E1A, E2, and E2A routes at the "window" proposed on property owned by The Nature Conservancy in Soledad Canyon will have a profound effect on riparian

<sup>5</sup> Nitrate concentrations extracted from local municipal wells in Acton are reported in Attachment 1. Also, arsenic is found in Agua Dulce groundwater (in fact, "Agua Dulce" or "sweet water" in Spanish is an historic term for water contaminated with arsenic. A study conducted by the Los Angeles County Health Department indicates many wells in Agua Dulce have detectable levels of arsenic and in some wells, the presence of Arsenic exceeds the MCL of 10 ppb [<http://file.lacounty.gov/SDSinter/box/supdocs/65110.pdf>].

3

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4519-10279

habitat and vernal pools in the Santa Clara River. In other words, mitigation measure MM PUF.#1 is both impractical and infeasible because it 1) Relies on AVEK water resources that do not exist; and 2) it will result in significantly adverse environmental impacts to local groundwater levels, groundwater quality, and rural drinking water resources. Moreover, none of these impacts are even mentioned in the Draft and they are certainly not addressed as required by CEQA and NEPA. The only way to avoid these impacts is to adopt a mitigation measure which asserts that Project construction will not rely on local groundwater resources and that tunneling will only be conducted using AVEK water resources during years when AVEK has water allocations which exceed their customer demand.

*2.1.2 The "Utilities Relocation Plans" Provided by the Draft Contradicts the Draft's Claim that AVEK Water Will be Used for Tunnel Construction in Acton and Agua Dulce.*

The intention expressed in Table 3.6-21 that construction on the Central section of the Project (where the Communities of Acton and Agua Dulce are located) will rely on AVEK water resources is utterly controverted by the "Utility Relocation Plans" presented in Volume 3 of the Draft which clearly demonstrate that CHSRA does not intend to utilize AVEK's water resources for constructing the central portion of the Project. Specifically, the "Utility Relocation Plans" definitively establish that CHSRA does not plan to connect to any AVEK facilities; they further indicate that local groundwater resources will be used for constructing all the Route Alternatives in Acton and Agua Dulce. For instance, Sheet UT-C4024-14A and Sheets UT-C4066-14A through UT-C4068-14A of the "Utility Relocation Plan" indicate that the water line serving the "Acton Window" construction site for the SR14A Alternative will originate in downtown Acton near an existing small waterline operated by Waterworks District 37 that connects to a local municipal well in the floodplain; there is no AVEK connection in downtown Acton. In fact, the nearest AVEK connection is located approximately 5 miles northwest of downtown Acton, and according to Sheet UT-C4013-14A, CHSRA does not intend to construct any water connections at that location. Similarly, Sheet UT-C4039-14A and Sheets UT-C4084-14A through UT-C4088-14A demonstrate that the water line that will serve the TBMs operating from the portal east of Agua Dulce Canyon Road to construct the SR14A and Refined SR14 Route alternatives will not connect to AVEK either; instead, the water line originates in the middle of Agua Dulce along Escondido Canyon Road. Sheets UT-C4031-E2, UT-C4032-E2, and UT-C4543-E2 through UT-C4547-E2 demonstrate that the water that will be used to operate the TBMs at the "Arrastre Canyon Window" location in South Acton for constructing all the "E" Route Alternatives will not come from AVEK either; instead, CHSRA will construct two new 16 inch water lines that originate at a location adjacent to the Santa Clara River floodplain near the intersection of Crown Valley Road and Arrastre Canyon Road where Waterworks District 37 has a small 12 inch water line that connects to a local municipal well to serve its customers. In other words, all of the "Utility Relocation Plans" presented in the Draft demonstrate that project tunneling and construction in Acton and Agua Dulce will rely on local groundwater resources either directly (by extracting water from the local basin) or indirectly (by connecting to Waterworks District 37 facilities that extract water from the local basin); this blatantly contradicts all the assurances provided in Section 3.6 that AVEK water resources will be used for tunnel construction in Acton and Agua Dulce. These contradictions provide abundant basis for legal challenge. It is not clear why Section 3.6 of the EIR/EIS substantially misrepresents material facts regarding the water resources that will be used for Project construction; the subterfuge is far too substantial to be a mere error. What is certain is that, the Draft neatly sidesteps the obligation imposed by CEQA and NEPA to assess potential environmental impacts

4519-10279

on local groundwater quality, groundwater basins, and riparian habitat by declaring that Project construction along the Central section will rely on AVEK resources. This deception is unacceptable and substantial revisions are required to bring the Draft into compliance with CEQA and NEPA; the revisions must properly address the following significant environmental impacts that will result from using local groundwater for tunnel construction in Acton and Agua Dulce:

*Impacts to groundwater levels:* Many domestic well yields in Acton and Agua Dulce have been reduced over the last few years because of persistent drought conditions, thus extracting an additional 1,500 acre feet per year from local basins will further exacerbate these problems. This constitutes a significant environmental impact on all residents of Acton who rely on domestic residential wells for drinking water. The most recent complete hydrology study of the Acton groundwater basin is provided in Attachment 2 and is referred to hereafter as the "Slade Report"; it was conducted decades ago and thus does not reflect the severe drought conditions that Acton has experienced since 2008. According to the Slade Report, during years when precipitation occurs, the Acton drainage area can provide a groundwater recharge rate of 5,200 acre-feet per year or more. Unfortunately however, much of this groundwater recharge is already fully subscribed. For instance, and as indicated in Attachment 3: Waterworks District 37 has historically extracted up to 2,000 Acre-feet per year; it has also informed the community that it wishes to extract an additional 1,000 acre-feet per year. Our local water hauling businesses that supply drinking water to residents who have dry or inoperable wells extract approximately 400 acre-feet per year<sup>6</sup>. According to data obtained from the Los Angeles Regional Water Quality Control Board, the local "1000 Trails Campground" extracted approximately 400 acre-feet during 2020 when it was operating at only 25% because of COVID; at full operation, this campground (which is authorized to accommodate more than 10,000 campers<sup>7</sup>) will easily extract more than 1,200 acre-feet per year. Several thousand Acton residents rely on private domestic well that also pull from the Acton groundwater basin; these users are estimated to extract an additional 1,000 acre-feet per year. In total, these existing users in Acton's groundwater basin already use at least 5,100 acre-feet per year (2,000 from WWD37, 400 from the water haulers, 1200 from "1000 Trails" and 1,000 from domestic residential wells); thus, there is little excess capacity in the local groundwater basin to serve the Project's construction needs even during years when precipitation occurs. These statistics clearly demonstrate that there will be insufficient groundwater available to sustainably provide the water resources required for tunnel construction in Acton even during years when precipitation occurs; they also demonstrate that, under the drought conditions that Los Angeles County has experienced for the last 10 years<sup>8</sup>, there is not even sufficient groundwater recharge to sustain existing uses. Accordingly, if the Project that CHSRA advances does rely on groundwater extraction to support tunnel construction in Acton and Agua Dulce, the EIR/EIS must be revised to include 1) a complete and accurate hydrology study of the Acton basin and

<sup>6</sup> The Conditional Use Permits ("CUPs") Issued to the Acton Water Company and the Lunde Water Company in 2021 limit each water hauler's extraction rate to 133 acre-feet per year. The Carson Water Company CUP is still pending, but it is assumed that it will also be limited to 133 acre-feet per year. Thus, the water haulers are presumed to collectively extract no more than 399 acre-feet per year from Acton.

<sup>7</sup> The CUP issued for the "1000 Trails" Campground authorizes more than 1,100 campsites and permits 10 campers per site.

<sup>8</sup> See the "U.S. Drought Monitor Map" for Los Angeles County provided in Attachment 4.

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4519-10279

the Agua Dulce basin that is based on projected drought conditions resulting from climate change and accounts for all existing uses in these basins; and 2) a detailed assessment of the effects that Project construction will have on groundwater levels in the Acton basin and the Agua Dulce basin.

*Impacts to Residential and Municipal Wells in Acton and Agua Dulce:* The results of the hydrology study described above must be used to assess the significant environmental impacts that the Project will have on residential and municipal well operations and local groundwater quality profiles. For instance, according to the statistics presented above, the Project will adversely impact local well yields because it will extract an unsustainable amount of groundwater from the basin; this concern must be addressed. Also, because the Project will essentially “compete” with domestic and municipal wells for scarce groundwater resources, it could result in contaminant migration within the basin which may cause local wells that currently produce relatively clean and potable groundwater to produce less clean (and perhaps even undrinkable) water. Also, the Project could introduce new contaminants into new locations where contaminants currently do not exist; this circumstance would result from tunnel construction using non-potable groundwater extracted from areas that have high levels of nitrates, arsenic, or other contaminants. All of these impacts must be fully and properly addressed and mitigation measures offered.

*Impacts to Perennial Streams and Riparian Habitat:* Because the Project will re-locate groundwater from the extraction location to a tunneling location far downgradient, it has the potential to significantly impact ephemeral and perennial streams in the Acton-Agua Dulce area which will in turn affect riparian habitat and the endangered Unarmored Three Spine Stickleback in Arrastre Canyon and the threatened Red-Legged Frog in Aliso Canyon [50 CFR § 17.11]. All of these impacts must be fully addressed and proper mitigation measures offered.

*Avoiding These Impacts:* It would be preferable for the Project to simply avoid all the impacts described above rather than develop strategies to mitigate them. This can be easily achieved by 1) Revising PUE-MM#1 to preclude the use of local ground water and non-potable water resources for tunnel construction in Acton and Agua Dulce; and 2) by revising all the “Utility Relocation Plans” to show that the water lines constructed to serve all tunnel portals in Acton and Agua Dulce are connected exclusively to AVEK facilities.

**2.1.3 Recent Statements by CHSRA Staff Assert that Local Groundwater will be Used Instead of AVEK Water Resources for Tunnel Construction in Acton and Agua Dulce.**

At a meeting that occurred on November 4, 2022 between members of The Nature Conservancy, local landowners, and CHSRA engineers and representatives, it was announced that CHSRA will **not** rely on AVEK water for constructing the tunnels in Acton and Agua Dulce and that local groundwater resources will be utilized instead. This was a shocking announcement which utterly contradicts the analysis presented in Section 3.6 of the Draft; it was apparently motivated by the belief that it would be a “waste” to use clean water to operate the TBMs and that local residents do not wish CHSRA to use AVEK water for tunnel construction. CHSRA’s announcement that tunnel construction in Acton and Agua Dulce will rely on groundwater resources also appears to have been made without regard for, or an understanding of, the impacts to local groundwater basins that will result from extracting nearly 1,500 acre-feet of groundwater per year (as described above). This is all exceedingly untenable,

6

4519-10279

and contradictions between CHSRA’s statements and the Draft must be resolved in the Final EIR/EIS in a manner which affirms without equivocation that only AVEK water resources will be used for tunnel construction in Acton and Agua Dulce. The Final EIR/EIS must also address the impacts that this will have on AVEK’s customers if AVEK’s allocation of SWP water resources is insufficient to serve the Project and all of AVEK’s existing customers.

**2.1.4 The Draft Fails to Address the Growth Inducing Impacts of the Extensive Water Distribution Facilities that will be Extended into Undeveloped Areas.**

The Project will result in the construction of extensive new water distribution facilities and water infrastructure throughout numerous undeveloped and underdeveloped areas in the Communities of Acton and Agua Dulce, and CHSRA has asserted publicly that these facilities would be made available to the County Waterworks District to supply water for development projects. For instance, the two 16-inch water lines that are proposed for construction of all the “E” Route Alternatives in Acton will have the capacity to carry more than 3 million gallons of water per day through an area that has remained largely undeveloped due to limited water supplies. If these water lines are turned over to the local waterworks district after Project construction, they can (and will) be used to support new development. Accordingly, the water infrastructure required for Project construction will have growth inducing impacts in the rural communities of Acton and Agua Dulce; CEQA and NEPA demand that these growth inducing impacts be addressed, but they are completely ignored by the Draft. This deficiency must be corrected and the Draft revised to address these impacts.

**2.2 The Draft Fails to Consider Project Impacts to Private Water Systems.**

The Draft fails to adequately address potential impacts to private drinking water systems or residential well facilities<sup>9</sup> even though CHSRA received hundreds of public comments at public workshops, meetings, and in written scoping comments which expressed concerns regarding impacts to private well systems and requesting that these impacts be addressed. The Project threatens private water systems in three different ways: 1) it will result in reduced groundwater levels if Project construction relies on local groundwater resources; 2) tunnel construction can actually destroy a well shaft and well infrastructure and render a domestic well inoperable; and 3) tunnel construction can alter the configuration of groundwater and perched water resources and in turn cause a domestic well to “dry up”. It is *astonishing* that the Draft does not properly consider the domestic well concerns that were clearly expressed in extensive public comments made by many Acton and Agua Dulce residents and does not offer any mitigation measures to address them. These deficiencies are also discussed in detail in comments we have submitted in response to Section 3.8 “Hydrology and Water Resources” (which are hereby incorporated herein by reference and made a part hereof<sup>10</sup>). The Draft must be revised to incorporate the following elements to address the significant environmental impacts that the Project will have on private water systems and residential wells: 1) A clear

<sup>9</sup> The impacts contemplated by the Draft are summarized on pages S-58 through S-82 of the Executive Summary; none of the impacts address private water systems or residential wells.

<sup>10</sup> Comments titled “ANALYSIS OF THE “HYDROLOGY AND WATER RESOURCES” SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT”, pages 5-8.

7

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4519-10279

statement that there is insufficient evidence to conclude that the impacts of tunnel construction on private water systems, residential wells, and groundwater resources in Acton and Agua Dulce will be less than significant; and 2) A mitigate measure to address the impacts of tunnel construction on private water systems, residential wells, and groundwater resources in Acton and Agua Dulce which includes an "Adaptive Management and Monitoring Plan" ("AMMP") that establishes protocols to determine baseline conditions of ground water levels at all wells in Acton and Agua Dulce that are located within 1/2 mile of any tunnel and detects changes in groundwater conditions at these locations which are related to tunnel construction to ensure timely implementation of remedial measures; these remedial measures must include supplying supplemental water to all affected well owners until baseline levels are restored or drilling new wells that comply with all applicable local and state requirements.

The primary purpose of "Scoping" in both CEQA and NEPA is to inform the Lead Agency regarding significant impacts of a Proposed Project that are not addressed or set forth in the Notice of Intent; accordingly, the Lead Agency is supposed to identify these impacts in the environmental review, assess their significance, and mitigate them. The Draft makes no mention of the residential well impact concerns raised by the public during Project Scoping and it certainly does not offer any mitigation measures. The Final EIR must correct these substantial CEQA and NEPA violations by 1) clearly identifying the adverse impacts that Project construction will have on residential wells; 2) establishing a "threshold of significance" in which the impact is considered significant if a single well is affected by project construction; and 3) adopting the mitigation measure described to groundwater levels and well yields and for all wells within 1/4 mile of reduce impacts on private water systems, residential wells, and groundwater resources in Acton and Agua Dulce to a level that is less than significant.

**2.3 The Draft Improperly Directs the Project's Stormwater Runoff Facilities to be Used for Wastewater Treatment.**

The Draft address wastewater impacts during construction on pages 3.6-78 to 3.6-79, and it concludes that wastewater impacts will be less than significant because two "impact avoidance and minimization features" (HYD-IAMF#1 and HYD-IAMF#3) will be implemented and because the project will adhere to applicable dewatering regulation permitting requirements; this will ensure that "dewatering discharges during construction would not contribute to exceedances of water quality standards". This conclusion is erroneous for several reasons. First, HYD-IAMF#1 and HYD-IAMF#3 apply to stormwater runoff and require the development of stormwater management facilities and the implementation of a "Stormwater Pollution Prevention Plan" (SWPPP)<sup>11</sup>; they are not relevant to, and have nothing to do with, wastewater treatment. Stormwater is merely rainwater that lands on the earth and flows downhill, and in rural communities like Acton where there are few impervious areas, stormwater is generally clean with few contaminants other than sediment. Wastewater on the other hand is process water that is contaminated with oils, chemicals, and other constituents

<sup>11</sup> HYD-IAMF#1 is "Stormwater Management—This IAMF describes the Authority's commitment to coordinate with the contractor to prepare a stormwater management and treatment plan, prior to construction" and HYD-IAMF#3 is "Prepare and Implement a Construction Stormwater Pollution Prevention Plan—This IAMF describes the Authority's commitment to coordinate with the contractor to comply with the SWRCB Construction General Permit requiring preparation and implementation of a SWPPP, prior to construction (ground disturbing activities). See page 3.8-11.

4519-10279

and it generally requires substantially more processing than rainwater to render it clean. In other words, "wastewater" and "stormwater" are two very different and completely unrelated project impacts that the Draft has improperly conflated; CHSRA cannot rely on the relatively small capacity of, and the limited treatment capabilities provided by, the Project's stormwater management facilities or its SWPPP to treat the significant wastewater volumes that will be generated at each tunnel portal location. For example, consider the "Acton Window" location that will occupy approximately 330,000 square feet; the capacity of the stormwater runoff facilities that will be required to accommodate a "1 inch" rain event at this location is only 27,500 cubic feet; this is a small fraction of the 130,000 gallons of wastewater that will be generated every day during tunnel construction at the "Acton Window"<sup>12</sup>. In other words, stormwater treatment facilities do not have either the capacity or the infrastructure required to properly clean the significant volumes of process wastewater that will be generated during construction; accordingly, the Draft errs in presuming that stormwater treatment facilities will mitigate wastewater impacts to a level that is "less than significant".

