

## 22 BUSINESS ORGANIZATIONS

## Submission 4040 (William Slocum, Kagel Canyon Civic Association, September 6, 2022)

**Palmdale - Burbank - RECORD #4040 DETAIL**

**Status :** No Action Required  
**Record Date :** 9/6/2022  
**Interest As :** Business and/or Organization  
**First Name :** William  
**Last Name :** Slocum

**Stakeholder Comments/Issues :**

4040-7624 | The extensive DEIR has too many pages to read in 60 days. We request 120 days.

## Response to Submission 4040 (William Slocum, Kagel Canyon Civic Association, September 6, 2022)

### **4040-7624**

Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS.

The commenter acknowledged the availability of the Draft EIR/EIS for review and comment and requested an extension of the public review period to 120 days. Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS, which provides general information regarding the public comment period and the extension of the public comment period. The Draft EIR/EIS was originally made available for review and comment for a 60-day public review beginning on September 2, 2022. In response to agency and stakeholder requests, the Authority extended the comment period by 30 days. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

## Submission 4050 (Gloria Sharpsteen, Kagel Canyon Civic Association, September 6, 2022)

**Palmdale - Burbank - RECORD #4050 DETAIL**

**First Name :** Gloria  
**Last Name :** Sharpsteen

**Stakeholder Comments/Issues :**

4050-7640

I have read Section 3.9, Geology, Soils, Seismicity, and Paleontological Resources for the Palmdale to Burbank Section Draft EIR/EIS, August 2022. I would like to read more of the report, but it is too long for me to read in 60 days and make an informed comment or ask specific questions. I am requesting that more time be allowed for individuals like myself, who are interested in this important project. Thank you.

## Response to Submission 4050 (Gloria Sharpsteen, Kagel Canyon Civic Association, September 6, 2022)

### **4050-7640**

Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS.

The commenter requested to extend the public comment period. The commenter's request has been noted. Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS which provides general information regarding the public comment period and the extension of the public comment period. The Draft EIR/EIS was originally made available for review and comment for a 60-day public review beginning on September 2, 2022. In response to agency and stakeholder requests, the Authority extended the comment period by 30 days. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

## Submission 4052 (John Joyce, Rosamond News, September 7, 2022)

To: Acton Town Council <atc@actontowncouncil.org>  
Cc: Jacki Ayer <airspecial@aol.com>, wolterpam@aol.com  
Subject: RE: TO: Jacki & Pam: High-Speed Rail Interactive Map

Hi Jacki & Pam:

I was able to get this answered by our Engineering Team. Those elements that extend beyond the route of the HSR are usually utilities easements (water & power) needed for construction purposes. In this case, that alignment is for an easement for water supply. I hope that makes sense. Let me know if you have any other questions.

Thank you.

Cc: Jacki Ayer <airspecial@aol.com>; wolterpam@aol.com  
Subject: Re: TO: Jacki & Pam: High-Speed Rail Interactive Map

Dear Ms. Arellano;

Thank you very much for the email.

I have gotten on the interactive map, and note that there are many areas outside the rail right of way that are projected to be affected by the project. For instance, with the SR14A all underground alternative, there are project elements that extend along Escondido Canyon Road all the way to downtown Acton (see figure embedded below). Unfortunately however, the map legend does not provide any information on what these project elements are, and I can find no description in the route map volumes. What are these elements and where are they described in the DEIR/DEIS?

Any help you can provide will be greatly appreciated.

Sincerely;

Jacqueline Ayer

Correspondence Secretary

4063-7662

## Response to Submission 4063 (Jacki Ayer, Acton Town Council, September 8, 2022)

### **4063-7662**

The commenter inquired about the different project elements that are not explained by the interactive map legend. Detailed descriptions of each of the alignments are provided in Section 2.5.3 of the Draft EIR/EIS. Each resource topic within Chapter 3, features figures with the applicable affected resources. Please refer to the various sections within Chapter 3 for more information. Additionally, Volume 3, Design Plans, provides plan and profile drawings showing the location and design of the project alternatives. The project element noted by the commenter along Escondido Canyon Road is a utility corridor (power and water) that would be located within and along the existing roadway.

## Submission 4065 (Matthew Richmond, Angelus Block Co, September 9, 2022)

**Palmdale - Burbank - RECORD #4065 DETAIL**

**Status :** Action Pending  
**Record Date :** 9/9/2022  
**Interest As :** Business and/or Organization  
**First Name :** Matthew  
**Last Name :** Richmond

**Stakeholder Comments/Issues :**

To Whom It May Concern:

4065-7660

My name is Matthew Richmond and I am a project manager for the sister companies Angelus Block Co., Inc. located at 11374 Tuxford St. and E-Z Mix Inc. located at 11450 Tuxford St. in Sun Valley. After reading the Palmdale to Burbank Draft EIR, we have multiple concerns and questions regarding potential temporary and permanent road closures that would severely impact our ability to do business at our current locations.

I have been trying to get ahold of the right people in the property management division for around a month to discuss our questions and concerns but have received no communication from them. I would like to schedule a call at their earliest convenience to discuss.

Sincerely,  
Matthew Richmond  
Office: (818) 767-8576 ex. 119  
Cell: (818) 383-2400  
11374 Tuxford St.  
Sun Valley, CA 91352  
[cid:image003.png@01D8C42D.6F941DE0]

## Response to Submission 4065 (Matthew Richmond, Angelus Block Co, September 9, 2022)

### **4065-7660**

The commenter expresses their concern regarding potential temporary and permanent road closures that would impact ability for continued business operations at multiple locations along Tuxford Street in Sun Valley, California. Specific road crossings for the Palmdale to Burbank Project Section, including the proposed modifications for these roads, are available in Appendix 3.11-B, Existing and Proposed Railroad Crossing Definitions, of this Final EIR/EIS. Impact S&S#1 and Impact S&S#2, in Section 3.11.6 of Chapter 3.11, Safety and Security, include discussions of temporary and permanent road closures resulting from the project, respectively. The project will include a Construction Transportation Plan (CTP) (TR-IAMF#2), which will establish procedures to maintain 24-hour access to residences and business during construction, including detour provisions for temporary road closures, provisions for safe pedestrian and bicycle passage or convenient detours, limiting road closures to hours that are least disruptive to access for adjacent properties, and provisions for 24-hour access by emergency vehicles (please refer to Appendix 2-E, Impact Avoidance and Minimization Features, of this Final EIR/EIS for further descriptions of project IAMFs).

In the vicinity of the two properties that are the subject of this comment, the following are the transportation network changes proposed along Tuxford Street: replacement of a railroad bridge, realignment of the Vulcan Industrial lead railroad track, realignment of the Metrolink tracks, modifications to a pump station and storm drain, and other minor changes. The Authority understands that the Angelus Block Co. buildings currently have a path that allows trucks to drive in from Tuxford Street and out to San Fernando Road. After construction, the overall configuration of Tuxford Street would not change. That would ensure permanent access to the parcel. Unfortunately, the project would require closing access to San Fernando Road, and that closure may require the company to reconfigure the buildings, to change its method for loading trucks, to use access to other roads, or otherwise to modify its operations.

The Authority does not see any feasible method for keeping vehicular access from the parcels to San Fernando Road. Doing so would require crossing underneath the I-5 freeway. At the freeway, the Sun Valley overhead is a five-span structure comprised of a reinforced concrete deck on simply supported composite welded steel plate girders on reinforced concrete abutments and column bents, all supported on spread footings. It carries the I-5 freeway over the San Fernando Road, Metrolink Antelope Valley Line

### **4065-7660**

tracks, and the proposed California High Speed Rail alignment. Constructing roadway access to San Fernando Road would require extensive analysis and modifications of the I-5 freeway. Because the abutment is supported on a shallow foundation, any roadway would likely require major temporary works during construction and final installation of a robust earth retaining system. That project would impact I-5 traffic during construction. Therefore, continuing roadway access from the parcels to San Fernando Road is not feasible due to the major cost, schedule, impacts on key existing transportation facilities, and third-party impacts associated with this alternative

Nevertheless, the Authority will provide the affected property and business owners a high level of individualized assistance and within the limits established by law and regulation, minimize the economic disruption that could be caused to property owners by the project.

## Submission 4066 (Wendy Schiff, Antelope Valley Conservancy, September 9, 2022)

**Palmdale - Burbank - RECORD #4066 DETAIL**

**Status :** Unread  
**Record Date :** 9/9/2022  
**Interest As :** Business and/or Organization  
**First Name :** Wendy  
**Last Name :** Schiff

**Stakeholder Comments/Issues :**

Ms. DeCamillo:

4066-7659

The Antelope Valley Conservancy was previously in contact with Rick Simon, who had informed us that there was an alternative route, labeled SR14A, that would cause the HSR to run east of 15th Street East in Palmdale. We understand Mr. Simon is no longer involved with the project, and, for that reason, we are requesting a current alignment parcel level map in order to get a clearer depiction of the various HSR route options. We are specifically looking for a close-up map that offers a street view with street names listed, if possible.

Thank you for your time. I look forward to hearing back from you.

Sincerely,  
Wendy Schiff, Assistant Administrator

Antelope Valley Conservancy  
P.O. Box 8  
Lake Hughes, CA 93532-0008  
(661) 943-9000

This email is private and confidential, intended for addressee only. It is not to be forwarded or distributed.

## Response to Submission 4066 (Wendy Schiff, Antelope Valley Conservancy, September 9, 2022)

### 4066-7659

The commenter requested an alignment and parcel map. The commenter's request has been noted and a member of the project team provided the requested materials. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

# Submission 4067 (Kelly Decker, SAFE, September 3, 2022)

**Palmdale - Burbank - RECORD #4067 DETAIL**

**Status :** Completed  
**Record Date :** 9/9/2022  
**Interest As :** Local Agency  
**First Name :** Kelly  
**Last Name :** Decker  
**Attachments :** FW\_ DEIR - Public Comment Period - Kelly Decker.pdf (136 kb)

**Stakeholder Comments/Issues :**

Hi Geneveva,

I hope you have been doing well. Thank you for keeping us abreast of CHSRA updates through Cindy Bloom. We always appreciate the heads up.

4067-7658

I am writing today with a complaint/request. As I am sure you could guess, we were all logging on to the website on Friday to check out the Draft EIR documents on the HSR website. Admittedly, Cindy was kind enough to share one of the flash drives with me, so I had an easier time of it than others who had to download 118 separate, individual PDFs. I spent several hours today just cataloguing the chapters to see what they were about and make my own "table of contents".

During this exercise, I happened to do a page count. Do you have any idea how many total pages is the DEIR for the Palmdale to Burbank Project Section? If you guessed 6,959 pages, you would be correct.

If a real human (i.e., me) were to be inclined to read such a document and provide public comment, one would need to read 116 pages every single day for the next 60 days in order to meet the deadline (forget about having any time to actually write a comment). THIS IS NOT REASONABLE. In my opinion, this is evidence that the Authority has no interest but to discourage public participation and comment on this document. Even folks who are dedicated to this mission like I am are understandably daunted by the volume of material here, and it almost seems hopeless and futile to even set about reading 116 pages per day.

What will it take to get the public comment period extended? I think if it were doubled to 120 days, that is still not enough time, but I would take it over 60 days.

Keep in mind that the Authority had YEARS to put this document together. According to the 16-page list of preparers, there were (by my rough count) 171 experts in their respective fields who contributed to this document, and even with all of those people on payroll, the document was still YEARS past its original intended release date. If a government agency gets the benefit of 171 paid employees and YEARS to prepare a document, how is it remotely fair or reasonable that the members of the community that will be impacted by this project only get 60 days to read and comment on this behemoth of a document?

Can you please make a plea to the Authority to extend the public comment period? Or tell me what we need to do to make that happen?

Thank you,  
Kelly Decker

**To:** Kelly Erin Decker <kellyerindecker@aol.com>  
**Subject:** RE: DEIR - Public Comment Period

Hi Kelly,

Thanks for your email. I hope you are doing well, too, and staying cool during these hot days!

I understand your request to extend the 60-day public comment period. The best way to submit this request is through the formal Comment Form here: [Palmdale to Burbank Project Section Draft Environmental Impact Report/Draft Environmental Impact Statement Comment Form - English - California High Speed Rail](#). The standard period length is 45 days, so the Authority chose to commence with a 60-day period at the outset to allow for more time. Nevertheless, I understand your points and will be sure to also relay your (and others') concern to the Project Team.

Please stay in touch with any other questions and I will help as much as I can.

Thank you.

**Stakeholder Comments/Issues :**

Hi Geneveva,

Happy Labor Day!

4068-7657

As you can imagine, I am busily reviewing the DEIR and am overwhelmed. It is nearly 7,000 pages and I feel a 60-day comment period is unrealistic, and quite frankly, unfair. To properly review and address the extremely detailed, copious, and challenging issues in this DEIR requires more than 60 days.

The Authority spent years compiling multiple documents, it was delayed several times, and even cites 2015 dollars in some places, with no update. It frequently references other documents which are not necessarily available on your website (especially after the ADA compliancy scrub a few years ago), and requires additional time to hunt those down—if we have them at all. There is not enough time for a Public Records Request either. Based on our prior PRRs, the Authority issued extensions of time which averaged several weeks to comply.

Would it be possible for the Authority to extend the comment period to 90 or 120 days? This is the most important comment period we have encountered to-date, and we need to be thorough. Additionally, I am assuming that this project section is the most complicated section of the statewide system and requires more time for public comment than what was granted for other project sections.

Thanks so much for your continued assistance!

Cindy Bloom

4069-7656

Actually, War and Peace is only 1.250 pages. The DEIR is almost 6 times as long as War and Peace.

We are going to have a quiz to see if the members of the board have read all 6,900 pages of the draft EIR in 60 days and whether they have any questions. The SAFE coalition knows as much as almost any person on the Board and we definitely need at least 120 days. Even then I do not know if this is a possible task. It is three times the length of War and Peace.

**Subject:** RE: Palmdale to Burbank DEIR Comment Period

Hi Bill:

Thank you for your emails! I am not sure if you also received my reply to Cindy on this same topic. The best way to make this request to extend the public comment period is through the formal Comment Form here: [Palmdale\\_to\\_Burbank\\_Project\\_Section\\_Draft\\_Environmental\\_Impact\\_Report/Draft\\_Environmental\\_Impact\\_Statement\\_Comment\\_Form\\_English\\_California\\_High\\_Speed\\_Bail](#) The standard period length is 45 days, so the Authority chose to commence with a 60-day period at the outset to allow for more time. Please know that I will also be sure to communicate your (and others') request to the Project Team.

Thank you!

Hi Genoveva,

Happy Labor Day!

As you can imagine, I am busily reviewing the DEIR and am overwhelmed. It is nearly 7,000 pages and I feel a 60-day comment period is unrealistic, and quite frankly, unfair. To properly review and address the extremely detailed, copious, and challenging issues in this DEIR requires more than 60 days.

The Authority spent years compiling multiple documents, it was delayed several times, and even cites 2015 dollars in some places, with no update. It frequently references other documents which are not necessarily available on your website (especially after the ADA compliancy scrub a few years ago), and requires additional time to hunt those down—if we have them at all. There is not enough time for a Public Records Request either. Based on our prior PRRs, the Authority issued extensions of time which averaged several weeks to comply.

Would it be possible for the Authority to extend the comment period to 90 or 120 days? This is the most important comment period we have encountered to-date, and we need to be thorough. Additionally, I am assuming that this

project section is the most complicated section of the statewide system and requires more time for public comment than what was granted for other project sections.

Thanks so much for your continued assistance!

## Response to Submission 4069 (William Eick, Eick & Freeborn, LLP, September 5, 2022)

### **4069-7656**

Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS.

The commenter requested an extension for the public comment period. The commenter's request has been noted. Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS, which provides general information regarding the public comment period and the extension of the public comment period. The Draft EIR/EIS was originally made available for review and comment for a 60-day public review beginning on September 2, 2022. In response to agency and stakeholder requests, the Authority extended the comment period by 30 days. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

## Palmdale to Burbank Project Section Stakeholder Working Group - September 20, 2022

The California High-Speed Rail Authority (Authority) invites you to participate in the next Stakeholder Working Group meeting for the San Fernando Valley area of the Palmdale to Burbank Project Section. The purpose of this invitation-only group meeting is to discuss key topics in the Draft Environmental Impact Report/Environmental Impact Statement (Draft EIR/EIS) including traffic, air quality, noise, vibration, aesthetics and more.

The Draft EIR/EIS for **the Palmdale to Burbank Project Section** will be made available for public review and comment starting on September 2, 2022 and ending on November 1, 2022. For more information, visit [link](#) to access the document and information on how to provide formal comments.

The Palmdale to Burbank Project Section will connect two key population centers in Los Angeles County by linking future multi-modal transportation hubs in Palmdale and Burbank. The Palmdale Station, and the alignment to Spruce Court in Palmdale, were evaluated as part of the Bakersfield to Palmdale Project Section, which was approved by the Authority Board in August 2021. The Burbank Airport Station was evaluated as part of the Burbank to Los Angeles Project Section, which was approved by the Authority Board in January 2022. This project section will provide a critical link between the Bakersfield to Palmdale and the Burbank to Los Angeles Project Sections.

The Draft EIR/EIS evaluates the impacts and benefits of six Build Alternatives, including Refined SR14, SR14A, E1, E1A, E2 and E2A. The Preferred Alternative is the SR14A Build Alternative. The Preferred Alternative avoids crossing Una Lake and minimizes impacts to nearby wetlands. Trains operating on the Preferred Alternative alignment would be fully underground through the community of Acton, the Angeles National Forest and the San Gabriel Mountains National Monument.

The Stakeholder Working Group will be held virtually on:

## Submission 4070 (Cindy Bloom, SAFE, September 6, 2022) - Continued

Date: Tuesday, September 20, 2022

Time: 10:00 a.m. to 12:00 p.m.

Link <https://us02web.zoom.us/j/8448661449>

Passcode: 267876

Please RSVP by September 15, 2022, to Matthew Maldonado of the Palmdale to Burbank Outreach Team via e-mail at [mmaldonado@mbimedia.com](mailto:mmaldonado@mbimedia.com).

Due to public health and safety concerns related to COVID-19, the meetings for the Draft EIR/EIS will be held online. Please check the Authority website ([www.hsr.ca.gov](http://www.hsr.ca.gov)) or call (800) 630-1039 for more information on additional opportunities for in-person meetings, if permissible by COVID-19 pandemic public health and safety directives.

Thank you for your time and participation. We look forward to hearing from you and working with you throughout this process.

The Authority is issuing this document as lead agency under CEQA, and also under NEPA pursuant to 23 U.S.C. 327 and a Memorandum of Understanding (MOU) effective as of July 23, 2019. The MOU is between the State of California and the Federal Railroad Administration (FRA) under a program commonly known as NEPA assignment (the MOU assigned FRA's NEPA responsibilities for the project to the State of California).

Sincerely,

**LaDonna DiCamillo**

## Response to Submission 4070 (Cindy Bloom, SAFE, September 6, 2022)

### **4070-7655**

The commenter inquired how the attendee list was developed for a group meeting with Authority staff and representatives from Acton, California. A member of the project team responded and indicated that the meeting in question was a smaller group meeting with agencies and local stakeholders. 'Invitation only' in this context means that it was not noticed widely to the public like the Open House meetings. The comment does not address technical analysis in the Draft EIR/EIS or suggest edits to the document. No change has been made to the document in response to this comment.

## Response to Submission 4093 (Josie Zarate, September 15, 2022)

### **4093-7683**

Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS.

The commenter requested to extend the public comment period. The commenter's request has been noted. Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS, which provides general information regarding the public comment period and the extension of the public comment period. The Draft EIR/EIS was originally made available for review and comment for a 60-day public review beginning on September 2, 2022. In response to agency and stakeholder requests, the Authority extended the comment period by 30 days. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### **4093-7684**

**Stakeholder Comments/Issues :**

4106-7671

Hello. The proposed E2 route is directly going through my property with permanent and temporary structures proposed to be installed.

So are you going to buy my property from me?

What's the plan to use my land?

Thanks  
Cory

## Response to Submission 4106 (Cory Lagusker, Reptacular Ranch, September 18, 2022)

### **4106-7671**

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations.

The commenter expresses concern on property and parcel acquisitions from building the project along the E2 Alternative route alignment. This topic is further discussed in PB-Response-SOCIO-1, Parcel Acquisitions and Relocations.

The Authority has identified the SR14A Build Alternative as the Preferred Alternative for the Palmdale to Burbank Project Section. For further discussion regarding the identification of the Preferred Alternative for the Palmdale to Burbank Project Section, please refer to Chapter 8, Preferred Alternative and Station Sites, of this Final EIR/EIS.

## Submission 4108 (Cory Lagusker, Reptacular Animals Corporate, September 14, 2022)

**Palmdale - Burbank - RECORD #4108 DETAIL**

Status : Action Pending

First Name : Cory  
Last Name : Lagusker

**Stakeholder Comments/Issues :**

4108-7669

The E2 line from Burbank to Palmdale goes directly through my home and business. Want to buy it? Because I won't allow you to build or stage or do anything, no matter what. So you might as well as buy me out.

I will NOT ride your slow speed train to no where

## Response to Submission 4108 (Cory Lagusker, Reptacular Animals Corporate, September 14, 2022)

### 4108-7669

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations, PB-Response-SOCIO-2: Property Values.

The commenter notes that the alignment goes through their home and business, and suggests a preference for the Authority purchasing the properties. Refer to PB-Response-SOCIO-1, Parcel Acquisitions and Relocations; and PB-Response-SOCIO-2, Property Values, which address these concerns. This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

Subject: Bad Link to Public Notice

Hi Genoveva,

Hope you are doing well.

4110-10281

Susan Lustig brought it to my attention that the link in HSR's Public Notice email containing the text of the Public Notice dated September 2nd ("view this email as a webpage") is not working, that you researched it, and then was told that it "could not be fixed." I then discovered, to my utter dismay, that the separate Public Notice link is also not working! (We had put that particular link on our [www.dontrailroad.us](http://www.dontrailroad.us) website.)

How can this be? All one has to do is update the HSR website with a fresh link. Obviously, since there was a previously-working link to the document, that pdf file or HTML document existed at one time.

When I got the box of documents and flash drives that HSR kindly provided to us, since this is a very important communique, I immediately put the Public Notice up on our website via a link to the HSR website. This link now reads:

"The system is temporarily unavailable. We apologize for any inconvenience. Please try again later."

There are two problems with this message. First, a Public Notice is a legally mandated document. Second, it says "temporarily unavailable" even though we learn, after Susan Lustig spend her volunteer time, I spent my volunteer time, and you spent time from your packed schedule, that it was intentionally permanently removed and further misled the public to think it was a temporary problem. It is not inconceivable that folks tried multiple times (due to the instruction to "try again later") to access it as we've been referring people to our website to learn about the DEIR.

So, I deleted the link to the HSR's website Public Notice, scanned the hard copy, and posted it to our website because (1) it is a public notice; (2) is likely governed by the Brown Act since it has public meeting notices within it; (3) residents must have the ability to access it, and (4) there is NO excuse for whoever is responsible for disseminating information not to provide this essential information in an easy accessible link.

I don't mean to be harsh, but please understand that this is ridiculous. We certainly appreciate your help on

## Submission 4110 (Cindy Bloom, SAFE, September 19, 2022) - Continued

4110-10281

everything, including going above and beyond but the public notice should be active on HSR's website until the comment period is closed (it expired in 2 weeks!) Not only does it give a summary of the DEIR, but also as noted above gives notice of two public meetings in October.

Please relay this to appropriate HSR person(s) and have this situation rectified immediately.

As usual, thanks for your help.

Warm regards,

Cindy Bloom  
818-445-5602

## Response to Submission 4110 (Cindy Bloom, SAFE, September 19, 2022)

### **4110-10281**

The commenter noted an error in an Authority public notice and referenced correspondence with a member of the project team and the correction that was made. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

To Marie Hoffman,

I was just informed that my records request dated September 13, 2022, has been closed but I did NOT receive all of the technical documents that I requested. Specifically, I did NOT receive: Palmdale to Burbank Project Section: Wildlife Corridor Assessment Report (2019c).

The file I received, Request\_22-163\_documents\_2022-09-16 00-37-02 +0000.zip included the list of documents shown in the attached image. I have opened and reviewed all of the documents included and the Wildlife Corridor Assessment Report for the Palmdale to Burbank Project Section was not included in this delivery. Please expedite the delivery of said document, which is the MOST important technical document pertaining to my review of the EIS/EIR.

Many thanks in advance for your immediate attention to this matter.

Respectfully submitted,  
Kristeen Penrod

Hi Jeff (and Peggy),

Thanks for reaching out. That section is in Southern California so that's not my jurisdiction.

Let me introduce you to LaDonna DiCamillo (who is our Southern California Regional Director) and Serge Stanich (Director of Encironmenral Services) who, along with Bruce, would be the best people to talk to about the Draft EIR/EIS for the Palmdale to Burbank section.

Thanks,  
Boris

Boris:

I think Bruce may be out.

I was wondering if you would be willing to have a meeting with us and walk through any interfaces/interactions between the Preferred Alternative and UP's operations?

If you are not up to speed on the Palmdale to Burbank DEIR, can you refer us to someone at CHSRA that could walk us through it?

Thanks.

## Response to Submission 4128 (Jeff Sheldon, Union Pacific Railroad, September 27, 2022)

### 4128-7526

The commenter requested information about the interfaces/interactions between the Preferred Alternative and UP's operations and the potential to schedule a meeting. As discussed in Section 2.5.1.6. of this EIR/EIS, the freight rail system in the Palmdale to Burbank Project Section is operated by UPRR and BNSF. As discussed in Section 2.5.2., the Preferred Alternative would require the acquisition of rail right-of-way from MP 67.2 to MP 69.1, which is a UPRR parcel up to 25 feet wide to the south. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

### 4128-7527

The commenter noted their availability for a meeting with Authority staff. The Authority met with the commenter (Union Pacific Railroad) on October 10, 2022, and responded to their questions and provided them with publicly available materials regarding the project. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration, Procedures for Considering Environmental Impacts, section 14(s), 64 Fed. Reg. 28548, 28556 (May 26, 1999)). The commenter has not provided a comment on environmental issues.

This is Gayle Joyce with the Acton/Agua Dulce News. And I understand that there is a high-speed rail meeting in Acton on October 8th. And that it is open for the community. However, we did not receive any kind of a notice to put in the paper to announce it to the community. Is this a private meeting? I don't think so. But please get back with me. My telephone number is [REDACTED], that's my cell. And I'm working on the issue for October 3rd so I could get an announcement in the paper. Please call me back. Gayle Joyce. Thank you.

## Response to Submission 4129 (Gail Joyce, Acton Agua Dulce News, September 28, 2022)

### 4129-7501

Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS.

The commenter inquired about the in person meeting that occurred on October 8th, 2022 and noted they did not receive a notice about the event. The Authority provided a broad notice of the availability of the Draft EIR/EIS and in person meetings. Notification efforts included an e-blast, notification through social media channels, and promotion through local newspapers in English and Spanish. The Notice of Availability included information about how to join the open house. Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS which provides additional information regarding the outreach efforts conducted by the project team. The comment does not address technical analysis in the Draft EIR/EIS or suggest edits to the document. No change has been made to the document in response to this comment.

California High-Speed Rail Authority  
 Attn: LaDonna DiCamillo, Southern California Regional Director  
 355 S. Grand Avenue, Suite 2050  
 Los Angeles, CA 90071

Re: Palmdale to Burbank Segment, Support for Alternative SR14A in southern Palmdale

Ms. DiCamillo and Members, High Speed Rail Authority:

Thank you for this opportunity to express the Antelope Valley Conservancy's support of the preferred alignment through southern Palmdale, designated as Alternative SR14A.