Second, meeting water quality standards is not the only factor that is relevant to determining whether wastewater impacts during construction will be less than significant; this is particularly true in rural areas where adverse impacts on downstream properties can be significant if the character, location, or flowrate of either stormwater or wastewater discharges result in new runoff patterns/conditions. The "Best Management Practices" (BMPs) and SWPPP measures that are described on page 3.6-79 may be perfectly reasonable for treating stormwater runoff in urban areas where the land surface is almost completely impervious and where extensive concrete drainage facilities capture and divert stormwater to large concrete-lined channels which carry the water to the ocean, but they are entirely inappropriate in rural communities like Acton where nearly all the roads are dirt and where natural drainage courses are relied upon almost exclusively because runoff infrastructure is virtually non-existent (as discussed in more detail below). The BMP described on page 3.6-78 is particularly alarming because it states that CHSRA will "minimize discharges of sediment" from all the tunnel construction sites; this means that CHSRA will discharge clean, "sediment free" wastewater and stormwater into the natural drainages surrounding the construction sites in Acton and Agua Dulce. These "sediment free" discharges will flow into the adjacent natural drainage courses and pick up sediment as they gain speed and flow toward the Santa Clara River<sup>13</sup>. Because this "sediment free" water will pick up sediment as it flows, it will cause significant erosion on the properties that are downstream of all tunnel portal and "window" construction locations. This will pose significant adverse erosion impacts on structures and residences located downstream of Project construction sites. For example, and as indicated on Sheets UT-C44023-14A and UT-C44024-14A, the "Acton Window" construction site is adjacent to, and immediately uphill from, an entire residential neighborhood and, as indicated in the drainage map provided in Attachment 5, there are several drainages across the "Acton Window" site that pass very close to the homes that are immediately south of, and downhill from, the construction site. If the BMPs

<sup>12</sup> Two TBMs will be operating from the "Acton Window", and according to page 3.6-78, each TBM will require 366 acre-feet per year; this will result in 653,500 gallons per day used at the "Acton Window". According to page 12 of Appendix 3.8-D, 20 percent of this water (or 130,700 gallons per day) will flow back and require treatment as contaminated wastewater.

<sup>13</sup> This is the principal characteristic of "two phase flow" conditions: clean water flowing over a natural surface will pick up sediment from the surface until an equilibrium is reached; the equilibrium is a measure of the sediment transport capacity of the flow.

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4519-10279

and SWPPPs described in the Draft are employed at the “Acton Window” site, then the drainage channels adjacent to these homes will be widened by erosion to such an extent that these homes will be substantially damaged. Similar problems are likely to occur at other tunnel and “window” construction sites located in rural residential areas. Accordingly, CHSRA must not utilize the BMPs and SWPPP measures that are described in the Draft in rural communities like Acton; instead, they must devise new BMPs for rural areas which provide discharges with sediment levels that are at equilibrium to prevent erosion on downstream properties.

#### 2.4 The Draft Does Not Properly Describe Stormwater Runoff Characteristics in Rural Areas or Accurately Portray Conditions in Acton and Agua Dulce.

The Draft asserts on page 3.6-51 that “Generally, storm drain systems are more prominent in developed urban areas. In rural areas, roadside ditches, irrigation canals, and natural drainages convey stormwater runoff.” This description of storm runoff characteristics in rural areas does not clearly reflect circumstances in most of Acton. Runoff patterns in much of Acton have remained unchanged for millennia; stormwater is typically sediment laden (because Acton is surrounded by mountains and most roads are dirt, thus rainwater runoff picks up and carries sediment down the hillsides to the Santa Clara River), it is generally not “conveyed” anywhere (because it flows naturally toward the Santa Clara River) and drainage paths in Acton are not irrigation canals or roadside ditches (though in some places the flood plain and drainage paths are adjacent to paved roadways). In a few areas, concrete v ditches have been installed to direct stormwater flows, but such facilities have caused terrible erosion problems on downhill properties because they remove sediment from the runoff and release “clean” water which picks up sediment as it flows downhill and thus erodes downhill properties (the Forecast Home development along Desert Road is an area where this is a particular problem).

Drainage patterns have generally dictated where development has occurred in Acton over the last 135 years; thus, to protect existing developments, it is critical that drainage patterns and characteristics remain unchanged. This, coupled with the fact that the only forces which alter drainage patterns in Acton are development and earthquakes, is why the community generally opposes stormwater “conveyance” facilities and works diligently to ensure that developments do not alter runoff patterns or characteristics. There are culverts under a few paved roads (the 14 Freeway, Escondido Canyon Road, Sierra Highway, and Soledad Canyon Road) but these culverts are located where natural flows occurred before the roads were built and they do not have sediment removal facilities; they simply carry sediment laden flows from one side of the road to the other and do not cause erosion or generally alter flow patterns. It is particularly important that the Final EIR clearly assert that the Project will not alter any stormwater runoff patterns or characteristics in Acton because of the devastating impact that such alterations would have on downstream properties. This is particularly true for the “Acton Window” location that will be constructed under the “preferred” SR14 A alternative because the residential neighborhood located just south of, and downhill from, the location has been configured with dirt roads and designed to accommodate existing flow patterns and characteristics. Any increase in flowrate or change in flow pattern will threaten these homes with inundation, and any decrease in sediment levels will threaten these homes with erosion. As indicated in the drainage map for this location provided in Attachment 5, homes are located near natural drainage swales that have not changed in many decades; the EIR must clarify that these drainage patterns and characteristics will be preserved.

10

4519-10279

#### 2.5 The Energy Impact Analysis Provided by the Draft is Substantially Deficient and Violates Both CEQA and NEPA.

Various statements and conclusions regarding electrical generation capacities, transmission capacities, natural gas capacities, and other “energy issues” are spread throughout Section 3.6 of the Draft, but they are internally inconsistent, rambling, and fail to address salient issues required by CEQA. For instance, the section titled “Existing Electric Power Generation Capacity” states that, as of 2017, California had an installed in-state generation capacity of 292,039 GWhr. However, this is contradicted by the paragraph above this section which indicates that, in 2016, California’s in state generation capacity was only 195,027 GWhr (70,857 GWh from governmental and utility-owned in-state facilities and 124,170 GWh from commercial in-state generation facilities). It is known with certainty that the State of California did not add more than 100,000 GWhr of generation capacity between 2016 and 2017, so one of the values reported by the Draft is erroneous. It is assumed that the error is in the 292,039 figure which appears to represent “Nameplate” generation capacity rather than *actual* generation capacity. CEQA requires that a discussion of the energy demand and energy resources that are required to support a Project be realistic and “actual”; thus, CEQA conclusions pertaining to energy issues should never be based on “nameplate” generation capacity. This is particularly true for renewable resources which typically have “nameplate” generation capacities that are much higher than their *actual* generation capacities<sup>14</sup>.

Section 3.6 also fails to provide the information required to conduct a thorough CEQA and NEPA energy impact analysis; it also fails to assess whether Project operations can be accommodated by existing and planned generation resources or whether it will affect statewide electricity reserves and transmission capacity or whether Project operation will require the addition of more generation and transmission capacities than what is already planned. This is particularly important given that CHSRA has stated that the Project will operate using 100% renewable energy; this will be very challenging given that there are insufficient renewable resources available to serve existing and projected energy demand (let alone satisfy the Project’s energy requirements). The Draft must be revised to include a renewable energy assessment that complies with CEQA and NEPA; this will require an analysis of the following factors: 1) A realistic assessment of what the projected “non-Project” electrical generation capacity will be when the Project comes on line and when it is operating at “full buildout”; 2) A realistic assessment of what the projected “non-Project” electrical demand will be when the Project comes on line and when it is operating at “full buildout”; and 3) A realistic assessment of the Project’s electrical demand when it comes on line and when it achieves full buildout. These factors must be reconciled to assess whether Project operations will require additional renewable generation beyond what is planned. It is likely that this analysis (if properly conducted<sup>15</sup>) will reveal that there will not be sufficient renewable generation capacity available

<sup>14</sup> A 1 MW wind turbine can theoretically generate 8,760 MWhr/year; thus, it has a very high “nameplate” generation capacity. However, high winds do not always blow and mechanical equipment is not always efficient; so the *actual* generation capacity of a wind turbine is much lower than the nameplate capacity. Many windturbines have capacity factors < 30% [<https://windexchange.energy.gov/maps-data/332>].

<sup>15</sup> Specifically, the “non Project” electrical demand (factor 2) should be added to the Project’s expected electrical demand (factor 3) and this sum should be compared to the projected “non-Project” electrical demand (factor 1); if the sum exceeds factor 3, then there will not be sufficient renewable generation capacity available to serve the Project when it comes online.

11

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4519-10279

to serve the Project when it comes online, and if so, the Final EIR must assess the environmental impacts that will result from creating the additional renewable generation capacity required for Project operation. This number will not be small: as indicated above, the Project is anticipated to result in more than 462 trips per day between Palmdale and Burbank. Unfortunately, the Draft fails to provide a CEQA/NEPA-compliant energy analysis; it also fails to provide the information necessary to perform such an analysis. Instead, the Draft simply declares (without basis or quantitative justification) that the Project will “not affect statewide electricity reserves or transmission capacity” because the will just “obtain electricity from the statewide grid” (page 3.6-86). Merely stating that the Project will not impact the State’s electrical system does not meet CHSRA’s burden to *demonstrate* that it will not. And, given that California’s current energy landscape is so anemic and so inadequate that it is demonstrably incapable of reliably serving Californians today<sup>16</sup> it is profoundly likely that the substantial amounts of renewable electricity which will be required to operate the Project will indeed worsen California’s electrical grid problems.

The Draft ignores all of this, and instead merely contends that the Project will “not affect statewide electricity reserves or transmission capacity” because “An industry survey in April 2013 indicated that there is sufficient renewable energy capacity to meet the system demand” (page 3.6-86). Notably, this “industry survey” is not included in the studies posted with the Draft, so the claim that the Project will “not affect statewide electricity reserves or transmission capacity” is unverifiable. Furthermore, in 2013, California only required 20% of electricity retail sales to be served by renewable resources; thus, any survey conducted in 2013 would reflect this low renewable energy target, and at that time, it could reasonably conclude that there would be sufficient renewable capacity to serve the Project. Now however, California has much more aggressive renewable energy goals<sup>17</sup> which the state is struggling to meet<sup>18</sup>; accordingly, there will be no surplus renewable generation capacity available to serve the Project and the Draft errs substantially in assuming that there will be. In other words, CHSRA’s obligation to address the Project’s impacts on local, regional, and statewide grid operations is not satisfied by a mere citation to some vague “industry survey” conducted a decade ago that is not even available to the public and which presumes an energy landscape that simply does not exist. Oddly enough, the Draft obliquely admits that Project operations will require the development of significant amounts of new renewable energy resources because it states on page 3.6-86 that CHSRA is developing an entire “renewable energy procurement plan” requiring “extensive collaboration” to ensure sufficient power procurement. This suggests that Project operations will require the development of extensive new renewable resources; thus, CEQA and NEPA demand that impacts resulting from these renewable energy developments be assessed and mitigated.

This is no small thing; because the State of California has chosen to achieve its renewable goals via energy procurements from remote, utility-scale renewable energy farms rather than relying on more reliable, more resilient, and more environmentally responsible distributed generation facilities, hundreds of thousands of acres of desertland has already been decimated

<sup>16</sup> For several years now, brownouts and blackouts are routinely threatened during the summer because California has insufficient generation resources to meet energy demand. These facts must be represented in the Final EIR.

<sup>17</sup> SB100 (adopted 2018) requires 100 percent of electric retail sales be renewable/zero-carbon in 2045.

<sup>18</sup> Because electrical supply does not meet demand, Californians are threatened with Summer blackouts.

4519-10279

and massive new transmission facilities have already been constructed through high fire hazard areas<sup>19</sup>. This is an ongoing trend which will eventually eliminate millions of acres of desertland. Accordingly, and given CHSRA’s stated intent to develop a renewable energy procurement plan in order to secure sufficient renewable energy to operate the Project, it is certain that the Project will result in substantial decimation of desert resources. Both CEQA and NEPA require that the Project EIR address and mitigate the impacts associated with developing the utility scale renewable energy resources required to serve the Project.

**3.0 ADDITIONAL SUBSTANTIVE DEFICIENCIES NOTED IN THE DRAFT**

For simplicity and to facilitate review, additional deficiencies and factual errors noted in the Draft are presented sequentially by page number below.

Page 3.6-10 identifies the Los Angeles County General Plan as a community plan that is pertinent to public utility issues addressed in the Draft, but it only identifies the “Public Services and Facilities Element” of the General Plan as being relevant; it fails to consider other equally important plan elements that pertain to utility issues (particularly in regards to water uses). For instance, and as indicated above, CHSRA has evinced a clear intent to substantially rely on local groundwater resources to construct all the tunnels for all 6 proposed routes through Acton and Agua Dulce; CEQA demands that CHSRA’s plan to utilize local groundwater resources be evaluated through the lens of applicable goals and policies that have been adopted by the County but are omitted from consideration on Page 3.6-10. For example, Goal C/NR 6 (Protected and usable local groundwater resources) and Policy C/NR 5.6 (Minimize point and non-point source water pollution) should both be considered; they are from the Conservation and Natural Resources Element of the County General Plan. Goal C/NR 6 is relevant because the residents of Acton and Agua Dulce rely on local groundwater resources for their water supply; thus, protecting local groundwater resources in a sustainable manner is critical to our communities. Over the years, the “depth to groundwater” measured by the local waterworks district in Acton has increased and Acton and Agua Dulce residents have experienced reduced well yields and been forced to supplement their water supply by purchasing water from licensed water haulers; CHSRA’s plan to utilize local groundwater for Project construction will further strain local groundwater resources and thus exacerbate this already significant problem. Accordingly, the Final EIR must address Goal C/NR 6 and assess Project impacts resulting from the use of local groundwater supplies to operate the TBMs. Additionally, General Plan Policy C/NR 5.6 pertaining to the minimization of point and non-point source water pollution is also relevant because contaminants will be distributed throughout the project area if groundwater containing excessive with nitrates or arsenic concentrations are utilized for TBM operations because the TBMs will pierce water channels and aquifers that serve as both public and private drinking water sources and inject unclean water directly into these groundwater sources. Accordingly, the Final EIR must address Policy C/NR 5.6 in assessing the impacts of TBM operation on

<sup>19</sup> The State of California intends to achieve its renewable energy goals via utility scale generation rather than distributed generation. For example, consider the map prepared by the California Energy Commission (“CEC”) [Attachment 6] showing where streamlined approvals for renewable energy development is expressly encouraged; the map demonstrates that the CEC recommends that virtually all of unincorporated Antelope Valley be converted to renewable energy purposes. The lands earmarked for renewable projects currently support thriving wildlife and numerous rural communities; the CEC did not assess the impacts that these massive industrial energy projects will have on rural residents or the extent to which the stripping and fencing of huge tracts of land will decimate habitat and wildlife corridors.

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4519-10279

drinking water systems. Finally, the Draft fails to identify the Antelope Valley Area Plan or discuss its relevance to the Public Utilities section of the Draft; the policies that are particularly relevant include Policy COS 2.7 (Limit use of groundwater sources to their safe yield limits) and Policy COS 3.5 (Protect underground water supplies by enforcing controls on sources of pollutants); the relevance of these policies to the public utility issues related to the Project is self-evident. Accordingly, the Draft must be expanded to address Antelope Valley Area Policies.

Page 3.6-10 discusses the Los Angeles County General Plan but it does not specifically identify Policy PS/F 6.6 pertaining to the undergrounding of new utilities; in fact, the Draft only addresses this Policy in a very rudimentary and cursory manner because it only commits to undergrounding *relocated* utilities to the extent feasible<sup>20</sup> and makes no commitment to underground any *new* utility infrastructure that will be constructed for the Project. This is a substantial deficiency that is of particular concern to the Communities of Acton and Agua Dulce which are located in Very High Fire Hazard Severity Zones (VHFHSZs) and experience frequent and lengthy power shutoffs by Southern California Edison. The Project must not result in the construction of new electrical facilities in the Communities of Acton and Agua Dulce that are located above ground for two critical reasons: 1) above ground electrical utilities pose a very real and significant fire risk in VHFHSZs; and 2) above ground electrical utilities are susceptible to frequent power shutoffs that can last for days<sup>21</sup> and which will cause extensive service interruptions on HSR lines. Accordingly, the Final EIR must adopt a mitigation measure stating definitively that any above ground electrical facilities that are constructed in the Communities of Acton and Agua Dulce as part of the Project shall be installed underground. The new 230 kV line that is proposed in Northeast Acton is of particular concern because it will be constructed in a new "right of way" and it introduces a new ignition source within the Community of Acton. To ensure consistency with Policy PS/F 6.6, this new 230 kV line must be undergrounded.

Page 3.6-13 addresses Project consistency with adopted County and local plans, and it defers to a "consistency analysis" presented in Appendix 2-H which concludes that the Project is consistent planning documents pertaining to the County of Los Angeles [pages 2.0-H-10 to 2.0-H-12]. However, the consistency analysis presented in Appendix 2-H is deficient. First, it does not even mention Goal C/NR 6 from the County General Plan or Policy COS 2.7 from the Antelope Valley Area Plan pertaining to protected and usable local groundwater resources which (as discussed above) are particularly relevant to Acton and Agua Dulce. Using local groundwater resources in Acton and Agua Dulce to operate the TBMs will conflict with Goal C/NR 6 and Policy COS 2.7; accordingly, these conflicts must be addressed and mitigation measures must be developed to resolve them. Second, Appendix 2-H does not even mention Policy C/NR 5.6 from the County General Plan or and Policy COS 3.5 from the Antelope Valley Area Plan pertaining to the protection of water supplies from pollution. Using non potable water for TBM operation will conflict with Policy C/NR 5.6 and Policy COS 3.5; accordingly, these conflicts must be addressed and mitigation measures must be developed to resolve them.

Page 3.6-14 asserts that the goals and policies enumerated in various county and city General Plans which apply to the Draft's discussion of "Public Utilities and Energy" relate to "reducing demands for natural resources, ensuring that public infrastructure is developed so that sufficient

<sup>20</sup> Appendix 2.0-H-12.

<sup>21</sup> Most power shutoffs in Acton last more than 20 hours and often range from 36-48 hours.

4519-10279

utilities are provided for the regional growth anticipated, and conserving energy". This statement is incorrect. As indicated above, there are a number of goals and policies in planning documents that have been adopted for unincorporated Los Angeles County which address protection of drinking water source, groundwater supplies, fire hazards, and electrical reliability and thus are directly applicable to "Public Utilities and Energy" matters. Page 3.6-14 must be revised to address these goals and policies which are entirely unrelated to "reducing demands for natural resources, ensuring that public infrastructure is developed so that sufficient utilities are provided for the regional growth anticipated, and conserving energy".

Page 3.6-14 asserts that "the project is consistent with the majority of regional and local policies and plans" and that "IAMFs (Impact Avoidance and Minimization Features) and mitigation measures will generally minimize utilities impacts and would ultimately meet the overall objectives of the local policies". This statement is incorrect. If CHSRA uses local groundwater supplies in Acton and Agua Dulce to supply water for TBM operation or if CHSRA does not underground all new and relocated utilities in Acton and Agua Dulce, the Project *will not* "meet the overall objectives of the local policies"; to the contrary, it will actively controvert such policies. Such circumstances would constitute a significant impact under CEQA and would require mitigation to render the project consistent with adopted "local policies".

Page 3.6-18 addresses "Utility Demands for Project Construction" and asserts that water supply estimates are compared to water supply forecasts from Urban Water Management Plans ("UWMPs). However, no UWMP has ever been prepared for the communities of Acton and Agua Dulce, therefore CHSRA lacks the information it requires to accurately assess water supply estimates for approximately half of all the route alternatives. This deficiency must be corrected and the Final EIR must properly assess utility demands for project construction and compare it to accurate and representative data pertaining to water resource availability.

Page 3.6-19 presents Table 3.6-4 which asserts each TBM will require 55,000–105,000 gallons/day per tunnel boring machine; this equates to 0.17 - 0.32 acre feet per day or 61 – 117 acre feet per year. These values are inconsistent with the values reported on page 3.6-78 which states that "each TBM operating from each twin tunnel portal would require a total of 1,829 acre-feet (366 acre-feet per year)". There is an enormous discrepancy between the TBM water requirements described on page 3.6-19 and the TBM water requirements described on page 3.6-78; this discrepancy must be explained and corrected.

Page 3.6-21 addresses "Construction Energy Uses" and though it describes how construction energy usage was estimated, it does not assert what the construction energy usage will actually be or whether local infrastructure in rural areas like Acton are sufficiently robust to serve the Project's energy demand during construction. Acton is served by a very small electrical substation that is fed by two 66 kV subtransmission lines; power is distributed from this substation via three distribution circuits (<16 kV) which traverse Acton's 100 square mile area; power service is not always reliable and power shutoffs lasting 20 hours to 48 hours or more are common (particularly in the Fall and Winter). The Draft does not address these concerns, and it does not assess whether the capacity of the local Acton distribution station is sufficient to serve electrical demand for Project construction. Thus, the Draft fails to assess whether electrical service to Acton residents will be interrupted to maintain CHSRA's construction activities (particularly during peak demand); it also fails to identify mitigation measures to address such impacts. These deficiencies must be addressed in the Final EIR/EIS.

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4519-10279

Page 3.6-21 also addresses "Operation Energy Uses" but it does not actually identify the amount of energy required to support high speed train operation (particularly given the projected 162 trips per day operating schedule between Palmdale and Burbank); it also fails to address whether the capacities of existing local and regional electrical facilities are sufficient to maintain Project operations. The CEQA Guidelines establish that EIRs are supposed to discuss the potential energy impacts of proposed project operations and, in particular, address whether the project will place a substantial demand on energy supplies or require additional capacity or increase peak electricity demand; as indicated above, the Draft fails to discuss any of these concerns and does not even identify an impact associated with such concerns. This deficiency must be corrected in the Final EIR/EIS.

Page 3.6-30 reports that Los Angeles County Waterworks District 37 (the local waterworks district in Acton that serves less than half of Acton residents) is supplied by the Metropolitan Water District, it is 473 square miles in area, and it has an annual average water demand of 659,000 acre feet. None of this is correct. Waterworks District 37 obtains its water from AVEK and from local municipal water wells, it serves an area that is less than 50 square miles and its annual water demand is approximately 2,000 acre feet. The Draft must be revised to reflect these facts.

Page 3.6-31 indicates that much of Central and North Acton does not have a natural gas pipeline; this is incorrect. Many areas in North, East, Central, and South Acton are served by a natural gas pipeline.

Page 3.6-41 indicates that much of Central and North Acton is not served by a water pipeline; this is incorrect. Numerous areas in North, East, Central, and South Acton are served by a water pipeline.

Page 3.6-45 asserts "The Acton Water Treatment Plant is a water treatment facility owned by AVEK. After treatment, the Acton Water Treatment Plant pumps about 4 million gallons of water per day from the plant site into a Los Angeles County Waterworks pipeline". This is incorrect. While the capacity of the Acton Water Treatment Plant is 4 million gallons per day, it does not operate at this rate; to the contrary, it pumps approximately 1 million gallons per day.

Pages 3.6-52 to 3.6-53 provide figures of "stormwater facilities" in Acton in the vicinity of all the proposed routes. Unfortunately, these figures fail to show most of the culverts in Acton which, as described above, release sediment-laden stormwater flows onto downstream properties. It is particularly worrisome that the figure provided on page 3.6-53 does not show the numerous culverts under the 14 Freeway that discharge sediment flows onto the property where the "Acton Window" is proposed for construction under the "preferred" SR14A Alternative; this suggests that CHSRA is unaware of these culverts. These figures must be revised to properly show the location of these culverts and the Final EIR must evince a clear plan which demonstrates that the Project will not alter any runoff flow patterns or flow rates or flow characteristics at any location in Acton.

Pages 3.6-58 to 3.6-59 provide figures of "electrical lines" in Acton in the vicinity of all the proposed routes. These figures show the location of high voltage transmission lines but they omit all the 66 kV subtransmission lines that serve the Acton substation and most of the 12 kV distribution lines in Acton. To ensure that CHSRA is aware of these facilities, they are indicated

4519-10279

in the figure provided below. The Draft must be revised to properly show the location of electrical facilities in the vicinity of all proposed route alternatives in the Community of Acton.

Subtransmission and Distribution Circuits in Acton

Page 3.6-63 discusses "Existing Electricity Demand" in California. Much of the information presented does not reflect current conditions and some of it is simply incorrect. For example, and contrary to what the Draft asserts, Statewide electrical consumption has actually dropped in recent years and was 277,764 GWhr in 2021<sup>22</sup>; this is approximately the same demand experienced in in 2010. There are many reasons for this reduction: more "behind the meter" distributed generation resources have been installed, the California population has dropped, and skyrocketing electrical costs are forcing people to use less electricity. Furthermore, the Draft reports that the highest recorded peak demand (which it describes as "the amount of generation needed to keep electrons flowing in the electricity system at any given moment of peak demand") was 60,713 MW in 2016; this is incorrect. The California Independent System Operator (CAISO) is responsible for keeping "electrons flowing in the electricity system" and according to CAISO, the highest peak demand on the California grid was 52,061 MW<sup>23</sup> recorded on September 6, 2022. There are no definitive citations provided in the draft for the 60,713 MW value that it reports, however it appears to have been obtained from a forecast study prepared by the California Energy Commission which made significant "adjustments" to historic data to project possible non-coincident peak loads under a variety of possible scenarios; such forecasts do not report actual peak demand and they cannot be relied upon for such information.

<sup>22</sup> <https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/2021-total-system-electric-generation>

<sup>23</sup> <https://www.caiso.com/documents/californiaisopeakloadhistory.pdf>

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4519-10279

Page 3.6-64 provides a Section titled "Existing Electricity Generation Capacity", but the associated paragraph merely describes the sources of electrical generation and does not materially address electrical generation capacity.

Pages 3.6-85 to 3.6-90 address the impacts of Project operations on energy demand. As discussed above, the impact analysis of project operation on energy resources presented in the Draft is substantially deficient; instead of analyzing the extent to which the electrical demand of Project operation will impact the local, regional, and national electrical system (as required by CEQA), the Draft presents a completely erroneous "net change in energy use" in which the Project's electrical usage is compared to hypothetical projections of fossil fuel reductions that could accrue from reduced vehicle and airline trips. The comparison is ludicrous and it fails to address the salient issue in CEQA; namely: will High Speed Rail operations adversely affect local, regional, or national electrical grids by drawing more electricity than the grids can provide? And if so, what measures has CHSRA developed to mitigate this significant adverse impact and what further impacts will result from implementing these mitigation measures? Answering these questions require CHSRA to look at Project energy demand and local and regional power systems. For example, the "Utility Relocation Plan" indicates that CHSRA intends to construct a new 33 kV power line along Aliso Canyon for all the "E" routes and a new powerline of unknown voltage and ampacity along Crown Valley Road for the SR14A routes; yet, the Draft fails to even consider whether the local electrical facilities in Acton are even sufficiently robust to serve these new powerlines, and it certainly does not provide any mitigation measures if the electrical facilities in Acton are insufficient for CHSRA's purposes. Insofar as the Community of Acton is aware, there are no 33kV service facilities anywhere near Acton; therefore, substantial substation modifications and transformer additions will be required to provide the 33 kV power that the Project construction apparently requires. These are the issues that must be analyzed pursuant to CEQA, not whether the Project will result in a "net change in energy use".

Furthermore, it is certain that the Project will adversely impact the electrical grid and the availability of renewable resources because CHSRA is apparently making plans to procure sufficient renewable resources to operate the High Speed Rail system (as discussed above). CHSRA's procurement of additional renewable resources will result in the development of thousands of acres of utility scale solar and wind farms which, in turn, will result in the destruction and fencing of thousands of acres of pristine desert habitats and the elimination of extensive wildlife corridors. The Draft fails to account for any of these impacts; in fact, it does not even report how much electricity is required to operate the Project. These are all substantial deficiencies which must be corrected. Specifically, the Final EIR/EIS must report the Project's construction energy demand and the Project's operating peak demand and total annual power demand at full buildout and reconcile these values with credible engineering factors to 1) determine what new electrical infrastructure will be required in Acton to supply electrical demand for both Project construction and Project operation; and 2) determine how much desertland will be converted to renewable energy farms to generate sufficient renewable energy for Project operation. For example, the Institute of Electrical and Electronics Engineers ("IEEE") estimates that 2.2 acres of solar panels are required to generate 1 GWh per year<sup>24</sup> (though this estimate does not account for the transmission lines and the battery storage

<sup>24</sup> <https://ieeexplore.ieee.org/stamp/stamp.jsp?tp=&arnumber=9676427>

4519-10279

that will be required to make energy continually available to the Project, therefore it is biased low). Additionally, the Final EIR must include measures to mitigate the significant impacts created by these utility scale generation, storage, and transmission projects (such as the ambient dust that these projects will create, elimination of habitat and wildlife corridors, etc.). Alternatively, the Final EIR can incorporate a mitigation measure that commits CHSRA to using distributed generation to supply electricity for the project rather than utility scale generation; this will eliminate all desertland and transmission impacts.

Page 3.6-91 through 3.6-97 present NEPA and CEQA significance conclusions which assert that the Project will "avoid, minimize, reduce, or compensate for all impacts on utilities and energy" (page 3.6-91) and that "Public utilities and energy impacts would be reduced to a less than significant level under CEQA with the implementation of the mitigation measures identified in this section". These statements are incorrect for the reasons set forth above and because:

- It is highly likely that sufficient water supplies will be unavailable from AVEK to construct the all the route alternatives within Acton and Agua Dulce. This is a significant environmental impact that is not addressed by the IAMFs or mitigation measures offered by the Draft; instead, the IAMFs and mitigation measures assume (wrongly) that AVEK will have excess water resources to sell to CHSRA when construction is initiated. If CHSRA uses its authority to compel AVEK to sell water for project construction, then AVEK's customers will be severely impacted; yet, the Draft fails to address these impacts.
- The use of local groundwater extracted from Acton and Agua Dulce for Project construction will severely impact local groundwater levels, local groundwater quality, and both municipal and residential well yields. These impacts are completely ignored by the Draft.
- Section 3.6 of the Draft states explicitly that AVEK water resources will be used for Project construction in Acton and Agua Dulce. Yet, the Project's "Utility Relocation Plans" indicate that the Project will not connect to AVEK facilities or use AVEK resources for Project construction in Acton and Agua Dulce; this has been confirmed by recent public statements made by CHSRA officials. These glaring inconsistencies demonstrate that the Project is neither stable nor finite; this, combined with the paltry environmental impact analysis provided by the Draft, this makes it impossible for the public to provide meaningful comment and it will prevent the decisionmakers from properly contemplating the Project and its associated impacts.
- The Draft fails to address the hundreds of scoping comments submitted by the public that expressed concerns regarding Project impacts on local well facilities.
- The Draft fails to assess the impacts of Project operation on local and regional electrical grids and the impacts of all the new utility scale generation projects that will be required to supply electricity for Project Operations.
- The Draft improperly relies on stormwater treatment facilities to treat the significant wastewater flows that will be generated during project construction.
- The Draft adopts BMPs and SWPPP measures that are entirely inappropriate for rural areas and which, if implemented, will result in significant erosion on downhill properties.

# Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

4519-10279

Sheet UT-C4537-E1 indicates that the water needed to construct the tunnel portals adjacent to Aliso Canyon Road for all the "E" route alternatives will not come from AVEK and will instead be supplied by a 16-inch water main that is supposedly proposed by Waterworks District 37 and which will extend from Avenue Y-8 out to Aliso Canyon; however, no such water line has been proposed insofar as the Community of Acton is aware.

Sheet UT-C4028-S14 indicates that the water needed to construct the tunnel portal adjacent to Red Rover Mine Road for the SR14A Route Alternative will not come from AVEK and will instead be supplied by a 16-inch water main adjacent to Hypotenuse Road that is supposedly proposed by Waterworks District 37; however, no such water line has been proposed insofar as the Community of Acton is aware.

Sheet UT-C4026-14A has mislabeled Hisey Ranch Road as Salty Dog Road; the house under which the 14A tunnel is located on the west side of this Sheet is on Hisey Ranch Road and not Salty Dog Road.

#### 4.0 CONCLUSION

For the reasons set forth above, the Draft EIR/EIS prepared for the Palmdale to Burbank section is deficient and does not comply with CEQA or NEPA; these deficiencies must be addressed and the impacts identified herein must be fully mitigated in the Final EIR issued for the Project.

INTRODUCTION

GENERAL STATEMENT

Presented in this report are the findings, conclusions and recommendations regarding our assessment of the hydrogeologic conditions within the alluvial and stream terrace deposits along the upper reaches of the Santa Clara River in the Acton area, Los Angeles County, California. Particular regard is given in this report to the groundwater storage capacity within the alluvial and terrace deposits and to potential locations for new wells.

As depicted on Figure 1 - Location Map - the approximately 80-square-mile, rectangular-shaped mapped area includes a main study region centered around the community of Acton. This latter area consists of approximately 16 square miles enclosed within the boundaries of the service area of Los Angeles County Waterworks District No. 37-Acton. The mapped area is located between the narrows within Soledad Canyon on the southwest and the San Andreas fault on the northeast, and between the Sierra Pelona on the north and the western San Gabriel Mountains on the south.

This report has been provided with a list of references which have been specifically reviewed and/or cited during the course of this study. Plates which accompany this report are bound at the end of this text.

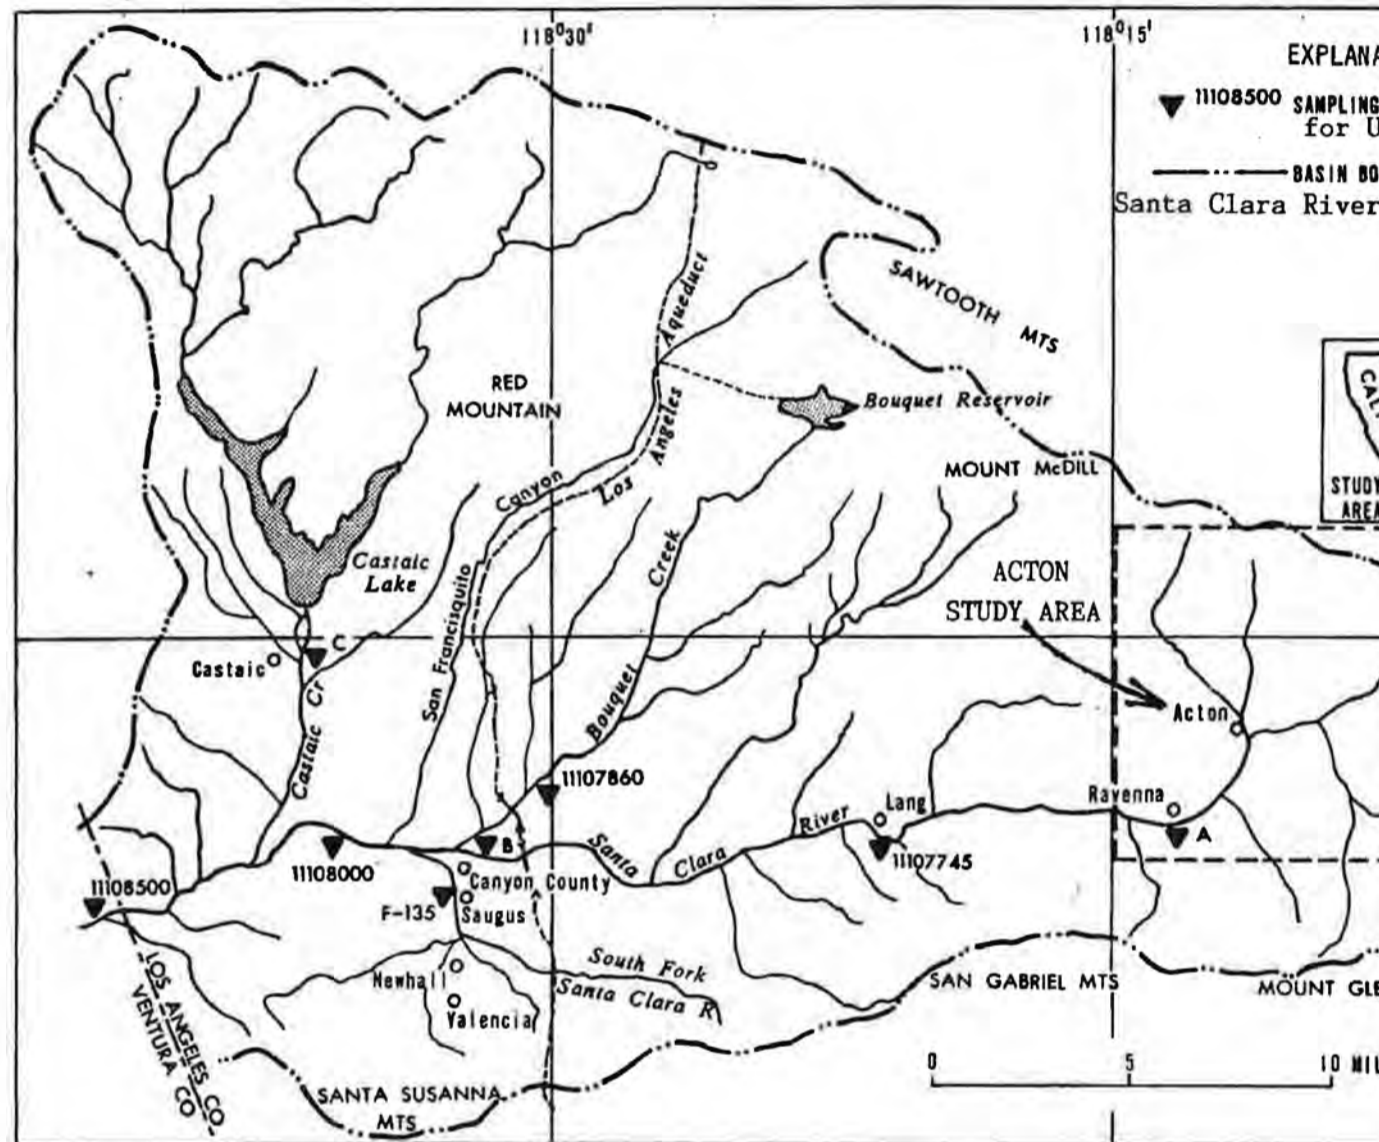

PURPOSE AND SCOPE

This hydrogeologic study has been undertaken to evaluate the alluvial and terrace aquifer system underlying Soledad Canyon and its tributaries in the Acton area with particular regard to: determining the surface boundaries and three-dimensional configuration of the local groundwater basin; assessing local hydrogeologic conditions within these deposits; determining their groundwater storage capacity; assessing general water quality conditions; and identifying regions for possible future groundwater development.