For over a decade, AVC has advocated for the High Speed Rail project to find route alternatives that would avoid impacts to Una Lake, the surrounding wetland complex, and wildlife connectivity in this critical wetland area. AVC is grateful to see that the Build Alternative SR14A for the Palmdale to Burbank segment of the HSR would accomplish these goals. **Therefore, we strongly support the refined SR14A Build Alternative in southern Palmdale and encourage you to approve this route.**

Founded in 2005, Antelope Valley Conservancy is a California public benefit corporation with the primary mission of preserving natural habitat lands for the public good. AVC has been authorized by the California Department of Fish & Wildlife to Hold Mitigation Lands and Endowments since 2008 and has fulfilled mitigation preservation and restoration services for CDFW, the State Water Boards, local counties and cities, as well as local government agencies and private landowners.

Antelope Valley Conservancy truly appreciates your consideration in leaving this small, historic lake and critical wetlands intact when constructing the High Speed Rail.

By Resolution of the  
 Board of Directors  
 ANTELOPE VALLEY CONSERVANCY

Attested By Christina Andrews  
 Corporate Secretary

4198-8718

## Response to Submission 4198 (Wendy Schiff, Antelope Valley Conservancy, October 18, 2022)

### 4198-8718

The commenter expresses support for the Preferred SR14A Build Alternative and encourages the HSRA to approve the Preferred SR14A Build Alternative alignment. The commenter's support is acknowledged.

## Submission 4230 (Clyde T. Williams, Citizens Coalition for A Safe Community, November 1, 2022)

**Palmdale - Burbank - RECORD #4230 DETAIL**

**Status :** No Action Required  
**Record Date :** 11/1/2022  
**Interest As :** Business and/or Organization  
**First Name :** Clyde T.  
**Last Name :** Williams

**Stakeholder Comments/Issues :**

4230-8487 | Palmdale-Burbank must first consider a dead straight tunnel from Palmdale to Burbank with appropriate access/ventilation shafts as Open/Rock transitions have too great of impacts and expense. Then compare all other alternatives quantitatively to this base case. Numerical comparisons must be based on a clear set of Goals (1-3) Objectives (10-20), and policies/programs. Current text does not comply with CEQA. Draft EIRs must include a draft mitigation, monitoring, and reporting Plan.

## Response to Submission 4230 (Clyde T. Williams, Citizens Coalition for A Safe Community, November 1, 2022)

### 4230-8487

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process.

The commenter recommends the Draft EIR compare the Build Alternatives against an HSR alignment that would directly tunnel from Palmdale to Burbank. The commenter also suggests that a draft mitigation, monitoring, and reporting plan is required under CEQA. The Authority evaluated and considered many Build Alternatives during the development process of alternatives. Alternatives to be carried forward must first be determined to be feasible from a constructability and technology standpoint. A straight alternative as proposed in the comment is not considered feasible as the design must consider various constraints, which include existing conditions such as topography, geology, and environmental factors as well as design constraints such as profile grade. Please refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process for a discussion of how the Authority evaluated and screened various Build Alternatives before determining the alternatives to be studied in the EIR/EIS and why the SR14A Build Alternative was selected as the preferred alternative. While numerical comparisons are included in the EIR/EIS wherever feasible and necessary for disclosure of environmental impacts, including, but not limited to, transportation, air quality, and noise, quantitative analysis is not always possible or appropriate. In these cases, CEQA allows for qualified analysis based on thresholds. Each impact analyzed within the EIR/EIS includes defined thresholds and presents the appropriate analysis to determine the potential for impacts. Further, CEQA does not require quantified analysis or comparisons to be tied to a clear set of goals, objectives or policies. As required under CEQA, the Draft EIR/EIS compares the project Build Alternatives against the No Project Alternative and includes a reasonable range of alternatives. An MMRP will be prepared prior to potential decision-making on the project, and in preparation for the Record of Decision.

## Submission 4234 (Jacqueline Ayer, Acton Town Council, October 21, 2022)

**Palmdale - Burbank - RECORD #4234 DETAIL**

**Status :** Delimited

**Interest As :** Business and/or Organization  
**First Name :** Jacqueline  
**Last Name :** Ayer

**Attachments :**

**Stakeholder Comments/Issues :**

4234-10282

Hello Geneveva!

We are working feverishly on our DEIR comments, and find some clarification is needed regarding the tunnel construction plan and I am hoping you will forward this email to the Engineers for further clarification. Specifically, I cannot find in the EIR where there is a description of TBM start and stop locations, but from the meeting on Sept 27, it sounded like:

A) For the SR14 A alternative, 2 TBMs will begin tunneling from the Acton Window. If true, will they be tunneling toward Palmdale (in which case there will be no TBMs tunneling from Palmdale toward Acton)? Or will they be tunnelling toward Agua Dulce (in which case there will be two TBMs tunneling from Palmdale toward Acton and the TBMs in Agua Dulce will be tunneling from the point west of Agua Dulce Canyon road toward Santa Clarita)?

B) For the Refined SR14 alternative: 2 TBMs will begin tunneling from Acton and 2 TBMs will begin tunneling from Agua Dulce. If true, will the TBMs that start in Acton be tunneling toward Palmdale (in which case there will be no TBMs tunneling from Palmdale toward Acton)? Or will they be tunnelling toward Agua Dulce (in which case there will be two TBMs tunneling from Palmdale toward Acton and the TBMs in Agua Dulce will be tunneling from the point west of Agua Dulce Canyon road toward Santa Clarita)?

C) For the E routes, Acton will have 4 tunnel portals and one window (located on the property owned by TNC); for these alternatives, where will the TBMs start and in which direction will they be tunnelling?

These questions are important because they will largely dictate the source of water used for tunnel construction. Until we understand the actual tunnel construction plan, it is not possible to provide substantive or cogent comments on the project.

Thank you for your time and assistance  
Jacqueline Ayer  
Correspondence Secretary

## Response to Submission 4234 (Jacqueline Ayer, Acton Town Council, October 21, 2022)

### **4234-10282**

The commenter has several comments regarding tunnel construction sequence in the Acton area.

For the SR14A Build Alternative, two TBMs (one for each tube of the twin bored tunnel) will be assembled at the Intermediate Window near Acton and will excavate the tunnel towards Palmdale. These TBMs will be dismantled at the portal located approximately 1.5 miles south of the California aqueduct. No TBMs will be tunneling in the direction from Palmdale to Acton. Also two TBMs (one for each tube of the twin bored tunnel) will be assembled at the portal just south of Vasquez Rocks and east of Agua Dulce Canyon Rd and will excavate the tunnel towards Acton. These TBMs will be dismantled at the Intermediate Window near Acton.

For the Refined SR14 Build Alternative, two TBMs (one for each tube of the twin bored tunnel) will be assembled at the tunnel portal east of Red Rover Mine Rd and will excavate the first tunnel towards Palmdale. These TBMs will be dismantled at the portal located just north the California Aqueduct. No TBMs will be tunneling in the direction from Palmdale to Acton. Also two TBMs (one for each tube of the twin bored tunnel) will be assembled at the portal near Big Springs Rd in Agua Dulce and will excavate the second tunnel towards Acton. These TBMs will be dismantled at the portal west of the intersection between Escondido Canyon Rd and 53rd St W near Acton.

For the E Build alternatives (E1, E1A, E2 and E2A), since all of them have the same alignment in the northern section of the project the construction sequence will be the same for all of them in the northern tunnels. Two TBMs (one for each tube of the twin bored tunnel) will be assembled at the Intermediate Window located in Arrastre Canyon and will excavate southwards towards the San Fernando Valley. The section of the tunnel between Aliso Canyon and Arrastre Canyon (2.3 miles) would be a mined tunnel excavated through conventional methods, since TBMs are more efficient for long tunnels, over 3 miles long.

## Submission 4247 (Liliana Sanchez, Big Tujunga Canyon Organization, October 18, 2022)

1 during this time. So further information on how will our  
2 wildlife be impacted as well -- and our water, the most  
3 precious resource that we have.

4 Thank you and look forward to hearing more  
5 from you.

6 MS. ARELLANO: Liliana, thank you very much  
7 for participating today and for your comment. Thank you.

8 I'd like to encourage anyone else who's in  
9 attendance, if you are ready to provide a public comment,  
10 please do so. Please indicate by raising your hand on  
11 screen or by choosing star 9 on your phone.

12 There are a variety of ways for the  
13 Authority to receive your formal comment during the  
14 public comment period of the Palmdale to Burbank Project  
15 section. We are currently in our formal public comment  
16 period which lasts 90 days. It commenced on Friday,  
17 September 2nd, and was extended an additional 30 days now  
18 ending on Thursday, December 1st.

19 We have five different ways for you to  
20 provide public comment, today being one of the ways folks  
21 who like to provide oral comment, and this virtual public  
22 hearing is designed to receive the public's oral public  
23 comments on the project at any time this evening until  
24 eight o'clock.

25 Please raise your hand by choosing that

## Response to Submission 4247 (Liliana Sanchez, Big Tujunga Canyon Organization, October 18, 2022)

### 4247-7768

Commenter is concerned with impacts associated with tunneling. Section 3.8.6.3 of the EIR/EIS indicates that while project construction could temporarily affect groundwater conditions in certain High Risk Areas, this effect would not interfere substantially with groundwater recharge such that the project may impede sustainable groundwater recharge in a groundwater basin. Additionally, groundwater intrusion into tunnels would be mitigated by HYD-IAMF#5 (tunnel boring machine design features), HYD-IAMF#6 (tunnel lining systems), and HYD-IAMF#7 (grouting), therefore, mitigating the depletion of groundwater resources due to tunnel construction.

### 4247-7769

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter expresses concerns related to water supply, pollution, noise, climate warming, flora and fauna, wildlife connectivity, and crossing opportunities. The commenter is also concerned about impacts to natural mountain springs, Big Tujunga Wash and the Haines Canyon Creek. Big Tujunga Wash and the Haines Canyon Creek are only crossed by alternatives E2 and E2A, which are not the preferred alternative. The commenter also feels the project is a terrible project during this time. As described in the WCA, over 80 percent of the project is permeable for wildlife movement since most of the project would be constructed underground in tunnels or elevated on viaducts, which would not have adverse noise effects on wildlife. Wildlife would be exposed to noise with the potential to alter behavior where the alignment would occur above ground and the threshold for disturbance (that noise levels above 100 decibels (dBA) Sound Exposure Level (SEL)) is met. As discussed in PB-Response-N&V-3, these impacts would be effectively reduced with implementation of Mitigation Measure N&V-MM#8. The effect of tunneling under the Angeles National Forest, and the associated hydrogeological impacts, are evaluated in the EIR/EIS. This analysis and its results are further explained in PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest. Section 3.8, Hydrology and Water Resources, describes the IAMFs and mitigation measures, such as HYD-IAMF#3, that would be implemented to reduce or avoid any contamination or polluted runoff with the potential to degrade water quality.

See Section 3.3, Air Quality and Global Climate Change, for the Global Climate Change Effect Analysis that was conducted for the project. The analysis found that after a maximum of 6 months, the Build Alternatives would result in net annual emissions reductions and a GHG benefit.

This letter submitted to: [Palmdale\\_Burbank@hsr.ca.gov](mailto:Palmdale_Burbank@hsr.ca.gov)

RE: Pacific Crest Trail Association Palmdale to Burbank Draft EIR/EIS Comment

To Whom It May Concern:

We are submitting this comment in response to the Palmdale to Burbank Project Section Draft EIR/EIS on behalf of the 15,400 member Pacific Crest Trail Association (PCTA). PCTA is the primary private partner in the management and maintenance of the Pacific Crest National Scenic Trail (PCT). PCTA is part of a long-standing partnership with the USDA Forest Service, California State Parks, the National Park Service, and the Bureau of Land Management that is formalized in a Memorandum of Understanding (15-MU-11132424-003). The foundation for this private-public partnership in the operation of National Scenic Trails (NSTs) is rooted in the 1968 National Trails System Act. Section 11 of the Act, titled "Volunteer Trails Assistance" states in Sec. 11(a), "... the head of any Federal agency administering Federal lands, are authorized to encourage volunteers and volunteer organizations to plan, develop, maintain, and manage, where appropriate, trails throughout the Nation." As the Authority is aware, PCTA, Bureau of Land Management and the Angeles National Forest have a strong partnership with the management and maintenance of the PCT.

We appreciate the opportunity to work collaboratively with the Authority to ensure that the project meets the purpose and needs, while still protecting the nature and purposes for which the PCT was designated a National Scenic Trail. The PCT's nature and purposes are documented on page 9 of the [PCT Foundation Document](#). Additionally, the trail's significance and fundamental resources and values, which build from the nature and purposes statement, are detailed in the Foundation Document. Our comments are to ensure that project activities and impacts are minimized on the PCT and the recreation opportunities the trail provides.

We have no objections or concerns for SR14A, E1, E1A, and E2A Build Alternatives, as they intersect the PCT with alignments located in a tunnel several hundred feet below the ground, thereby crossing underneath the PCT and precluding surface impacts to the trail and trail experience.

If Refined SR14 is decided upon as the final alternative, then PCTA would need to revisit previous conversations about realignment of the trail to sufficiently mitigate the project's impacts on the trail and to the trail experience. Should we need to pursue this option, PCTA is confident in the agreed upon alternate trail alignment, however we must

## Submission 4303 (Anitra Kass, Pacific Crest Trail Association, November 21, 2022) - Continued

### Pacific Crest Trail Association

4303-7841 | confirm details and mitigation funds and determine if needed land acquisition is a feasible option.

4303-7842 | My only concern is page 4-95 of Chapter 4 Draft Section 4(f) and Section 6(f) Evaluations. Table 4-6 Parks and Recreation: Summary of Preliminary Section 4(f) Use Determinations indicates that, regarding the PCT, Refined SR14 is "no use" and SR14A is "de minimis". On page 4-76 of the document under **Preliminary Summary of Findings** it states "Refined SR14A Build Alternative would be *de minimis* because the features and attributes that qualify the resources for protection under Section 4(f) would not be diminished." This inconsistent language needs to be corrected and clarified.

4303-7843 | While PCTA's priority must be the experience offered by the PCT to the public, we are committed to working with the Authority to ensure the purposes of this project are met while protecting the PCT experience.

As always, the PCTA wishes to offer our assistance as this project moves forward.

Thank you,

Anitra I. Kass

## Response to Submission 4303 (Anitra Kass, Pacific Crest Trail Association, November 21, 2022)

### 4303-7840

Refer to Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only).

This commenter presents introductory material and reiterates the importance of ensuring that project activities and impacts are minimized on the Pacific Crest Trail (PCT) and to the recreation opportunities the trail provides. The Authority appreciates the comments received from the Pacific Crest Trail Association (PCTA). Please refer to Responses to Comments #7841 through #7843 for additional discussion of the PCT. The only Build Alternative that would cross the PCT at grade and impact the trail is the Refined SR14 Alternative. This is not the Authority's Preferred Alternative. As discussed in Chapter 8, Preferred Alternative and Station Sites of the Draft EIR/EIS, the Authority's Preferred Alternative is the SR14A Alternative, which would cross the PCT underground in a bored tunnel and would have no effect on the existing trail. Please also refer to Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only) for additional discussion of the impacts associated with the Refined SR14 Build Alternative. The Authority will continue to coordinate with the PCTA and will notify the public as the project moves forward.

### 4303-7841

Refer to Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only).

The commenter expresses no objections to the SR14A, E1, E1A, and E2A Build Alternatives. The commenter indicates that, if the Authority selects the Refined SR14 Build Alternative as the preferred alternative, then the Pacific Crest Trail Association (PCTA) would need additional coordination with the Authority related to realignment of the Pacific Crest Trail (PTC). The PCTA also expresses confidence in the agreement made with the Authority regarding the trail realignment. Additional information regarding the PCT realignment can be found in Table 3.15-4 in Section 3.15 of the Draft EIR/EIS, and in Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only). The Authority expects that the Refined SR14 Build Alternative would not inhibit access or the desirability of the PCT overall, to the extent that it would decrease use. It would not increase or decrease PCT use and would not lead to physical deterioration of the PCT. The Authority acknowledges coordination with the PCTA regarding the PCT realignment in Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only).

### 4303-7842

The commenter notes inconsistencies in Table 4-6 in the Draft EIR/EIS with regard to the findings for the Pacific Crest Trail (PCT). The commenter is correct, Table 4-6 in the Draft EIR/EIS incorrectly labeled the Refined SR14 Build Alternative as "No Use" and the SR14A Build Alternative as a "de minimis impact." The analysis explains that the Refined SR14 Build Alternative would result in a de minimis impact because it would require relocating a portion of the PCT. All other Build Alternatives would cross the PCT in a bored tunnel, which would not result in any impacts at the surface or to the trail and as such no use would occur. Table 4-6 in the Final EIR/EIS has been revised to correctly note that the Refined SR14 Build Alternative would result in a de minimis impact on the PCT and that the SR14A Build Alternative would result in no use of the PCT. The SR14A Build Alternative is the Authority's Preferred Alternative.

## Response to Submission 4303 (Anitra Kass, Pacific Crest Trail Association, November 21, 2022) - Continued

### 4303-7843

Refer to Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only).

The commenter expresses willingness to work with the Authority to ensure project objectives are met and the Pacific Crest Trail (PCT) experience is protected. The Authority appreciates the opportunity to work with the Pacific Crest Trail Association (PCTA). The only Build Alternative that would cross the PCT at grade and impact the trail is the Refined SR14 Build Alternative. This is not the Authority's Preferred Alternative. As discussed in Chapter 8, Preferred Alternative and Station Sites of the Draft EIR/EIS, the Authority's Preferred Alternative is the SR14A Build Alternative, which would cross the PCT underground in a bored tunnel and would have no effect on the existing trail. Please refer to Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only) for additional discussion of the impacts associated with the Refined SR14 Build Alternative. Also refer to Section 3.15, Parks, Recreation, and Open Space, of the Draft EIR/EIS for a discussion regarding mitigation measures that would be implemented to avoid and mitigate potential impacts to the PCT during project construction.

**Re: California High-Speed Rail – Palmdale to Burbank Project Section  
 SCH 2014071074 — Draft Environmental Impact Report / Environmental Impact Statement**

Dear Mr. Serge Stanich:

4313-7833

The California Public Utilities Commission (Commission/CPUC) has jurisdiction over rail crossings (crossings) in California. CPUC ensures that crossings are safely designed, constructed, and maintained. The Commission's Rail Crossings Engineering Branch (RCEB) is in receipt of the *Draft Environmental Impact Report (DEIR) / Environment Impact Statement (EIS)* for the proposed California High-Speed Rail – Palmdale to Burbank Project Section. California High-Speed Rail Authority (Authority) is the lead agency.

The Palmdale to Burbank Project Section will provide a High-Speed Rail (HSR) connection from the city of Palmdale near the vicinity of Spruce Court just west of Sierra Highway in the north, to the city of Burbank in the south. The Palmdale to Burbank Project Section includes a station in the city of Burbank near the Hollywood Burbank Airport (formerly Bob Hope Airport). Chapter 2 of the DEIR/EIS outlines the Palmdale to Burbank (P-B) Build Alternatives SR14, SR14A, E1, E1A, E2, and E2A. The DEIR/EIS states that the Preferred Alternative for the proposed project is the SR14A Build Alternative, which includes the Burbank Station (Refer to Chapter 8, Preferred Alternative and Station Sites).

4313-7834

CPUC General Orders set forth regulations governing construction and design for new crossings or alteration of existing crossings. As such, DEIR/EIS Appendix 2-A Roadway and Grade Separation and Appendix 2-B Railroad Crossings should include CPUC General Orders under Applicable Design Standards for alteration of existing state and local roadways.

CPUC General Order (GO) 88-B establishes criteria for altering existing crossings, including roadway realignment, reconstruction or modification of grade-separated structures, and construction of a grade-separated structure that eliminates an existing grade crossing. The Authority will be required to submit a GO 88-B request for alteration of each existing crossing on the corridor unless an application to the Commission is required. Requests to alter existing crossings may be approved by RCEB staff, provided completion of request as outlined in GO 88-B, Section 5, and consensus among parties. Roadways closed at the HSR corridor may require GO 88-B authorization if a nearby grade crossing remains in place. Under Commission GO 75-D, CPUC shall be notified of the closure of any existing crossings.

GO 88-B also establishes cases for which the Authority must apply to the Commission for authorization, including construction of new highway-rail or rail-rail crossings. Refer to the CPUC Rules of Practice and Procedure ([www.cpuc.ca.gov/rpp/](http://www.cpuc.ca.gov/rpp/)), Rule 3.9 Railroad Across Public Road and Rule 3.10 Railroad Across Railroad, for new crossing application requirements. You may consult with RCEB staff to determine the need for authorization by GO 88-B or by formal application to the Commission at each proposed crossing on the corridor.

4313-7835

DEIR/EIS Chapter 2: Alternatives and Chapter 8: Preferred Alternative and Station Sites detail proposed typical cross-sections with minimum clearances. All grade-separated structures, including rail-rail structures, are subject to minimum vertical and horizontal clearance requirements outlined in Commission GO 26-D, Section 2, Section 3, and Section 4. Clearance between parallel tracks is governed by GO 26-D, Section 5. Public roads, highways, and streets crossing under tracks and over tracks are subject to GO 26-D, Section 12 and Section 13, respectively.

4313-7836

The overhead contact system (OCS) powering the HSR is subject to clearance requirements stated in GO 95 and GO 176. Construction and maintenance of walkways adjacent to track is subject to Commission GO 118-A, which details standards for vegetation abatement, surface materials, slope, track clearance, and width. GO 72-B details the rules governing the construction and maintenance of crossings at grade of railroads with public streets, roads, and highways.

4313-7837

A diagnostic meeting is required for each crossing alteration or construction. The diagnostic team consists of representatives from the railroads, roadway agencies, local government agencies, CPUC, and other stakeholders. You may contact RCEB staff to schedule diagnostic meetings and to discuss preliminary designs of all proposed crossings. Section 3.2.7 Mitigation Measures includes considerations for changes to traffic signal operations and roadway alignments during construction, including existing highway-rail crossings approaches. Such alterations to crossing roadway approaches and traffic signal phasing or preemption timing require CPUC review and may require GO 88-B authorization prior to implementation.

4313-7838

Appendix 2-A provides plans sheets for roadway, grade separations, access roads and Appendix 2-B: Railroad Crossings, lists proposed roadway crossings of high-speed rail, modifications, and closures. According to GO 75-D, Section 2, CPUC's policy is to reduce the number of at-grade crossings of freight and passenger railroad mainlines. RCEB recommends that the entire HSR corridor be grade separated with no at-grade highway-rail crossings. Grade separated crossings provide a greater level of safety, for both the roadway users as well as railroad employees, than at-grade highway-rail crossings.

4313-7839

Please continue to keep RCEB informed of the project's development. If you have any questions or require clarification on CPUC's role in rail crossings projects, you may contact Chris Palas at [Christopher.palas@cpuc.ca.gov](mailto:Christopher.palas@cpuc.ca.gov).

Sincerely,

Chris Palas

## Response to Submission 4313 (Christopher Palas, California Public Utilities Commission, November 22, 2022)

### 4313-7832

The commenter confirmed receipt of the Palmdale to Burbank Project Section Draft EIR/EIS and provided an attachment featuring comments on the Draft EIR/EIS. No change has been made to the document in response to this comment.

### 4313-7833

The commenter defined the jurisdiction of the California Public Utility Commission over rail crossings in California, and also reiterated HSR project alternatives from the Draft EIR/EIS. The comment is acknowledged. No change has been made to the document in response to this comment.

### 4313-7834

The commenter states that the Authority would be required to submit a General Order (G.O.) 88-B request to the California Public Utilities Commission (CPUC) for alteration of an existing crossing on the corridor, unless an application to the Commission is required. It also states that the CPUC requires the Authority to apply for authorization to construct new highway-rail or rail-rail crossings. This discussion has been added to the EIR/EIS for consistency. The Authority will follow the steps required by CPUC prior to design approval. Refer to Table 2-39 in Chapter 2 of this Final EIR/EIS which identifies the approvals required from the CPUC to construct the project.

### 4313-7835

The commenter noted the project would need to adhere to California Public Utilities Commission, Commission GO 26-D. As noted in Chapter 2, Alternatives of the Final EIR/EIS, if the engineering design for new or upgraded SCE facilities results in new or different significant environmental impacts, the Authority would comply with NEPA and CEQA as applicable, including evaluating the potential for an environmental reexamination and/or a Supplemental EIR/EIS, prior to engaging with the California Public Utilities Commission permit application process.

### 4313-7836

The commenter noted the project would need to adhere to California Public Utilities Commission, Commission GO 72-B, 95, 118-A, and 176. As noted in Chapter 2, Alternatives of the final EIR/EIS, if the engineering design for new or upgraded SCE facilities results in new or different significant environmental impacts, the Authority would comply with NEPA and CEQA as applicable, including evaluating the potential initiate for an environmental reexamination and/or a Supplemental EIR/EIS, prior to engaging with the California Public Utilities Commission permit application process.

### 4313-7837

The comment indicates that a diagnostic meeting is required for crossing alterations or construction at all highway-rail crossings, and it asserts that GO 88-B would require CPUC review and, perhaps, authorization for changes to traffic signal operations and roadway alignments during construction. The commenter states that a diagnostic meeting is required for each crossing alteration or construction. Diagnostic meetings for all crossings will be held early in the next phase of the design with all key stakeholders to discuss potential impacts and proposed improvements. Each of the Build Alternatives in the HSR Palmdale to Burbank Section would be fully grade-separated.

## Response to Submission 4313 (Christopher Palas, California Public Utilities Commission, November 22, 2022) - Continued

### 4313-7838

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process.

The commenter recommended the entire HSR corridor to be grade separated with no at grade crossings. Unlike existing passenger and freight trains in the project vicinity, the Palmdale to Burbank Project Section would not include at-grade road crossings, nor would the rail alignment be shared with freight trains. Where the Build Alternatives would be at grade and parallel to state facilities, access would be severed where an at-grade leg of an intersection crosses a Build Alternative. Therefore, road overcrossings would be required to maintain the function of the state highway and local road systems. Intersecting roads would be realigned horizontally and adjusted vertically to cross over the HSR. The possibility of encroaching into the Caltrans right-of-way would depend on the placement of the overcrossing columns. The design intent of these crossings is to maintain the existing intersection and traffic patterns during construction. However, some short-term closures could be required; in such cases, local traffic would use one of the other overcrossings or intersections in the vicinity. Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, for a discussion of how alternatives were selected.

### 4313-7839

The commenter asked the Authority to keep their agency informed on the development of the Project. The Authority will continue to keep CPUC informed regarding the California HSR System. CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). CEQA and NEPA require a Final EIR and EIS to respond to the comments received on environmental issues (see 14 C.C.R. §15088(a) and Federal Railroad Administration Procedures for Considering Environmental Impacts 14(s)). This comment does not address the sufficiency of the Draft EIR/EIS, nor does it suggest edits to the document. No change has been made to the document in response to this comment.

November 30, 2022

Attn: Palmdale to Burbank Project Section Draft EIR/EIS Comment; California High-Speed Rail Authority  
355 S Grand Ave, Suite 2050  
Los Angeles, CA 90071

To Whom It May Concern:

Union Pacific Railroad Company (UPRR) submits these comments in response to the California High-Speed Rail Authority's (CHSRA) Draft Environmental Impact Report/Environmental Impact Statement (DEIR/DEIS): Palmdale to Burbank Project Section.