S8931 - Acton Report

2

This project has been conducted for the Los Angeles County Department of Public Works and for ASL Consulting Engineers. The scope of work was outlined as five tasks in our letter of proposal dated October 27, 1989, to Mr. Thomas O'Laughlin of ASL Consulting Engineers. A summary of the five work tasks performed for this investigation is as follows:

**Task 1 - Acquisition of Available Basic Data**

- Collect basic geologic, hydrogeologic, land use, rainfall and water-well records and data.
- Develop a screened mylar, topographic base map for all proposed plates in the final report.

**Task 2 - Field Reconnaissance**

- Conduct field visits to assess locations of active and inactive water wells and to validate topographic and geologic conditions.
- Review and verify geologic exposures and rock types, and observe local topography and watersheds.
- Obtain non-pumping water levels in active water wells, if possible.
- Collect water samples from active wells, if necessary.

**Task 3 - Hydrogeologic Conditions**

- Hydrogeologically analyze all available data.
- Prepare hydrogeologic maps and cross-sections.
- Prepare maps showing current and historic water level elevations.
- Assess general water quality, quality problems and problem areas in the region.
- Prepare hydrographs from selected water wells.
- Correlate electric logs of recently-drilled test holes in the region, if possible.

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

3

- Assess the three-dimensional configuration of the local groundwater basin.
- Identify the surface boundaries of the local groundwater basin.
- Assess the quantity of groundwater in storage for current conditions and for basin-high and basin-low conditions.
- Identify potential sites for new water wells.

**Task 4 - Analyses and Reports**

- Write and prepare our report with conclusions and recommendations regarding historic and current groundwater conditions in the basin.
- Provide supporting maps, figures and tables to document our findings.

**Task 5 - Meetings and Consultation**

- Provide hydrogeologic consultation during the project to ASL and to the Los Angeles County Department of Public Works via meetings, telephone communications, etc.

Analyses for this project relied solely on available background data and reports. No subsurface exploration or well testing was conducted for this study. Reports specifically reviewed for this project are shown on the list of References Reviewed.

Field work consisted solely of field meetings with County and Acton-Camp staff, and of reconnaissance geologic field mapping to more accurately define the surface boundaries of alluvial and terrace deposits in the project area. The field meetings occurred in December 1989, while the field mapping took place on January 12, 1990. On this latter date, which was prior to any significant rainfall in the area, we also made estimates of subsurface water runoff, if any, in various creeks in the region.

Throughout the remainder of this report, there will be numerous discussions of water wells in the region. The major purveyor in the region, the Los Angeles County Waterworks District No. 37-Acton is a public agency, and it uses its wells to meet local

S8931 - Acton Report

4

domestic water needs. In addition, Acton-Camp, which is located on the east side of Soledad Canyon approximately two miles south of Acton, uses a few wells to meet the domestic and irrigation needs of the Camp. The Big Dipper Water Delivery and Carson Brothers are local purveyors which each operate at least one well along Soledad Canyon south of Acton. These purveyors do not provide water for municipal purposes through a distribution system. Instead, both companies haul or provide bulk water for grading and individual home tanks which are used for domestic, irrigation and fire protection purposes.

In addition to the wells discussed above, there are an unknown number of wells used by private homeowners, ranches, new housing tracts, and/or commercial establishments in the area. For the purposes of this report, wells owned by this group of users will be called privately-owned wells.

This report has been written for the Los Angeles County Department of Public Works and for ASL Consulting Engineers with specific application to the hydrogeologic assessment of the alluvial and terrace deposits aquifer systems in the Acton area. This report has been prepared in accordance with the care and skill generally exercised by reputable professionals, under similar circumstances, in this or similar localities. No other warranty, either expressed or implied, is made as to the professional opinions presented herein.

**AVAILABILITY OF BASIC DATA**

Previous studies. Because the study area does not overlie any major oilfields and/or ore deposits, there has not been an extensive history of published and unpublished geologic reports and maps dealing with surface and subsurface geologic conditions. Other than a driller's log and well history from a wildcat oil well drilled to a depth of 1650 ft in 1926, there are no subsurface data for the area available from oil industry sources. This well

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

5

predates geophysical electric logs, therefore, no electric log is available to serve as control for correlation with the few available electric logs for shallower water wells in the area.

The earliest significant literature, dating from the 1920s and 1930s, addresses the petrography and relationships of the crystalline and metamorphic rocks in the western San Gabriel Mountains, immediately south of the study area (Miller, 1934). These rocks also occur in the Acton area and were the focus for reports which describe placer and gold mining operations that occurred north and south of Acton during the late 1800s and early 1900s (Simpson, 1934).

Investigations during the 1930s and 1940s provided the initial efforts at naming and mapping the surface exposures of the stratigraphic units and structure in the eastern part of the Ventura basin. The eastern Ventura basin is also referred to as the Soledad basin in reports prepared for the comprehensive geology of California presented in Bulletin 170 by the California Division of Mines and Geology (Jahns, 1954).

Adaptation of the geologic maps provided in Bulletin 170 and from investigations conducted by Noble (1953) and Dibblee (1960, 1967) permitted the preparation of Plate 1 - Geologic Map - in this report. Portions of the geologic conditions shown on Plate 1 were modified and updated from work recently available as a university thesis (Hendrix, 1986).

Published hydrogeologic and hydrologic information for the region is similarly limited. There have been essentially no previously-published studies detailing aquifer characteristics, well testing, water level fluctuation or groundwater variations in water wells in the Acton area.

The few hydrologic studies of the region that were reviewed for this project included a report published in 1967 by the United States Geological Survey in conjunction with the Antelope Valley-East Kern Water Agency (Bloyd, 1967) which included the Acton area

S8931 - Acton Report

6

in the extreme southwest portion of their study area. Generalized geology and water-level contours in the Acton area for the period 1958-1965 are shown on maps included with that study, but data were insufficient for the Acton area to permit that investigator to prepare maps showing average specific yield of sediments and specific capacity of wells in our study area. That report itself focuses on the region northeast of the San Andreas fault so there is little information specifically applicable to the Acton area.

Previous assessments of hydrogeologic conditions in the region are limited to those by: the Regional Water Quality Control Board for the Los Angeles Region (1975) in preparing the water quality control plan for the Santa Clara River basin; Williams (1979) which provided an evaluation of sediment discharge in the Santa Clara River basin for Ventura and Los Angeles Counties; and Bowers and Irwin (1978) which summarized water-quality data collected during a reconnaissance study in the upper Santa Clara River basin during August 1974 through June 1976.

A groundwater report on current water quality and the effects of private sewage disposal systems on that quality within the Acton area has recently been prepared for Acton Builders by Brockmeier Consulting Engineers, Inc. (Feb. 1990).

Water Well logs. Historically available records reveal that at least 90 water wells have been drilled in the basemap area for domestic, agricultural, and stock-watering purposes. As seen on Plate 2 - Basin and Water Agency Boundaries and Well Location Map - most of these wells have been drilled within the area of the alluvial or stream terrace deposits which underlie the channels of the upper reaches of the Santa Clara River and its major tributaries. It should be noted that well locations illustrated on Plate 2 are those adopted from maps on file at the Department of Water Resources (DWR) and the Los Angeles County Flood Control District (LACFCD). In addition to these, there is also a small

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

7

number of monitoring holes and/or test holes drilled for water well tests or other study purposes.

Most of the 90 wells are shallow (less than 200 to 250 feet) and are probably completed solely in alluvial and/or terrace deposits. Of these wells, about 26 drillers' logs and only two geophysical electric logs are available for analysis of subsurface conditions. Electric logs are available for Acton Camp Test Hole No. 4, which was completed into Los Angeles Co. Waterworks District (LACWWD) Well No. 37-3, and for Griffin Homes Test Hole No. 2, approximately located in the area of Township 4 North, Range 12 West, Section 32F.

The electric log below 110 ft for LACWWD No. 37-3 appears to show the extremely high resistivity characteristic of crystalline rocks. The sedimentary section in this well is too thin to correlate with any degree of certainty to the electric log for Griffin Homes Test Hole No. 2, which is located several miles to the northeast. Therefore, for the Acton area there is no geophysical data control on the subsurface configuration of sediments, and all lithologic assessments have to rely on interpretation of surface geology using drillers' logs.

Water Level and Water Quality Data. The historic collection and filing of basic hydrogeologic data for the study area has been sporadic and random in terms of the date and location of well monitoring. There is no comprehensive basin-wide program to provide consistent and periodic monitoring of water levels, quality, specific capacity and/or well efficiency on an on-going basis. In general, data are not available prior to about 1950. Most well records of water levels have a ten-year gap in data from roughly 1965 to 1975, with additional shorter data gaps during other time intervals. Water levels and pumping rates are obtained on a more or less monthly basis in LACWWD Well 37-1, and date from about 1970.

S8931 - Acton Report

8

Scrutiny of the water level data record for the area reveals occasional measurements which are anomalously low; these anomalously low water levels are considered to not be directly related to climatological fluctuations. Such anomalies are considered to relate to either monitoring error, the reporting of pumping levels or partial recovery levels instead of true static (non-pumping levels), or the monitoring of a water level in a well affected by mutual drawdown interference from another, nearby well.

For our assessment of water levels, we have plotted nine hydrographs, three of which consist of two nearby wells (one of which is LACWWD Well 37-1) each with pre-1965 and late-1960s/early-1970s to recent data in order to span the large data gaps found so consistently throughout the Acton area. Water-level contours from monitoring data on file with the LACFCD were independently prepared for water level high and low periods as identified by the hydrographs. For our assessment of water quality, we have relied on recent State data for nine wells, plotted on a trilinear analysis diagram later in this text. The only surface water data available, at Lang along the Santa Clara River downstream from Acton-Camp dates from January, 1969, and is also included on the trilinear diagram.

Agencies Contacted. Data repositories and persons contacted during this investigation included the following:

1. Los Angeles County Waterworks Districts - Department of Public Works: Mssrs. Gary Hartley, Joe Aja, and Ken Roseander. Data collected here included drillers' logs, water levels and water quality for wells owned by the Waterworks District and by Acton-Camp.
2. Los Angeles County, Flood Control District: Mr. George Farag for drillers logs, for historic water level data, for recently monitored water levels in the area, for possible surface water quality data, and for precipitation data from long-term rainfall stations.
3. California Department of Water Resources: Mr. Ed Lowe, for historic water level and water quality data, and for water well location maps.

# Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

9

4. California Division of Oil and Gas: office staff. Data collected included information on wildcat oil well (drillers' log and well history), wildcat well location map and reports published on various oil fields in the surrounding region.
5. California Division of Mines and Geology: Mr. Bob Hill, for published and unpublished geologic reports and maps for the various rock types in the mapped area.
6. United States Geological Survey: office staff. Basic data relating to any possible geologic and hydrogeologic maps and reports for the region.
7. University of California at Los Angeles Geology Library: office staff. Basic data relating to geologic maps and reports, and for any geologic theses for the region.

### AREA OF INVESTIGATION

#### PROJECT LOCATION AND PHYSICAL FEATURES

As shown on Figure 1 - Location Map - the rectangular-shaped mapped area encompasses approximately 80 square miles along the upper reaches of the Santa Clara River within Soledad Canyon in north-central Los Angeles County. The mapped area includes the alluvial and stream terrace deposits within the nearby reach of the Santa Clara River and its tributaries, as well as a portion of the hills to the north and south of the river itself.

The Soledad basin is a topographic low as well as a basin of deposition. It lies north of the San Gabriel Mountains, south of the Sierra Pelona, and is bounded by the San Gabriel and San Andreas faults on the southwest and northeast, respectively. The Acton study area is located in the eastern portion of the Soledad basin (Muehlberger, 1958).

Geomorphically, the study area consists of the relatively wide and flat lands along the course of the east-west trending Santa Clara River (Soledad Canyon) and the hills and low-lying mountains which border both sides of the river. Elevations along the river valley in the study area range approximately from 2460 ft at

S8931 - Acton Report

10

Ravenna to 3200 ft at the river's headwaters in Soledad Pass near Vincent. The overall river gradient across this 8.3-mile long reach is on the order of 0.017 ft/ft (about 94 ft per mile). Maximum elevations in the hills north of the river are on the order of 4700 ft at Harold Beacon, while maximum elevations to the south are approximately 4400 ft, southeast of Kentucky Springs. Kentucky Springs Canyon represents the main tributary in the headwaters area of the Santa Clara River.

Acton, the only community in the area, has historically been a rural and equestrian-oriented development. Development consists of a school and a main commercial area near the intersection of Crown Valley Road and Soledad Canyon Road. Additional developments include Acton-Camp, a County-owned facility along Soledad Canyon Road south of Acton, a large trailer and recreational vehicle park and campground located just southwest of Acton-Camp, and numerous single-family homes and ranches scattered throughout the main valley and its tributary canyons. In the past few years, a few large residential tracts of single-family dwellings have been built and/or proposed.

At present, private subsurface disposal of onsite-generated sewage has been the sewage disposal alternative used throughout most of the region. Acton Camp reportedly discharges approximately 30,000 to 50,000 gallons per day of secondary-treated sewage effluent to Soledad Canyon. Commercial areas within the community of Acton, including at least one laundry, utilize subsurface disposal of their sewage effluent also. Another area for effluent disposal via leachfields is the large recreational vehicle park located within Soledad Canyon just downstream from Acton Camp.

#### GROUNDWATER BASIN BOUNDARIES

To facilitate analysis of water supply problems, the California Department of Water Resources established names and locations of groundwater basins along the course of the Santa Clara River in

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

11

both Los Angeles and Ventura Counties (1953, 1975 and 1980). Hydrologic unit boundaries were delineated principally on the basis of topography and watershed divides, and as such, included both alluviated valleys and the adjoining hills and mountains. Each hydrologic unit was further divided, using similar bases, into hydrologic subunits for further definition of runoff and other hydrogeologic conditions.

As a result of these studies, the principal hydrologic unit in the study area is known as the Santa Clara River Valley Unit. Within the region, it has been subdivided in Los Angeles County into the Eastern Subunit and the Acton Valley Subunit.

For detailed assessments of hydrogeologic conditions, DWR further delineated various groundwater basins within each of the above hydrologic units and subunits. Basin boundaries were selected on the basis of such features as faults, groundwater divides, exposures of bedrock in the hills, or at areas of rising water caused by the presence of bedrock shallowly underlying river alluvium. Where none of these types of conditions were determined to exist, arbitrary or even political divides were occasionally selected as groundwater basin boundaries.

The boundary between the Acton Valley and Eastern Subunits was selected by DWR along an arbitrary narrowing of the river channel (caused by exposures of nonwater-bearing bedrock) located between Ravenna and Lang. However, for the purposes of this study, only that portion of the Acton Valley basin, southwesterly to a narrows within the river channel that lies approximately 3000 ft northeast of Ravenna, is included in the analysis. This is because the area southwest of this position does not contribute to groundwater storage or recharge to the LACWWD-Acton area. The upstream boundary of the local groundwater basin for this study is considered to be the narrows through Soledad Pass, since surface and groundwater northeast of the narrows do not flow toward the LACWWD-Acton area. As shown on Plate 1 - Basin Boundaries and Water

S8931 - Acton Report

12

Service Area - the LACWWD-Acton area groundwater basin is comprised by the alluvial and stream terrace deposits which lie along the Santa Clara River and its tributaries between the Soledad Pass narrows and 3000 ft northeast of Ravenna.

#### CLIMATE

The climate of the Santa Clara River basin varies from a moist, Mediterranean-type near the Pacific Coast to a near-desert-type at the extreme eastern boundary, near the study area (Williams, 1979). Climate within the study area is characterized by long, dry summers and relatively short, wet winters. Typical temperatures in the area range from maximums of approximately 100° F during the summer to minimums as low as 30° F, or less, occasionally in the winters. Mean monthly temperatures range between approximately 77° F in summer to 48° F in the winter.

Though not reproduced herein, an isohyetal contour map prepared by Los Angeles County-Department of Public Works, has been reviewed to assess mean annual precipitation in the Acton watershed area (Nov. 1988 report). That isohyetal map was prepared for a period of record of 1897-98 through 1946-47, and it reveals the following for the area mapped on our base maps:

- a. Mean annual precipitation in the hills and mountains on the northerly and westerly side of Soledad Canyon (the Sierra Pelona) is relatively low. For the period of record, mean rainfall has ranged from about 8 inches per year in the northeastern portion of this watershed to about 12 inches per year in the southwestern portion of this watershed.
- b. Mean annual precipitation in the hills and mountains on the southerly side of Soledad Canyon (the San Gabriel Mountains) is relatively high. For the period of record, mean annual precipitation has ranged from about 32 inches near the watershed divide on the south to about 12 inches along the foothills of these mountains on the north

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

13

Rainfall data have been obtained from Los Angeles County Flood Control District for two rainfall gages, one near Blum Ranch in Aliso Canyon (Station No. 341, elevation 2900 ft) and one near Acton-Camp (Station No. 250D, elevation 2625 ft). Locations for the gage stations are shown on Plate 2. These data, which are presented in Tables 1.1 and 1.2, respectively, have been graphed (Figures 2.1 and 2.2, respectively) to show the accumulated departure in percent from the mean annual rainfall, for each station.

Review of the annual rainfall and cumulative departure data reveals the following:

1. Blum Ranch Gage (upstream area):
  - a. The average rainfall over the 1914-15 to 1987-88 period of record is 9.91 inches.
  - b. The historic high was 24.09 inches and occurred in 1977-78; 22.99 inches occurred in 1982-83 and 22.38 inches in 1940-41.
  - c. The historic low was 3.56 inches in 1959-1960; 3.79 inches occurred in 1950-1951.
2. Acton-Camp Gage (downstream area):
  - a. The average rainfall over the 1929-1930 to 1987-88 period of record is 10.22 inches.
  - b. The historic high was 26.96 inches in 1977-1978; 24.3 inches occurred in 1982-83.
  - c. The historic low was 2.97 inches in 1959-1960; 3.09 inches occurred in 1950-1951.

Approximately 80 percent of the average annual precipitation in the region occurs between November and March. Moreover, the bulk of these winter storms last for one to only a few days; relatively long periods of clear weather typically occur between these storms. Notable on Figures 2.1 and 2.2 is that the precipitation fluctuates widely from year to year.

CUMULATIVE DEPARTURE DATA: RAINFALL

GAGE NO. 341 BLUM RANCH ELEVATION 2900 FT

YEAR	PRECIP. (inches)	% OF AVG.	CUM. DEPARTURE
1915	12.78	128.96	28.96
1916	10.2	102.93	31.89
1917	6.76	68.22	0.11
1918	9.96	100.51	0.62

Figure 2.1  
Rainfall Cumulative Departure Curve

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

14

Figure 2.2  
Rainfall Cumulative Departure Curve

As seen on the cumulative departure curves, there have been pronounced periods of dry years followed by periods of wet years. However, no rhythmical or fixed cycle of fluctuations is detectable. For these cumulative departures, a positive (or upward) slope for each curve indicates above-normal rainfall, while a negative (or downward) slope indicates below-normal rainfall, regardless of the position of the curve with respect to the ordinate representing the long-term mean (*i.e.*, the zero percent cumulative departure).

For example, the period 1936 through 1946 on the cumulative departure curve for the Blum Ranch gage is characterized by positive (upward to the right) slopes; this is indicative of a hydrologically wet period which was characterized by an accumulation of years of average or above-average precipitation.

In contrast, the period 1947 through 1977 on the curves for both rainfall stations display a protracted, hydrologically dry period that was characterized by an accumulation of generally average or below-average rainfall (a negative or downward-sloping curve). The curves for both rain gages reveal a generally upward trend from 1977 to 1983, but since that time, the data appear to have begun a generally downward trend; deficient precipitation has occurred in the area in the past three to four years, including 1989-1990.

**DRAINAGE**

Regional drainage across this portion of Los Angeles County, and continuing westerly across Ventura County to the Pacific Ocean, is provided by the Santa Clara River (see Figure 1). The Acton area is located in the upper portion of Soledad Canyon, relatively near the headwaters of the Santa Clara River. The local watershed area comprises a total of approximately 55,600 acres (about 86 square miles), based on data presented by Brockmeier Consulting

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

15

Engineers, Inc. (1990, in conjunction with Geraghty & Miller, Inc.).

The nearest gage to measure surface water runoff in the Santa Clara River lies at Lang, several miles downstream from Acton (see Figure 1 for location of Lang). This gage (Station No. F93B-R) has a tributary drainage area of approximately 157 square miles. DWR (1968) reported that runoff in the Santa Clara River has ranged from nearly 550 percent of the mean to less than one percent. CRWQCB (1975) indicated that severe storms may cause river discharge to increase from nearly zero flow to flow as high as thousands of cubic feet per second within a few hours.

Principal tributaries draining in a southerly direction to their confluence with the Santa Clara River in Soledad Canyon include, from east to west across the study area: Soledad Pass, Acton Canyon, unnamed canyons leading to the Governor, Red Rover and Puritan Mines, and Jones Canyon. Principal tributaries which drain in a northerly direction to their confluence with the river include, from east to west: Kentucky Springs Canyon, Aliso Canyon, Arrastre Canyon, Bootleggers Canyon and Mattox Canyon.

Because the headwater areas of these drainages do not extend into high mountainous areas, and because the local climates preclude the buildup of large snowpacks in the watersheds, flow in all the stream canyons is considered to be ephemeral only and, thus, diminishes rapidly after most rainfall events.

For example, LACFCD records for the Santa Clara River gaging station near Lang date from 1949-50 and, through 1981-82, reveal the following information about flow variations:

- a) Mean daily flows ranged from a low of 0.2 cubic feet per second (cfs) in 1976-77, to a high of 29.3 cfs in 1951-52. One cfs equals about 450 gallons per minute. There are no data for 1968-69 which is known to have had very high rainfall and runoff.

S8931 - Acton Report

16

- b) Peak flows ranged between about 2 cfs (in 1950-51 and in 1956-57) to an estimated 5900 cfs in 1968-69.
- c) Total runoff ranged between 147 acre-feet (AF) in 1976-77 to 21,230 AF in 1950-51

In addition, during our field reconnaissance of January 12, 1990, the following runoff information was noted (this date was prior to any significant rainfall in the area): the channel of the Santa Clara River and all of its tributaries in the area mapped on Plate 1- Basin Boundaries and Water Service Area - contained no surface water runoff, except as noted below (all these channels are wholly unlined in the study area). Surface flows were observed as follows:

1. A flow of about 15 to 20 gpm was observed in Arrastre Canyon about 300 ft southeast of (upstream from) its confluence with the Santa Clara River in Soledad Canyon. Just upstream from this confluence, and including the channel near Acton Camp, there was no runoff in the channel of the Santa Clara River.
2. Just downstream from the above confluence, and very near the center of Section 11, T4N, R13W, surface flow in the Santa Clara River was estimated at 20 to 30 gpm.
3. Within the river channel and about 700 ft downstream from (southwest of) the center of Section 11, surface flow in the river was estimated to be at least 200 gpm.
4. Within the river channel and about 1000 ft downstream from the site in No. 3 above, surface flow was also estimated to be at least 200 gpm.
5. In the river channel just south of Ravenna, runoff was estimated at 75 gpm.
6. About 2500 ft downstream from Ravenna, surface runoff in the river was again estimated to be at least 200 gpm.

S8931 - Acton Report

17

### LOCAL WATER PURVEYORS

The study area lies within the service area of the Los Angeles County Waterworks District No. 37-Acton. As seen on Plate 1, the approximately 16-square mile service area of this District occupies the heart of the Acton region. The service area extends along the Santa Clara River-Soledad Canyon and includes Acton Camp at its southwesterly boundary. Much of the service area of the District extends northerly from the main river channel. Metered groundwater production data for 1989 for District well No. 37-1 was 1223 AF. Plate 1 shows this well lies near the intersection of Crown Valley Road and Soledad Canyon Road.

Other major producers in the study area include: Acton Camp which reportedly produced approximately 115 AF of groundwater from its two active wells in 1989 (see Plate 1 for locations; neither of these wells are metered); Big Dipper Water Delivery which lies just north of Acton Camp and which reportedly produced an estimated 107 AF from its unmetered well in 1989; Carson Brothers, which lies just north of the Big Dipper Water Delivery and which reportedly produced an estimated 75 AF of groundwater from its unmetered well in 1989; and the Acton School well, currently used for irrigation purposes only due to high nitrates and which, reportedly, produced on the order of 20 AF in the 1989 irrigation season.

Hence, groundwater extractions by major producers for municipal purposes in 1989 may reasonably be assumed to total about 1520 AF. An additional 20 AF were pumped for irrigation by the single Acton School well, and an unknown additional volume of groundwater was pumped from the remaining active wells in the main river channel and its tributaries to meet all remaining domestic, irrigation, and stock watering needs in the entire study area.

S8931 - Acton Report

18

### GROUNDWATER GEOLOGY

#### GENERAL STATEMENT

Geologic materials depicted on Plate 2 - Hydrogeology Map - have been divided according to their relative water-bearing characteristics, that is, to their relative ability to contain, transmit, and yield groundwater to wells. As such, two divisions can be recognized: a water-bearing sediment group (map symbols Qal and Qt) and a relatively nonwater-bearing rock group (all other geologic unit map symbols). Plate 2 provides the exposures and areal extent of these materials, together with local geologic structure, including some folds and bedding attitudes for sedimentary units and the alignment of major faults.

Depending on water levels, the water-bearing sediments can become saturated, thereby permitting them to provide water to wells. Thus, they constitute the groundwater reservoir of the study area. Underlying the water-bearing sediments in the valley areas, and exposed on all adjoining hill and mountain areas, is the relatively impermeable, nonwater-bearing bedrock.

#### WATER-BEARING SEDIMENTS

This group comprises two units, as follows:

- a. Undifferentiated Alluvium, of Holocene age (map symbol Qal). "Younger" alluvium consists of unconsolidated, poorly- to well-stratified clay, silt, sand and gravel and includes alluvial fan, flood-plain and streambed deposits.
- b. Terrace deposits and older valley fill, of Pleistocene age (map symbol Qt). Terrace deposits generally consist of porous well-drained silt, sand and gravel capped by fairly well-developed soil where the upper surfaces are preserved.

In general, these water-bearing strata are geologically younger, more permeable, less consolidated and less structurally

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

19

deformed than the nonwater-bearing underlying bedrock. The water-bearing sediments have been penetrated to various depths by wells in the basin and historically have provided virtually all of the groundwater extracted by these wells.

Analysis of available drillers' logs reveals that these sediments are composed of extensively interlayered and inter-fingered mixtures of gravel, sand, silt and clay with variable concentrations of cobbles and boulders. Due to its unconsolidated to poorly-consolidated condition, and its lack of cementation, Holocene alluvium is subject to rapid erosion. Correlation of individual strata from one well to another is difficult due to the manner of deposition of these stream-deposited alluvial deposits.

Alluvial sediments lie within and along the course of the upper Santa Clara River in Soledad Canyon and its main tributaries (refer to Plate 2 and Plate 3 - Hydrogeologic Sections A-A' and B-B'), while terrace deposits are located along the low lying flanks of the foothills and upper reaches of the tributaries. Thickness of alluvial sediments varies along the river, but the maximum appears to be approximately 225 ft, located near the community of Acton. Typically, the alluvium tends to be thickest near the central portion of the river and thins or pinches out as the flanks of the adjoining hills are approached (refer to cross sections also).

Alluvial thicknesses in all of the tributary canyons are considered to be less than that in the main river valley of Soledad Canyon. In general, larger watershed areas such as Arrastre, Aliso and Kentucky Springs Canyons are underlain by more areally extensive and thicker accumulations of alluvium than the smaller tributary canyons, which generally contain only terrace deposits. In the larger canyons, the maximum alluvial thickness occurs near the confluence with the main river valley and is on the order of 90 to 200 ft (see Plates 2 and 3).

S8931 - Acton Report

20

Older alluvium of late-Pleistocene age has been mapped to include the exposures of sediments that have been elevated onto mesas and terraces along the main river valley. These terrace deposits (map symbol Qt, on Plates 2 and 3) are considered to be of the same general composition as Holocene alluvium and were formed in much the same manner. Regional uplift and continued downcutting of the creeks and washes have left these terrace deposits elevated with respect to current stream gradients.

In general, the terrace sediments are more deeply weathered and characteristically reddish-brown in color; due to chemical and mechanical breakdown of the minerals within these sediments, there also tends to be light to moderate cementation by clays and/or iron oxides. These sediments are in relatively topographically-elevated positions in the study area, but appear to be in hydraulic continuity with the alluvial sediments, based on water level data. Maximum thicknesses of terrace deposits are approximately 195 ft in the Kentucky Springs area and 210 ft in the wide valley just north of the community of Acton (see Plates 1 and 3).

#### NONWATER-BEARING ROCKS

Underlying the water-bearing sediments in the study area are a series of consolidated, cemented sedimentary rocks of Tertiary geologic age, and/or an assemblage of crystalline or metamorphic rocks of pre-Tertiary age. This group is composed of the following units, from youngest to oldest:

- a. Punchbowl Formation, of Miocene and Pliocene age (map symbol Tpb). The formation is confined to the northeastern portion of the study area and consists of white, buff to pink sandstone, grey to red siltstone and clay shale, and grey to red conglomerate.
- b. Vasquez Formation, conglomerate and sandstone units (map symbol Tv), and volcanic rocks associated with the Vasquez Formation (map symbol Tvv), of Oligocene to Miocene age. The formation consists of up to 12,500 ft of red to light-brown, non-marine sandstone to cobble-boulder conglomerate units interlayered with nearly 4,200

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

21

ft of volcanic flows and volcanic sills of greenish-black basalt and dark reddish-brown andesite.

- c. Granitic rocks, of Jurassic and/or Cretaceous age (map symbol gr). Crystalline granitic rocks in the area are usually medium- to moderately-coarse-grained, orange- to pinkish-grey, quartz-rich and massive to crudely-foliated.
- d. Diorite, quartz diorite and granodiorite, of Jurassic and/or Cretaceous age (map symbol gd). These crystalline rocks are grey-white, massive, medium-grained and weather grey-buff from iron-oxide staining.
- e. Quartz-bearing syenite, of pre-Cambrian age (map symbol sy). The crystalline syenite appears to be a differentiation product of the original anorthositic magma. Iron-bearing units are light-brown to grey, massive and medium-grained.
- f. Mafic gabbroic rocks, of pre-Cambrian age (map symbol gb). Gabbroic rocks are part of the anorthosite-gabbro-syenite layered intrusive complex. These crystalline rocks may be mottled to very dark, banded, with coarse- to fine-grained texture.
- g. Anorthosite, of pre-Cambrian age (map symbol an). These rocks are white, bluish-grey to light grey, medium- to coarse-grained and consist almost entirely of plagioclase feldspar.
- h. Gneissic metamorphic rocks, of pre-Cambrian age (map symbol gn), are composed of blue-quartz-feldspar gneiss with some recrystallized limestone and quartzite.
- i. Pelona schist, of pre-Cambrian age (map symbol ps). This metamorphic unit consists of silvery-grey to dark green, strongly foliated mica and chlorite-actinolite schist with a few beds of quartzite and marble.

In general, the older sedimentary and/or volcanic units (Punchbowl and Vasquez Formations) are exposed along the flanks of the hills and mountains which border the Santa Clara River valley in Soledad Canyon while the older crystalline and metamorphic rocks crop out in the upper watershed areas of the Sierra Pelona and the San Gabriel Mountains. The pre-Cambrian units consist of an

S8931 - Acton Report

22

anorthosite-gabbro-syenite layered intrusive complex which intruded into older gneissic metamorphic rocks. The Pelona schist is confined to the northern part of the study area, along the southern flank of the east-west-trending Sierra Pelona Mountains.

Due to their cemented and/or crystalline nature, the above rocks possess only secondary porosity and may contain groundwater only along bedding planes, joints, shears or fractures. As a result, and due to their structural complexity and low permeability, these rocks are not considered capable of yielding water readily to wells. Moreover, they have a very limited storage capacity, and their ability to provide long-term sustained yields to wells is unpredictable. These cemented and/or crystalline rocks are not considered part of the groundwater reservoir in the Acton study area.

GEOLOGIC STRUCTURE

The principal geologic structures in the Plate 2 mapped area are the northwest to southeast-trending Kashmere Valley and Acton faults and the west to northeast-trending Soledad fault system. In the northeast corner of the mapped area is a small portion of the Nadeau fault, a branch of the northwest to southeast-trending San Andreas fault. The Acton area consists, essentially, of a relatively thin mantle of alluvial and terrace deposits overlying vast thicknesses of Miocene to Pliocene sedimentary and volcanic rocks, intrusive crystalline basement and older metamorphosed country rock.

The faults, as mapped by others, are recognized as rupturing certain bedrock formations of relatively old geologic age and/or juxtaposing separate bedrock formations of different geologic ages. However, those previous investigators did not reveal whether or not any of these faults are active or potentially active, and they did not definitively state whether or not any of these faults are considered to offset the geologically young alluvium or stream

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

23

terrace deposits in and along Soledad Canyon. Further, it is not within the scope of work for this investigator to determine the relative degree of activity for any of the faults in the area mapped on Plate 2.

As a result wherever any of the fault traces cross the alluvium or terrace deposits on Plate 2, the fault alignment is indicated by a dotted pattern. Such a pattern reveals the fault alignment in that area is either not known with certainty, and thus inferred, or is doubtful and questioned.

Because of the active scouring and/or alluviation of the youthful alluvial river deposits, it is probable that the faults neither intersect the alluvium nor create any groundwater barriers within the alluvium in the study area; this includes such faults as the Soledad, the Kashmere Valley, and the Acton faults (see Plate 2). Groundwater contours inferred within Soledad Canyon as discussed later in this report, do not clearly reveal the presence of any groundwater barriers created by faults displacing the alluvium.

#### HYDROGEOLOGY

##### GROUNDWATER OCCURRENCE, RECHARGE AND DISCHARGE

Within the saturated zone of the water-bearing alluvial and terrace deposits of the Acton basin, groundwater occurs in the pore spaces and voids between the individual sedimentary grains. In general, water table conditions appear to prevail throughout the alluvial and terrace deposits, although semi-perched conditions may exist locally in portions of the main river valley and its tributary canyons, particularly within the terrace deposits. Due to the mode of deposition of these materials, sedimentation of thick and areally extensive clay layers has been precluded; as a result, confined artesian conditions have not been developed.

S8931 - Acton Report

24

Natural sources of recharge to the groundwater reservoir within the alluvium and terrace deposits include: deep percolation of direct precipitation; infiltration of stream runoff in the river valley and its tributaries; and subsurface inflow, depending on water levels from the adjoining hill and mountain areas. The relative magnitude of each of these recharge sources has not been quantified for this investigation, due principally to a lack of requisite data.

Man-made sources of recharge to the alluvium and terrace deposits systems include: deep percolation of irrigation returns and returns from private subsurface sewage disposal systems. No artificial recharge operations, either by direct surface spreading basins or by shallow well injection, have historically been utilized in the river valley to make use of excess surface runoff, or of imported water, for purposes of augmenting water levels in the alluvium or terrace deposits.

Outflow or discharge from the alluvium and terrace deposits occurs by water well extractions by LACWWD-Acton, by Acton Camp, and by the various private water companies, housing tracts and ranches in the region. Additional discharge is known to occur by: subsurface outflow to the downstream Eastern Groundwater Basin to the west; surface outflow from the area of rising water within the alluvium located downstream from the Acton Camp; subsurface outflow, depending on water levels, to the permeable or fractured portions of the Vasquez Formation and older crystalline or metamorphic rocks which underlie the alluvium and/or terrace deposits; and evapotranspiration in areas of phreatophytes that grow in the downstream reaches of the main river valley where rising water is known to occur.