UPRR owns and operates a common carrier freight railroad network in the western two thirds of the United States, including the State of California. Specifically, UPRR owns and operates rail mainlines connecting the San Francisco Bay Area to Sacramento and points east and north, and to Los Angeles and points east and southeast. UPRR is the largest rail carrier in California in terms of both mileage and train operations. UPRR also has a multitude of public private partnerships across the state, including active and planned projects with various state agencies and passenger rail partners. UPRR's network in California is vital to the economic health of the state and the nation as a whole, and its rail service to California customers is crucial to the current and future success and growth of those customers.

UPRR has been actively engaged in discussions with CHSRA for many years in order to ensure that the safety and efficiency of the UPRR system, including UPRR's ability to serve current and future customers, is preserved during the planning, construction, and operation of the California high-speed rail project. UPRR and CHSRA have entered into several agreements that reflect these interests, including the Memorandum of Understanding and Implementing Agreement Related to High-Speed Rail Development in California dated July 11, 2012 (MOU) and the Engineering, Construction, and Maintenance Agreement Related to the California High-Speed Rail Authority Project Merced to Bakersfield Segment dated December 23, 2014.

UPRR has also submitted formal comments in response to proposals at several points during the environmental permitting process for various aspects of the high-speed rail project. That communication has included comments on plans for the proposed Fresno to Bakersfield high-speed rail segment, the Downtown Bakersfield High-Speed Rail Station Area Plan, the DEIR/DEIS submittals for the Bakersfield to Palmdale high-speed rail segment, the San Jose to Merced project segment, and the Burbank to Los Angeles project segment.

# Submission 4358 (Jeffrey Sheldon, Union Pacific Railroad, November 30, 2022) - Continued

2

4358-8573

CHSRA's Palmdale to Burbank DEIR/DEIS proposes a Preferred Alternative (SR 14A) alignment that seeks to utilize some of an existing railroad right-of-way, resulting in a blended system and operations. The Preferred Alternative alignment touches a complex mix of UPRR owned right-of-way, in addition to corridors not owned by UPRR but where UPRR retains and exercises its freight operating rights. These corridors host UPRR premium freight service along with several freight rail served customers and facility infrastructure.

A shared corridor concept raises several operating, engineering, real estate and commercial franchise challenges through these corridors. Except where UPRR has, following negotiation with CHSRA, implemented significant capacity improvements and other mitigation measures to address adverse impacts to its franchise, UPRR will not allow any part of the high-speed rail system to be located on UPRR-owned property or diminish UPRR operating rights on corridors owned by others. For these reasons CHSRA must develop viable alternatives that protect for freight, as the Preferred Alternative shown here is not acceptable to UPRR.

With these general principles as context, UPRR offers these specific points:

- In this congested corridor, existing & future capacity must be preserved (including currently unused right-of-way). CHSRA must acquire the requisite property to preserve this capacity. It is absolutely necessary to protect commuter and freight traffic growth, and the Preferred Alternative directly conflicts with commuter and freight traffic growth.
- Proposals to remove or degrade capability of spur tracks or otherwise degrade the freight capability network are not acceptable.
- Any new facilities that cross UPRR's right of way in relation to the project, including new or realigned roads, must be grade-separated and comply with UPRR's then-current minimum engineering standards.
- Depending on the design and proximity of the CHSRA facilities to the UPRR right of way, special conditions such as safety barriers may be required.
- There may be new and modified bridges to be constructed as a result of accommodating the Preferred Alternative. CHSRA must share in the maintenance of existing and new structures.
- CHSRA cannot further constrain the existing clearances on tracks, and any realignment must preserve or enhance existing clearances.
- To comply with the terms of the MOU, CHSRA must design its alignment in a manner that does not interfere with UPRR's access to current or future customers. Section 2(A)(2) of the MOU says CHSRA "will take all steps available under law to avoid

3

4358-8573

impeding UPRR's commercially reasonable access to current and potential customers and the access of current and potential customers to UPRR along the corridor." Drawings for the Preferred Alternative from Palmdale to Burbank depict the CHSRA alignment realigning UPRR track infrastructure and right of way in various segments, thereby impacting existing UPRR spur tracks and facilities owned or operated by current UPRR customers.

4358-8574

The proposed alignment also appears to separate UPRR from developable property adjacent to the UPRR main line at various points along the proposed route. Impacts to existing and future freight rail customers associated with the proposed Preferred Alternative alignment are unacceptable. UPRR will require modification of the route per the terms of the MOU so that there are no impacts to our ability to serve existing or future customers.

4358-8575

- It is not clear whether the DEIR/DEIS has examined the impact that construction of the CHSRA alignment may have on the future ability of cities or other road authorities to grade-separate roads that cross the UPRR tracks along the route. State and federal policies encourage the elimination of railroad grade crossings for the benefit of safety and the efficient movement of trains and vehicular traffic. The design of the CHSRA alignment and its proximity to the UPRR right of way under the Preferred Alternative may permanently prevent roads that currently cross the freight tracks at grade from being grade-separated in the future. UPRR requests that an analysis be completed to determine the extent of these potential impacts and that the results be formally communicated to the respective roadway authorities who might be impacted and to UPRR.

4358-8576

Considering the potentially serious and detrimental impacts to UPRR facilities, operations, current and future customer access, and to long-term roadway accessibility over UPRR tracks along the Preferred Alternative route, UPRR encourages CHSRA to continue working with UPRR to develop an alignment that meets UPRR safety and engineering guidelines, addresses the concerns identified in this letter or that have yet to be identified, and meet the obligations outlined in our standing agreements. If CHSRA does select the Preferred Alternative route, then CHSRA must mitigate any and all impacts to UP and our customers. CHSRA must provide solutions to overcome the impacts to UPRR noted above and any others UPRR identifies as the design of the Preferred Alternative route is developed in more detail.

Thank you for considering our comments.

Sincerely,

Jeff Sheldon  
General Director Network Development

## Response to Submission 4358 (Jeffrey Sheldon, Union Pacific Railroad, November 30, 2022)

### 4358-8572

This comment contains introductory material and describes the intersections of Union Pacific Railroad Company (UPRR) operation and the project section and the longstanding cooperation between the Union Pacific Railroad Company (UPRR) and the Authority. Thank you for your comment. The Authority will continue to coordinate with UPRR on the project where intersections occur. Responses are provided for each substantive comment in this comment letter.

### 4358-8573

Refer to Standard Response PB-Response-TRA-5: Connection to Existing Transportation Infrastructure.

Refer to Standard Response PB-Response-TRA-5: Connection to Existing Transportation Infrastructure. The commenter states that the SR14A Build Alternative touches a mix of UPRR owned right-of-way, and rights-of-way used for freight operating, and expresses concern about the impacts the SR14A Build Alternative will have on freight operations, meeting customer needs, and access to potential future customers. The commenter also states that CHSRA must work with UPRR for UPRR right-of-way safety, protecting UPRR freight capacity, complying with UPRR engineering standards, and complying with the terms of the MOU. Additionally, the commenter states that the Preferred Alternative directly conflicts with commuter and freight traffic growth.

The Palmdale to Burbank Project Section will not have blended operations with UPRR or other railroads. As noted in Section 2.3.1 of Chapter 2 of the Draft EIR/EIS, the HSR system will use a dedicated right of way. The HSR Palmdale to Burbank Project Section will pass under the SCRRA/UPRR alignment near Palmdale Avenue S, there is an overcrossing near the California Aqueduct and the HSR alignment will be on viaduct south of Soledad Canyon passing over the SCRRA/UPRR alignment. As discussed in Section 2.5.2., the Preferred Alternative would also require the acquisition of rail right-of-way from MP 67.2 to MP 69.1, which is a UPRR parcel up to 25 feet wide, and would realign UPRR in that area. TR-IAMF#9, Protection of Freight and Passenger Rail during Construction, in Section 3.2, Transportation of the Draft EIR/EIS, describes the Authority's commitment to repairing any structural damage to freight or public railways that may occur during the construction period and return damaged sections to their original structural condition or better. With implementation of TR-IAMF#9, Section 3.2, Transportation concludes that the Existing (2015) Plus Construction Conditions for the Preferred Alternative would not permanently interfere with freight rail, passenger rail, or transit services in the Palmdale to Burbank Project Section region.

The California HSR System alignment would be fully access-controlled, meaning that the public would be able to access the system only at the station platforms. Access-control barriers and railway/roadway vehicle barriers along the right-of-way would prevent intrusion into the right-of-way. A minimum separation of 29 feet is required

## Response to Submission 4358 (Jeffrey Sheldon, Union Pacific Railroad, November 30, 2022) - Continued

### 4358-8573

between centerlines of HSR and adjacent railroad tracks, and this separation requires a physical intrusion barrier. When intrusion protection is needed, the minimum total height must be 10 feet with ditch plus berm, concrete wall plus screen, or only a concrete wall. The Authority would regularly perform maintenance along the track and railroad right-of-way, as well as on the power, train control, signaling, communications, and other vital systems required for safe operation of the California HSR System. . Other than those mentioned above pertaining to the SCRRA/UPRR Antelope Valley alignment, no new or modified UPRR bridges will be constructed in the Palmdale to Burbank Project Section in any of the six Build Alternatives. The UPRR track in the section between south of Avenue R in Palmdale and the UPRR Colton Cutoff connection runs parallel and east to the existing SCRRA track. The SCRRA track will be realigned and displaced west of its existing location. Therefore the clearance between the existing UPRR track and the proposed SCRRA track realignment will be maintained or increased.

For other concerns regarding connections to existing transportation networks, refer to Standard Response PB-Response-TRA-5: Connection to Existing Transportation Infrastructure. The Authority is committed to coordinating with UPRR with regard to future right-of-way acquisition and grade separations and throughout the environmental process.

### 4358-8574

The commenter states that to comply with the terms of the Memorandum of Understanding (MOU), the Authority must design its alignment in a manner that does not interfere with UPRR's access to developable property adjacent to the UPRR main line along the proposed route. The HSR alignment makes every effort to protect UPRR's existing and future freight rail customers and the Authority will continue to honor commitments made pursuant to its agreements, including the referenced 2012 MOU.

Chapter 3.2, Transportation, of the Draft EIR/EIS includes analysis of rail and transit services and addresses modifications to portions of existing freight and passenger railroad facilities between Palmdale and Burbank, implementing track reconfigurations, bridge modifications, and grade-separated roadway crossings. Project design includes implementation of TR-IAMF#9 Protection of Freight and Passenger Rail during Construction, which involves construction of a "shoofly" track to allow existing freight and passenger rail lines to bypass areas closed for project construction.

The current preliminary engineering design includes the relocation of the existing rail access to customers along the proposed Build Alternatives alignments if impacted by the project. This includes the siding and unloading facility for Vulcan Materials Company in Sun Valley. Beyond this existing rail access the Authority is unaware of any existing or future developable property near MP 67.2 to MP 69.1 for placement of UPRR freight rail customers

## Response to Submission 4358 (Jeffrey Sheldon, Union Pacific Railroad, November 30, 2022) - Continued

### **4358-8575**

The commenter requests that an analysis be completed to determine potential impacts to future roadways that may cross UPRR tracks, including the potential to preclude future grade separation from railroad tracks.

There are no at-grade crossings on rail lines owned by UPRR within the Palmdale to Burbank Project Section. However, UPRR operates on the SCRRA Antelope Valley Line. As shown on the project alignment plans included in Volume 3 of the Draft EIR/EIS and as further elaborated in this response to comment, it can be concluded that the project would not preclude future grade separations of the existing SCRRA Antelope Valley line tracks.

At the Olinda Street at-grade crossing, the SR14A, Refined SR14, E1 and E1A Build Alternatives would cross underneath the existing road, not precluding a future grade separation, as either Olinda Street or the SCRRA track vertical alignment could be modified for that purpose.

The existing at-grade crossing at Penrose Street would be eliminated by the SR14A, Refined SR14, E1 and E1A Build Alternatives.

The SR14A, Refined SR14, E1 and E1A Build Alternatives would result in grade separating Sheldon Street from the existing SCRRA rail tracks, as well as the HSR proposed alignment.

The existing at-grade crossing between SCRRA and Branford Street is located at enough distance from the SR14A, Refined SR14, E1 and E1A Build Alternatives alignment to allow for a future grade separation.

From Branford Street to Sierra Highway (south of Palmdale), there are no at-grade crossings in the vicinity of the HSR Build Alternatives and, therefore, the project would not preclude a future grade separation.

At the at-grade crossing between the SCRRA track and the service access road to the east side of Soledad Siphon, the SR14A, E1A and E2A Build Alternatives would not preclude a future grade separation, as the horizontal and vertical alignment of the

### **4358-8575**

service road could be modified for that purpose. A future grade separation at this location is already constrained by the proximity between SCRRA track and Sierra Highway.

The Sierra Highway at-grade crossings are located at enough distance from all Build Alternatives to allow for a future grade separation.

At the at-grade crossing between the SCRRA track and Barrel Springs Road, E1, E2 and Refined SR14 Build Alternatives would not preclude a future grade separation, as the road horizontal and vertical alignment could be modified for that purpose. A future grade separation at this location is already constrained by the proximity between SCRRA track and Sierra Highway.

Avenue S would be modified to cross over the proposed HSR Build Alternatives and SCRRA, resulting in the grade separation of Avenue S and the SCRRA track. For concerns regarding connections to existing transportation networks, refer to Standard Response PB-Response-TRA-5: Connection to Existing Transportation Infrastructure.

As demonstrated in this response to comment, the HSR Palmdale to Burbank Project Section would grade separate some existing at-grade crossings and would not preclude the ability for other grade separations to occur in the future. The Authority will continue to coordinate with UPRR with regard to future grade separations and throughout the environmental process.

## Response to Submission 4358 (Jeffrey Sheldon, Union Pacific Railroad, November 30, 2022) - Continued

### 4358-8576

The commenter encourages ongoing coordination with the Authority and identifies Union Pacific Railroad (UPRR) safety and engineering guidelines, the concerns raised in this comment letter, and obligations provided for in existing agreements as areas that will benefit from continued coordination. The Authority is committed to continued work with UPRR regarding these issues and the design of the HSR Palmdale to Burbank Project Section. The commenter also states that if the Authority constructs the Preferred Alternative, any and all impacts to UPRR and its customers must be mitigated. The Authority is committed to implementing the mitigation measures described in the MMRP and MMEP that will incorporate all mitigation measures in this Final EIR/EIS, and the Authority will continue to coordinate with UPRR.

California High-Speed Rail Authority  
 ATTN: Palmdale to Burbank Draft EIR/EIS Comment  
 355 S Grand Avenue, Suite 2050  
 Los Angeles, CA 90071

4359-8566

The Glendale Homeowners Coordinating Council (GHCC) and our Member Associations are deeply committed to uniting our neighborhoods, preserving our rich history, and protecting our high quality of life throughout the City of Glendale. One of the collective goals of our membership is to ensure that development is sensitive to and compatible with our neighborhoods and nearby open space and does not cause undo harm to our residents and wildlife.

In the broader scope, the GHCC has an interest in CAHSR because the City of Glendale is one of the members of the Burbank-Glendale-Pasadena Airport Authority and home to the Larry Zarian Transportation Center, a multimodal station on the National Register of Historic Places. But the main, more important focus, is that the GHCC represents the interests of the Glendale residents whether living their daily lives at home, commuting to work, or traveling to the airport to catch a flight. Thank you for the opportunity to comment on this project, potentially the most significant one in our lifetime.

Based on inadequate environmental review due to project segmentation and evidence of substantial, long-term environmental impacts, we believe the only viable alternative is **No Build**.

4359-8567

Segmentation Minimizes Full Project Impact Resulting in False Assumptions

The Rail Authority has divided the massive high-speed rail project into smaller area sections to focus on design, environmental review, infrastructure, funding, and implementation. However, this process segments the project thereby not taking into consideration the combined cumulative effect of such a large-scale operation and the practical and environmental challenges throughout the entire region.

Taking sections out of order and studying each in isolation, disregards the substantial regional impact, presents skewed data and distorts final results. To fully understand the magnitude of effects to the whole region, the Rail Authority should have studied the southern half of the Bakersfield to Palmdale section as well as the Palmdale to Burbank, and the Burbank to Los Angeles sections all as one unit. This is a significant error.

Aside from this point, the public has been advised that the proposed rail transportation stations in Palmdale and Burbank have already been finalized and approved in previous EIRs and therefore, no comment can be made on them now. We wholeheartedly disagree. The Palmdale to Burbank section, at the very least, should be examined from station-to-station and should not just address

# Submission 4359 (Susan Bolan, Glendale Homeowners Coordinating Council, November 30, 2022) - Continued

4359-8567

the huge tunnels between them. This decision to disregard the stations as they relate to the rest of the section and other sections, further divides the project and misrepresents the full impact to the municipalities and unincorporated areas.

4359-8568

Inadequate Mitigation for Substantial Air Quality and Noise Impacts

For a city like Glendale that is sandwiched between the Palmdale to Burbank and the Burbank to Los Angeles sections, the deleterious effects on air quality and noise levels will likely impact residents for upwards of 20 years. Our construction-weary cities have already seen a decade of simple highway and rail projects that have taken significantly longer than scheduled so there is little trust that a comprehensive project like the CAHSR will be completed before the half-century mark.

The CAHSR project route in our region will cross at least seven freeways and countless arterial highways within a 50-mile stretch. During construction, every rail/vehicle exchange will need to be reconfigured and/or rebuilt to provide grade separation, high-speed capability and accommodate extra tracks. Three rail transportation centers will be built/reconstructed. Raw materials and spoils at every location and along the route will be delivered and removed primarily by trucks using area freeways. Tunnel portals, surface staging areas, conveyor systems and dump sites will produce concentrated levels of airborne debris. Utility infrastructure will be significantly augmented throughout the project areas and new lines/equipment will pepper the urban and natural landscape.

The environmental document does not adequately address mitigation for the high level of debris that will be airborne during construction. The draft EIR/EIS summary states, "Construction period emissions would exceed the applicable SCAQMD and AVAQMD CEQA thresholds for all Build Alternatives." In the report, a suggested mitigation for poor air quality in general is to "secure emission offsets." This is not an acceptable solution especially considering that "cap and trade" offset fees are helping to fund the project. This is circular logic -- paying fees into the fund that pays for the project. It does nothing to improve the quality of the air. The suggested mitigation of "near zero emission technology for 25 percent of light-duty on-road vehicles" doesn't go far enough to reduce vehicle pollutants. Heavy earth moving equipment and tunnel boring machines typically do not utilize near zero emission technologies.

The environmental document does not adequately address mitigation for long-term effects from noise levels above those acceptable for humans and wildlife during construction and train operation. The draft EIR/EIS summary states, "HSR construction activities would expose residences near the HSR construction footprint to construction noise that exceeds recommended threshold criteria" and "Build Alternatives would result in startle effects on horses." While we appreciate that, "The Authority will implement noise barriers, sound insulation, and noise easements as mitigation for noise impacts," residents and businesses adjacent to the project will most definitely be exposed to long-term vibration and noise disruption that cannot fully be mitigated. The report also suggests that for noise level mitigation for wildlife, the Authority will "post signage to warn users of upcoming train crossings and the approximate time for the crossing at equestrian facilities...reducing noise impacts on domestic animals to less than significant." This is frankly, absurd.

The draft EIR/EIS defines the construction period as "temporary." How long is temporary? No one will know what that means until all sections in our region are completed. The new US Link Station designed to be built at Union Station in Los Angeles is not projected to have high-speed trains come through until the year 2040. That's at least 17 years, if everything goes according to plan. A great many respiratory conditions can develop in 17 years, especially in children.

4359-8568

This colossal proposal is not a straightforward linear enterprise by any standard. It is a multilayered, multijurisdictional, megaproject like never seen before. It is quite common for megaprojects less complicated than this one in the U.S. and abroad to have extended timelines and huge cost overruns. The estimated costs for the CAHSR project are growing daily and future funding is uncertain. To date, no private funding mechanism has presented itself and based on history, it is highly likely that taxpayers will need to subsidize future operations and ridership to keep fees affordable. The cumulative, long-term detrimental effects of the CAHSR project cannot be weighed against the very small carbon benefit of perhaps enticing some people out of their vehicles who might otherwise drive to another part of the state. When looking at the big picture of impact vs. benefit, the only acceptable choice for our region is the **No Build** option.

4359-8569

CAHSRA Must Coordinate with the Airport Authority and City of Burbank

Like Glendale, the greater Burbank area has seen a lot of change in the past 100 years, from horse ranches and open land to the early beginnings of the movie industry; World War II aviation manufacturing; the post-war housing boom; freeway construction; and the surge of both large-scale and small-scale retail outlets and services. Burbank has always been a premier destination for families, employment, medical care, shopping, dining, and recreation while it has maintained its small-town charm and respect for its history and the natural environment.

The City of Burbank is most proud of the Hollywood Burbank airport, self-described as "the friendliest, most convenient airport for flying to or from Los Angeles, Hollywood, and the San Fernando Valley." Built in 1930, the airport is currently preparing for an expansion project called *Elevate BUR* to increase passenger and operational safety, replacing an outdated terminal layout. The Burbank-Glendale-Pasadena Airport Authority ("Airport Authority") intends to build a 14-gate, 355,000 square foot replacement passenger terminal on the property and demolish the existing terminal.

On February 17, 2022, the Airport Authority filed a lawsuit against the Rail Authority referring to the environmental study for Burbank to Los Angeles stating, "The draft EIR failed to fully analyze, disclose, and mitigate potential project impacts on the airport, including to the safety of the airport's operations." The City of Burbank agreed that the Rail Authority proposal needed further study and coordination with the Elevate BUR plan and regular airport operations.

In reviewing both the Palmdale to Burbank and Burbank to Los Angeles EIR/EIS and the Burbank Station schematics, the GHCC Member Associations understand that it is imperative that the entities coordinate plans moving forward or abandon the idea of a rail station at the Burbank airport altogether. The City of Burbank will suffer significant disruption on every street from construction and rail operations for years to come as well as substantial loss of parcels (AKA "conversion to transportation use.") The business and residential landscape will be forever changed. The Rail Authority must ensure buy-in from all three cities of the Airport Authority, especially the City of Burbank, to be able to build the rail project. A similar arrangement should be made with the City of Palmdale and Palmdale Airport when planning for the rail station located there.

4359-8570

Community Outreach Has Been Abysmal

Public participation is mandated and an essential component of the CEQA process. For megaprojects like the CAHSR, it is critical that the lead agency take very broad actions to ensure the public is aware of the project, has full access to source materials, and provides a forum for the public to comment. Outreach methods should utilize but not be limited to print, broadcast and online media; direct mail, email, newsletters and flyer communiques; community forums and

# Submission 4359 (Susan Bolan, Glendale Homeowners Coordinating Council, November 30, 2022) - Continued

4359-8570

meetings; and providing informational meetings and public hearings within the affected communities.

Outreach by the CAHSRA for the Burbank to Los Angeles section was so poor during the first summer of the pandemic that no Member Associations of the GHCC knew the draft EIR/EIS had been released on May 29, 2020, nor had the opportunity to attend the single online meeting on June 18 or the online public hearing on July 8. No GHCC Member Associations knew to draft comments by the August 31, 2020 deadline. Some individuals were able to scramble at the last minute and submit comments during the last week after becoming aware of the deadline through word of mouth. We hope that any lack of comments submitted for the Burbank to LA section by the GHCC Member Associations did not get misconstrued as there were no objections and that residents approved the proposals for the six Build Alternatives.

For the Palmdale to Burbank section, GHCC members were notified of the release of draft EIR/EIS by email and only if they had signed up for notifications from CAHSRA. No other notifications were seen in the usual media outlets except on the [hsr.ca.gov](http://hsr.ca.gov) website. The release announcement took place at the least favorable time – the Friday of Labor Day weekend, September 2, 2022.

There was one scheduled online open house October 6 followed by one online public hearing October 18, 2022. At the October 6 meeting, it was announced that two in-person meetings had been added -- one for October 8 in Acton and another October 12 in Pacoima. Not only was this very short timing to encourage more participation but the announcement was made only to attendees of the online informational meeting. It did not get sent out via email or broadcast anywhere else. It finally appeared on the [hsr.ca.gov](http://hsr.ca.gov) website late in the afternoon on October 12. Both in-person meetings had approximately 30 people in attendance, some of whom were likely consultants. The information shared was limited in scope and specific only to that particular community.

Considering the sheer magnitude of this project, it is reprehensible for the CAHSRA to have such poor communication with the public. There were no public meetings held in Palmdale, Agua Dulce, Santa Clarita, San Fernando, Lake View Terrace, Sunland-Tujunga, Sun Valley, or Burbank. Participants in Pacoima were shocked by the proposed disruption to their neighborhoods and businesses with absolutely no proposed benefit to their town. Many residents, who felt they were being targeted and dismissed, stated plausibly that they would be victims of social/environmental injustice due to the traditionally lower-income communities of color that surround the project area. The CAHSRA completely fell short of a comprehensive outreach effort.

Thank you for considering these comments of the Glendale Homeowners Coordinating Council as part of the draft environmental review process for the California High-Speed Rail, Palmdale to Burbank section. Please include them in the final document and provide response to our concerns.

Sincerely,

Grant Michals, President  
Glendale Homeowners Coordinating Council

Susan Bolan, Secretary  
Glendale Homeowners Coordinating Council  
[sbolan1@aol.com](mailto:sbolan1@aol.com)

## Response to Submission 4359 (Susan Bolan, Glendale Homeowners Coordinating Council, November 30, 2022)

### 4359-8566

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process.

The majority of the comment describes the interests of the Glendale Homeowners Coordinating Council and their Member Associations; the remainder of the comment expresses that they support the No Build Alternative since they believe the environmental review was inadequate due to project segmentation and evidence of substantial, long-term environmental impacts. Regarding project segmentation, the Authority disagrees with this characterization. The Authority has used a tiered environmental review process and prepared a programmatic EIR/EIS examining the effects of the entire nearly 800-mile statewide HSR system. (Draft EIR/EIS, Section 1.1.2, Decision to Develop a Statewide High-Speed Rail System.) Draft EIR/EIS, Section 1.1.3.5 explains that the statewide HSR system was then divided into individual project sections for further environmental review. Each segment of the statewide California HSR System has independent utility and purpose, even if the adjacent sections were not completed. Therefore, the project has not be segmented. While the commenter mentions substantial, long-term environmental impacts, the commenter does not identify in its introductory comment what substantial, long-term environmental impacts it believes were not disclosed in the EIR/EIS. Therefore, no additional response is needed. Please refer to Standard Response PB-Response-GEN-4: General Opinions, Opposition or Support. The commenter's preference for the No Build Alternative is acknowledged and included in the record for consideration by decisionmakers.

### 4359-8567

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process.