The approximate zone(s) of rising water and roughly estimated amounts of rising water (as observed during a field reconnaissance on January 12, 1990) were discussed previously in the Drainage section of this report. Also, the only estimates of natural

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

25

recharge to the Acton area were provided by Geraghty & Miller, Inc. (in the Brockmeier report, dated Feb. 1990). In that report, they determined the annual recharge to the Acton area to be approximately 11,100 acre-feet per year (AF/yr), calculated as the difference, over the entire Acton region, between annual rainfall (10.42 inches for their period of record) and the average groundwater recharge threshold value (they used 8 inches of rainfall).

Their total watershed area was determined to be approximately 55,600 acres, defined as follows:

- a. 45,000 acres of watershed which drains into Soledad Canyon from the watershed divides to the north in the Sierra Pelona and to the south in the San Gabriel Mountains, as measured from the narrows on the northeast at Soledad Pass, just southwest of Kentucky Springs Canyon, to the narrows on the southwest located between Arrastre Canyon and Bootleggers Canyon. (Plate 6 later in this report uses these same two narrows locations in Soledad Canyon for boundaries used herein for calculations of groundwater in storage.) Recharge from this watershed represents 9000 AF/yr of the 11,100 AF/yr total annual recharge.
- b. An additional 10,600 acres in the northeast which consists of the watershed that drains into upper Soledad Canyon from the Soledad Pass area and Kentucky Springs Canyon. Recharge from this watershed represents the remaining 2100 AF/yr of the total 11,100 AF/yr of recharge described above.

For comparison, a typical "rule-of-thumb" estimate of annual recharge within a watershed is to multiply the total watershed size (55,600 acres), by the average annual rainfall on the entire watershed area (about 12 to 16 inches, or 1.0 to 1.3 ft), by a factor of about 10 percent (0.10). Such a calculation suggests a total annual recharge to the area of about 5600 to 7200 AF/yr.

Average annual basin outflow as measured at the narrows locations within Soledad Canyon just downstream from Arrastre Canyon were calculated by Geraghty & Miller, Inc. (Brockmeier report of Feb. 1990) to be approximately 11,100 AF/yr. That calculation included: 2100 AF/yr of subsurface outflow through the

S8931 - Acton Report

26

alluvium in the canyon itself; and an additional 900 AF/yr of surface water runoff at that location.

For our assessment of subsurface groundwater outflow from the alluvium within the narrows of Soledad Canyon just downstream from Arrastre Canyon, we relied on the Darcy equation. Here, subsurface outflow,  $Q$  (gallons per day, gpd) is equal to the product of: the permeability  $P$  of the sediments (gpd per square foot, gpd/ft<sup>2</sup>); the groundwater gradient  $I$  (feet per foot, ft/ft); and the cross sectional area of saturated flow  $A$  (square feet, ft<sup>2</sup>).

Hence, the relationship used was  $Q = PIA$ . Our estimates of alluvium permeability are on the order of 1000 gpd/ft<sup>2</sup>. The groundwater gradient, as discussed later in this text and as adapted for this downstream reach of Soledad Canyon, ranges between approximately 0.017 ft/ft for a relatively wet hydrologic period (November 1983 to May 1984) and 0.012 ft/ft for a relatively dry hydrologic period (November 1964 to December 1965).

Also, the cross sectional area of flow, as discussed later in this text and as taken at the location of this same narrows in the canyon, is determined by the product of: the width of the alluvium at the narrows, which is approximately 1500 ft; and the thickness of the zone of saturated alluvium, which ranges from 100 ft in a relatively wet period to about 60 ft in a relatively dry period (as adapted from data on storage units and subunits later in this text). The least well known of the variables is the value for sediment permeability.

Regardless, the requisite calculations for subsurface outflow within the alluvium at the downstream terminus of the Acton basin, as defined herein, show the following:

- a. for a relatively wet period, an outflow of about 2800 AF/yr;
- b. for a relatively dry period; an outflow of about 1200 AF/yr.

27

WATER LEVELS

To evaluate the status of groundwater levels and flow directions in the study area, the elevation of the water table at numerous points must be obtained. When lines connecting points of equal water table elevation are drawn, the lines represent contours of equal elevation of the water table. Construction of water level contour maps requires obtaining non-pumping water depth measurements for a specific time period from wells spaced throughout the study area. These water level depths are then corrected for elevation, plotted on a map, together with the well location and well identification, and then contoured.

Groundwater flows from high head to low head, and hence, flow directions are perpendicular to the contour lines themselves. However, it should be noted that because most wells in the region contain relatively long lengths of continuously perforated casing, groundwater enters the well bore from all strata encountered by the well. This precludes analysis of water movement in individual aquifers. Also, because there is not an even distribution of wells throughout the study area, there are numerous data gaps and contour lines must be interpolated in these areas. Lastly, it should be noted that some reported water levels are questionable and likely relate to some form of measuring error.

For this investigation, two time periods were selected to represent basin-wide groundwater conditions and the direction of groundwater flow. The period from November 1964 to December 1965 was selected because it represents that period of time for which water level data are available when water levels in the study area were at or near their all-time low (a hydrologically dry period). The period from November 1983 to May 1984 was selected because it represents the all-time high period (a hydrologically wet period) for which water level data are available in the project area.

S8931 - Acton Report

28

As shown on the rainfall cumulative departure curves (Figures 2.1 and 2.2), the all-time high for precipitation appears to have occurred from 1944 to 1947. However, no water level data for this period are available, therefore, the second period of high water levels which occurred in response to above-average precipitation during the period 1978 to 1983 was used to represent high water levels.

Data was obtained for the low and high groundwater level contour maps from basic water level readings for wells in the region that were on file at LACFCD. These readings were annotated for each water well monitored, and then contoured as illustrated on Plates 4 and 5 - Groundwater Contours - for the periods November 1964 to December and 1965 to November 1983 to May 1984, respectively.

As described in other sections of this report, the alluvium and terrace deposits in the study area are divided into numerous subunits, or storage units, the boundaries of which have been selected on the basis of geologic and topographic features. However, in describing groundwater movement, the alluvial and terrace deposits are considered to be a single entity across the study area from the Soledad Pass watershed divide on the east, to the narrows at the downstream end of the study area which lies approximately 3000 ft northeast of Ravenna on the southwest side of the study area. The location and areal extent of the alluvium and terrace deposits are shown on Plate 1 (and in further detail later in this text on Plate 6).

During the water level low period of November 1964 to December 1965, groundwater levels in the investigation area varied in elevation from 3050 ft above sea level at the easterly limits of the study area in Soledad Pass to 2450 ft at the westerly limits near Ravenna. Highest groundwater elevations were exhibited in terrace deposits in the upper portions of Kentucky Springs Canyon, where groundwater reached a maximum elevation of 3950 ft above sea

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

29

level. Groundwater movement was to the west in the main channel of the Santa Clara River in Soledad Canyon, generally to the south in tributary canyons lying north of the river, and to the north in the southern tributaries.

Depth to water in the terrace deposits during the water level low period of November 1964 to December 1965 period in the study area is considered to be moderately deep, with typical water levels being 150 to 200 ft below ground surface, except in Arrastre and Aliso Canyons, where typical water levels were on the order of 25 to 50 ft below ground surface. Depth to water in the alluvium during this low water level period ranged from 100 to 180 ft below ground surface except for the area of rising groundwater near Acton Camp, where depth to water ranged from 40 to 60 ft below ground surface.

During the water level high period of November 1983 to May 1984, groundwater levels in the study area varied in elevation from 3150 ft above sea level in Soledad Pass to 2450 ft near Ravenna. Highest groundwater elevations of 4000 ft above sea level occurred in terrace deposits in Kentucky Springs Canyon. Depth to water in the terrace deposits during this period ranged from 20 to 70 ft below ground surface, while depth to water in the alluvium was on the order of 10 to 40 ft below ground surface except in the river channel southwest of Acton Camp, where water levels were just below, or occurred at ground surface as rising waters.

Notable in an analysis of water level contour data for both the low period of November 1964 to December 1965 and the high period of November 1983 to May 1984 is the fact that water levels in the alluvial and terrace deposits fluctuated rapidly and to a large degree in response to wet and dry conditions; this occurred not only in individual areas or individual wells, but in general throughout the entire study area. Such a condition of rapid and/or large scale water level fluctuation results from a combination of

S8931 - Acton Report

30

sediments with high permeability, and aquifers of limited areal extent and/or of limited storage capacity.

Review of the groundwater contours for the hydrologically dry and wet periods (Plates 4 and 4) indicates that the gradients for any particular canyon are relatively similar regardless of the climatic period. The overall gradient,  $I$ , within the alluvium of the river from the northeast to the southwest limits of the Acton basin, as defined herein, are approximately: 0.014 ft/ft, about 73 ft/mi for the dry period (Plate 4); and 0.016 ft/ft, about 86 ft/mi for the wet period (Plate 5).

Similar calculations, but only for the reach of the river near Acton Camp, near the downstream end of the basin, reveal the following:

- a. in the dry period,  $I = 0.012$  ft/ft, or about 64 ft/mi;
- b. in the wet period,  $I = 0.017$  ft/ft, or about 91 ft/mi.

This indicates that the subsurface outflow from the basin below Acton Camp would be greater by the ratio of 91/64, or about 1.42 times larger in the wet period compared to the dry period, assuming that the other two variables in the Darcy equation were constant (specifically, the thickness of the saturated zone of the flow, and the permeability of the alluvial sediments). It should be noted that the thickness of the saturated zone does change depending on long-term climate (see discussion of storage subunits later in this report) and on sediment permeability. The least known and/or tested of these variables is sediment permeability.

**HYDROGRAPHS**

Water level fluctuations in 12 wells in the study area were obtained from various data repositories and plotted versus time to construct water level hydrographs. The hydrographs, as presented in Figures 3.1 to 3.9, reveal the continuous adjustment of groundwater in storage to changes in basin-wide recharge and discharge. The hydrographs permit the assessment of both long-term and short-

S8931 - Acton Report

31

term seasonal changes occurring within the aquifer systems comprised by the alluvium and by the terrace deposits.

Due to the sporadic nature of water level data collection in the Acton area, three of the hydrographs consist of pairs of nearby wells, the first well covering the period from the early 1950s to the mid-1960s, and the second well covering the period from the late 1960s or early 1970s to the present. Of the remaining six wells, five have data gaps from the mid-1960s to the mid-1970s.

Assessment of the hydrographs is supplemented with the use of precipitation data shown on Tables 1.1 and 1.2 and the cumulative rainfall departure curves on Figures 2.1 and 2.2, for Blum Ranch and Acton Camp, respectively.

The specific wells for which hydrographs have been prepared include (see well locations on Plate 1):

- a. Wells 4N/12W-2E1 and -2E2 which are located in the central portion of Kentucky Springs Canyon, south of Soledad Canyon (Fig. 3.1).
- b. Well 4N/12W-11G1 located in the southern portion of Kentucky Springs Canyon (Fig. 3.2).
- c. Well 4N/12W-5G2 located in Aliso Canyon, south of Soledad Canyon (Fig. 3.3).
- d. Well 5N/12W-28F3 located in the zone of terrace deposits which lies near the Vincent Fire Station, just north of Soledad Canyon (Fig. 3.4).
- e. Well 5N/13W-25C1 located in the zone of terrace deposits near the freeway, north of Acton and Soledad Canyon (Fig. 3.5).
- f. Well 5N/13W-25L1 located in the terrace deposits, between Acton and the freeway, north of Soledad Canyon (Fig. 3.6).
- g. Wells 4N/13W-1C1 and -1C2 (also known as LACWWD Well No. 37-1), located at Acton, within the deposits of the Santa Clara River (Fig. 3.7).
- h. Well 4N/13W-12C3 (also known as Acton Camp No. 3), located within the deposits of the Santa Clara River (Fig. 3.8).

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

32

- i Wells 4N/13W-10R1 and -15A1, located in Soledad Canyon, near Ravenna (Fig. 3.9).

Inspection of the water level fluctuations on Figures 3.1 to 3.9 indicates that changes in groundwater in storage in the study area occur both in the short-term (seasonal) and in the long-term (period of several years).

Short-term, seasonal water level fluctuations are typically in the range of 2 to 10 ft, except for well 4N/12W-5G2 (Fig. 3.3) which displays several seasonal fluctuations in recent years of 20 to 30 ft. For the hydrographs, annual water level highs tend to occur in the spring months (following increased recharge and decreased groundwater pumpage), while the water level lows tend to occur in the fall months (following decreased recharge and increased groundwater pumpage). Rapid and large scale water level rises are commonly observed immediately following large rainfall and/or surface runoff water events and/or rainfall seasons (e.g., see the large rise in early 1978 for well 4N/12W-5G2 on Fig. 3.3 following very high winter-spring rains).

Longer term water level fluctuations reveal the results of basin-wide trends in long-term rainfall, runoff, and deep percolation (recharge). Typical long-term trends for the hydrographs include: a general water level declining period extending (data permitting) from the 1950s, through the 1960s and into the mid-1970s; this is followed by a relatively rapid period of rising water levels into the mid-1980s; and following that, a return to a period of water level declines. Figures 3.1, 3.2, or 3.7 depict these relationships effectively. It is notable that these water level "trends" are analogous to the trends in the cumulative rainfall departure curves (Fig. 2.1 and 2.2).

THEORETICAL AQUIFER PARAMETERS

To assess well yields and aquifer parameters, the water transmitting, or hydraulic properties of the aquifers must be

S8931 - Acton Report

33

evaluated. These aquifers represent the water-bearing zones in the groundwater reservoir; that is, those strata comprised of permeable sandy or gravelly materials, or both, which are mixed with lesser concentrations of silt and clay. The arrangement, sorting, shape, and size of the individual grains in the aquifers control the ability of water to move through the strata.

Characterizing the water transmitting properties of the aquifers are the aquifer coefficients of transmissivity (symbol T, in gallons per day per foot of aquifer, gpd/ft), and storativity (S, in cubic feet per square foot per foot, ft<sup>3</sup>/ft<sup>3</sup>). An additional parameter, permeability (P, in gallons per day per square foot, gpd/ft<sup>2</sup>) can be calculated from T values, or is determined by field tests or by soils laboratory testing of aquifer samples.

Transmissivity and permeability will be discussed in this section of the report. Storativity, the amount of storage in the reservoir, will be discussed in the Geohydrology section.

Typically, T is calculated from aquifer tests conducted in the field on individual pumping wells (based on water level drawdown and recovery measurements versus time). Due to a virtual absence of requisite field data in the basin, such direct calculations of transmissivity were not possible.

Instead, an empirical method of assessing T values was used for this project in order to review the relative ability of the local aquifers in the basin to yield water to wells. This method determines the theoretical value of transmissivity by relating T to the specific capacity of the well.

For the assumed water table conditions in the study area, the empirical relationship is approximately:

Theoretical T = 1750 Q/s, where Q/s is the specific capacity of the well;  
Q is the well yield in gpm;  
s is the amount of drawdown, in feet, created in the well by that pumping rate;  
1750 is an empirical constant.

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

34

Actual values of Q and s are generally obtainable from data on drillers' logs or from efficiency tests conducted on local wells by the Edison Company. Again, however, data are meager.

Using data from the well logs, and based on the empirical formula above, theoretical T values for a few wells were then calculated. Because aquifer T values are additive, it follows that if wells were drilled deeper into the alluvium and/or terrace deposits, then the overall T value would increase at that particular location.

It must be recognized that such calculations of theoretical T relate directly to the age, efficiency, condition, and design of the well and its perforations. This is because the key factor in the calculation is well drawdown (symbol, s). Drawdown, in turn, is a measure of the head loss for water entering the well perforations as a result of pumping. Wells that are old, have inefficient designs, that contain precipitates or encrustation on perforations, or that have limited open areas in their perforated intervals will have larger head losses (drawdown) than wells with the opposite of such conditions.

Using existing information for specific capacity, the following are derived:

- a. A new well for Acton Camp (No. 4; 130 ft deep, perforations from 40 to 100 ft) was reportedly test pumped in late-1989 (information from Brockmeier Consulting Engineers, Inc.), and produced 800 gpm with a drawdown of 60 ft, and 1100 gpm with a drawdown of 104 ft (initial static level = 18 ft); the length of the tests is not known. Resulting specific capacities are 13.3 and 10.6 gpm per foot of drawdown, respectively. These data suggest T values in the range of 23,000 and 18,500 gpd/ft, respectively. The decrease in the T value at the higher pumping rate indicates that the 1100 gpm is excessive for this well. In addition, both pumping rates created pumping levels (78 ft and 122 ft, respectively) that are below the uppermost perforations in this well (40 ft).
- b. Acton Camp Well No. 3, drilled in 1962, displayed an original pumping rate of 1000 gpm from a pumping level of

S8931 - Acton Report

35

95 ft, after 50 hours of pumping according to well log records (static level of 37 ft; top of perforations at 42 ft). These data indicate a specific capacity of 17.2 gpm per foot of drawdown, and a transmissivity of about 30,100 gpd/ft. At a pumping rate of 700 gpm, the well showed a specific capacity and transmissivity of 16.3 gpm per foot of drawdown and 28,500 gpd/ft, respectively.

A 1984 Southern California Edison Company efficiency test of this well showed a pumping rate of 249 gpm from a pumping level of 10 ft (water levels were high in the area in the early-1980s). This calculates to a specific capacity and transmissivity of approximately 65 gpm/ft of drawdown and 114,000 gpd/ft, respectively.

- c. Several miles upstream near the intersection of Carson Mesa Road and Aliso Canyon Road, a 354-foot deep well drilled in September 1989 (perforations from 134 to 354 ft) reportedly revealed a specific capacity of 70 gpm per foot of drawdown, at a pumping rate of 350 gpm. If accurate, this would suggest a T value on the order of 120,000 gpd/ft.
- d. A 260-foot deep well drilled in September 1989 for Acton I Builders Group revealed pumping rates of 400 to 500 gpm, specific capacities in the range of 10.2 to 10.5 gpm per foot of drawdown, and T values of 17,800 to 18,400 gpd/ft, respectively. This well also lies in the main portion of Soledad Canyon, relatively near the one discussed above.
- e. LACWWD Well No. 37-1 (232 ft deep, perforations from 70 to 209 ft) is located in the river area near Acton, and showed a pumping rate of 1000 gpm from a depth of 90 ft when first drilled in 1967 (static level = 75 ft). These data show a Q/s = 66.6 gpm per foot of drawdown and a T = 116,700 gpd/ft.

To evaluate sediment permeability, it is necessary to utilize transmissivity (T) and the relationship  $T = Pm$ , where P = permeability (in units of gallons per day per square foot, gpd/ft<sup>2</sup>), and m = aquifer thickness (in ft). This relationship must be used for Acton because no laboratory permeability test data are available in the literature. Also, when the full aquifer thickness is not known, it is possible to have m = total footage of perforations in the well.

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

36

Job S8931

Figure 4  
Trilinear Analysis Diagram

Hence, for the wells discussed above, theoretical permeability values would be as follows:

- a. For the 60 ft of perforations in the new Acton Camp well, P would be approximately 400 to 300 gpd/ft<sup>2</sup>, respectively.
- b. For Acton Camp No. 3 (100 total feet of perforations) theoretical P would be approximately 300 gpd/ft<sup>2</sup> for the original 30,000 gpd/ft transmissivity. For the 1984 Edison test, theoretical P would be approximately 1140 gpd/ft<sup>2</sup>.
- c. For the new well near Carson Mesa and Aliso Canyon roads (220 ft of perforations), P would be approximately 550 gpd/ft<sup>2</sup>.
- d. For the Acton I Builders Group well (150 ft of perforations), theoretical P would be approximately 120 gpd/ft<sup>2</sup>.
- e. For LACWWD Well No. 37-1 (139 ft of perforations), the theoretical P value would be on the order of 840 gpd/ft<sup>2</sup>.

**GROUNDWATER QUALITY**

Concentrations of dissolved mineral constituents in groundwater are influenced by the quantity and quality of groundwater which percolates into the groundwater reservoir. Once in the ground, the water quality is influenced by such factors as: the lithology and age of the sediments through which it flows; the rate of groundwater flow; the rates and locations of recharge; fluctuation in basin-wide water levels; well construction and abandonment techniques; methods of water sampling; the locations for and qualities of any artificially-recharged waters; and the proximity to sources of potential degradation such as irrigation-return waters, and industrial discharges, or deep percolation of sewage effluent from the multitude of leachfields in the Acton region.

Identification of the chemical character of groundwater in the Acton area has been determined by the construction of a Trilinear Analysis Diagram - Figure 4. Trilinear diagrams are prepared using the percent reactance values of the principal cations and anions

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

37

listed in the original laboratory analysis of the well water. Total dissolved solids (TDS) values used in this study are for total filterable residues and not the higher values historically reported as the summation of constituents; this is consistent with TDS values currently reported by local laboratories.

Figure 4 presents the results of the required calculations for: two relatively deep wells drilled in the region of terrace deposits which may also contain perforations within and produce some water from fractured bedrock (diagram symbols 1 and 2); for two wells probably producing only from terrace deposits (diagram symbols 4 and 5); and for five wells probably producing only from alluvium (diagram symbols 3, 6, 7, 8 and 9). The well represented by symbol no. 9 is located at the western limits of the study area, near Ravenna. Well data is the most recent available and ranges from June, 1988 to July, 1989. The only surface water samples available date from January, 1969, and represent pre- and post-flood periods for a station at Lang, a few miles downstream (diagram symbols 10 and 11).

All the samples show similar calcium-magnesium-bicarbonate character except Nos. 4 and 5, which show calcium-magnesium sulfate character due to a higher sulfate ion concentration. These two wells are located in the broad valley north of Acton community and are part of a four-well group (diagram symbols 3, 4, 5 and 6) situated in the more developed parts of the Acton basin which also display elevated nitrate ion concentration (as  $\text{NO}_3$ ) ranging from 17.0 to 24.7 mg/l. In contrast, the remaining wells on Figure 4 display nitrate levels ranging from 3.9 to 11.0 mg/l. An evaluation of the present nitrate situation in the Acton area, together with an assessment of possible future changes in this ion with time due to proposed developments in the Acton area, are provided in the Geraghty & Miller, Inc. report for Brockmeier Consulting Engineers, Inc. (Feb. 1990).

S8931 - Acton Report

38

Total dissolved solids concentrations for existing data range from 279 to 480 mg/l while total hardness (TH) ranges from 172 to 271 mg/l. There does not appear to be any obvious relationship between TDS or TH concentrations for wells producing from terrace deposits versus alluvial wells.

Comparison of historical quality data with hydrographs of water levels for nearby wells (Plate 2, Figures 3.1-3.9), suggests that TDS may have responded inversely to precipitation (recharge). That is, as water levels rose within the alluvium and terrace deposits in response to direct and rapid infiltration of precipitation and stream runoff, the TDS content in wells tended to decline because of large dilution effects of recharge. Similarly, the surface water samples at Lang (symbols 10 and 11, Figure 4) for January 20 and 21, 1969, show a decrease in TDS and TH with an increase in flow from 10 cubic feet per second (cfs) to an estimated 500 cfs, after heavy rainfall and flooding.

#### GEOHYDROLOGY

##### GENERAL STATEMENT

Within a groundwater basin, the available groundwater storage capacity represents the total volume of water that can be held in underground storage at a given period of time and that can become readily available for extraction by wells. For the water table environment in the Acton area, the groundwater storage capacity potentially available for extraction by wells depends on the total volume of the alluvial and terrace deposits that are, or can become, saturated in the groundwater reservoir, and on the specific yield of those sediments. Hence, groundwater in storage is a constantly changing value which fluctuates in response to both seasonal and long-term changes in recharge to, and discharge from, the groundwater reservoir. A rising water table increases the thickness of the saturated water-bearing section, which results in

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

39

a greater volume of groundwater in storage; the reverse is true for a declining water table (a decreasing saturated thickness).

To be usable, the void space or reservoir space for groundwater storage in a given volume of sediments must have at least two capabilities: it must be economically capable of being dewatered during periods of deficient surface supply; and it must be capable of being re-saturated either naturally or artificially during periods of excess surface supply. Thus, the groundwater reservoir must contain usable water, which may be defined as that having a satisfactory quality for prevailing beneficial uses and that occurring in sufficient quantity in the underground reservoir to be available without uneconomic yield or excessive drawdown.

Within the water table conditions in the study area, the amount of water available for use at the beginning of the pumping season is dependent entirely upon the amount of water which the formations will yield by gravity when the water levels are depressed by pumping.

For this investigation, it was necessary to assess the quantity of groundwater in storage during periods of average or above-average rainfall; from these calculations, it is then possible to determine the change in storage in response to the quantity of precipitation.

Also, the aquifer system within the study area is comprised of alluvial and terrace deposits derived from the surrounding highland areas and deposited as interfingering lenses of clay-, silt-, sand-, gravel- and boulder-sized sediments. The materials vary in composition and grain size vertically as well as horizontally, and tracing of individual beds or units was not possible. Because the aquifer system is both heterogeneous and non-isotropic, it was considered unreliable to merely select an average thickness for the alluvial and terrace deposits and to apply this value throughout the study area. Likewise, it was deemed inadvisable to select one value of specific yield for all of the alluvial and terrace

S8931 - Acton Report

40

deposits and to utilize this single value for computational purposes.

GROUNDWATER STORAGE CAPACITY

To quantify the volume of groundwater in storage that is potentially available for extraction, it is necessary to multiply the total volume of water-bearing sediments by the specific yield of the various strata. In this assessment, specific yield represents the ratio of the volume of water which can be drained by gravity from a saturated stratum to the unit volume of that stratum. The procedure for calculating storage capacity involved the following steps:

1. Subdivision of the study area into individual groundwater storage units within the alluvium and also within the terrace deposits.
2. Assessment of the total thickness of potentially saturated sediments in each of the two storage units.
3. Grouping of earth materials described on drillers' logs into categories based on grain size.
4. Assignment of specific yield values to each category of earth materials.
5. Computation of groundwater storage capacity (SC) using  $SC = Ams_y$ , where A = surface area of the storage unit, m = thickness of potentially saturated deposits in that unit, and  $S_y$  = the assigned specific yield.

STORAGE UNITS AND SEDIMENT THICKNESSES

The first step in determining storage capacity is to subdivide the study area into individual groundwater storage units. To accomplish this, boundaries of the storage units were selected to coincide with either surface or subsurface geologic features or topographic features such as canyon "narrows," obvious surface "divides," or similar features. The purpose of using such subdivisions was twofold: first, our study area was too large and

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

41

had to be divided into smaller, more-easily-managed units; and second, hydrogeologic features varied markedly throughout the investigation area.

As a result, two separate storage units were selected: Unit No. 1, alluvium (map symbol Qal) and Unit No. 2, terrace deposits (map symbol Qt). Unit No. 1 was divided into nine separate subunits and Unit No. 2 was divided into 18 separate subunits. As illustrated on Plate 6 - Groundwater Storage Units, the two storage units are of different areas and geometry. Based on our field reconnaissance in January 1990, the alluvial and terrace deposits contacts on Plates 2 and 5 have been modified from the published geology (as shown on Plate 1) in order to more accurately represent the surface extent of the alluvial and terrace deposits that are being studied for this investigation. Our interpretation of the relationship between the alluvium and the terrace deposits, and the surrounding older nonwater-bearing rocks, is presented in cross-sections A-A' and B-B' (Plate 3). Locations of the cross-sections are shown on Plate 2.

To assess the quantity of groundwater in storage at any given time that is potentially available for extraction by wells, it was necessary to assign specific yield values to each subunit and to multiply this figure by the volume of saturated sediments in the subunit. The volume of saturated material is a product of the area of the individual subunit and the saturated thickness of the material underlying the particular subunit, multiplied by a correction factor to take into account the fact that: the sides of the subunits are not vertical; and the base of the subunit is not a horizontal plane. The total planimetered surface area in each subunit was reduced by a factor of 25 percent to account for the reduction in volume of the subunit caused by the sloping sides of the canyon walls which adjoin the channels and valleys.

To ascertain the thickness of the saturated material, it is necessary to determine the base of the fresh water-bearing

S8931 - Acton Report

42

sediments and the elevation of the water table at a specific time period within each of the subunits. Maps depicting the elevation of the water table for specific time periods (November 1964 to December 1965 and November 1983 to May 1984, as seen on Plates 4 and 5) were used for these purposes. The initial interval represents a water-level low period which had been preceded by a series of dry years while the second interval represents a water-level high period following several years of above-average precipitation.

Lastly, the following important assumptions were used:

1. All surface boundaries were considered to be sloping planes.
2. The depth to water in each storage subunit was averaged across the subunit to create a flat water table and a uniform thickness of saturated sediments across each particular subunit.
3. The base of fresh water for each storage subunit was averaged across that subunit to create a flat bottom for each particular subunit; however, the volume of saturated material was corrected, as described above.

#### SPECIFIC YIELD VALUES

Specific yield in water table environments represents the quantity of water that a unit volume of the material will release from storage when drained by gravity. The part of the water that is not removed by gravity during drainage is held against the force of gravity by such conditions as molecular attraction and capillarity; this water is not available to wells.

For this investigation, drillers' logs or other lithologic data were available for approximately 30 wells and test holes. Those locations completed as wells are shown on Plate 1. Specific yield values were obtained from studies of sediments similar to those at Acton where terms from drillers' logs had been empirically matched to specific yield for the wells in question.

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

43

Specific yield values were determined to range from 10 to 19 percent in the alluvium and from three to five percent in the older, more highly weathered terrace deposits. The higher values of specific yield were found to be restricted to only a few alluvial storage units. Once a determination was made of the specific yield values for selected wells, each storage subunit was assigned a single value which was considered to best represent that entire subunit.

ESTIMATED QUANTITY OF GROUNDWATER IN STORAGE

The estimated quantity of groundwater in storage that is potentially available for extraction within the investigation area was computed by multiplying the area of each storage subunit by the saturated thickness of that storage subunit (based on the water table elevation for that particular period), and by the specific yield value, in percent, assigned to the subunit. Tables 2.1 and 2.2 - Groundwater Storage Calculations - present the results of our calculations of groundwater in storage for Storage Unit Nos. 1 and 2 for the periods November 1964 to December 1965 and November 1983 to May 1984. To provide a detailed summary breakdown of the groundwater in storage in the alluvium and terrace deposits storage units, the reader is referred to Table 3 - Summary of Groundwater Storage Calculations.

Review of Table 2.1 for Storage Unit No. 1 (the alluvium aquifer system) reveals the following:

1. The alluvial aquifer system in the Santa Clara River and its tributaries in the Acton area (see exposure area on Plates 1 and 6) has a total area of 1587 acres, or 2.5 square miles.
2. Total groundwater in storage ranged from a low of approximately 9783 ac-ft during the low water level period November 1964 to December 1965 to a high of approximately 22,271 ac-ft during the high water level period November 1983 to May 1984.

2r	1047	785	3030	4	2980	2990	314	30
TOTAL	11,144	8360					5100	

NOTES:  
 1) See Plate 6 for location of storage units and subunits.  
 2) Total planimetered surface area for each subunit has been reduced by 25% to account for reduction in volume of the subunit caused by sloping sides of the canyon walls adjoining the terrace deposits.

3. During periods of low groundwater, the upper reaches of the alluvium (Storage Subunits 1a and 1b, Plate 6) and a shallow canyon on the north side of the area (Storage Subunit 1e) may be virtually dry, with water levels at or below the base of the alluvial aquifer.

Review of Table 2.2 for Storage Unit No. 2 (the stream terrace deposits aquifer system) indicates the following:

1. The terrace deposits aquifer system in the Acton area has a total area of 11,144 acres, or 17.4 square miles (refer to Plates 1 and 6).
2. Total groundwater in storage ranged from a low of approximately 5100 ac-ft during the water level low period of 1964 to 1965, to a high of 12,124 ac-ft during the water level high period of 1983 to 1984..
3. During periods of low groundwater, the water table may be at or below the base of the terrace deposits throughout most of the aquifer system. The exceptions are likely to be the large canyons in the foothills of the San Gabriel Mountains (Kentucky Springs, Aliso and Arrastre Canyons; Storage Units 2d, 2f, and 2i) and the wide valley north of Acton community (Storage Units 2k and 2l).

Summary Table 3 indicates that total surface area for both the alluvial and terrace deposits is 12,731 acres (19.9 mi<sup>2</sup>) and that total groundwater in storage that is potentially available for extraction from the two aquifer systems ranges approximately between: 14,900 AF during the water level low period between November 1964 and December 1965; and 34,400 AF during the water level high period between November 1983 and May 1984. Cumulative departure data for Blum Ranch and Acton Camp (Figures 2.1 and 2.2, respectively) indicate that rainfall for the 1944-47 period was significantly more than for the 1983-84 period, and therefore, the November 1983 to May 1984 groundwater storage calculations likely represent above-average groundwater storage, but likely not the all-time high. The period of November 1964 to December 1965 appears to represent a period at or near the all-time low for water levels in the area.

Table 3 - Summary of Groundwater Storage Calculations

Storage Unit Name	Total Planimetered Surface Area of Aquifer (acres)	Effective Surface Area of Aquifer (acres)	Groundwater in Storage 11/64 - 12/65 (acre-feet)
Alluvial Aquifer System (No. 1)	1587	1191	9783
Stream Terrace Aquifer System (No. 2)	11,144	8360	5100
TOTAL	12,731	9551	14,883

NOTES: 1) See Plate 6 for locations of storage units and subunit  
 2) Effective surface area taken at 75% of the planimetered area of aquifer in each storage unit (see text).

It should be noted here that groundwater levels in the terrace deposits lying along the foothills of the western San Gabriel Mountains, south of the Santa Clara River, are considerably higher during dry periods than are groundwater levels in the terrace deposits along the foothills of the Sierra Pelona, to the north of the Santa Clara River. Isohyetal contours prepared for the 1897 to 1947 period for the entire Santa Clara River drainage system (CRWQCB, 1975) show a maximum rainfall zone (32 inches per year) over the western San Gabriel Mountains, which decreases markedly to approximately 10-12 inches per year along the course of the river and to 8-10 inches per year in the northern part of the Acton area. This large rainfall decrease is considered to account for the relatively low groundwater levels during dry periods in the northern part of the Acton area.

In comparison to the groundwater storage volumes potentially available for withdrawal, as calculated for this investigation, we note that Geraghty & Miller, Inc. (in Brockmeier, 1990) also calculated the magnitude of total groundwater in storage. Their calculations were based on the following assumptions and/or criteria:

- a. A 75-foot average thickness of saturated flow within the alluvium.
- b. A porosity of 0.30 (30%) for the alluvium.
- c. A 25-foot average thickness of saturated flow within the terrace deposits.
- d. A porosity of 0.20 (20%) for the terrace deposits.
- e. An area of alluvium of 2480 acres as identified from published geologic maps.
- f. An area of terrace deposits of 10,400 acres as identified from published geologic maps.
- g. The upgradient boundary (at Soledad Pass) and the downgradient boundary (about 3000 ft northeast of Ravenna) selected by Geraghty & Miller, Inc. for the

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

46

alluvium within Soledad Canyon are the same as used by this investigator.

- h. The use of porosity (instead of specific yield) allows them to calculate total water in storage, which is not the quantity of water available for withdrawal as has been calculated for our report.

As a result of the above, Geraghty & Miller, Inc. calculated a total volume of groundwater in storage in their alluvium area of 56,000 AF, and a total volume of groundwater in storage in their terrace deposits area of 52,000 AF. Hence, their total volume of groundwater in storage in the basin is approximately 108,000 AF. They also recognized that basement rocks contain little water, although some wells may produce some water from such rocks.

#### CONCLUSIONS AND RECOMMENDATIONS

Based upon review and analyses of existing data for the region, we submit the following conclusions and recommendations.

##### 1.0 DATA BASE

Only a limited number of drillers' logs and/or electric logs are available for water wells in the Acton region. Only a very few wells are monitored for water levels and/or water quality. Data gaps in these water level records include information for a) prior to 1950; and b) for the period between 1965 to 1975.

##### 2.0 HYDROGEOLOGY

- 2.1 Water-Bearing Sediments. The local groundwater reservoir in the Acton region is known as the Acton Valley Basin (or Acton Basin). Comprising this groundwater reservoir for the purposes of this study are all the potentially water-bearing alluvium and stream terrace deposits along and adjacent to Soledad Canyon (the Santa Clara River) and its major tribu-

S8931 - Acton Report

47

aries. Plates 1 and 6 identify the surface exposures of these sediments as mapped for this project. These materials extend northeasterly along Soledad Canyon to the narrows at Soledad Pass, and southwesterly along the canyon to a narrows located about 3000 ft northeast of Ravenna.