The commenter states that dividing the statewide HSR system into smaller sections segments the project and fails to consider the combined cumulative effects throughout the region. The commenter further states that taking sections out of order and studying each in isolation disregards the substantial regional impact, presents skewed data, and distorts final results. The commenter suggests the Authority should have conducted a study of the southern portion of the Bakersfield to Palmdale Section, Palmdale to Burbank, and Burbank to Los Angeles as one unit. The commenter also expressed their belief that the public should be able to comment on the proposed station improvements as well as that the independent review of the proposed stations further fragments and misrepresents the full impact of the HSR project. Regarding the commenters specific issue about analyzing each section independently, one of the three criteria used by the Authority to determine the scope of a project to be considered in an EIS was the independent utility of each project section. Each project section was determined to be a usable and reasonable expenditure even if no additional transportation improvements are made which is why the environmental impacts for each project section were studied separately. For additional discussion about the independent utility of each project section, please refer to Section 2.1.2, Independent Utility and Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process. Additionally, please refer to Section 3.19, Cumulative Impacts which provides an overview of the cumulative impacts of the Palmdale to Burbank Project Section along with the adjacent Bakersfield to Palmdale and Burbank to Los Angeles Project Sections. In response to the commenter's specific point about analyzing the station impacts, the impacts of the Palmdale Station were evaluated in the Bakersfield to Palmdale Project Section EIR/EIS while the impacts of the Burbank Airport Station were evaluated in the Burbank to Los Angeles Project Section EIR/EIS. A draft version of the Burbank to Los Angeles Project Section EIR/EIS document was circulated for public comment beginning on May 29, 2020, and concluded on August 31, 2020 while a draft version of the Bakersfield to Palmdale Section EIR/EIS was circulated for public comment beginning on February 28, 2020 and ending on April 28, 2020. No changes to the proposed station area designs for the Burbank Airport Station or the Palmdale Station have been made since these public review periods and the Authority approvals of each station. Information about the

## Response to Submission 4359 (Susan Bolan, Glendale Homeowners Coordinating Council, November 30, 2022) - Continued

### 4359-8567

impacts of these stations was included in this Palmdale to Burbank EIR/EIS for informational purposes. Please refer to Section 2.5.2.2 for a description of the previously approved stations.

### 4359-8568

The commenter believes the project construction will take 20 years, and they ask how long the construction will last. The Authority expects the construction period for the entirety of the Palmdale to Burbank segment will vary between 8.33 and 9.25 years, depending on the alternative (Draft EIR/EIS, p. 2-198).

The commenter states that three rail transportation centers will be built. It is unclear what "rail transportation centers" are being referred to. The EIR/EIS analysis does not include the Palmdale Station, as that station was approved as part of the Bakersfield to Palmdale project section in 2021. The construction emissions included in the Draft EIR/EIS include the emissions associated with the construction of the Burbank station. No other stations or transportation centers are located within the Palmdale to Burbank project section, and no other transportation centers are analyzed in this EIR/EIS.

The commenter states that a "high level of debris . . . will be airborne during construction." The construction will require moving dirt, soils, and spoil. The Authority is implementing impact avoidance and minimization features and other mitigation measures to reduce air quality impacts from construction. Ultimately, construction of the project would lead to significant and unavoidable impacts even after implementation of AQ-IAMF#1 through AQ-IAMF#6 and AQ-MM#1 through AQ-MM#3. See Table 3.3-48 in Section 3.3 of the Draft EIR/EIS (showing that for Impact AQ#2, Impact AQ#3, and Impact AQ#5). All other air quality impacts related to construction (Impacts AQ#1, AQ#4, and AQ#12) would be less than significant. For impacts to regional air quality during construction (Impact AQ#2) and compliance with air quality plans during construction (Impact AQ#3), only two of six pollutants would exceed applicable thresholds: NOx and CO. VOCs, SO2, PM10, and PM2.5 would not exceed regional thresholds. The Draft EIR/EIS further found that localized impacts from particulate matter (PM) (Impact AQ#5) would result in exceedances of PM10 in only three out of six worst-case construction scenarios, despite implementation of IAMFs and MMs (see pages 3.3-113 to 3.3-114). Although this represents a significant and unavoidable impact, the exceedances would be temporary and relatively minor, ranging from a 0.2 to 1.8 exceedance of the annual average CAAQS threshold for PM10 (see Table 3.3-35 of the Draft EIR/EIS).

The commenter asserts that heavy earth-moving equipment and tunnel boring machines "typically do not utilize near zero emission technologies." Here, however, the tunnel

## Response to Submission 4359 (Susan Bolan, Glendale Homeowners Coordinating Council, November 30, 2022) - Continued

### 4359-8568

boring machines would be electrically-powered, generating no direct criteria pollutant emissions. Furthermore, the health risk assessment (HRA) conducted for project construction takes into account the various phases of construction and the exposure of sensitive populations over the full course of project construction. Projected health risks are below applicable thresholds. For more details on the project's HRA, see pages 3.3-105 to 3.3-106 of the Draft EIR/EIS. In addition, all operational air emissions impacts (Impacts AQ#6, AQ#7, AQ#8, AQ#9, AQ#10, AQ#11, and AQ#13) would be less than significant.

Regarding the commenter's concern about noise, at locations where severe noise impacts have been identified, mitigation measures, as described in Section 3.4.7 of the Draft EIR/EIS, will be implemented in accordance with the CA HSR Noise Mitigation Guidelines, which are included as Appendix 3.4-C of the Draft EIR/EIS. The primary form of noise mitigation would be noise barriers. The CA HSR Noise Mitigation Guidelines outline where noise barriers would be constructed. Barriers would need to achieve between 5 and 15 dB of noise reduction and meet cost thresholds to be considered reasonable and benefit a minimum number of impacted locations. In areas where barriers are not effective or not feasible, sound insulation of buildings could be considered. In some cases, the mitigation measures may not be fully effective, and locations exist where sound walls would not be feasible, based on the mitigation guidelines. Some unavoidable adverse noise effects would result from implementation of the Build Alternatives.

### 4359-8569

Refer to Standard Response PB-Response-SOCIO-1: Parcel Acquisitions and Relocations, PB-Response-TRA-1: Temporary Traffic Associated with Construction, PB-Response-TRA-5: Connection to Existing Transportation Infrastructure.

The commenter requested continuing coordination with the Airport Authority and City of Burbank on issues related to the Burbank Airport Station including the need for further study and coordination with the Elevate BUR Plan and regular airport operations. The commenter also expresses concern regarding traffic impacts due to construction and rail operations, changes to the business and residential landscape, and the loss of parcels from conversion to transportation use. As discussed in Draft EIR/EIS, Chapter 2, Section 2.5.2.2, the Burbank Airport Station was evaluated as part of the Burbank to Los Angeles Project Section. The Final EIR/EIS for the Burbank to Los Angeles Project Section was released on November 5, 2021. The Authority's Board approved the Burbank to Los Angeles Project Section Preferred Alternative, including the Burbank Airport Station on January 20, 2022. The information and analysis in this Palmdale to Burbank EIR/EIS about the Burbank Airport Station is for information and reference. The Authority has been in coordination with the Burbank-Glendale-Pasadena Airport Authority (BGPAA) and FAA since 2014 and will continue to work closely with the FAA and BGPAA through final design and construction to avoid impacts to the airport and airport operations to the greatest extent practicable. This coordination is required as part of SS-IAMF#6: Stakeholder Coordination for the Hollywood Burbank Airport, which is discussed in Section 3.11, Safety and Security of the Draft EIR/EIS. SS-IAMF#6 requires continued coordination with the FAA and BGPAA to avoid conflicts due to overlapping construction schedules and future operations at the Hollywood Burbank Airport. The purpose of this ongoing stakeholder coordination is to ensure that the design, construction, and operation of the HSR Build Alternative takes into consideration the Airport Layout Plan and any future improvements to the Hollywood Burbank Airport identified in SCAG's 2020-2045 Regional Transportation Plan/Sustainable Community Strategy (SCAG 2020) and to ensure that construction and operation of the HSR Build Alternative do not negatively impact these future improvements. The Burbank to Los Angeles Project Section Final EIR/EIS can be accessed on the Authority website using the following link: <https://hsr.ca.gov/programs/environmental-planning/project-section-environmental-documents-tier-2/burbank-to-los-angeles-project-section-draft-environmental-impact-report-environmental-impact-statement/>.

## Response to Submission 4359 (Susan Bolan, Glendale Homeowners Coordinating Council, November 30, 2022) - Continued

### 4359-8570

Refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS.

The commenter expresses disappointment in the public outreach effort associated with the California HSR System, specifically related to the public meetings and public comment period for the Burbank to Los Angeles Project Section and public meetings for the Palmdale to Burbank Project Section. The commenter also notes that residents attending the public meeting in Pacoima stated they would be victims of social/environmental injustice.

CEQA Guidelines Section 15087 identifies the requirements for providing notice of availability of a Draft EIR, including notices be given by at least one of the following procedures: 1. Publication at least one time by the public agency in a newspaper of general circulation in the area affected by the proposed project. If more than one area is affected, the notice shall be published in the newspaper of largest circulation from among the newspapers of general circulation in those areas. 2. Posting of notice by the public agency on and off the site in the area where the project is to be located. 3. Direct mailing to the owners and occupants of property contiguous to the parcel or parcels on which the project is located. Owners of such property shall be identified as shown on the latest equalized assessment roll. In addition, CEQA Guidelines Section 15087 identifies the requirement to post the Notice of Availability with the County Clerk and the State Clearinghouse.

As described in Chapter 9 of the Draft EIR/EIS, the Authority met these CEQA requirements and in fact, provided more public outreach opportunities than required under CEQA. CEQA requires only one of the three methods listed above to be used to provide the notice of availability; however, the Authority provided notices on newspapers, as well as postcards in multiple languages to properties located near the various Build Alternatives. Please refer to Standard Response PB-Response-GEN-3: Public Outreach on the Draft EIR/EIS, which discusses the various ways of noticing including publication in newspapers, direct mailing, e-mail, and filed electronic notices pursuant to CEQA Guidelines Sections 15086 and 15087 and FRA's Procedures for Considering Environmental Impacts (Fed. Register, Vol 64 No. 101) and the Council on Environmental Quality's NEPA regulations (40 CFR parts 1500–1508 (1978)). A list of

### 4359-8570

public meetings for the Palmdale and Burbank Project Section can be found in Table 9-5 of Chapter 9 of the EIR/EIS. Additionally, following the direction of U.S. Executive Order (USEO) 12898, and the U.S. Department of Transportation (USDOT) Order 5610.2C, the Authority conducted specific outreach efforts to low-income and minority populations. EJ outreach has been accomplished through a range of efforts, starting with bilingual English-Spanish meeting flyers that also included information about how to access the meetings in additional languages. Please refer to Table 9-1 and Table 9-2 of Chapter 9 for a list of media publications and public meetings held at various locations, including Palmdale, Agua Dulce, Santa Clarita, San Fernando, Lake View Terrace, Sunland-Tujunga, Sun Valley, and Burbank. The Authority understands the concerns expressed by the commenter and takes them seriously. While CEQA requirements for public notice were met and exceeded for the Draft EIR/EIS, the Authority will continue to explore opportunities for additional outreach in the future.

**Re: Comments on Draft Environmental Impact Report/Environmental Impact Statement for the Palmdale to Burbank Project Section of the California High-Speed Rail Project**

Dear California High-Speed Rail Authority:

These comments are submitted on behalf of the Center for Biological Diversity (the "Center") regarding the Draft Environmental Impact Report/Environmental Impact Statement (DEIR) for the Palmdale to Burbank Project Section of the California High-Speed Rail Project ("Project") proposed by the High Speed Rail Authority (the "HSRA"). The Center is encouraged to see that much of the alignment is underground to reduce impacts to terrestrial habitat connectivity; however, we remain concerned about tunneling impacts to hydrology, surface waters, and the species and habitats that rely on those waters throughout the region. With ongoing climate change and extensive drought throughout the state, we urge the HSRA to comprehensively study and assess the Project's potential impacts prior to Project approval and monitor the region's hydrological systems during Project construction and implementation. In addition, mitigation for significant impacts to wildlife connectivity, particularly in identified important connectivity areas where the alignment is at-grade, is inadequate. Given the importance of the area for habitat connectivity and gene flow for mountain lions and statewide biodiversity, more must be done to adequately mitigate the Project's impacts.

While the Center sees some benefits to high-speed rail transportation, high-speed rail must be planned to adequately avoid and minimize impacts to sensitive species, habitats, and connectivity between and among heterogeneous habitats, even in areas where connectivity is constrained. More robust mitigation must be required to adequately offset the Project's significant impacts to habitat and wildlife movement and forward the State's 30 by 30 goals to combat climate change and advance biodiversity conservation. The proposed mitigation does not adequately minimize impacts to local and regional connectivity to less than significant. At a time when the world is facing both an extinction crisis and a climate crisis, the Center urges state agencies like the HSRA to take on more responsibility to assess and learn from our previous land-use planning mistakes and plan for a future that has the greatest chances of maintaining and

Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

4378-8693

amplifying ecosystem health and climate change resilience. Tackling the climate crisis must include ensuring landscape connectivity that provides multiple pathways for animals and plants to adapt to shifting climates as climate change worsens. We urge the HSRA to increase the proposed mitigation to adequately mitigate the Project's impacts to special-status species, sensitive habitats, wildlife movement, and habitat connectivity.

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over 1.7 million members and online activists throughout California and the United States. The Center and its members have worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in the region and throughout California.

4378-8694

**I. The DEIR must assess a more expansive definition of species habitat to adequately assess impacts to special-status species and wildlife movement.**

The DEIR focuses the analysis for the Wildlife Corridor Assessment ("WCA") on five species, including mountain lions, mule deer, desert tortoise, American badger, and San Joaquin kit fox. According to the WCA, "The suitable core-and-patch habitat was clipped by the known species ranges (California Wildlife Habitat Relationships System [CWHRS] 2016) or urban development edge (as shown the Fire and Resource Assessment Program - FRAP vegetation map" (WCA at 4-11). While using data and information from state agencies like the California Department of Fish and Wildlife ("CDFW") is a good starting point for the analysis, the CWHRS does not use species distribution models and may not capture all areas of the state the species may use or move through. The DEIR's reliance on just the CWHRS and FRAP vegetation map excludes other important data and some of the best available science that would help inform the Project's impacts assessments. In these species' cases, such exclusions lead to an underestimate of the impacts to these sensitive species. The DEIR analysis should include the best available data and information to adequately assess and mitigate the Project's potential impacts to sensitive species and wildlife connectivity. While CDFW's CWHRS provides some valuable information, there are other important sources of data that must be included to more fully represent existing conditions and how the Project could impact these species and the connectivity they rely on for survival.

For example, Figure 2-12 in the WCA Supplement excludes most if not all of the Verdugo Mountains in the species range for mountain lions (WCA Supplement Figure 2-12 at 2-34). Yet there is ample scientific evidence that indicates otherwise. The Santa Monica Mountains National Park Service ("NPS") biologists were monitoring P-41 for several years; his home range encompassed almost the entirety of the Verdugo Mountain Range (NPS, 2017). Scientists (NPS, 2017) speculate he came from the San Gabriel mountains, which highlights the valuable mountain lion connectivity in the area of the Project. At least two other mountain lions (not part of the NPS study) have been documented in the Verdugo Mountains, named Nikita and Adonis (Cardine, 2018), and multiple sightings or other evidence of mountain lions (i.e., paw prints, scat) have been documented in the Verdugo Mountains on iNaturalist.<sup>1</sup>

<sup>1</sup> iNaturalist mountain lion observations available at: [https://www.inaturalist.org/observations?taxon\\_id=42007](https://www.inaturalist.org/observations?taxon_id=42007). Accessed November 16, 2022.

4378-8694

Mountain lions are wide-ranging species with large home ranges that include heterogeneous habitats. Such information is critical to consider when assessing the Project's potential impacts to this candidate species under the California Endangered Species Act (CESA). By excluding the Verdugo Mountains as suitable mountain lion habitat, the DEIR underestimates the Project's impacts to mountain lion habitat (Table 3.7-20, DEIR at 3.7-149) and mountain lion movement. Such calculations affect the proposed mitigation, particularly BIO-MM#97, which provides compensatory mitigation for permanent impacts to suitable mountain lion habitat (DEIR at 3.7-238). By only accounting for a fraction of the mountain lion habitat that the Project is impacting, the DEIR underestimates the Project's impacts to suitable mountain lion habitat, which will lead to fewer acres of compensatory mitigation required. Like the WCA Supplement does with American badger (WCA Supplement Figure 2-14 at 2-37), the entire Project area should be assumed to be in mountain lion habitat/range. The Project's impacts to mountain lion habitat and movement are not adequately disclosed, assessed, or mitigated.

Similarly, the WCA analysis for mule deer excludes the Verdugo mountains as suitable habitat within the species range (WCA Supplement Figure 2-13 at 2-35). Mule deer have been documented throughout the Verdugo Mountains, as evidenced by iNaturalist data.<sup>2</sup> The DEIR's WCA analysis should expand the assessment to incorporate the Verdugo Mountains as suitable habitat for these wide-ranging species.

The WCA also under-represents the potential range of desert tortoise. The species range provided in Figure 2-15 of the WCA Supplement (at 2-39) should extend more west and encompass both at-grade and tunneled portions of the alignment not currently included in the EIR analysis. The DEIR states that the analysis used the desert tortoise habitat model developed for the Desert Renewable Energy Conservation Plan; however, it appears the DEIR used the "predicted occupied habitat," which does not fully encompass suitable habitat that desert tortoises have the potential to occur in. According to the USFWS, desert tortoise has potential to occur further west towards where Agua Dulce Canyon Road intersects with SR-14 (USFWS, 2011)<sup>3</sup>. In addition, the DEIR fails to mention that the portion of the alignment east of Agua Dulce Canyon Road lies entirely within the Western Mojave Recovery Unit for desert tortoise (USFWS, 2011). This is important to consider because this federally- and state-threatened species continues to hurtle towards extinction due to habitat loss and fragmentation, vehicle strikes, increasing raven populations, military maneuvers, disease, drought, extreme heat, wildfires, illegal marijuana grows, and development of massive solar farms (Sahagun, 2022). Therefore, for a species to recover, it is important to assess impacts to areas where the species may currently occur as well as areas where there is suitable habitat and the species has potential to occur, establish, or re-establish. Both at-grade and tunneled segments have the potential to impact desert tortoise movement and foraging and refuge habitat, and the Project's impacts to desert tortoise habitat is greater than the 99 acres calculated for Table 3.7-22 (DEIR at 3.7-158). Such calculations affect the proposed mitigation, including BIO-MM#53's compensatory

<sup>2</sup> iNaturalist mule deer observations available at: [https://www.inaturalist.org/observations?taxon\\_id=42220](https://www.inaturalist.org/observations?taxon_id=42220). Accessed November 21, 2022.

<sup>3</sup> See also Conservation Biology Institute's Desert Tortoise - Species Distribution Model Map, DRECP available at: <https://databasin.org/maps/385dd726e56b4a7eac8b46ccb3389e24/>. Accessed November 29, 2022.

Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

4378-8694

mitigation plan. Therefore, the Project’s impacts to desert tortoise habitat and movement are not adequately disclosed, assessed, or mitigated.

4378-8695

**II. The DEIR fails to adequately mitigate impacts to mountain lions and other special-status species and sensitive habitats**

*A. Mountain lions*

The DEIR fails to adequately assess and mitigate the Project’s impacts to mountain lions. As mentioned above, excluding a large portion of mountain lion habitat (i.e., the Verdugo Mountains) from the analyses significantly reduces the amount of acres reported as impacted by the Project footprint (see Table 3.7-20, DEIR at 3.7-149). The acres of impacted mountain lion habitat should be more like 790-859 acres for the SR14A alignment, as is the case for American badgers, for which the species range was assumed to be “the entirety of the state” (WCA Supplement at 2-37). Under-reporting the amount of acres of mountain lion habitat impacted by the Project will lead to less compensatory mitigation required in BIO-MM#97.

In addition, the compensatory mitigation ratios required in BIO-MM#97 are too low and the language is vague and unclear. BIO-MM#97 states that “Habitat will be replaced at a minimum ratio of 2:1 for permanent impacts on breeding/foraging habitat and high-priority foraging and dispersal habitat, and at a ratio of 1:1 for low-priority foraging and dispersal habitat” (DEIR at 3.7-238), but it is unclear how “high-priority” and “low-priority” habitat will be defined or identified. Also, the MM only mentions permanent impacts, though the DEIR claims BIO-MM#97 would “ensure permanent and temporary impacts on mountain lion habitat would be offset” (DEIR at 3.7-156). This must be clarified. The HSRA should provide compensatory mitigation to any type of mountain lion habitat, including but not limited to breeding, foraging, or dispersal habitat (permanent or temporary) at a minimum ratio of 3:1 for preservation and 5:1 for restoration, enhancement, or creation. Connectivity for gene flow and climate adaptability among and between suitable habitat must be prioritized.

As discussed below, the proposed mitigation for the Project’s impacts to wildlife connectivity is insufficient, which could lead to devastating impacts to struggling mountain lions. The Project area is within a region that serves not only to connect the Southern California and Central Coast subpopulations within the proposed Evolutionarily Significant Unit (ESU), but to connect the ESU with all other California mountain lions (Gustafson et al., 2018, 2021; Yap et al., 2019). Gustafson et al. (2021) state:

“this region is of critical importance for maintaining statewide puma gene flow. Enhancing connectivity through the Transverse Ranges (including the Tehachapi Mountains, Sierra Pelona, San Gabriel Mountains, and San Bernardino Mountains: Fig. 1B) is a critical conservation priority in order to maintain gene flow between the Southern Coast populations and the Sierra Nevada or Central Coast groups” (Gustafson et al., 2021).

4378-8695

Maintaining and enhancing the connection between the San Gabriel Mountains and the Sierra Pelona Mountains is of the highest importance. As the Project is currently proposed, the at-grade segments that go through the important San Gabriel-Castaic design linkage, which connects the Sierra Pelona and San Gabriel mountains, will degrade critical remaining puma connectivity and inhibit much needed connectivity enhancements.

4378-8696

*B. Other special-status species and sensitive habitats*

Although the Center acknowledges that the design is at just 15% and estimated impacts can change to more or less impacts, more detail and information is required for the public and decisionmakers to determine whether the Project’s impacts to special-status species and sensitive habitats are adequately assessed and mitigated. For example, BIO-MM#53 requires the HSRA to prepare a Compensatory Mitigation Plan for Species and Species Habitat (DEIR at 3.7-222), and it includes encouraging language by referencing providing descriptions of success criteria (which should be measurable), adaptive management approaches, funding mechanisms/financial assurances. However, as currently written, there is no way to determine if future descriptions will adequately assess and mitigate the Project’s impacts. In addition, there is no guarantee a prepared CMP will be implemented; the DEIR states “The Authority will prepare a CMP...” but does not require the HSRA to implement the CMP (DEIR at 3.7-222). BIO-MM#53 is insufficient and amounts to improperly deferred mitigation.

Compensatory mitigation ratios are too low for special-status species and sensitive habitats. Provided mitigation ratios vary by species, habitat, whether impacts are permanent or temporary, whether impacts are to breeding or foraging habitat, etc. An overarching theme is the mitigation ratios are too low and lack specificity. They fail to adequately mitigate the Project’s impacts. For example, the DEIR provides a mere 1:1 compensatory mitigation ratio for listed plant species (BIO-MM#38), vernal pool fairy shrimp and vernal pool tadpole shrimp habitat (BIO-MM#39), and “active primary foraging habitat” for Swainson’s hawk (less for “active secondary foraging” and “active tertiary foraging habitat,” BIO-MM#43). The DEIR provides a 2:1 compensatory mitigation for “permanent impacts” to riparian habitat (BIO-MM#46) and active burrowing owl burrows and habitat (BIO-MM#44), which is also insufficient. These and other sensitive species and habitats have protected status for a reason: further destruction and degradation of these habitats, particularly in an area where there are identified significant ecological areas (SEAs) and there is important wildlife connectivity, will cause further harm to sensitive species and habitats and reduce their chances of recovery and resilience to climate change. The HSRA should provide compensatory mitigation for impacts to any type of suitable habitat, including but not limited to breeding, foraging, or dispersal habitat (permanent or temporary) at a minimum ratio of 3:1 for preservation and 5:1 for restoration, enhancement, or creation. Such mitigation should apply to suitable habitat whether it is occupied, potentially occupied, historically occupied, or within an area that would allow for species to adapt to climate change. Connectivity for gene flow and climate adaptability among and between suitable habitat must be prioritized. In addition, any mitigation should prioritize occurring onsite, within the impacted watershed, or within important connectivity areas that the alignment slices through.

Wildlife suffering from barotrauma from major air pressure changes caused by human infrastructure is a growing concern that has not been assessed in the DEIR. A 2019 study

Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

4378-8696

estimated that an Amazonian rail operation kills about 10,000 toads every year (they were struck, desiccated, or died of barotrauma) (Dornas et al., 2019). A 2011 study found that wind turbines were killing bats via direct collisions and barotrauma (Grodsky et al., 2011). Major air pressure changes could occur with high speed rail, and given that there will be portions of the alignment at-grade and on viaduct, such potential impacts to wildlife should be considered and assessed.

4378-8697

**III. The DEIR requires additional wildlife crossings to adequately mitigate the Project's impacts to wildlife movement.**

As high-speed rail slices through much of the state, it is critical to minimize impacts to wildlife connectivity as much as possible to preserve any remaining intact habitats and allow for enhancement and recovery of areas with constrained connectivity. Protecting and improving connectivity will improve chances for sensitive species to survive and adapt to climate change while improving the State's chances to reach its 30 by 30 goals.

*A. Connectivity is critical for healthy species and populations*

The proposed Project will result in habitat loss and fragmentation and edge effects that will degrade a critical connectivity area between the San Gabriel Mountains and the Sierra Pelona Mountains/Castaic area.

As detailed in a 2021 Center Report (Yap et al., 2021), transportation infrastructure and development create barriers that lead to habitat loss and fragmentation, which harms native wildlife, plants, and people. As barriers to wildlife movement, poorly-planned development and roads can affect an animal's behavior, movement patterns, reproductive success, and physiological state, which can lead to significant impacts on individual wildlife, populations, communities, landscapes, and ecosystem function (Brehme et al., 2013; Ceia-Hasse et al., 2018; Haddad et al., 2015; Marsh & Jaeger, 2015; Mitsch & Wilson, 1996; Trombulak & Frissell, 2000; van der Ree et al., 2011). For example, habitat fragmentation from roads and development has been shown to cause mortalities and harmful genetic isolation in mountain lions in Southern California and along the Central Coast (Ernest et al., 2014; Gustafson et al., 2018, 2021; Riley et al., 2014; Saremi et al., 2019; Vickers et al., 2015). Habitat fragmentation has also been found to increase local extinction risk in amphibians and reptiles (Brehme et al., 2018; Cushman, 2006; Delaney et al., 2021), cause high levels of avoidance behavior and mortality in birds and insects (Benítez-López et al., 2010; Kantola et al., 2019; Loss et al., 2014), and alter pollinator behavior and degrade habitats (Aguilar et al., 2008; Goverde et al., 2002; Trombulak & Frissell, 2000).

Habitat fragmentation also severely impacts plant communities. An 18-year study found that reconnected landscapes had nearly 14% more plant species compared to fragmented habitats, and that number is likely to continue to rise as time passes (Damschen et al., 2019). The authors conclude that efforts to preserve and enhance connectivity will pay off over the long-term (Damschen et al., 2019). In addition, connectivity between high quality habitat areas in heterogeneous landscapes is important to allow for range shifts and species migrations as climate changes (Cushman et al., 2013; Heller & Zavaleta, 2009; Krosby et al., 2018). Loss of wildlife connectivity decreases biodiversity and degrades ecosystems while reducing climate change resilience.

4378-8697

Edge effects of development in and adjacent to critical linkage areas, like the proposed Project, will likely impact key, wide-ranging predators, such as mountain lions and bobcats (Crooks, 2002; Delaney et al., 2010; Lee et al., 2012; Riley et al., 2006; Smith et al., 2015, 2017; Vickers et al., 2015; Wang et al., 2017), as well as smaller species with smaller home ranges, such as song birds, bats and other small mammals, and herpetofauna (Benítez-López et al., 2010; Bunkley & Barber, 2015; Cushman, 2006; Delaney et al., 2010; Gray, 2017; Kociolek et al., 2011; McClure et al., 2013; Slabbekoom & Ripmeester, 2008; Ware et al., 2015). Limiting movement and dispersal can affect species' ability to find food, shelter, mates, and refugia after disturbances like fires or floods. Individuals can die off, populations can become isolated, sensitive species can become locally extinct, and important ecological processes like plant pollination and nutrient cycling can be lost. Negative edge effects from human activity, such as traffic, lighting, noise, domestic pets, pollutants, invasive weeds, and increased fire frequency, have been found to be biologically significant up to 300 meters (~1000 feet) away from anthropogenic features in terrestrial systems (Environmental Law Institute, 2003).

*B. Mitigation must include movement studies, more wildlife crossings, and land acquisition in important connectivity areas*

Despite acknowledging that the SR14A alignment goes through several areas identified as important for connectivity and biodiversity, including the San Gabriel-Castaic linkage design and the designated San Andreas and Santa Clara River significant ecological areas (SEAs) (CDFW, 2018; SC Wildlands, 2008),<sup>4</sup> the DEIR downplays the importance of those areas to wildlife connectivity. Instead, the DEIR focuses on existing constraints from existing infrastructure, whether it is the SR-14 freeway, the California Aqueduct, or fencing at Una Lake and Lake Palmdale (DEIR at 3.7-190). For example, the DEIR asserts:

“for all practical purposes, the SR 14 freeway serves as a barrier to wildlife movement. Numerous bridges and culverts provide potential crossing opportunities under the SR 14 freeway. However, because of their width and height, many bridges and culverts would not facilitate wildlife movement due to lack of vegetative cover and due to the design of the bridge/culvert.” (EIR at 3.7-93).

Yet the DEIR does not provide any studies or other evidence to support such claims, nor does it acknowledge that there are varying degrees of permeability, as some species are more adaptable to human development and infrastructure than others. The DEIR also does not provide the dimensions of the culverts and bridges that they purport would not facilitate wildlife movement. While indeed roads and other infrastructure may present significant barriers to wildlife movement, no fieldwork was conducted for the Wildlife Corridor Assessment (WCA Supplement at 2-4). And according to the WCA, Caltrans does not collect roadkill data for SR-

<sup>4</sup> See also Biodiversity Atlas of LA Significant Ecological Areas available at: <https://biodiversityla.org/conservation/significant-ecological-areas/>. Accessed Nov 29, 2022.

## Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

4378-8697

14 (WCA at 4-7). Therefore, these analyses were provided with limited movement data and without conducting any movement or on-the-ground studies along the alignment.

Although the SR-14 likely serves as a barrier to some wildlife movement, it is not impermeable (i.e., there is no 10-foot fence) and some valuable wildlife movement in the area likely persists (e.g., animals may successfully cross when there is low or no traffic). Without documenting roadkill, conducting targeted species movement studies, and/or conducting studies to determine if existing culverts and bridges are being used by wildlife, the DEIR cannot rightfully conclude that SR-14 is a complete barrier to wildlife movement. However, placing segments of a noisy, vibrating, at-grade high speed rail alignment with 10-foot tall fencing along the SR-14 will be a formidable barrier that will fortify any existing barriers and preclude opportunities to enhance connectivity, gene flow, and climate change resilience in this critical connectivity area.

Even if the SR-14 is currently a significant barrier to wildlife movement, that simply underscores how important preserving *existing* connectivity and restoring *formal* connectivity is for the Project Area. The DEIR should not unduly minimize the value of compromised movement opportunities; indeed, the fact that the use of a highly constrained opportunity for movement between natural areas might be made more difficult by a project should *always* be considered a potentially significant impact, requiring mitigation. If an existing movement opportunity on the SR-14 lacks a vegetated approach or sufficient culverts, crossings, or other features to facilitate movement, that doesn't mean it doesn't pose an *opportunity* for movement.

Mitigation should include conducting movement studies to inform the placement and design of more wildlife crossings for the at-grade segments of the proposed Project. A wildlife connectivity technical working group comprising of members from the HSRA, the Center, Caltrans, CDFW, The Nature Conservancy, Wildlands Network, University of California, Davis, the U.S. Fish and Wildlife Service, as-needed species-specific experts, and other appropriate stakeholders should be established, coordinated, and consulted with by the HSRA. And more wildlife crossings should be included to adequately mitigate the Project's impacts to both large, wide-ranging species as well as small, less-mobile species.

The DEIR's approach is also inconsistent with the HSRA's obligations under state law. AB 2344 establishes a state policy to "protect, *restore*, and enhance the functioning of fish, wildlife, and habitat connectivity in connection with the planning, construction, and improvement of transportation infrastructure throughout the state and, where feasible, the operation and maintenance of transportation infrastructure throughout the state." As a state agency tasked with designing and implementing transportation infrastructure, the HSRA may not simply consider the baseline connectivity conditions and seek to maintain them; it must affirmatively take steps to *restore* connectivity, particularly when connectivity has been degraded by other state agencies (here, Caltrans). In addition, it would be a grievous misstep to preclude Caltrans from being able to effectively retrofit SR-14 to enhance connectivity in the area.

HSRA has an opportunity to mitigate the Project's impacts to wildlife connectivity – and restore connectivity degraded by other state projects – in the area by enhancing connectivity at

8

4378-8697

existing barriers. The DEIR points to undercrossings that align with adjacent tunneled and viaduct segments of the at-grade rail near Bee Canyon; however, according to the WCA Supplement, at-grade segments of the SR14A alignment will go through a significant portion (~30% or more) of the San Gabriel-Castaic linkage design and the modeled least cost corridors for mountain lions and mule deer (WCA Supplement at 2-27, 2-28, 2-32). Therefore, more mitigation is needed to adequately offset the Project's impacts. Mitigation should include upgraded culverts and/or a wildlife overpass or underpass on SR-14, acquired adjacent lands where SR14A is at-grade near Bee Canyon (at the western side of the San Gabriel-Castaic linkage design), and a wildlife overpass over the rail. In addition, much of the area along SR-14 is vulnerable to development (Yap & Rose, 2020); therefore, the HSRA should also prioritize compensatory mitigation to be acquired within the design linkage or in areas where future on-the-ground movement studies determine connectivity is important.

In addition, while the DEIR commits the HSRA to build two wildlife crossings along the rail near Una Lake and the Soledad Siphon, it is not clear what size or type of crossings these will be, and the target species for the crossings are not specified. As mentioned in the DEIR, "The recommended wildlife crossing spacing interval is 1.0 mile for large crossings and 0.3 mile for small crossings" (DEIR at 3.7-189). Two unspecified crossings on a 3-mile stretch of at-grade rail is insufficient to meet those recommendations. Additional crossings for specified target species, including but not limited to desert tortoise, San Joaquin kit fox, mountain lions, western pond turtle, and other bird, reptile, amphibian, mammal, and invertebrate special-status species must be considered.

Providing corridor redundancy, even when connectivity is already constrained, can benefit numerous sensitive species and habitats. If properly planned, it can help to mitigate the Project's impact to connectivity. Corridor redundancy is important because it allows for improved functional connectivity and resilience at a regional scale. Compared to a single pathway, multiple connections between habitat patches increase the probability of movement across landscapes by a wider variety of species, and they provide more habitat for low-mobility species while still allowing for their dispersal (Mcrae et al., 2012; Olson & Burnett, 2008; Pinto & Keitt, 2008). In addition, corridor redundancy provides resilience to uncertainty, impacts of climate change, and extreme events, like flooding or wildfires, by providing alternate escape routes or refugia for animals seeking safety (Cushman et al., 2013; Mcrae et al., 2008; Mcrae et al., 2012; Olson & Burnett, 2008; Pinto & Keitt, 2008).

Corridor redundancy is critical when considering the impacts of climate change on wildlife movement and habitat connectivity. Climate change is increasing stress on species and ecosystems, causing changes in distribution, phenology, physiology, vital rates, genetics, ecosystem structure and processes, and increasing species extinction risk (Warren et al., 2011). A 2016 analysis found that climate-related local extinctions are already widespread and have occurred in hundreds of species, including almost half of the 976 species surveyed (Wiens, 2016). A separate study estimated that nearly half of terrestrial non-flying threatened mammals and nearly one-quarter of threatened birds may have already been negatively impacted by climate change in at least part of their distribution (Pacifci et al., 2017). A 2016 meta-analysis reported that climate change is already impacting 82 percent of key ecological processes that form the foundation of healthy ecosystems and on which humans depend for basic needs

9

# Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

4378-8697

(Scheffers et al., 2016). Genes are changing, species' physiology and physical features such as body size are changing, species are moving to try to keep pace with suitable climate space, species are shifting their timing of breeding and migration, and entire ecosystems are under stress (Cahill et al., 2012; Chen et al., 2011; Maclean & Wilson, 2011; Parmesan, 2006; Parmesan & Yohe, 2003; Root et al., 2003; Warren et al., 2011). Thus, mitigation that includes on-the-ground movement studies and implementing more wildlife crossings on the at-grade segments of the alignment and adjacent roadways like SR-14 would more sufficiently mitigate the Project's significant impacts to wildlife movement and habitat connectivity in this critically important area for statewide connectivity for mountain lions, other wildlife, and overall biodiversity.

4378-8698

## IV. Conclusion

Although these comments are not comprehensive, the Center presents some key concerns regarding insufficient impact analyses and mitigation for special-status species, sensitive habitats, and wildlife connectivity. High-speed rail must be planned to adequately avoid and minimize impacts to sensitive species, habitats, and connectivity between and among heterogeneous habitats, even in areas where connectivity is constrained. More robust mitigation is needed to adequately offset the Project's significant impacts to sensitive species and habitat and wildlife connectivity to forward the State's 30 by 30 goals to combat climate change and advance biodiversity conservation.

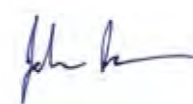

At a time when the world is facing both an extinction crisis and a climate crisis, the Center urges state agencies like the HSRA to take on more responsibility to assess and learn from our previous land-use planning mistakes and plan for a future that has the greatest chances of maintaining and amplifying ecosystem health and climate change resilience. Tackling the climate crisis must include ensuring landscape connectivity that provides multiple pathways for animals and plants to adapt to shifting climates as climate change intensifies. We urge the HSRA to increase the proposed mitigation to adequately mitigate the Project's impacts to special-status species, sensitive habitats, wildlife movement, and habitat connectivity.

Thank you for the opportunity to submit comments on the DEIR for the Burbank to Palmdale Project Section of the California High-Speed Rail Project. Please include the Center on your notice list for all future updates to the Project and do not hesitate to contact the Center with any questions at the email addresses listed below.

Sincerely,

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022)

### 4378-8692

The commenter notes that they are submitting attached comments on behalf of the Center for Biological Diversity, and provides a link to where references cited can be found. Comment noted. Responses are provided for each substantive comment in the attached comments.

### 4378-8693

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-BIO-3: Wildlife Movement Corridors, PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF.

The commenter expresses concerns related to adequacy of mitigation measures needed to account for the project's impact on hydrological systems, wildlife connectivity, sensitive species, and climate change. The Authority has developed 12 Impact Avoidance and Minimization Features (IAMF) described in Appendix 2-E and over 100 mitigation measures described in Section 3.7.7, which are designed to avoid, minimize, and offset impacts to special-status species, sensitive habitats, wildlife movement, and habitat connectivity.

Each of the six Build Alternatives would traverse the ANF, including the SGMNM, underground in a tunnel. Because of the high mountains, faulting, hard rock formations, and potentially high water pressures that could be encountered, tunnel construction under the ANF could alter hydrogeological conditions, resulting in inflows of groundwater into the tunnel and the subsequent change in groundwater levels. The Authority's analysis of hydrogeological effects from tunnel construction involved a detailed assessment of known hydrogeologic and hydrologic conditions of the western San Gabriel Mountains; the professional judgment of experts in the field of hydrogeology, hydrology, and tunnel construction; and reviews of case studies of similar types of tunnel construction projects. Based on the findings of this analysis, potential risk areas were identified and mapped in the tunnel construction RSA in the ANF, with relative rankings of High Risk, Moderate Risk, and Low/No Risk of impacts on subsurface, surface, and other water resources. The Authority will use state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, such as HYD-IAMF#5 (TBM Design Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting). Notwithstanding these measures, in High-Risk Areas, which are zones associated with tunnels intersecting areas with faults and high hydrostatic pressure, groundwater inflow into the tunnels would likely occur during construction. Although actions would be implemented during construction to reduce the indirect impacts on special-status species and to minimize the loss of habitat resulting from

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

### 4378-8693

tunnel construction, the project could result in loss and degradation of habitat. To address this impact, the Authority would implement an AMMP. BIO-MM#93 will involve implementation of the bioresource portions of the AMMP prepared under HYD-MM#4, which will require monitoring of groundwater-dependent surface water resources and associated habitat within the tunnel construction RSA, providing supplemental water where needed, and remediating or compensating for any adverse effects identified during monitoring in a timely manner. If the Authority determines, through direct monitoring or data interpretation, that substantial disruption (i.e., loss of 0.5 acre or greater) to habitat supporting special-status species has likely occurred during or after construction and that habitat restoration efforts did not achieve success criteria or that restoration was determined unfeasible, compensatory mitigation to offset the loss of habitat would be provided. With implementation of these mitigation measures, the Build Alternatives would not result in a substantial adverse effect on special-status species and habitat as a result of indirect impacts from tunnel construction.

Please refer to Standard Responses PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, and PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF for further information regarding concerns about hydrologic impacts that could potentially result from tunneling under the ANF, including areas within the SGMNM, as well as concerns regarding the ongoing availability of water supply.

Please refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife regarding concerns about project construction and operations impacts to special-status plants and wildlife and habitat.

The Palmdale to Burbank Project Section: Wildlife Corridor Assessment Report (Authority 2019c) highlights permanent effects on wildlife movement that would result from operation of the Build Alternatives. Despite existing constraints (SR 14 and suburban land uses), a majority of the Build Alternatives would be permeable (i.e., no impediments to wildlife movement) outside of the urban areas of Palmdale and the San Fernando Valley. These permeable areas occur where the Build Alternatives would be elevated on a viaduct or underground in a tunnel because wildlife can travel above tunneled segments or under elevated viaducts. Tunnels and viaducts provide almost

### 4378-8693

unimpeded connectivity for wildlife and would have no impact on wildlife movement and connectivity. The Authority (2019c) concluded that as long as there is a viaduct/tunnel/at-grade transition and/or drainage structure within 1.0-mile intervals for large crossings and 0.3-mile intervals for small crossings, wildlife movement would not be impeded.

Despite the extensive tunnel and viaduct segments, the Authority determined that mitigation measures were required to address significant impacts related to at-grade segments near Una Lake and the California Aqueduct (See Draft EIR/EIS Section 3.7.6.3). The Authority developed BIO-MM#64 to require installation of one wildlife crossing south of the California Aqueduct and one wildlife crossing east of Una Lake to improve the permeability of SR14A. Other mitigation measures were also developed to further reduce impacts, including: preparation and implementation of a restoration and revegetation plan (BIO-MM#6); installations of aprons or barriers within security fencing (BIO-MM#36); minimize effects on wildlife movement corridors during construction (BIO-MM#37); establish environmentally sensitive areas (BIO-MM#58); limit vehicle traffic and construction site speeds (BIO-MM#60); implement wildlife height requirements for enhanced security fencing (BIO-MM#77); install wildlife jump-outs (BIO-MM#78); and implementation of measures to reduce, avoid and minimize effects on wildlife movement (BIO-MM#83). Standard Response PB-Response-BIO-3: Wildlife Movement Corridors, provides detailed information regarding the methodology and analysis used to analyze the project's effects on wildlife movement. Maintaining habitat connectivity among the natural lands that exist in the Antelope Valley, the San Gabriel Mountains, and the San Bernardino Mountains is recognized as a key tool in ensuring the long-term population viability of special-status and non-special-status species. The Authority recognizes that this is a high conservation priority identified by both regulatory agencies and conservation groups. In recognition of this conservation priority, the Authority is committed to addressing wildlife connectivity based on the best available science and based on input from knowledgeable stakeholders in the region. The Authority undertook an extensive review of information on regional wildlife movement and integrated substantial wildlife crossing opportunities into the project design.

The commenter also references the ongoing climate crisis and urges the Authority to take more responsibility in maintaining and amplifying ecosystem health and climate

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

### 4378-8693

change resilience. See Section 3.3, Air Quality and Global Climate Change, for the Global Climate Change Effect Analysis that was conducted for the project. The analysis found that after a maximum of 6 months, the Build Alternatives would result in net annual emissions reductions and a GHG benefit.

### 4378-8694

The commenter expresses that the Draft EIR/EIS must assess a more expansive definition of species habitat to adequately assess impacts to special-status species and wildlife movement. The Authority acknowledges there are limitations to the California Wildlife Habitat Relationships System (CWHRS) 2016, but this is the best available dataset applicable to the extent of the Resource Study Area (RSA) and identified by the California Department of Fish and Game as the species' ranges.

The commenter is concerned that the suitable core and patch habitat was clipped by the known species range (CWHRS) and urban development edge. The Authority disagrees with the commenter's assertion that the model underestimates mountain lion impacts. The species predictive model overestimates the potential habitat for this species within the RSA by using large blocks of CWHRS vegetation communities that assumes all areas within the community are habitat. The urban edge and CWHRS data are large scale regional data sets appropriate for a project of this scale. It is acknowledged that individual animals will stray outside of the known species range; however, the data set captures the overall trends and provides opportunities for updates upon review by the wildlife agencies. In addition, the urban edge is a general boundary of urban development. Individual mountain lion may utilize backyard habitat, but backyards are generally not considered suitable mountain lion habitat. Furthermore, the CWHRS has not yet decided whether to incorporate the individual mountain lion records from NPS and iNaturalist from the Verdugo Mountains, into their species range.

The commenter is concerned that the Verdugo Mountains are not included within the CWHRS mountain lion species range and impacts to mountain lion movement. The Refined SR14, SR14A, E1, and E1A Build Alternatives do not cross the Verdugo Mountains. Alternatives E2 and E2A are the only alignments that cross the Verdugo Mountains and they are not the preferred alternative. Modifying the species range would not change the result of the analysis for the preferred alternative. Alternatives E2 and E2A traverse the approximate 1.77-mile distance across the Verdugo Mountains either underground in tunnel or elevated on viaduct, allowing wildlife to cross the HSR alignment. There is a 0.038 mile (200 foot) at-grade section that would be fenced and impermeable; however, it is assumed that a highly mobile mammal such as mountain lion would be able to traverse around this small segment.

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

### **4378-8694**

The commenter is concerned the Draft EIR/EIS underestimates the project impacts on mountain lion habitat (Table 3.7-20, Draft EIR/EIS page 3.7-149) and mountain lion movement. Impacts on mountain lion breeding, foraging, and dispersal habitat are shown in Figure 3.7-25 and in Table 3.7-20 of the Draft EIR/EIS.

The commenter correctly notes the desert tortoise data used was from the Desert Renewable Energy Conservation Plan (DRECP). The DRECP data does not show suitable desert tortoise habitat within the project alignment. In addition, the DRECP does not show any occurrences south or west of Palmdale. Generally, disturbed areas are not considered desert tortoise habitat. The commenter states USFWS determined that desert tortoise has the potential to occur where Agua Dulce Canyon Road intersects the SR 14 freeway; however, desert tortoise is not known to occur south and west of Palmdale. No records for desert tortoise occur in the California Natural Diversity Database west and south of Palmdale. In addition to Palmdale being urban, the California Aqueduct, and the SR 14 freeway restrict tortoise movement south and west of Palmdale. The commenter also states that a portion of the HSR occurs within the Western Mojave Recovery Unit for desert tortoise. These recovery areas are used as policy planning areas for the recovery of the species and include developed and urbanized areas in the City of Palmdale and Lancaster. It is not expected that desert tortoise would be re-established in urban and developed areas even though they are within the Mojave Recovery unit.

The commenter is concerned that the acreage calculated for impacts on desert tortoise habitat is greater than the amount shown in Table 3.7-32 of the Draft EIR/EIS. The desert tortoise species model was created by USGS. The USGS model is a statistical habitat model for parts of the Mojave and Sonoran Deserts and was created by inputting environmental and occurrence data into Maxent (v3.3.3e).

### **4378-8695**

Refer to Standard Response PB-Response-BIO-3: Wildlife Movement Corridors.

The commenter states the opinion that the Draft EIR/EIS fails to adequately address the project's impact on mountain lions. Specifically, the commenter states that excluding the Verdugo Mountains from the analysis reduces the area of reported impacts.

The breeding, foraging, and dispersal habitats for mountain lion and American badger are defined in Table 3.7-7 in Section 3.7, Biological and Aquatic Resources of the Draft EIR/EIS and are based on the CWHR vegetation communities and CWHR species ranges. The impact calculations in Table 3.7-20 reflect the total potential habitat within the Core Habitat RSA (1,000 feet from Build Alternative). The Preferred Alternative, SR14A, and the Refined SR14, E1, and E1A Build Alternatives do not cross the Verdugo Mountains. Build Alternatives E2 and E2A are the only alternatives that cross through the Verdugo Mountains. The E2 and E2A Build Alternatives traverse the approximately 1.77-mile distance across the Verdugo Mountains either underground in tunnel or elevated on viaduct, allowing wildlife to cross the HSR alignment. There is a 0.038-mile (200-foot) at-grade section that would be fenced and would be impermeable; however, a highly mobile mammal such as mountain lion would be able to traverse around this small segment. Impacts on mountain lion breeding, foraging, and dispersal habitat are shown in Figure 3.7-25 and with data provided in Table 3.7-20 of the Draft EIR/EIS. Habitat acreage for mountain lion and American badger, as with other species, are based on a variety of factors, including historically known ranges, vegetation community affiliations taken from CWHR, elevation, and topography. Impacts to species habitat are based on where the direct project footprint or larger indirect effects area (wildlife resource study area) overlap with the species habitat acreage. As such, impact acreages are taken directly from geographic information systems analysis of project feature overlap with species habitat overlap, and then are subsequently reviewed for accuracy. This provides an objective and robust estimate of project impacts. American badger tend to be more extensive in their use of land than mountain lion, including urban and other developed lands, and have a historically broader range than mountain lion; therefore, badger is expected to have a larger impact acreage than mountain lion. BIO-MM#97 (Provide Compensatory Mitigation for Impact on Mountain Lion Habitat) includes a compensatory mitigation plan prepared and implemented to address impacts to mountain lion habitat following the methodology in BIO-MM#53 (Prepare and Implement a CMP for Species and Species Habitat).

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

### 4378-8695

The commenter requests clarification regarding whether compensatory mitigation will be provided for temporary impacts as well as permanent impacts. As described in Draft EIR/EIS Section 3.7.6.3, for the purposes of quantifying acreages of habitat impacts, temporary impacts are considered to be permanent impacts due to the length of the construction period. Therefore, implementation of BIO-MM#97 would cover temporary impacts as well as permanent impacts.

The commenter also requests clarification on how “high-priority” and “low-priority” mountain lion habitat will be defined or identified to ensure permanent and temporary impacts are offset by BIO-MM#97. The Final EIR/EIS has been revised to provide a distinction between “high-priority” and “low-priority” habitat as relates to mountain lion by identifying the vegetation layers that correspond with high and low priority habitat. The commenter also states that the Authority should provide compensatory mitigation for mountain lion habitat at a 3:1 ratio for preservation and 5:1 ratio for restoration, enhancement, or creation, and that gene flow and climate adaptability among and between suitable habitat must be prioritized. As described in BIO-MM#97, habitat will be replaced at a minimum ratio of 2:1 for permanent impacts on breeding/foraging habitat and high-priority foraging and dispersal habitat (CRC, MCH, SGB, CSC, COW, DSW, DSC, AGS, JUN, VRI, LAC), and at a ratio of 1:1 for low-priority foraging and dispersal habitat (BAR, DOR/VIN), unless a higher ratio is required by regulatory authorizations issued under CESA. Compensatory mitigation concentrates on high value habitat acquisition, with a focus on factors such as location, function, conservation value, and development threat, rather than acreage ratios. A 2:1 ratio for permanent impacts on breeding/foraging habitat and high-priority foraging and dispersal habitat, and a 1:1 for low-priority foraging and dispersal habitat are standard minimum ratios and sufficient to provide equivalent replacement of potentially lost functions and values of mountain lion habitat. Nevertheless, through ongoing coordination with CDFW, higher ratios that provide superior replacement of potentially lost functions and values of habitat may be required.

The commenter states the maintaining and enhancing the connection between the San

### 4378-8695

Gabriel Mountains and the Sierra Pelona Mountains is of the highest importance. The Build Alternatives maintain wildlife movement connectivity across the extensive series of tunnels and viaducts that correspond with existing crossing opportunities along the existing constrained SR 14 freeway. The lengths of those tunnels and viaducts are listed in Table 6-6 in the WCA (Authority 2019c) and Table 2-13 of the supplemental WCA (Authority 2019c). The SR14A Build Alternative includes six permeable segments that include 13.25-mile, 8.28-mile, and 1.04-mile tunnel segments where wildlife can cross over the alignment. Furthermore, the SR14A Build Alternative includes 0.43-mile, 0.40-mile, and 0.19-mile elevated viaduct segments where wildlife can cross underneath the HSR alignment. Similarly, the Refined SR14 Build Alternative includes 13.06-mile, 7.21-mile, 3.14-mile, 1.62-mile, 0.99-mile, and 0.51-mile tunnel segments where wildlife can cross over the alignment. Furthermore, the Refined SR14 Build Alternative includes 0.68-mile, 0.65-mile, 0.44-mile, 0.37-mile, 0.32-mile, 0.16-mile, 0.06-mile, and 0.03-mile elevated viaduct segments where wildlife can cross underneath the HSR alignment. As described above, the extensive number of crossing opportunities at the tunnels, viaducts, and designated wildlife crossings are viable movement opportunities for wildlife.

Both the SR14A Build Alternative and Refined SR14 Build Alternative are 83 percent permeable for wildlife movement. Wildlife movement will be further enhanced at two proposed wildlife crossing locations - one located near East Barrel Springs Road (east of Una Lake) and a second crossing south of the Soledad Siphon (south of the California Aqueduct) and will be designed as indicated in BIO-MM#64 (Establish Wildlife Crossings). The E1 Build Alternative is 80 percent permeable, and the E1A Build Alternative is 83 percent permeable. The E2 Build Alternative is 79 percent permeable, and the E2A Build Alternative is 82 percent permeable. In addition to the extensive tunnels in these HSR alternatives, Alternatives E1 and E2 include the one proposed wildlife crossing south of the California Aqueduct, and Alternative E1A includes the one proposed wildlife crossing near East Barrel Springs Road (east of Una Lake). Alternative E2A also includes both of the proposed wildlife crossings. While there could be an overall cumulative significant impact to wildlife movement resulting from all past, present, and foreseeable projects, given the design of the HSR Palmdale to Burbank Section to be permeable, the HSR Palmdale to Burbank Section would add wildlife movement opportunities, as well as implement other relevant mitigation described

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

### **4378-8695**

below. Specifically, the SR14A Build Alternative (Preferred Alternative) would not have a cumulative impact with SR14 given the alignment is primarily underground and provides movement corridor opportunities where it transitions above ground.