Alluvium attains a maximum thickness of perhaps 175 to 225 ft in the Acton community area and is comprised of coarse-grained and permeable materials that are readily subject to scour and erosion by the river. Terrace deposits appear to attain a maximum thickness of about 210 ft in the wide valley north of Acton community and are comprised of porous, well-drained silt, sand and gravel. Because of their greater age and degree of weathering, the terrace deposits are likely more clay-rich than the alluvium.

- 2.2 Bedrock. Underlying the potentially water-bearing sediments, and exposed within the hills and mountains adjacent to Soledad Canyon, are a series of cemented sedimentary rocks, volcanic rocks, and/or crystalline or metamorphic rocks. The geologically older rocks are considered to be bedrock, and they may contain groundwater generally only along bedding planes, fractures, shears or joints. Their permeability is low and they are not considered capable of readily yielding water on a sustained basis to wells.

- 2.3 Geologic Structure. Several faults traverse the hills in the southwestern portion of the region. Based on water level data in the alluvium, these faults do not appear to create any groundwater barriers within Soledad Canyon.

Water, which was observed to be flowing in the lower reach of Soledad Canyon southwest of Acton Camp on January 12, 1990 (prior to any rainfall in the area), is considered to represent rising water. Such rising water is lost to the basin. This was the only reach of the Santa Clara River in the study area where surface flow was observed on that date.

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

48

It results from a change in the cross sectional area within the zone of saturation in the alluvium in this region. Bedrock highs created by faulting and/or lack of deep erosion exist in this reach of the canyon, thereby creating a reduced cross sectional flow area.

2.4 Groundwater Occurrence and Movement. Water table conditions exist in the alluvium and in the terrace deposits. Due to their mode of deposition, confined (artesian) conditions are not expected to occur in these sediments. Wells drilled by others deep into the underlying bedrock will likely encounter various degrees of confinement.

Historically, and at present, groundwater in these sediments within Soledad Canyon flows from northeast to southwest across the study area. In the Acton area, the November 1964 to December 1965 interval represents approximately the all-time water level low, while the interval November 1983 to May 1984 represents a realistic water level high.

In the wetter period, depth to water in the alluvium ranged from 10 to 40 below ground surface while depth to water in the terrace deposits ranged from 20 to 70 below ground surface. In the drier period (November 1964 to December 1965) depths to water in the alluvium and in the terrace deposits ranged between 100 to 180 ft and between 150 to 200 ft below ground surface, respectively. Even within the drier period it was probable that rising water still occurred in Soledad Canyon downstream from Acton Camp.

Water level fluctuations seen on hydrographs closely follow long-term hydrologic (climatic) conditions in the area. Water levels tend to fluctuate rapidly and to a large degree in response to wet conditions (recharge); response to drier periods are somewhat more subdued. Such responses result from a combination of sediments with high permeability and aquifers

S8931 - Acton Report

49

of limited areal extent and/or of limited storage capacity. That water levels do not decline as rapidly as they do for recharge events indicates that discharge from the basin (by pumping and/or natural subsurface outflow) is of a lesser magnitude than recharge to the basin (by deep percolation of rainfall and of stream runoff).

As a result, the amount of groundwater in storage in the basin can be expected to fluctuate seasonally and year-to-year, depending mainly on rainfall and surface water runoff characteristics. Periods of excess rainfall and runoff will tend to rapidly fill the basin, while periods of deficient rainfall and reduced runoff will tend to gradually cause a reduction in basin-wide water levels.

Shallow wells and/or wells with a shallow depth to their uppermost perforations will notice such fluctuations more rapidly and to a larger degree than wells with the opposite conditions. Water quality problems, if any, would also tend to be noticed more rapidly and to a larger degree in shallow wells and/or in wells having shallow perforations. Furthermore, the rapid and large scale recharge induced by periods of rainfall will tend to flush out and/or induce dilution to certain kinds of water quality problems in the groundwater reservoir should they occur.

2.5 Groundwater Recharge and Discharge. Principal sources of natural recharge to the groundwater reservoir are deep percolation of direct precipitation and infiltration of stream runoff. Estimates of recharge from precipitation range from 5600 to 7200 AF/yr (using a factor of 10 percent of the rainfall volume as being available for deep percolation), to 11,100 AF/yr (using the Brockmeier report). No separate estimates of stream runoff infiltration have been made to date by any other investigators. Rising water of at least 200 gpm was observed in the river channel just downstream from Acton

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

50

Camp at a time (January 1990) that includes three prior years of deficient rainfall and runoff.

Man-made sources of recharge include deep percolation of irrigation returns and returns from private subsurface sewage disposal systems. There are no estimates of these quantities available due to a lack of requisite data. There are no artificial recharge spreading basins or injection wells in the region.

Discharge (subsurface outflow) from the basin occurs by water well pumpage, subsurface outflow to the next downstream groundwater basin, deep percolation into underlying bedrock, and evapotranspiration of shallow waters by phreatophytes.

Metered and/or estimated groundwater extractions for 1989 totaled approximately 1540 AF, as produced by: the County Waterworks District; the two privately-owned companies that supply bulk water to their customers; and the Acton school. The volume produced by all other privately-owned wells to meet all remaining domestic, irrigation, and stock-watering needs in the region is unknown, but is probably less than 1000 AF/yr.

Subsurface outflow from the alluvium at the downstream end of the Acton basin was calculated for this study to range approximately between 2800 AF/yr for a relatively wet period (November 1983 to May 1984) to about 1200 AF/yr for a relatively dry period (November 1964 to December 1965). Geraghty & Miller, Inc. (Brockmeier report) reported a subsurface outflow at the same location downstream from Acton Camp of approximately 2100 AF/yr.

The amounts of outflow by deep percolation into bedrock and by evapotranspiration are unknown.

- 2.6 Theoretical Aquifer Parameters. Using empirical relationships, due to meager requisite data, theoretical aquifer transmissivity for wells within the alluvial deposits ranges

S8931 - Acton Report

51

between 20,000 gpd/ft and 120,000 gpd/ft. The wide latitude of these values results from such factors as: the age of the well; the efficiency of the well; the type of well perforations; and the location of the well within the alluvium of Soledad Canyon.

Because alluvium thickness appears to be generally greater in the reach of the canyon easterly from the community of Acton, it can be assumed that aquifer transmissivity may be larger in this region also.

Transmissivity, together with pumping rates and specific capacity within alluvial wells, will tend to vary directly with changes in saturated thickness. That is, when water levels are high (during periods of excess recharge) T, Q, and Q/s will tend to increase. When water levels are low (during periods of deficient rainfall and recharge), these aquifer and water well parameters will tend to decline.

- 2.7 Water Quality: A calcium-magnesium-bicarbonate character and TDS values in the range of 280 to 480 mg/l are representative of groundwater within the alluvium and the terrace deposits, except in the area in the wide valley north of Acton community where the water appears to be degraded with an increase in sulfate ion concentration. Nitrate values are elevated in the more developed parts of the Acton area, and range from 17.0 to 24.7 mg/l while the rest of the basin displays nitrate values ranging from 3.9 to 11.0 mg/l. There do not appear to be any definitive long-term and/or continuous trends toward poorer groundwater quality (such as increasing nitrate concentrations) discernible from available data.

Surface water quality was found to be similar to groundwater quality, but with less tendency for increased sulfate ion concentration. Much of the recharge to the groundwater is by deep percolation of surface water runoff.

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

52

Shallow wells, wells with shallow perforations and/or wells with inadequate cement seals will be affected more rapidly and to a greater degree by surface spills and contamination than wells with the opposite conditions.

3.0 GEOHYDROLOGY

3.1 Groundwater Storage Capacity. Using a total surface area of alluvial and terrace deposits in the study area of 12,731 acres, a specific yield of 10 to 19 percent for alluvium and three to five percent for terrace deposits, and variable thicknesses based on basin location (maximum thickness of 225 ft), the following storage capacities were calculated in the alluvium: 9783 ac-ft for the period November 1964 to December 1965 (basin-low) and 22,271 ac-ft for the period November 1984 to May 1985 (basin-high); and in the terrace deposits: 5100 ac-ft (basin-low) and 12,124 ac-ft (basin-high).

Hence, the total groundwater in storage in the two aquifer systems in the Acton study area ranged from a low of approximately 14,900 AF in the basin-low period of November 1964 to December 1965, to a high of approximately 34,400 AF in the basin-high period of November 1983 to May 1984.

It is likely that problems will develop in the basin for groundwater levels higher than those measured during the November 1983 to May 1984 basin-high period. Such high groundwater levels probably occurred during the all-time higher period following the 1944-1947 interval of high rainfall, although there are no water-level records from that time period to confirm this probability.

4.0 FUTURE WATER DISTRICT WELLS

4.1 Feasibility. Additional groundwater development by Los Angeles County Waterworks District No. 37 appears feasible in the Acton area based on the difference between calculated

S8931 - Acton Report

53

volumes of groundwater in storage available to wells and presently estimated volumes of annual groundwater extraction.

4.2 General Locations. General locations for new Waterworks District-owned wells include those areas of alluvium along the Santa Clara River in the vicinity of and easterly from existing Well No. 37-1. In this reach of the river (groundwater storage units 1d and 1h), alluvial thicknesses and, hence, the potential for greater thicknesses of saturated sediments, are larger particularly in the center portion of the alluvial area, away from the valley walls. Such greater thicknesses would improve the opportunity for maximizing production rates, transmissivity, and specific capacity in future wells. In addition, such greater thicknesses of saturated sediments tend to: increase the amount of available drawdown in the wells; permit the wells to be deeper; and allow for a greater depth to the uppermost perforations.

New wells are not recommended in areas that contain stream terrace deposits at ground surface.

If more than one well is desired in a given area, construction should be conducted in phases, with the first well being drilled, completed, developed, and thoroughly tested prior to selecting the final sites and design criteria for additional wells in that given area. New wells should be spaced at least 1000 ft apart, based on limited evaluation of mutual drawdown interference criteria using existing data.

4.3 General Well Parameters. New alluvial wells in the recommended areas are likely to be capable of producing in the range of 500 to 800 gpm without inducing excessive amounts of drawdown during wetter hydrologic periods. Production rates are likely to decline, and pumping levels are expected to drop during drier hydrologic times.

Typical completed well depths are expected to be on the order of 250 ft. Fourteen-inch diameter well casing (pump

## Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

54

house casing) and 12-inch diameter well screen (either well screen or louvers) are considered acceptable for the anticipated pumping rates. Such well screen (or louvers), utilized with an appropriate gravel pack, will preclude sanding conditions in new wells.

A minimum 50-foot deep cement sanitary seal is essential. If, based on evaluation of the drill cuttings and electric log, a deeper seal can be constructed without adversely impacting production rates, then such a seal could be useful in minimizing possible impacts of nitrates or other possible quality impairment.

- 4.4 Down-Hole Quality Testing. The opportunity does exist during pilot hole drilling to conduct limited down-hole water sampling of individual aquifers in the open borehole in an effort to determine whether or not contamination exists at the well site; however, collecting conclusive data by this procedure is difficult. That is, such select aquifer sampling is typically conducted by airlifting techniques and can cost on the order of \$4,000 to \$7,000 per aquifer test zone for mobilization and airlifting alone. Airlifting, however, is not considered appropriate for sampling of volatile organic compounds. Moreover, airlifting typically is conducted at low rates of discharge (less than 50 to 75 gpm) and for relatively short time periods (less than three to four hours). Long-term pumping (several hours to a day or more) is not possible in an open borehole under such circumstances due to the risks of collapsing the borehole and losing the sampling equipment.

A contamination plume, if it existed, would have to be virtually at the well site in order to be intercepted by such low capacity, short-term down-hole sampling. A more distant plume could require hours, days, weeks or even months of pumping at high rates to be intercepted, assuming such a plume exists at all. Naturally-occurring inorganic water quality

S8931 - Acton Report

55

problems are capable of being identified by down-hole testing since these contaminants often occur throughout the entire aquifer.

- 4.5 Construction Operations. Future wells should be drilled using either direct rotary or reverse rotary drilling methods. Cable-tool drilling is not recommended.

Depending on the site(s) selected, a potential problem will be the availability of water for drilling purposes, especially for the reverse circulation method which may require 100 to 300 or more gallons per minute of continuous supply. If the direct rotary method is used, particular care must be given to control of drilling fluid properties so as to not induce permanent damage to the aquifers.

Detailed geologic mud logs should be prepared from drill-cuttings data as monitored by field geologists during the drilling. At the completion of the pilot bore, an electric log survey is essential in order to define available aquifers and potential locations for the well perforations.

Well screen slot widths and gravel pack grain sizes are to be selected based on analysis and grain size distribution of the drill cuttings from each pilot hole.

Important to well site selection and well site usage will be the wellhead protection utilized for the permanent well. This is because the optimum well sites for alluvial wells lie within the active course of the river and, hence, within the flood hazard zone. It is recommended that you work closely with your engineers in designing the wellhead and appurtenances (pipelines, electrical, etc.) for each well.

- 4.6 Construction Costs. Approximate costs at this time for a contractor to drill, install casing, develop, and test pump one new well on the order of 250 ft in depth will likely be on the order of \$100,000 to \$125,000. A more detailed and

Submission 4519 (Don Henry, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

56

refined breakdown of costs can be provided when the site(s) for eventual wells is(are) selected.

In addition to the drilling costs, there also will be costs for the final pumping equipment, chlorination facilities, electrical appurtenances and transmission lines, property and/or rights-of-way for the new wells, wellhead protection for flood hazard, and for required hydrogeologic services during construction.

5.0 GROUNDWATER MANAGEMENT

Existing extraction data are incomplete because not all water purveyors meter their production for their individual wells. In addition, the number, locations, and production from privately-owned wells in the basin are not known.

To better understand the hydrogeologic regime in the region, the following are recommended:

- a. Accurately establish the locations of each well on U. S. Geological Survey quadrangle maps.
- b. Install accurate flow meters (both instantaneous rate and totalizer volume meters) on each well.
- c. Establish a permanent reference point on all wells from which future depth-to-water measurements can be taken; use a surveyor to obtain accurate elevations for these reference points.
- d. Monitor water levels on a regular basis (at least twice per month); ensure that these are true static levels, not partial recovery levels.
- e. When abandoning wells, make sure that accurate records are kept as to which well, its location, etc., and the methods used for abandonment. Methods for abandonment should comply with State of California requirements (DWR Bulletin 74-81). Wells which will not be used in the future for monitoring, pumping, etc. should be destroyed instead of abandoned (DWR Bulletin 74-81).
- f. Verify that active wells have State-approved sanitary seals; remove from active service those domestically-used wells which do not meet minimum sealing standards;

S8931 - Acton Report

57

consider abandonment of those wells with very high perforations in the alluvium.

- g. Conduct Edison efficiency tests on a regular basis in all wells (at least once or twice per year).
- h. Plot water level hydrographs and graphs of specific capacity vs time for all wells; monitor water for inorganic and organic constituents on a regular basis.
- i. Conduct a well canvass of the entire region to verify the existence, location, viability, and usage of all active and potentially active municipal and private wells.
- j. Establish a key well monitoring program for wells in the region.
- k. Perform operation and maintenance (O & M) on the wells on a regular basis. Such O & M is essential to maintain well efficiency and to return declining specific capacities to their original values. The wells should be periodically surged in order to prevent clogging of the gravel pack by silt or clay.
- l. Because of the propensity of the alluvium to be easily contaminated, become cognizant of present and future land use in and along the alluvium; work with the RWQCB to recognize landfill problems, runoff from hazardous waste sites, migration of gasoline from leaky underground service station tanks, or even potential problems from wastewater effluents. Locate all industrial dischargers, if any, on a map and determine the types and amounts of such discharges.
- m. Coordinate, with the appropriate regulatory agencies, current and future planned programs for any possible lining of the Santa Clara River or its tributaries for flood protection; maximize the potential for recharge in the river by allowing for percolation of low-flow runoff in any possible future lining operation plans.

The attachments which complete this report are listed in the Table of Contents.

California High-Speed Rail Authority (CA HSRA)

Re:

\*California High-Speed Rail Authority\*

\* Palmdale to Burbank Project Section Draft EIR/EIS\*

Dear Board of Directors:

4534-10672

I am writing to express my concern about the proposed California High-Speed Rail Project, particularly the Palmdale to Burbank Section. I am a board member of the Sun Valley Area Neighborhood Council (SVANC), and a resident of Sun Valley, CA 91352. I am concerned about the Environmental Impact of the Palmdale to Burbank High-Speed Rail Project in my community. I am concerned about the impact on the San Gabriel Mountains and surrounding areas and neighborhoods, including what effect it will have on the San Andreas Fault Line. I am concerned about the potential dangers it may or will impose on the environment, communities, and wildlife.

I think that the State of California and the CA High-Speed Rail Authority should look into this thoroughly. The route proposed by the CA High-Speed Rail Authority poses a danger to the surrounding environment.

Thank you for taking the time to read my concerns

Sincerely,

\*Lionel Mares\*  
Board-Member

## Response to Submission 4534 (Lionel Mares, Sun Valley Area Neighborhood Council (SVANC), December 29, 2022)

### **4534-10672**

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

The commenter expresses concern regarding impacts to the Sun Valley community and surrounding community, the San Gabriel Mountains, San Andreas Fault Line, the environment, and wildlife. As described in Section 3.9, Geology, Soils, Seismicity, and Paleontological Resources of the Draft EIR/EIS, implementation of GEO-IAMF#6 ensures that project design would incorporate early warning systems to track strong ground motion associated with fault rupture. This would help identify situations where fault creep or rupture have the potential to damage facilities and enable control of trains in a manner that would reduce the potential for accidents. GEO-IAMF#7 requires the preparation of a technical memorandum to address fault rupture for construction components. As established in GEO-IAMF#7, potentially hazardous faults crossed by the HSR Build Alternatives would be evaluated by conducting field investigations to establish updated estimates of levels of ground motion prior to construction and during final design. Final design would be further supported by additional seismic studies and compliance with Caltrans seismic design criteria. Geotechnical and design protocol would adhere to established engineering procedures listed in GEO-IAMF#10 to minimize hazards associated with fault rupture and ground shaking. Refer to PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, for concerns regarding project related seismic activity. Additionally, refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife for concerns regarding impacts to wildlife. Regarding community impacts to the Sun Valley area, please refer to Submission PB-4427, Response to Comment #8104.