The Final EIR/EIS provides mitigation measures specific to mountain lion to avoid, minimize, and otherwise, mitigate impacts to the species and its habitat. These measures include, but are not limited to: BIO-MM#77 (Implement Wildlife Height Requirements for Enhanced Security Fencing), which establishes requirements for security fencing to direct wildlife species, including mountain lion, to movement corridors where wildlife would not become entrapped or harmed within the right-of-way; BIO-MM#96 (Conduct Pre-Construction Surveys and Implement Avoidance and Minimization Measures for Mountain Lion Dens), which includes measures that would avoid or minimize disturbance from construction to mountain lion individuals; and BIO-MM#97 (Provide Compensatory Mitigation for Impact on Mountain Lion Habitat), which will ensure permanent and temporary impacts on mountain lion habitat would be offset.

In addition, other mitigation measures not specific to mountain lion but would benefit the species are provided in detail in Section 3.7.7, including BIO-MM#37 (Minimize Effects on Wildlife Movement Corridors During Construction), BIO-MM#50 (Implement Measures to Minimize Impacts During Off-Site Habitat Restoration, or Enhancement, or Creation on Mitigation Sites), BIO-MM#53 (Prepare and Implement a CMP for Species and Species Habitat), BIO-MM#56 (Conduct Monitoring of Construction Activities), BIO-MM#58 (Establish Environmentally Sensitive Areas and Nondisturbance Zones), BIO-MM#60 (Limit Vehicle Traffic and Construction Site Speeds), BIO-MM#63 (Work Stoppage), BIO-MM#64 (Establish Wildlife Crossings), BIO-MM#78 (Install Wildlife Jump-outs), BIO-MM#83 (Measures Intended to Reduce, Avoid, and Minimize Effects on Animal Movement), BIO-MM#99 (Implement Lighting Minimization Measures During Construction), and BIO-MM#100 (Implement Lighting Minimization Measures for Operations). Section 3.7.7.1 provides an assessment of potential impacts from implementation of mitigation measures during various stages of the project.

Please also refer to Standard Response PB-Response-BIO-3: Wildlife Movement Corridors for more detail. Based on the information provided above, including implementation of the extensive suite of mitigation measures, impacts to mountain lions

### **4378-8695**

and other special-status species, sensitive habitats, and wildlife movement would remain less than significant.

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

### 4378-8696

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-GEN-6: Impacts on the Santa Clara River.

The commenter expresses concern that more detail is required for the public and decision makers to determine whether the Project's impacts to special-status species and sensitive habitats are adequately assessed and mitigated, including that "...there is no guarantee a prepared CMP will be implemented..." and "BIO-MM#53 is insufficient and amounts to improperly deferred mitigation."

BIO-MM#53 (Prepare and Implement a CMP for Species and Species Habitat) has been revised in the Final EIR/EIS to include a commitment to "implement" the Compensatory Mitigation Plan (CMP). Furthermore, language has been added to BIO-MM#53 that states, where compensatory mitigation is identified as the preferred approach, mitigation ratios for federal and state listed species will be identified pursuant to regulatory authorizations issued under FESA and CESA. Furthermore, the Authority will commit to all mitigation through adoption of a Mitigation Monitoring and Reporting Plan.

The commenter also states that compensatory mitigation ratios are too low for special-status species and sensitive habitats. The mitigation outlined in the Draft EIR/EIS is adequate to offset the impacts and is consistent with the mitigation provided in other sections of the High-Speed Rail program with previously certified EIR/EIS documents.

In summary, during the compensatory mitigation planning process, subsequent permitting efforts, and consultation with regulatory agencies, consideration will be given to whether mitigation should apply to suitable habitat whether it is occupied, potentially occupied, historically occupied, or within an area that would allow for species to adapt to climate change, as well as considerations for gene flow and climate adaptability among and between suitable habitats. Please also refer to Standard Responses PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife and PB-Response-GEN-6: Impacts on the Santa Clara River.

In response to the comment regarding barotrauma, the Authority has reviewed the commenter's cited sources on barotrauma impacts. The cited studies find that injury or

### 4378-8696

mortality resulting from bat strikes are more common than a pressure differential generated by the increased pressure at the front of the train and reduced pressure at the rear of the train causing barotrauma. Implementation of BIO-MM#98 (Minimize Permanent Intermittent Impacts on Aerial Species Wildlife Movement) will result in a design of aerial structures and tunnel portals to discourage bats from roosting in expansion joints, light tunnel entrances, or other crevices, and are specified in detail in the Wildlife Corridor Assessment Report (Authority 2019c). These design features would minimize the presence of roosting bats where effects from barotrauma may be experienced. Impact BIO#14 (Section 3.7 Biological and Aquatic Resources) analyzes bat strikes associated with operation of the Build Alternatives. Please also refer to Standard Responses PB-Response-GEN-6: Impacts on the Santa Clara River –Aquatic and Biological Resources - Significant Ecological Areas and PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife for more information.

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

### 4378-8697

Refer to Standard Response PB-Response-BIO-3: Wildlife Movement Corridors.

The commenter states that additional wildlife crossings are required to adequately mitigate the Project's impacts on wildlife movement. The commenter describes the high-speed rail as slicing through much of the state, emphasizes minimizing impacts to wildlife connectivity as much as possible to preserve any remaining intact habitat and allow for enhancement and recovery of areas with constrained connectivity. The commenter goes on further to highlight the importance of protecting and improving connectivity to improve the chances for sensitive species to survive and adapt to climate change while improving the State's chances of reaching the goal of conserving 30% of California's lands and coastal waters by 2030 - known as the 30x30 California initiative. The Climate Adaptation and Resiliency Program in the 30x30 California initiative is described as follows:

***Program: Climate Adaptation and Resiliency Program. The intent of the Climate Adaptation and Resiliency Program is to fund projects that provide climate adaptation and resilience on California's natural and working lands throughout the state. Funding priorities focused on the protection and/or conservation of lands that facilitate wildlife adaptation to projected climate impacts by providing transitional habitat features and habitat linkages that enable wildlife movement to and from adjacent wildlife corridors and open space areas.***

The commenter states the importance of wildlife connectivity for healthy species and populations, and that the project will result in habitat loss, fragmentation, and edge effects that will degrade a critical connectivity area between the San Gabriel Mountains and the Sierra Pelona Mountains/Castaic Area. The commenter cites the 2021 Center for Biological Diversity Report (Yap et al., 2021), identifying transportation infrastructure and development as creating barriers that lead to habitat loss and fragmentation, which harms native wildlife, plants, and people. In addition, the commenter provides additional citations that describe how poorly planned development and roads can affect an animal's behavior, movement pattern, reproductive success, and physiological state which can lead to a significant impact on individual wildlife, populations, communities, landscape, and ecosystem function.

### 4378-8697

The commenter states that mitigation must include movement studies, more wildlife crossings, and land acquisitions in important connectivity areas. The Wildlife Crossing Assessment (WCA) includes a robust analysis of wildlife connectivity and movement both with and without the project. Electronic copies of the WCA, WCA Supplement, and other technical reports are available through submitting a request on the Public Records Act portal (available at: <https://hsr-ca.nextrequest.com/>). The WCA compiled extensive studies on wildlife movement, including the SC Wildlands least cost corridor data that was used to identify the importance of the San Gabriel-Castaic Linkage Design. The WCA acknowledges the importance of the Linkage Design, and Table 6-6 in the WCA and Table 2-13 in the WCA Supplement highlight the extent of the wildlife movement opportunities maintained through a series of tunnels and viaducts to maintain movement corridors that align with existing crossing opportunities along the SR 14 freeway shown on Figure 5-7 in the WCA.

The commenter states the Draft EIR/EIS downplays the importance of the Linkage Design, and the Los Angeles County San Andreas and Santa Clara River Significant Ecological Areas (SEA). The commenter states that the Draft EIR/EIS focuses on existing constraints from existing infrastructure, specifically the SR 14 freeway, the California Aqueduct, or fencing at Una Lake and Lake Palmdale. The SR 14 freeway, the California Aqueduct, or fencing at Una Lake and Lake Palmdale do provide significant barriers to wildlife movement. However, the individual impact of the Project was evaluated and disclosed separately from existing barriers to movement, such as the SR 14 freeway. The local permeability analysis did not factor the SR 14 freeway, the California Aqueduct, or fencing at Una Lake and Lake Palmdale into the calculations of reduced permeability; if it had done so, the result would have been a reduction in permeability lower than what was disclosed.

The commenter highlights that no roadkill or field data was completed to verify that roads and other infrastructure may prevent significant barriers to wildlife movement. The South Coast Missing Linkages Project: A Linkage Design for the San Gabriel - Castaic Connection (Penrod et al. 2004) identifies the SR 14 freeway as the largest impediment to wildlife movement in the Linkage Design. Section 5.3.1 and Figure 4-5 in the WCA identify existing crossing structures such as bridges under the SR 14 freeway that provide movement opportunities but also serve as bottlenecks for wildlife movement.

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

### 4378-8697

The commenter states the Draft EIR/EIS lacks dimensions of the culverts and bridges along the SR 14 freeway. Potential crossing opportunities across the SR 14 freeway are provided below and photographs of these locations are provided in Appendix C in the WCA:

- California Aqueduct undercrossing of the SR 14 freeway
- SR 14 undercrossing south of California Aqueduct
- Sierra Highway-SR 14 undercrossing
- Mountain Springs Road-SR 14 overcrossing
- Sierra Highway-SR 14 overcrossing
- Santiago Road-SR 14 undercrossing
- Crown Valley Road-SR 14 undercrossing
- Red Rover Mine Road-SR 14 undercrossing
- Culvert under SR 14 near Red Rover Mine Road
- Ward Road-SR 14 undercrossing
- Culvert under SR 14 near Ward Road
- Puritan Mine Road-SR 14 undercrossing
- Escondido Canyon Road-SR 14 overcrossing
- Pacific Crest Trail SR 14 undercrossing
- Culvert under SR 14 near Vasquez Rocks
- Agua Dulce Canyon Road-SR 14 undercrossing
- Culvert under SR 14 near Agua Dulce Canyon Road
- Stone Crest Road-SR 14 undercrossing
- Soledad Canyon Road-SR 14 undercrossing

Furthermore, Figure 4-5 in the WCA shows the spatial relationship between these wildlife crossing opportunities at the existing bridges on the SR 14 freeway and the alignment with the adjacent permeable elevated and underground HSR segments that maintain wildlife movement opportunities.

The commenter highlights that Caltrans does not collect roadkill data for the SR 14 freeway and therefore concludes that the analysis is limited due to the lack of on-the-ground studies. Field studies were not conducted due to the lack of access at the time the WCA was developed. The commenter suggests that because of the lack of Caltrans roadkill data, the analyses were provided with limited movement data and without field

### 4378-8697

studies. The WCA analysis used the same base data (topography, vegetation, road density, and elevation) that the least cost corridors and the Linkage Design developed for the South Coast Missing Linkages Project: A Linkage Design for the San Gabriel - Castaic Connection was based on.

The commenter asserts that since the SR 14 freeway is not impermeable (i.e., there is no 10-foot-tall fence), some valuable wildlife movement in the area likely persists (e.g., animals may successfully cross when there is low or no traffic). Subsequent to the development of the WCA, the University of California Davis, Road Ecology Center created the Real-time Deer Incidents & Wildlife-Vehicle Conflict (WVC) Hotspot maps, with live data feeds from the California Roadkill Observation System (CROS) and the California Highway Incident Processing System (CHIPS) (UC Davis 2023) (Figure 1, below). The map does not show wildlife species. The data shows the following rate of incidents per mile per year:

- East Avenue S (north and south adjacent to Lake Palmdale) –0.3 incidents per mile per year
- E Barrel Springs Road (Lake Palmdale to across the CA Aqueduct) –0.5 incidents per mile per year.
- Sierra Highway to Mountain Springs Road –0.5 incidents per mile per year
- Soledad Canyon Road to Santiago Road –0.3 incidents per mile per year
- Red Rover Mine Road to Ward Road –0.5 incidents per mile per year
- Escondido Road –0.3 incidents per mile per year
- Stonecrest Road to Soledad Canyon Road –0.5 incidents per mile per year

No large roadkill or deer incidents were reported along the stretch of the SR 14 freeway between Palmdale and Santa Clarita, concluding that the hotspots listed above are comprised of small to medium wildlife. The nearest deer incident reported on CHIP was on Placerita Canyon Road near Santa Clarita, east of the SR 14 freeway, recorded on September 16, 2023 (Figure 1, below).

# Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

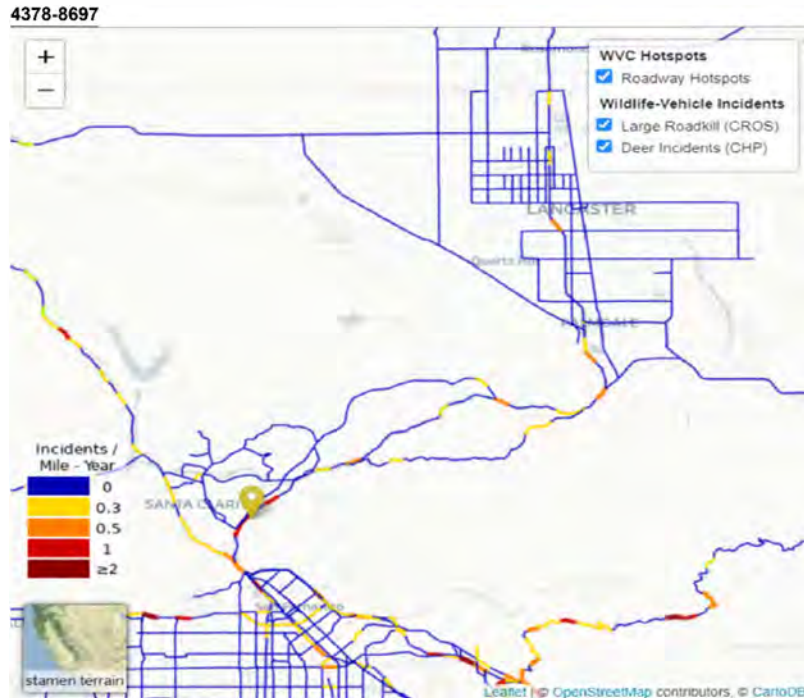

Figure 1. Real-time Deer Incidents & Wildlife-Vehicle Conflict (WVC) Hotspot maps, with live data feeds from the California Roadkill Observation System (CROS) and the California Highway Incident Processing System (CHIPS), University of California Davis, Road Ecology Center, September 16, 2023.

With respect to the discussion in the Draft EIR/EIS of existing crossing opportunities, the Draft EIR/EIS unintentionally combined bridges with culverts in providing reasons why some of the existing culverts are not conducive for wildlife movement, as described in the WCA. The Draft EIR/EIS has been revised to remove the word “bridge” from that sentence to accurately reflect what was stated in the WCA, which is that most of the existing culverts under the SR 14 freeway do not appear to function as wildlife crossings because of their opening and steep grade under the freeway, whereas the bridges do

**4378-8697**  
provide crossing opportunities.

The commenter states the lack of field studies does not support the conclusion that the SR 14 freeway constitutes a complete barrier to wildlife movement. The WCA noted that the SR 14 freeway acts as a semipermeable barrier, as evidenced by the numerous undercrossings described in the WCA. However, in the area adjacent to Bee Canyon, there is substantial evidence to indicate that the SR 14 freeway constitutes a complete barrier. The 2014 annual average daily traffic volume (AADT) for the SR 14 freeway ranges between 71,000 and 99,000 vehicles in Palmdale and Santa Clarita, which is seven to ten times the volume that Clevenger and Huijser (2009) found to repel wildlife due to the almost constant level of disturbance and heavy traffic volume. In addition, the steep road cuts and steep terrain along the SR 14 freeway between Stonecrest Road and Agua Dulce Canyon Road make the freeway less likely to facilitate wildlife movement as highlighted in the high wildlife use hotspot areas compiled by UC Davis (UC Davis 2023). Examples of the steep road cuts are provided in the Google Streetview images below (Figure 2).

4378-8697

Figure 2. Looking north at the steep cut slopes along the SR 14 freeway adjacent to Bee Canyon.

4378-8697

Figure 3. Looking north at the steep natural terrain and steep road cuts along the SR 14 freeway adjacent to Bee Canyon.

The commenter describes that placing a noisy, vibrating, at-grade high speed rail alignment with a 10-foot tall fence along the SR 14 freeway would be a formidable barrier and preclude opportunities to enhance connectivity, gene flow, and climate resiliency. The extensive series of tunnels and viaducts that maintain wildlife movement opportunities are listed (Table 6-6 in the WCA and Table 2-13 of the WCA Supplement) and align with the existing bridges on the SR 14 freeway. Figure 5-4 in the WCA identifies the existing bridges on the SR 14 freeway that provide wildlife crossing opportunities that align with tunnel and viaduct segments to facilitate wildlife movement. Areas along the SR 14 freeway that would be conducive to the enhancement of crossing

# Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

**4378-8697**

opportunities are not impeded by the project, which has extensive tunnels and viaducts in those areas.

The commenter continues that even if the SR 14 freeway is currently a significant barrier to wildlife movement, that underscores how important preserving existing connectivity and restoring former connectivity is for the project area. The commenter is of the opinion that a highly constrained opportunity for movement between natural areas might be made more difficult and should be considered a significant impact, requiring mitigation. Again, the SR14A Alternative and the SR14 Refined Build Alternative both provide movement opportunities directly adjacent to the existing freeway bridge crossings. Figures 4 and 5, below, further illustrate wildlife movement opportunities across the SR 14 freeway at the existing undercrossings and the adjacent permeable tunnel and viaduct segments for the SR14A Build Alternative to maintain gene flow.

**4378-8697**

Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

4378-8697

Figure 5 - Aerial photograph showing wildlife movement opportunities, looking north from Stonecrest Road, through the Linkage Design, across the SR 14 freeway corridor with UC Davis Wildlife-Vehicle Conflict Hotspots identified.

The commenter suggests mitigation should include conducting movement studies to inform the placement and design of more wildlife crossings for the at-grade segments of the project. The project engineers conducted an extensive analysis at the longer at-grade segments to determine where crossings could be located. Due to the project design constraints, the alignment requires gentle slopes and turns. Areas that cut through steep alternating ridges and ravines provide limited opportunities to create wildlife crossings across the alignment.

4378-8697

The commenter suggests creating a wildlife connectivity technical working group comprised of members from the Authority, the Center, Caltrans, CDFW, The Nature Conservancy, Wildlands Network, University of California, Davis, the U.S. Fish and Wildlife Service, as-needed species-specific experts, and other appropriate stakeholders should be established, coordinated, and consulted with by the HSRA. Although not required based on the anticipated impacts and sufficiency of existing mitigation, the Authority is open to coordinating with the appropriate wildlife agencies, conservation organizations, and academic organizations for input on the micro-location siting, type, and design of the wildlife crossing opportunity. The commenter requests that a wildlife connectivity technical working group be established to assist with decisions on wildlife crossings. Once a Build Alternative has been selected, the Authority will determine the form of the coordination with stakeholders and the wildlife agencies, including whether to establish a formal technical working group as requested by the commenter.

The commenter suggests there should be more wildlife crossings to adequately mitigate the project impacts on both large wide-ranging species as well as small, less mobile species. As shown in Table 6-6 in the WCA and Table 2-13 of the WCA Supplement, the SR14A Build Alternative includes six permeable segments that include a 13.25 mile, 8.28 mile, and 1.04 mile tunnel segments and a 0.43 mile, 0.40 mile, and 0.19 mile elevated viaduct segments where wildlife can cross the HSR alignment. The Refined SR14 Build Alternative includes a 13.06 mile, 7.21 mile, 3.14 mile, 1.62 mile, 0.99 mile, and 0.51 mile tunnel segment, and a 0.68 mile, 0.65 mile, 0.44 mile, 0.37 mile, 0.32 mile, 0.16 mile, 0.06 mile, and 0.03 mile elevated viaducts where wildlife can cross the HSR alignment. As described above, the extensive number of crossing opportunities at the tunnels, viaducts, and designated wildlife crossings align with crossing opportunities along the SR 14 freeway to maintain gene flow from wildlife permeability for both large and small species. For this reason, the post-project permeability would closely resemble the existing condition. As such, additional wildlife crossings are not required.

The commenter states that the Draft EIR/EIS approach is inconsistent with AB 2344, which establishes the policy of “protect, restore, and enhance the functioning of fish, wildlife, and habitat connectivity in connection with the planning, construction, and improvement of transportation infrastructure throughout the state and, where feasible, the operation and maintenance of transportation infrastructure throughout the state.” The Authority respectfully disagrees. The Build Alternatives in their planning have an extensive series of tunnels and viaducts that will protect and ensure wildlife will be able to move freely across the alignment (listed in Table 6-6 in the WCA and Table 2-13 of

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

### 4378-8697

the WCA Supplement) and these permeable segments (tunnels and viaducts) align with the existing bridges on the SR 14 freeway. The figures in this response further illustrate the extent of the wildlife movement opportunities across both the SR 14 freeway and the SR14 and SR14A alignments. The design features, two dedicated wildlife crossings, and the commitment in BIO-MM#64 to enhance replaced or modified culverts for wildlife movement are consistent with AB 2344.

The commenter suggests that the Authority must affirmatively take steps to restore connectivity, emphasizing the SR 14 freeway. The SR 14 freeway is an existing condition that the Project does not impact; however, the Project is designed to maintain wildlife movement opportunities through a series of extensive tunnels and viaducts that effectively align with bridges on the SR 14 freeway.

The commenter highlights that approximately 30 percent or more of the San Gabriel-Castaic Linkage Design will be impacted by at-grade segments. Again, the size and spacing of the tunnels and viaducts through the Linkage Design makes the project highly permeable for wildlife movement, including mountain lion and mule deer, see Table 6-6 in the WCA and Table 2-13 of the WCA Supplement. The existing freeway bridge structures are shown in Figure 4-5 of the WCA. The figures in this response illustrate how the tunnels and viaducts align with the existing bridge structures on the SR 14 freeway that are currently providing wildlife movement opportunities.

The commenter requests that the Authority upgrade the culverts and/or a wildlife overpass or underpass on the SR 14 freeway; acquire adjacent lands where the SR14A Build Alternative is at-grade near Bee Canyon and where the land is vulnerable to development; and install an overpass over HSR. The project is already highly permeable with permeable sections that align with existing SR 14 freeway crossings. A wildlife overcrossing over the SR14A Build Alternative and SR 14 freeway would be expensive and require extensive grading but would provide only a minor enhancement of movement opportunity because the available data indicates wildlife is not crossing the SR 14 freeway in the area adjacent to Bee Canyon. Although the Linkage Design is located between Stonecrest Road and Agua Dulce Canyon Road through Bee Canyon, the Linkage Design was based on a model without the support of field data that wildlife move across this section of freeway. The high wildlife use hotspot areas compiled by UC Davis (UC Davis 2023) demonstrate that the SR 14 freeway adjacent to Bee Canyon between Stonecrest Road and Agua Dulce Canyon Road are not high-use areas. As discussed above, the UC Davis data identifies high use/vehicle conflict in the vicinity of the existing freeway undercrossings. The wildlife at the Stonecrest Road/SR 14 freeway

### 4378-8697

undercrossing would likely use the Santa Clara River as a movement corridor where wildlife can cross underneath the 0.4 mile long viaduct. The Agua Dulce Canyon Road under the SR 14 freeway also aligns with a viaduct adjacent to extensive tunnel segments that provide for unimpeded wildlife movement. There are no crossing opportunities under the SR 14 freeway adjacent to Bee Canyon. As demonstrated above, the SR14A Build Alternative maintains wildlife movement opportunities for wildlife to cross the existing SR 14 freeway undercrossings at the bridges and existing high-use areas that align with the extensive network of tunnels and viaducts. The UC Davis data that shows high-use wildlife road crossing areas does not show the area adjacent to Bee Canyon as one of the hotspots, likely due to the steep natural terrain and steep road cuts, and high volumes of traffic deterring wildlife use. The WCA and WCA Supplement, corroborated by the recent UC Davis wildlife use data indicates that this area is not a highly used area by wildlife, such that enhancement/habitat acquisition adjacent to Bee Canyon difficult would not be biologically meaningful. Furthermore, addressing a legacy barrier on the SR14 freeway is not required for this project because effects will be reduced to less than significant levels by the proposed design features and mitigation measures.

As a result of the comments received on the Draft EIR/EIS, the Authority considered alternative design options that would increase the permeability of the Build Alternative alignments to wildlife movement in the Bee Canyon area. This design option would involve moving the alignment into a tunnel in Bee Canyon and under Santa Clara River is not feasible since it would require a vertical profile for HSR to return to a grade that exceeds the maximum allowable grade of 2.5% as defined in the Authority's Technical Memorandum (TM) 2.1.2 Section 3.3.1. Furthermore, a multidisciplinary team of engineers from SENER reviewed the topography and the design for the HSR Palmdale to Burbank Section and found that constructing the HSR rail alignment in a tunnel in the northern portion of Bee Canyon and then emerging from the tunnel only for the portion crossing over the Santa Clara River with a viaduct would not be feasible. The alignment requirements and the topography of the area do not allow for maintaining the minimum vertical clearance of the rail viaduct over Soledad Canyon Road. Additionally, this approach would result in deeper cut sections in the southwestern part of the Canyon, which could result in a larger environmental footprint in this area and a net increase in excavated volume.

The commenter expresses concern that the size and type of the wildlife crossings at Una Lake and Soledad Siphon are not clear. The details of the dedicated wildlife crossings will be decided as the project design progresses, but size and dimensions will

## Response to Submission 4378 (Tiffany Yap, Center for Biological Diversity - Oakland, November 30, 2022) - Continued

### 4378-8697

be designed based on standards recommended in the Wildlife Crossing Structure Handbook Design and Evaluation in North America (Federal Highway Administration 2011 [identical to Clevenger and Huijser 2009 and Meese et al. 2009]). In addition, in BIO-MM#64, the Authority recognizes and commits to implementing the following design recommendations:

- Undercrossings intended to be used by large mammals (i.e., mule deer) within the mule deer species range would have a 10-foot-tall concrete arch to accommodate the mammals' larger stature.
- Any culvert intended to function as an undercrossing for carnivores and small animals would be no smaller than a 6-foot-wide arch culvert for lengths up to 200 feet, or an 8-foot-wide arch culvert for lengths up to 300 feet. The substrate would be natural soil of the surrounding area, and the grade would not exceed 2 percent. Culverts longer than 200 feet would not be considered wildlife crossing structures. If any portion of the bottom of the wildlife undercrossing is likely to be inundated longer than 24 hours at least once per year, the structure would have a dry ledge. Ledges or tunnels and cover features to prevent predation will also be incorporated into the design to facilitate safe passage of small wildlife. The structure would be straight enough that a mammal entering the culvert can see the other end of the culvert.
- Slope within the crossing structure would be consistent with the natural (pre-construction) grade (optimally less than 2%). Slopes that follow natural grades greater than 2% are acceptable in bridged undercrossings (viaducts).

The commenter highlights the importance of corridor redundancy to allow for improved functional connectivity and resilience at a regional scale. In addition, corridor redundancy provides resilience to uncertainty, impacts of climate change, and extreme events, like flooding or wildfires, by providing alternate escape routes or refugia for animals seeking safety. The number and lengths of elevated viaducts and underground tunnels create the corridor redundancy the commenter is identifying.

The commenter expresses concerns related to corridor redundancy and states that only two dedicated wildlife crossings for the at-grade segments are insufficient such that impacts on wildlife movement and habitat connectivity are significant. The Authority respectfully disagrees. Based on the analysis of changes in permeability, the Refined SR14 and SR14A Build Alternatives would reduce permeability for mountain lion by approximately 1 percent, mule deer by 1 percent, and badger by 1 percent. In terms of

### 4378-8697

miles, more than 80 percent of the project section is in tunnel or on viaduct providing for unimpeded movement across the project. These changes in permeability are illustrated in the WCA for mountain lion, mule deer, and American badger, Graphs 6-1 through 6-9.

The commenter states that mitigation must include on-the-ground movement studies and implementing more wildlife crossings on the at-grade segments of the alignment and adjacent roadways like the SR 14 freeway. The Authority respectfully disagrees. Subsequent to the publication of the Draft EIR/EIS, the Authority received roadkill data from UC Davis (UC Davis 2023) that supports the conclusions reached in the WCA and WCA Supplement. Additional wildlife crossings are not required for the Project. The SR 14 freeway is a legacy barrier that is unrelated to the Project. The primary approach for addressing the potential effects of the proposed HSR project on wildlife movement and habitat connectivity is to maintain existing local permeability through design measures that include:

1. Placing segments underground in tunnels
2. Siting and constructing wildlife under/overcrossing structures in areas that facilitate (local) animal movement between suitable habitat areas and across the (regional) landscape –specifically a dedicated wildlife crossing at Una Lake, and a dedicated wildlife crossing at the California Aqueduct.
3. Ensuring that bridges and viaduct structures are designed to help facilitate wildlife movement.

Adding a crossing at an at-grade segment that leads to an area along the SR 14 freeway that is not highly used by wildlife such as the area adjacent to Bee Canyon is difficult to justify. The project design maintains wildlife movement opportunities that align with the existing crossing opportunities at the SR 14 freeway.

### 4378-8698

The comment provides a summary of previous comments for which responses have already been provided. These comments are noted and no further response or change to the EIR/EIS is necessary.

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10245

**ANALYSIS OF THE “NOISE AND VIBRATION” SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT.**

**1.0 INTRODUCTION**

4413-10244

The noise impact assessment presented in Chapter 3.4 of the Draft Environmental Impact Report/Environmental Impact Statement (hereafter referred to as “the Draft”) that was prepared by the California High Speed Rail Authority (“CHSRA”) for the Palmdale-Burbank Segment of the High Speed Rail Project (“HSR Project” or “Project”) has been evaluated and numerous material deficiencies, factual errors and other substantial insufficiencies have been identified. These deficiencies, errors, and insufficiencies are set forth in the comments provided below; they demonstrate that the Draft does not comply with either the California Environmental Quality Act (“CEQA”) or the National Environmental Protection Act (“NEPA”). Please note: These comments were prepared by a competent engineer with more than 35 years of environmental engineering experience and they present expert opinion supported by fact pertaining to the significant environmental effects that will be caused by the Project and which must be mitigated. Accordingly, the comments provided herein constitute “substantial evidence” as that term is defined by the CEQA Statute [California Public Resources Code §21080(e)(1)] and Guidelines [California Code of Regulations Section 15064(f)(5)]. These comments also demonstrate that CHSRA/FRA have failed to conduct a substantive ‘hard look’ review of the Project’s environmental impacts as required by NEPA.

**2.0 MAJOR DEFICIENCIES NOTED IN THE DRAFT**

4413-10245

**2.1 The Draft Fails to Provide ANY information Regarding Noise Modeling or the Model Inputs and Assumptions or the Model Output or Results.**

The noise impact analysis presented in the Draft was prepared in accordance with the directives established by the Federal Railway Administration (“FRA”) in the manual titled “High-Speed Ground Transportation Noise and Vibration Impact Assessment” (“FRA Manual”); this manual establishes methodologies for calculating the noise generated by a high speed train as it passes by (referred to as a “passby”) at any distance from the track. It also recommends thresholds for evaluating train noise impacts that are based on a parameter referred to as the “Day-Night” noise level (or “L<sub>dn</sub>”); L<sub>dn</sub> does not reflect the actual noise level that occurs during a train “passby” event; instead, it is a calculated value which averages of all the train noise levels experienced at a particular location over a 24 hour period and is “weighted” with a penalty of 10 dBA for noises that occur between 10 PM and 7 AM<sup>1</sup>. This averaging technique effectively “masks” the significant noise created during train “passby” events by simply averaging all the noise insults together; this allows the Lead Agency to conclude that a proposed train project will not result in significant noise impacts even when if it generates 86 dBA noise levels hundreds of

<sup>1</sup> L<sub>dn</sub> “may be thought of as a noise exposure, totaled after increasing all nighttime A-Levels (between 10 p.m. and 7 a.m.) by 10 dBA. FRA Manual at 2-4. [https://railroads.dot.gov/sites/fra.dot.gov/files/fra\\_net/2680/20120220\\_FRA\\_HSR\\_NV\\_Manual\\_FIN\\_AL\\_102412.pdf](https://railroads.dot.gov/sites/fra.dot.gov/files/fra_net/2680/20120220_FRA_HSR_NV_Manual_FIN_AL_102412.pdf)

times a day at a residential location. Moreover, the “Noise Impact Criteria” established by the FRA Manual are relatively lenient because they permit significant L<sub>dn</sub> increases before the noise impacts of a train project are deemed to be “severe”. For example, a relatively quiet area that has an existing average noise level of 55 dBA is not deemed to be severely affected by train noise until the L<sub>dn</sub> resulting from train operations increases to 61.1 dB (which represents a 50% increase over the existing 55 dBA ambient noise levels).

While the Draft describes FRA calculation methodologies used to derive train noise L<sub>dn</sub> values, it does not provide any specific information pertaining to the noise calculations performed for the Project itself. Presumably, CHSRA relied on a noise modeling program to prepare the noise impact results presented in the Draft; however, the Draft fails to disclose any of the assumptions and data that were input to the model. These are critical omissions and without them, the efficacy of the noise impact results cannot be assessed<sup>2</sup>. Worse yet, the Draft provides no information whatsoever regarding the results from the model or the noise levels that the project will generate; instead, the Draft merely identifies a handful of vaguely described locations where various number of residences are identified as having either “severe” or “moderate” noise impacts [Tables 3.4-31 and 3.4-32]. At the very least, the paltry results presented by the Draft violate FRA Manual directives to provide noise contour results and other data. Specifically, the FRA Manual states:

*“Illustrate the areas of Impact and Severe Impact on maps or aerial photographs. This illustration could consist of noise impact contours on the maps or aerial photographs, along with the impact areas highlighted. This is done by delineating two impact lines: one between the areas of No Impact and Impact and the second between Impact and Severe Impact. To conform with the practices of other agencies (e.g., FHWA, U.S. Federal Aviation Administration (FAA)), include several contour lines of constant project noise, such as L<sub>dn</sub> 65, L<sub>dn</sub> 70, and L<sub>dn</sub> 75.”*

As discussed in more detail below, some locations in Acton are so quiet that they will experience “severe” noise impacts if the L<sub>dn</sub> level generated by the Project is only 61 dBA; therefore, and in accordance with the directives issued by the FRA Manual, the Draft should have provided noise contours with L<sub>dn</sub> values that are as small as 55 dBA. Yet, the Draft provides no noise contours at all<sup>3</sup>. Apparently, CHSRA simply expects the public to “take it on faith” that the modeling was done correctly, that the assumptions upon which the modeling was done are reasonable, and that the modeling results themselves are unassailably accurate. However, this is not permissible under either CEQA or NEPA; CHSRA is reminded that CEQA Guidelines Section 15147

<sup>2</sup> For example, sound propagation and attenuation characteristics are dictated by a number of factors (geography, development densities, vegetation characteristics, etc.); therefore, sound propagation and attenuation characteristics in Acton differ substantially from urban and suburban areas. Because the Draft fails to provide any information pertaining to sound propagation and attenuation assumptions (or any other assumptions) that were used to calculate noise impacts, it is impossible to assess the efficacy of CHRA’s noise modeling results.

<sup>3</sup> Page of the Draft states on page 3.4-38 that “detailed mapping of noise effect locations is provided in Appendix E of the Noise and Vibration Technical Report” however, no noise contour maps are provided in Appendix E. In fact, the “maps” provided in Appendix E of the “Noise and Vibration Technical Report” appear to be the same as the maps provided in the Draft (specifically, Figures 3.4-17 to 3.4-35).

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10245

mandates EIRs provide sufficient technical information to “permit full assessment of significant environmental impacts by reviewing agencies and members of the public” and that Section 1502.23 of the NEPA regulations requires that agencies “identify any methodologies used and shall make explicit reference to the scientific and other sources relied upon for conclusions in the [Environmental Impact] Statement”. The Draft does not comply with these requirements because it does not provide sufficient technical detail to “permit full assessment” of the Draft’s conclusions regarding significant Project noise impacts and it does refer to the sources or data that were relied upon to derive these conclusions. Finally, an independent assessment of noise impacts that will be experienced by “receptor sites” (aka residences) in Acton which have an unobstructed “line of sight” view to the train tracks is provided in Attachment 14 and it reveals that noise impacts in the Community of Acton will be much more substantial and far-reaching than what is reported in the Draft (as discussed in more detail below). Taken together, these factors demonstrate that the noise analysis presented in the Draft is deficient and will not withstand judicial review; these deficiencies can only be overcome by revising the draft to 1) provide all relevant modeling information (including inputs, outputs and assumptions) and in particular, data regarding “shielding” and noise attenuation assumptions that were made for the Community of Acton; and 2) provide noise impact contours down to 55 dBA in areas like the Community of Acton where existing noise levels are substantially low compared to urban and suburban areas. Another alternative is select the SR14A Route Alternative and forego all the others.

4413-10246

**2.2 The Draft Fails to Identify Numerous Acton Residences that will Experience Severe Noise Impacts.**

The Draft asserts that “existing”  $L_{dn}$  noise levels are 60 dBA in the area surrounding Red Rover Mine Road where the Refined SR 14 route crosses the 14 Freeway on elevated tracks [Table 3.4-16]. Accordingly, and consistent with page 3-4 of the FRA Manual, all residences that experience an  $L_{dn}$  noise level of 63.3 dBA along the Refined SR 14 route are deemed to be “severely impacted”. The Draft only considers noise impacts on residences located within 1,800 feet of the tracks [page 3.4-38], so only residences within this narrow envelope were evaluated for noise impacts. However, and according to the noise analyses provided in Attachment 1, residences located within 3,600 feet of the elevated tracks that have an unobstructed “line of sight” view of the tracks over the 14 freeway will experience “severe” noise levels with an  $L_{dn}$  that exceeds 63 dBA; this represents a large portion of the Crown Valley area of Acton where many homes have a “line of sight” to the elevated track location. Yet, the Draft reports that only 11 residences in Acton will be severely affected by the Revised SR14 Route [Page 3.4-78]. The discrepancies between these results cannot be reconciled because the Draft fails to provide any quantitative information regarding the noise analysis upon which its results are based.

<sup>4</sup> The noise analyses were prepared in accordance with calculation procedures set forth in Chapter 5 and Appendix C of the FRA Manual and based on the train configuration data provided on Page 3.4-23 of the Draft. These calculations assume 1) The train operates at 220 mph at ground level; 2) the receptor has an unobstructed view of the tracks and there is no “shielding” (which is appropriate to Acton’s geography and sparse development profile); 3) the ground is acoustically “hard” (which accurately represents the rock and hardpack clay of Acton’s geology and the fact that there is little vegetation because of Acton’s arid environment); and 4) there is no ground attenuation for trains traveling in the aerodynamic regime (FRA Manual at 5-13). The calculations presented in Attachment 1 are consistent with information published by CHSRA in 2018 which is provided in Attachment 2 indicating that the noise generated by a high speed train at a location 100 feet from the tracks is 98 dBA.

4413-10246

A similar discrepancy is noted in the Draft’s noise impact analysis of the “E” routes in the Aliso Canyon area of Acton where, according to Table 3.4-17 of the Draft, the existing  $L_{dn}$  level is 57 dBA (which means the “severe” noise impact threshold is 61.9 dBA per the FRA Manual [Page 3-4]). Nonetheless, the Draft concludes that no Acton residences in Aliso Canyon will experience severe noise impacts even though the tracks that cross Aliso Canyon Road on aerial structures at that location [Figure 3.4-25] are visible from Acton residences. This conclusion is contradicted by the results presented in Attachment 1 showing that residences located within 5,300 feet of, and which have an unobstructed “line of sight” to, the elevated tracks will experience  $L_{dn}$  levels exceeding 62 dBA. Several residences are located within 5,300 feet of the “E” tracks and have a “line of sight” to the aerial structure locations (including the historic “Blum Ranch”). Yet, for reasons that remain inscrutable, the Draft concludes that Acton residences in the Aliso Canyon area will not experience any noise impacts from any of the “E” Route alternatives all.

A deficiency that has been noted (which may explain the discrepancies observed above) is that the Draft does not properly report “severe” impact thresholds established by the FRA Manual. For example, in areas where the existing  $L_{dn}$  noise level is 60 dBA, the Draft asserts that the  $L_{dn}$  noise threshold for “severe” impacts to residential properties is 64 dBA [Page 3.4-78]; this is incorrect. The FRA Manual clearly establishes at Page 3-4 that the noise threshold for severe impacts is 63.3 at residential locations where existing  $L_{dn}$  values are 60 dBA. Another possible reason for the discrepancies noted above is that the Draft’s noise analysis generally only considers “noise receptors” within 1,200 feet of the tracks [Page 3.4-38]; thus, the Draft did not evaluate noise levels out to 5,200 feet or even 3,600 feet. In fact, the Draft concludes that, beyond 1,800 feet “noise impacts were no longer detected” at any location along any of the route alternatives [Page 3.4-38]. The noise analysis results presented in Attachment 1 contradict this conclusion because they show that noise levels at receptor sites that have an unobstructed “line of sight” to the train at 1,800 feet from the tracks will experience  $L_{dn}$  levels of 66.74 which exceed FRA’s “severe” noise impact thresholds for areas like Acton where existing  $L_{dn}$  levels are 60 dBA or less. Another possible reason for the discrepancies is that the Draft’s noise analysis may have failed to properly account for the lack of vegetation and sparse development profile in Acton and therefore assumed incorrect noise attenuation parameters. This is important; sound propagates with little attenuation in Acton because of the low density development and the lack of vegetation and “hard ground” (i.e., rock and packed clay) characteristics in the Community. In any event, the discrepancies noted above cannot be reconciled because the Draft fails to provide any technical data pertaining to its noise analyses that it presents; this is a substantial deficiency because it prevents the public from properly assessing the efficacy of the Draft’s conclusions regarding significant noise impacts and offering substantial evidence pertaining to deficiencies in the Draft’s analyses.

Notably, the noise analyses presented in Attachment 1 are very conservative because they do not factor in the incrementally higher noise levels attributed to elevated tracks compared to “at grade” tracks on the ground. Specifically, the calculations presented in Attachment 1 understate the actual noise levels by at least 2 dBA because they assume that the train tracks are on the ground and not elevated in the vicinity of Red Rover Mine Road (for the Refined SR14 alternative) or Aliso Canyon Road (for the “E” routes)<sup>5</sup>. Thus, the actual noise levels will be at least 2 dBA louder than what the calculated results in Attachment 1 indicate.

<sup>5</sup> Trains on aerial tracks are 2 dBA louder than trains “at grade”. FRA Manual at 4-10.

## Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10247

**2.3 The Draft Suppresses Noise Impact Results for Neighborhoods in Acton**

Another substantial deficiency of the Draft's Noise analysis is that it suppresses noise impact results for neighborhoods in Acton. For example, according to the Technical Report titled "Noise and Vibration Technical Report" that was obtained via an information request submitted pursuant to the California Public Records Act ("CPRA"), CHSRA collected baseline noise measurements over three one-hour periods at the intersection of Y-8 and Aliso Canyon in Acton (which is referred to as location "N8" on the data sheets provided on pages D-48 through D-50); these results indicate that existing  $L_{dn}$  levels at this location are 54.7 dBA<sup>6</sup>. Thus, according to Page 3-4 of the FRA Manual, residences at this location are deemed to experience "severe" noise impacts by rail Projects that generate  $L_{dn}$  levels at or above 61 dBA. The intersection of Alison Canyon Road and Avenue Y-8 is adjacent to the historic Blum Ranch in Acton and has a "line of sight" view of the tracks for all the "E" Route alternatives where they cross over Aliso Canyon Road on aerial structures approximately 2,200 feet away. As indicated in the noise calculation results presented in Attachment 1, Project  $L_{dn}$  levels at this location will be almost 66 dBA; therefore, residences in these areas (including Blum Ranch) will experience severe noise impacts if CHSRA selects any of the "E" route alternatives for the project. Yet, the Draft fails to even identify location N8 or the baseline noise data collected for location N8<sup>7</sup> and it does not report the significant noise impacts that Project operations pose to Blum Ranch and nearby homes. This constitutes a significant deficiency that must be addressed in the Final EIR; or, in the alternative, CHSRA can simply approve the Route SR14A (in which case, noise impacts to Blum Ranch and other areas of Acton become moot).

4413-10248

**2.4 The Methodology Adopted by the Draft to Assess Project Noise Impacts Does Not comply with CEQA or NEPA.**

The Noise Analysis presented in the Draft does not comply with CEQA or NEPA in a number of ways. First, both CEQA and NEPA require the Lead Agency to provide details regarding how a project will alter the existing environment<sup>8</sup>; with respect to noise impacts, these CEQA and NEPA provisions necessarily require CHSRA to provide some indication of what the Project's noise levels will be within the affected environment. Unfortunately, the Draft does not comply with this requirement because it does not provide any indication of how the Project will alter the existing noise environment. The Draft does not provide "noise contour" data or give any indication of what noise levels will be when the trains are operating. It does not explain that the Project will cause noise levels exceeding 80 dBA more than 400 times per day at residences that are in view of, and located within a mile of, the elevated tracks. It does not explain that the equestrian trails in Acton which are directly under elevated tracks will experience noise insults exceeding 100 dBA which will make it too dangerous for horses to use. It does not explain that

<sup>6</sup> The three one-hour sets of noise measurements were ostensibly collected in the morning, in the afternoon, and very late at night, and the average results for each of the three time intervals were 46.2, 47.6, and 49.7 dBA. Using these three numbers to represent baseline conditions during the morning, afternoon, and nighttime intervals in the  $L_{dn}$  calculation methodology yields an  $L_{dn}$  value of 54.7.

<sup>7</sup> Tables 3.4-15 and 3.4-16 in the Draft.

<sup>8</sup> CEQA requires that the EIR "include relevant specifics" of "physical changes" that will result from the Project [Guidelines 15126.2(a)] and NEPA requires that the EIS "Identify environmental effects and values in adequate detail so the decision maker can appropriately consider such effects" [1501.2(b)(2)].

4413-10248

the noise level that will be experienced at Vasquez High School with every "passby" event on the Refined SR14 route will exceed 85 dBA and that, to comply with adopted safety requirements, teachers and staff will have to wear hearing protection when outdoors<sup>9</sup>. In fact, the only "noise impact" information that the Draft provides is a vaguely described list of areas where "severe" noise impacts are projected to occur and a number indicating what the 24-hour weighted average noise level is projected to be in that area; the Draft does not report any *actual* noise levels that will result when an *actual* "passby" events occur, so no *actual* noise impacts are reported. Nothing in the Drafts' noise impact analysis comports with CEQA's requirement to "include relative specifics" of "physical changes" that will result from the Project; in fact, the Draft deliberately omits any "specifics" regarding how existing noise levels will be altered by the Project. Nothing in the Draft's noise impact analysis comports with NEPA's requirement to "Identify environmental effects and values in adequate detail"; in fact, the Draft specifically omits all details regarding the Project's actual noise effects on the environment.

Second, the Draft fails to analyze the noise effects of Project operations as required by CEQA and NEPA. Specifically, both CEQA and NEPA require that the EIR/EIS clearly identify the "effects" that a Project will have on the environment and both CEQA and NEPA define "effects" to include "direct effects" which are caused by the action and occur "at the same time and place" as the action<sup>10</sup>. To comply with these definitions, an EIR/EIS noise analysis is required to report noise effects "at the same time and place" they occur. The Draft fails to comply with this requirement because it does not report Project noise effects "at the same time and place" they occur; instead, the Draft averages all the noise effects together and reports a single "cumulative" value that does not in any way represent the *actual* "direct" noise effects of the Project which occurs at the time and place of a "passby" event. In other words, the "cumulative"  $L_{dn}$  values that are calculated and reported in the Draft for a few vaguely described locations in Table 3.4-31 through 3.4-33 do not represent the "direct" noise effects of the Project that occur "at the same time and place" as required by CEQA and NEPA. This is a substantial deficiency that can only be corrected by revising the Draft to include noise contour maps indicating what the *actual* Project noise levels (referred to as the "Sound Exposure Levels" or "SELs") will be in all areas where Project operations will alter existing noise profiles. For the Community of Acton, it is recommended that SEL noise contours maps be prepared in 5 dBA increments starting at 100 dBA and extending down to 65 dBA. It must be pointed out that these CEQA/NEPA compliance concerns have been raised several times in comments submitted over the last 7 years both verbally and in writing; it seems that these comments were ultimately ignored. Fortunately, the entire issue will be rendered moot if CHSRA selects the SR14A Route Alternative because this would eliminate all "direct" noise effects from Project operations in Acton.

<sup>9</sup> Vasquez High School is located 1,600 feet from the elevated tracks that will be constructed under the Refined SR14 route alternative. Thus, and as indicated in Attachment 1, each train "passby" event will generate a Sound Exposure Level of at least 86.8 dBA; this will occur more than 400 times per day. Because the Federal Occupational Safety and Health Administration requires hearing protection in work areas where noise levels exceed 85 dBA [Draft at Page 3.4-8], teachers and staff will be required to wear hearing protection whenever they are outside to protect their ears from the noise insults created by Project operations.

<sup>10</sup> NEPA Section 1508.1(g)(1) defines effects to include "Direct effects, which are caused by the action and occur at the same time and place". CEQA Guidelines Section 15358 defines effects to include "Direct or primary effects which are caused by the project and occur at the same time and place".

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10248

Finally, both CEQA and NEPA require CHSRA to evaluate indirect impacts, which are defined as effects caused by the action and are later in time or farther removed in distance<sup>11</sup>. Because the  $L_{dn}$  results reported in the Draft are derived from cumulative noise levels averaged over a 24 hour interval, it could be argued that  $L_{dn}$  values reasonably represent the indirect noise impacts that will result from Project operations. However, and as discussed above,  $L_{dn}$  does not provide an adequate basis for assessing the direct noise impacts resulting from the Project.

4413-10249

**2.5 The Model Used by CHSA to Derive Project Noise Impacts Is Not Shown To Be Properly Validated.**

The Draft asserts on page 3.2-24 that a “Benchmark test” was used to validate the model that was relied upon to derive the noise impact results, and that details regarding the benchmark test are provided in a “Technical Report” that has been withheld from the public. When a copy of this “Technical Report” was procured pursuant to a CPRA record request, it revealed that the “benchmark test” was not particularly rigorous: “The environmental program manager for the Authority distributed a series of input parameters and output results against which the noise model could be compared for accuracy.” However, nothing about this procedure establishes the accuracy of the model or materially “validates” the model results:

- The proper way to “validate” a model and assess its accuracy is to compare the output from the model (in this case, the “Sound Exposure Levels” calculated for a train “passby”) to actual physical measurements that are collected under the conditions that are modeled. The “benchmark” test did not utilize physical noise measurements or compare modeled SEL values to measured SEL values; thus, it cannot be concluded that the “benchmark” test demonstrates that the model is either accurate or valid.
- There is no provenance or background information regarding the “output results” that were provided by the “environmental program manager for the Authority” and used to compare the model results for accuracy, so there is no basis to conclude that such “output results” are an appropriate standard by which to validate CHSRA’s noise model. In other words, there is no information explaining where these “output results” came from or how they were derived or why the public and the decisionmakers should accept them as the appropriate “standard” for validating the noise model; so, they prove nothing. It is certain that they were not derived from physical measurements taken from actual trainsets because the configurations they represent are not typical and in fact some configurations are completely implausible (as discussed below); accordingly, the “benchmark” test does not constitute evidence that the noise model is either valid or accurate.
- The “output results” that were provided by the “environmental program manager for the Authority” assume unrealistic conditions and are therefore facially invalid. For example, the configuration assumed in the “output results” for elevated structures are particularly unrealistic because they all include the placement of a 63 foot high noise barrier just

<sup>11</sup> NEPA Section 1508.1(g)(2) establishes that indirect effects “are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable”. CEQA Guidelines Section 15358 defines indirect or secondary effects” as those effects “which are caused by the project and are later in time or farther removed in distance, but are still reasonably foreseeable”.

4413-10249

15.5 feet from the track; this configuration is implausible. CHSRA would never install 63 foot high barriers adjacent to an elevated tracks because the purpose of elevating tracks by 63 feet is to cross over a large physical impediment (such as a river or freeway or seismic fault area); so, installing a 63 foot high wall adjacent to the tracks would defeat the whole purpose for elevating the tracks. As another example, all of the “output results” assume the presence of noise barriers (see Tables 4-2 and 4-3) however noise barriers will generally not be used for the Project<sup>12</sup>. The defects in this analysis are of particular concern to the Community of Acton because all the route alternatives except SR14A require the construction of elevated structures in Acton, and since high speed trains traveling on elevated structures are much louder than trains traveling on the ground<sup>13</sup>, it is critical to Acton’s future that the Project noise analysis accurately and realistically portray the actual noise insults that Acton will experience if any alternative other than SR14A is selected. The “Benchmark test” does not demonstrate that CHSRA’s models are either accurate or realistic because they reflect configurations that are at best, not useful, and at worst, completely implausible.

- The results provided in Attachment 1 indicate that the modeled results upon which the Draft’s noise impact analysis is based may not be accurate because they show that significant noise impacts in Acton will extend beyond 1,800 feet and will be much more significant than what is predicted by CHSRA’s model.

It is essential that both the public and the CHSRA Board have confidence that the noise analyses and the noise impact results presented in the EIR/EIS are accurate and reliable, and that they realistically reflect the actual noise impacts that Acton residents will experience if any route other than SR14A is selected. For the reasons set forth above, the public has no such confidence and the Board has no substantive basis to conclude that the noise analysis and noise impact results reported in the Draft are either accurate or reliable, or realistic. Accordingly, CHSRA cannot certify or adopt an EIR for the Project, and FRA cannot issue a Record of Decision for the Project until the significant deficiencies noted above are corrected.

4413-10250

**2.6 Key Reports That Were Relied Upon to Prepare the Draft Were Not Made Accessible to the Public.**

The Draft frequently cites various “technical reports” which provide all the fundamental technical information upon which the Draft’s conclusions regarding the “significance” of all environmental impacts are based (see for example pages 3.4-1, 3.4-2, 3.4-14, 3.4-24, 3, etc.). However, none of these reports were made available to the public: they were not posted on the CHSRA website with the Draft and they were not included in the copies of the Draft that were provided for the public to review and they were not filed with the State Clearinghouse as required by CEQA<sup>14</sup>. These documents can only be accessed by submitting a record request pursuant to the California Public Records Act (“CPRA”). All of this is utterly contrary to the open and public processes that are intended by both CEQA and NEPA.

<sup>12</sup> Only two noise barriers are proposed for the Refined SR14 route, only one is proposed for the SR14A route, and only three or fewer barriers are proposed for the “E” routes. Page 3.4-148.

<sup>13</sup> FRA Manual at Page 4-10.

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

**3.0 ADDITIONAL SUBSTANTIVE DEFICIENCIES NOTED IN THE DRAFT**

To facilitate review, additional deficiencies noted in the Draft are presented sequentially below.

4413-10251

Page 3.4-8 discusses Federal Noise Standards that apply to interstate rail carriers, and it asserts that these standards will not be met by the Project; it further indicates that CHSRA's position is that Federal Noise Standards will not be addressed and instead CHSRA will apply European Noise Standards to its environmental analysis. CHSRA's position is not only legally untenable, it makes no sense. First, CHSRA cannot simply ignore federal noise standards or replace them with standards developed by European lawmakers and bureaucrats over which American voters have no control; all high speed rail projects will have to comply with Federal Noise Standards the instant they initiate any operation that is subject to such standards. Second, even if CHSRA were permitted to ignore Federal Noise Standards and instead comply with European noise standards, the Draft is still deficient because it fails to identify what the European Standards are and it certainly does not demonstrate how the Project will meet these standards. Third, the European Noise Standard is based on trainset speeds; in fact, the "Technical Specification for Interoperability" ("TSI") pertaining to noise that was adopted by the European Union limits train speeds to 320 kilometers per hour<sup>15</sup> (or 190 miles per hour). This means that Project operations will not comply with the European Noise Standard because CHSRA's trainsets will operate at 220 miles per hour, not 190 miles per hour. Fourth, it is patently false to conclude that California high speed rail trainsets cannot comply with Federal Noise Standards; these Standards are easily be met by limiting trainset speeds to less than 190 miles per hour because this restriction will eliminate primary aerodynamic noise sources and thereby maintains compliance with Federal Noise Standards<sup>16</sup>. In other words, by limiting trainset speeds, project operations will comply with both Federal and European Noise Standards. Finally, according to a recent publication by the Federal Railway Administration, noise measurements taken for a variety of trains operating throughout Europe demonstrate that *the Federal Noise Standard is achievable through speed control*<sup>17</sup>, therefore, Project operations can comply with Federal Noise Standards despite the Draft's statements to the contrary. Furthermore, there is nothing to prevent CHSRA from operating the Project at 190 mph once construction is completed because Proposition 1A does not require the Project to operate at 220 mph; to the contrary, it merely requires CHSRA to prioritize corridors based on criteria that includes "the need to test and certify trains operating at speeds of 220 miles per hour<sup>18</sup>".

<sup>15</sup> Page 34 of "High Speed Rail Noise Standards and Regulations" issued by the Federal Railway Administration February, 2021 states "The introduction of normalized noise limit values was introduced to consolidate the TSI Noise regulations to one document. The increase in train speed is not a key reason for this consolidation *since the current TSI also limits train speeds to 320 km/hr*" (emphasis added). <https://railroads.dot.gov/sites/fra.dot.gov/files/2021-02/HSR%20Noise%20Standards%20and%20Regulations.pdf>

<sup>16</sup> Aerodynamic noise does not become significant until the train reaches 180 miles per hour. Page 2-11 of FRA's 2012 "High-Speed Ground Transportation Noise and Vibration Impact Assessment" Manual. [https://railroads.dot.gov/sites/fra.dot.gov/files/fra\\_net/2680/20120220\\_FRA\\_HSR\\_NV\\_Manual\\_FIN\\_AL\\_102412.pdf](https://railroads.dot.gov/sites/fra.dot.gov/files/fra_net/2680/20120220_FRA_HSR_NV_Manual_FIN_AL_102412.pdf).

<sup>17</sup> Table 78 in the FRA "High Speed Rail Noise Standards and Regulations" document issued Feb, 2021. <https://railroads.dot.gov/sites/fra.dot.gov/files/2021-02/HSR%20Noise%20Standards%20and%20Regulations.pdf>.

<sup>18</sup> Streets and Highways Code Section 2704.08(f)(2).

4413-10252

Page 3.4-12 mentions the Los Angeles County General Plan ("Plan"), but it fails to articulate the policies or goals of the Plan. CEQA demands that Plan goals and associated policies and relevant factors be identified and discussed in the EIR because CEQA requires CHSRA to identify all instances in which the Project is inconsistent with adopted planning documents. For instance, the Plan asserts that there is a 30% probability that people will be awakened by a peak noise level of 70 dBA, and therefore establishes that a primary goal is to reduce excessive noise impacts in unincorporated areas [Goal N 1 and Page 191]; the Project will not meet this Goal because all routes except the SR14A will result in peak noise levels that substantially exceed 70 at all locations in Acton that are within two miles of, and have an unobstructed "line of sight" to, the tracks. This fact is demonstrated by the noise analyses presented in Attachment 1 which reports that, even two miles away, peak noise levels (referred to as "Cumulative Sound Exposure Level" or "Cumulative SEI.") exceed 75 dBA during a train "passby". Since all the tracks are elevated in Acton for all the routes other than the SR14A alternative, many Acton residents will have a "line of site" to the tracks and will therefore experience noise levels exceeding the Plan's 70 dBA objective more than 460 times per day<sup>19</sup>. Moreover, 56 trains will traverse Acton between 10 PM and 7 AM, which means that many Acton residents will not get *any* sleep because they will experience a noise event exceeding 70 dBA with every nighttime train "passby". And, if the Refined SR14 A alternative is selected, students at Vasquez High School will constantly experience 86 dBA noise events throughout the school day<sup>20</sup>. It is clear that, other than the SR14A alternative, all of the Project route alternatives are inconsistent with, and will substantially interfere with, the Los Angeles County General Plan goal of "reducing excessive noise impacts" in the Community of Acton; yet, the Draft fails to mention any of this. The Draft must be substantially revised to quantitatively show the extent to which the Project will interfere with the County's objective of reducing excessing noise impacts; this concern will be eliminated if CHSRA approves Route SR14A.

4413-10253

Page 3.4-12 "The Los Angeles County General Plan 2035 refers to the Los Angeles County Municipal Code for direction on and definition of specific noise criteria". This statement is incorrect. Consistent with Government Code Section 65302(f), the Noise Element of the Plan includes implementation measures and solutions to address existing and foreseeable noise problems; the purpose of the Municipal Code is to implement these measures established by the Plan. In other words, the Plan drives the Municipal Code, not the other way round.

4413-10254

Page 3.4-13 states "The Authority is a state agency and therefore is not required to comply with local land use and zoning regulations". While it is true that CHSRA is not required to comply with local land use and zoning regulations, CEQA requires that CHSRA ascertain whether the Project is inconsistent with any general plan policies that were adopted for the purpose of avoiding or mitigating an environmental effect and whether these inconsistencies will result in significant environmental impacts; if so, mitigation must be offered<sup>21</sup>. Accordingly, while the

<sup>19</sup> The Project will result in 189 trains per day in each direction during the daytime hours, 28 trains per day in each direction during the nighttime hours, and 14 trains in each direction during the peak hours. Page 3.4-23.

<sup>20</sup> The aerial structure required by the Refined SR14A Alternative will be located within 1,600 feet of Vasquez High School, and as shown in the analyses provided in Attachment 1, each train "passby" will generate a sound level exceeding 86 dBA on the Vasquez campus.

<sup>21</sup> California Code of Regulation, Title 14, Chapter 3, Appendix G.

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10254

Project is not required to conform with local land use and zoning policies, CEQA nevertheless requires the Project to mitigate the significant environmental impacts that arise from non-conformance. Because all the noise protection policies set forth in the Plan were adopted for the purpose of mitigating noise effects on the environment, any noise protection policy that is not met by the Project constitutes a potentially significant environmental impact that must be addressed. The Draft fails to even mention that the Project is inconsistent with the Plan's 70 dBA noise objective and it certainly does not address this inconsistency or offer mitigation measures to ameliorate it. Therefore, the Draft does not comply with CEQA.

4413-10255

Page 3.4-13 asserts that CHSRA has "endeavored to design and construct the HSR project so that it is consistent with land use and zoning regulations. For example, the proposed Build Alternatives would incorporate IAMFs that require the contractor to prepare a plan to demonstrate how construction noise and vibration impacts will be maintained below applicable standards. The Authority has also adopted statewide policies that seek to reduce noise and vibration impacts associated with new sources of noise and vibration (Appendix 3.4-C) below applicable standards". While these statements may be true regarding the SR-14A alternative in Acton, they are not true regarding the other alternatives for several reasons. First, it is clear from the noise analyses provided in Attachment 1 that the Project will result in substantial noise impacts on the Community of Acton regardless of whether CHSRA "endeavors" to be consistent with adopted plans or "seeks" ways to reduce noise impacts. Second, it does not matter whether CHSRA endeavors for the Project to be consistent with adopted plans and policies; it only matters if the Project is consistent with adopted plans and policies; as discussed above, the Project's noise profile in Acton will not be consistent the Los Angeles County General Plan for any of the routes except SR14A. This fact should be clearly asserted in the Draft and not buried under a "word salad" of meaningless aspirations. Third, requiring a contractor to develop a plan that will show how the contractor will comply with applicable noise standards is impermissible under CEQA because it defers the development of mitigation measures to reduce significant noise impacts until after the Project is approved. Finally, while CHSRA may assert that its policies seek to reduce noise impacts, the noise mitigation policies provided in Appendix 3.4-C do not actually reduce noise impacts in most areas. For instance, CHSRA only provides noise barriers under certain circumstances and will not deploy them to reduce noise impacts in most areas even though they would be both feasible and effective<sup>22</sup>. Virtually every statement found on page 3.4-13 is either disingenuous or factually incorrect or intended to obscure the facts regarding Project noise impacts and the extent to which they are inconsistent with adopted Plans and standards: other than Alternative SR14A, every single route alternative in Acton fails to comport with adopted County noise policies and standards. The Draft must be revised to present this simple truth.

4413-10256

Page 3.4-13 also presents Table 3.4-2 that identifies numerous noise standards in adopted plans and codes and which states that the construction and operation of all six proposed routes "may not be possible to meet standards" established by the Los Angeles County General Plan (which applies to unincorporated communities like Acton). This characterization is incorrect. Based on the noise calculations provided in Attachment 1, none of the proposed route alternatives except

<sup>22</sup> CHSRA only deploys noise barriers when there are at least 10 receptor sites who will experience significantly adverse noise levels; if 9 or fewer receptor sites will experience significantly adverse noise levels, no noise barriers will be installed, and the people who live and work at these sites will suffer immeasurably. Appendix 3.4-C Noise and Vibration Mitigation Guidelines at c-1.

4413-10256

SR14A will meet the Los Angeles County General Plan noise standards in Acton; this is particularly true given that no noise mitigation measures are proposed for the elevated tracks that will be constructed in Acton if either the Refined SR14 route or any of the "E" routes are selected. Therefore, Table 3.4-2 must be revised to state that it "will not be possible to meet standards" in the Los Angeles County Plan and further clarify that this constitutes a significant environmental impact. All route alternatives will generate noise levels in unincorporated areas which exceed the Los Angeles County General Plan noise standards; the only way to minimize this significant environmental impact is to select the SR-14A route alternative route which provides the fewest number of miles of above-ground tracks in unincorporated communities.

4413-10257

Page 3.4-14 states "Despite the inconsistencies, the project is consistent with the majority of regional and local policies and plans". The logical fallacy presented by this statement renders it false: The Project is materially inconsistent with 10 of the 12 local and regional plans adopted for the project area [Page 3.4-13]; these inconsistencies are not mitigated away. Therefore, it can only be concluded that the project is not consistent with the majority of regional and local policies and plans. The Draft errs substantially in declaring otherwise.

4413-10258

Page 3.4-14 states "Table 3.4-2, IAMFs and mitigation measures would generally minimize noise impacts and would ultimately meet the overall objectives of the local policies". This statement is categorically false. As discussed above, for all alternatives other than SR14A, project operations within the Community of Acton will result in more than 460 noise events per day that exceed 75 dBA in many areas of Acton; these noise events will not be reduced by any IAMFs or mitigation measures. Accordingly, the Project will not meet any objectives of local noise policies applicable to Acton (and on this basis, it could be argued that CEQA prevents the Project from being approved at all). The Draft must be revised to clarify that, even with IAMFs and mitigation measures, the Project will not meet most local policy objectives.

4413-10259

Page 3.4-16 asserts that NV-IAMPF#1 will minimize construction noise, and the Draft implicitly presumes that it will do so. However, NV-IAMPF#1 is nothing more than a statement that the contractor will prepare a "technical memorandum" stating that FTA and FRA guidelines will be utilized to reduce noise impacts on sensitive receptors within 1,000 feet of construction activity. NV-IAMPF#1 is deficient because the 1,000 foot distance is far too short; the noise generated by Project construction will be significant well beyond a 1,000 foot perimeter. This is especially true in Acton near Red Rover Mine Road (at the refined SR 14 construction site) and Aliso Canyon (at the "E" Route construction site) because the construction sites are surrounded by hills where sound reverberates instead of attenuates due to Acton's low density development profile and sparse vegetation. The constant, mind-numbing operation of pile drives and other construction equipment will make living adjacent to the construction site and learning at Vasquez High School impossible. NV-IAMPF#1 is also deficient because the "thresholds of significance" that are established by the Draft for construction noise impacts are based on federal standards that are far too lax (as discussed in detail below); when the draft is revised to incorporate more appropriately restrictive significance thresholds for construction noise impacts, NV-IAMPF#1 will have to include receptors much further away than 1,000 feet from the construction site. Alternatively, CHSRA can simply select alternative SR14A.

4413-10260

Page 3.4-16 asserts "Wildlife and human sensitive receivers could be startled or annoyed by California HSR System passbys, and wildlife communication could be affected by project noise". This is an understatement. There is no uncertainty regarding whether high speed train noise

## Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10260

affects wildlife and domesticated animals; the Federal Railway Administration's 2012 "High-Speed Ground Transportation Noise and Vibration Impact Assessment" Manual ("FRA Manual") fully admits to this [Appendix A]. In fact, the FRA Manual not only acknowledges that animal startle and annoyance are real problems, it openly asserts that it has no definitive information upon which to establish a quantitative threshold for determining the significance of these impacts<sup>23</sup>. Astonishingly, after admitting that it has no quantitative basis for establishing significance thresholds for startle impacts, the FRA Manual arbitrarily assigns a 100 dBA sound exposure level (averaged over a 1 second time interval) for startle effects and then, without justification, the Draft simply adopts this as a significance threshold [Page 3.4-34]. This 100 dBA threshold is based purely on speculation and conjecture and is therefore impermissible under CEQA. Because the Draft's threshold for noise impacts on animals is completely unsubstantiated and admittedly indefensible, it will not withstand judicial review. Furthermore, as a rural agricultural community that is surrounded by national forestland, Acton is replete with both domesticated animals and wildlife, and the "lived experiences" of our residents directly contradict the presumption established by the Draft that animal startle and annoyance is not significant until noise levels reach 100 dBA. As has been explained in numerous and extensive public comments submitted to CHSRA, animal startle (whether wild or domesticated) can result from a distant helicopter flyover and even a distant car passby or backfire; all of these noise levels are far less than 100 dBA. Conveniently, the unsubstantiated and arbitrarily high 100 dBA noise threshold that CHSRA establishes for animal impacts allows the Draft to conclude that noise impacts on animals resulting from all the route alternatives are generally "insignificant"; in fact, the only locations where the Draft concludes that potentially significant noise impacts on animals will occur are on the Pacific Crest Trail, in the Vasquez Rocks Natural Area, at the Hansen Dam Recreation Area, and at the Stonehurst Park and Recreation Center because horses are known to be there [page 3.4-107]. CHSRA is reminded that horses, cows, sheep, goats, chickens, llamas, ducks, lions, tigers, and many other types of animals are known to be in Acton (as the public has pointed out many times over the last 10 years); therefore, Acton should be included in this list of locations where potentially significant noise impacts on animals will occur. Furthermore, the Refined SR14 route travels directly over established equestrian trails along Sierra Highway, Red Rover Mine Road, and Escondido Canyon Road (including over the Darrell Readmond trail), and according to Sheet ST-J1009-S14 of the "Bridges and Elevated Structures Plans", the tracks will be less than 40 feet above the trail; this means that noise levels on the trail will actually exceed 102 dBA<sup>24</sup>. Thus, even if the 100 dBA threshold for significant noise impacts on animals were acceptable (which it is not), it is certain that the Project will result in significant animal impacts in the Community of Acton. Furthermore, there is no uncertainty regarding whether humans will be startled or annoyed by Project operations; according to a 2021 study issued by FRA, human startle effects can occur at

<sup>23</sup> The 100 dBA threshold identified in the FRA Manual was based on observed turkey responses to aircraft and Table A-1 of the Manual demonstrates a wide variety of aircraft reaction thresholds for animals. Because there is no data pertaining to high speed trains, and because what little data there is regarding animal responses to aircraft, the FRA Manual lamely states on page A-20 that "Until more definitive information on thresholds can be developed, an interim criterion of SEL = 100 dB will be used for disturbance by high-speed rail operations."

<sup>24</sup> The noise that is generated by a train traveling on aerial structure exceeds 101 dBA at a location 50 feet from the tracks; since the trails along Red Rover, Escondido Canyon Road, and Sierra Highway will be only 39 feet from the tracks, noise levels at these trails will greatly exceed 101 dBA.

4413-10260

Noise levels less than 90 dBA<sup>25</sup>. Additionally, a 1974 study by the Federal Department of Transportation demonstrates that human startle impacts can occur at noise levels that are as low as 81 dBA<sup>26</sup>. That high speed train noise will annoy humans is a *fact* that is demonstrated by the infamous "Schultz Curve" which shows measurable human annoyance occurring at  $L_{dn}$  levels as low as 60 dBA<sup>27</sup>. Given that all but one of the six Project alternatives will increase  $L_{dn}$  sound levels in Acton well beyond 60 dBA (see table 3.4-31), it is a certainty that Acton residents will be annoyed by the Project. In other words, the Draft errs substantially in stating that human sensitive receptors *could* be startled or annoyed by HSR operation; it is a certainty that they *will* be startled and annoyed by HSR operation. Startle and annoyance impacts of the proposed project on the community of Acton can only be avoided by selecting the SR14A alternative which eliminates all operational noise impacts. All the deficiencies noted here render the Draft substantially deficient; these deficiencies can only be corrected by substantially revising the Draft to properly address startle effect on animals and startle and annoyance effects on humans.

4413-10261

Pages 3.4-17-3.4-18 describes various sources of noise that may result from Project construction, but it fails to identify or discuss the blasting noise impacts that will occur as a result of using "traditional" tunneling techniques to construct the tunnels in Acton for all the "E" Route alternatives<sup>28</sup> (specifically, in the residential neighborhoods around Foreston Street and Aliso Canyon Road). Blasting techniques are substantially disruptive in rural communities like Acton where a sudden noise can cause horses, livestock, and other domesticated animals to panic and become very difficult and dangerous to handle. The Draft fails to disclose that blasting techniques will be used in the Community of Acton, it fails to consider the adverse impacts of such techniques in the community, and it certainly fails to offer mitigation measures to reduce these impacts. The Draft must be revised to address all of these deficiencies and it must also clarify that these impacts cannot be mitigated to a level that is less than significant and will only be avoided if the none of the "E" Routes are approved.

<sup>25</sup> According to the FRA report issued in February, 2021 and titled "High Speed Rail Noise Standards and Regulations", startle effects are deemed excessive by the public when a high speed train's average noise level measured 25 feet from the track centerline is only 90 dBA. This conclusion is based on the following specific facts drawn from the "High Speed Rail Noise Standards and Regulations" report: 1) Page 45 states that "The startle noise of the Thalys trains running at 300 km/h (186 mph) was deemed excessive"; 2) Page 136 that the Thalys train running at 300 km/hr generates a passby noise level  $L_{paeqp}$  of 90 dBA; 3) Page 20 states that  $L_{paeqp}$  is the average of noise energy a train generates from all cars during the time of the passby of the entire train; and 4) Page 31 states that  $L_{paeqp}$  is measured 7.5 meters (approximately 25 feet) from the track centerline. The extent to which the Thalys  $L_{paeqp}$  values represent the average noise level during a train passby event is demonstrated in figure 5 from a separate FRA study titled "High Speed Rail: Cost of Compliance for Noise Mitigation Procedures". Because the Project will expose people and animals to 90 dBA noise levels in Acton within 700 feet of the track (as indicated in Attachment 1), startle effects will be much more prevalent than the Draft suggests.

<sup>26</sup> "Development of an Acoustic Rating Scale for Assessing Annoyance Caused by Wheel/Rail Noise in Urban Mass Transit". U.S. Department of Transportation Interim Report. 1974. At Table 1.

<sup>27</sup> See page A-12 of the FRA Manual.

<sup>28</sup> At a meeting with CHSRA engineers and staff on October 4, 2022, it was announced that tunnel boring machines would not be used to construct any of the tunnels for the "E" Route alternatives between Palmdale and Arrastre Canyon and that "traditional" tunnelling methods would be used instead.

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10262

Page 3.4-19 addresses the “Construction Noise Criteria” applied for assessing project construction noise impacts, and it states that the Draft relies solely upon federal criteria established by the FRA for determining whether the Project’s construction noise impacts are “significant”. This is unacceptable. FRA construction noise standards are substantially lax because they allow a daytime 8-hour average noise level (referred to as “8-hour Leq”) of 80 dBA and a nighttime 8-hour average noise level of 70 dBA; this means that Project construction can continuously create noise levels up to 80 dBA all day and 70 dBA all night in a residential area and such noise impacts would not be considered “significant”. It also means that daytime and nighttime noise levels can be as high as 100 dBA or even higher as long as these high noise events are sufficiently balanced by lower noise events to ensure that the cumulative noise level averaged over an 8 hour interval does not exceed 80 dBA in the daytime or 70 dBA at night. To be clear, an 80 dBA noise insult is quite loud (it is equivalent to an alarm clock<sup>29</sup>), thus it is entirely unreasonable to conclude that residents will not be significantly affected if they are continuously exposed for an entire day to noise levels that are equivalent to an alarm clock. Yet, that is precisely what the federal standard allows for daytime construction activities. Moreover, local noise policies and standards more accurately reflect just how disruptive noise impacts can be in rural communities like Acton (particularly at night). For instance, and as discussed above, the Los Angeles County General Plan affirms that there is a 30% probability that people will be awakened by 70 dBA noise events; this is why the Los Angeles County Code prohibits construction noise disturbances across residential property line that exceed 75 dBA during the day and 60 dBA during the night<sup>30</sup>. The Draft ignores all these material facts, and instead adopts a noise standard which is so lenient that it *guarantees* sleepless nights for many Acton residents because it allows for continuous nighttime noise levels of 70 dBA. It is entirely inappropriate and arguably a CEQA violation for CHSRA to disregard local noise policies in determining the significance of noise generated by Project construction in favor of a federal standard that was developed without regard for rural circumstances or consideration of local conditions. CEQA is very clear: it requires the Lead Agency to 1) exercise careful judgement in making determinations regarding whether a project may have a significant effect on the environment; 2) base such determinations on scientific and factual data; and 3) recognize that an activity which may not be significant in an urban area may be significant in a rural area [CEQA Guidelines 15064(b)(1)]. The Draft fails to comply with these CEQA directives because it simply adopts a federal standard without thought or analysis and despite the fact that it is entirely inappropriate for local conditions. In other words, it is technically unacceptable and legally insupportable under CEQA to adopt “thresholds of significance” which are inappropriate for the rural environmental and are so lenient that a Project is not deemed to pose significant effects even when it causes significant and continuous incursions of noise events that are of sufficient magnitude to substantially interrupt sleep and interfere with living conditions. These are precisely the circumstances presented by the Draft; accordingly, the Draft is deficient and it will not withstand legal challenge. To correct these deficiencies, the Draft must be revised to incorporate restrictions on construction noise within the Community of Acton which are reasonable and appropriate for the rural community of Acton; the construction noise standards adopted by Los Angeles County Code are a good starting point. Alternatively, CHSRA can just approve the SR14 A route alternative and eliminate all construction noise impacts in Acton.

<sup>29</sup> <https://decibelpro.app/blog/decibel-chart-of-common-sound-sources/>

<sup>30</sup> The County Code prohibits residential noise disturbances ≥ 75 dBA from 7:00 a.m. to 8:00 on Monday-Saturday, and ≥60 dBA from 8:00 p.m. to 7:00 a.m. at all other times. [IACC 12.08.440].

4413-10263

Page 3.4-23 states “For the Palmdale to Burbank Project Section, it is assumed that there would be 189 trains per day in each direction during the daytime hours (7:00 a.m. to 10:00 p.m.), 28 trains per day in each direction during the nighttime hours (10:00 p.m. to 7:00 a.m.), and 14 trains in each direction during the peak hours.” This description is ambiguous. Specifically, it is not clear whether the statement “14 trains in each direction during the peak hours” means that each peak hour will have an additional 14 trains or it mean that the additional 14 trains in each direction will be spread over all the peak hours. The difference is significant; the former implies that there will be 231 daily trains in each direction (189 + 28 + 14) for a total of 462 trains per day and the latter implies there will be 301 daily trains in each direction per day (189 + 28 + (14 x 6 peak hours per day)) for a total of 602 trains per day. This ambiguity should be addressed and the projected train schedule should be clearly identified.

4413-10264

Page 3.4-24 generally discusses noise propagation and the factors that affect sound travel; however, it does not correctly represent material facts that are pertinent to the Project. For example, it states that “If a line of sight exists from a subsource on the HSR to a noise-sensitive receiver, the ground factor becomes more critical in determining the amount of attenuation over a given distance”. This statement is not accurate and does not represent conditions that will result from Project operations. Specifically, Project train speeds will exceed 200 mph, therefore, aerodynamic noise will tend to dominate the radiated noise levels<sup>31</sup>; therefore, the “ground factor” is not relevant because in the aerodynamic regime, ground absorption has little attenuating effect<sup>32</sup>. Furthermore, in the Community of Acton, “ground factor” will not contribute significantly to sound attenuation because many neighborhoods will have a direct “line of sight” to the train because the tracks are elevated in the Community for all route alternatives except SR14A. Finally, the discussion regarding noise barriers and the extent to which they will attenuate noise gives the false impression that noise barriers will be deployed to protect the public from the Project’s significant noise impacts when in reality, CHSRA is generally disinclined to utilize noise barriers and is only proposing that a few be used to mitigate noise impacts (as discussed above).

4413-10265

Page 3.4-33 addresses “startle effect” in humans and wildlife due to “Rapid Onset Rates” from high speed trains, and it presents a “distance verses speed” chart that was ostensibly developed by FRA to indicate the distances from a high speed rail track where human “startle” effects can occur at various train speeds. According to the chart, an unsuspecting a person walking only 47 feet from a high speed rail track will not be “startled” by an oncoming high speed train unless the train speed exceeds 225 mph. This conclusion is *preposterous* because a person walking only 47 feet from a train traveling at 220 mph will experience a sudden noise level exceeding 101 dBA (as well as a significant air pressure wave) and will absolutely experience “startle”. Yet, the Draft concludes that no such startle effects would occur because the train is only moving at 220 mph. Given the absurdity of this conclusion, a further review of the FRA figure was conducted. It turns out that the FRA Manual does not explain the “distance verses speed” chart at all; it does not disclose the chart’s origins or cite the technical data that the chart reflects or describe the assumptions that underlie it or articulate the circumstances under which is deemed to apply. Furthermore, the “distance verses speed” chart appears to contradict other information that is provided in the FRA Manual. For instance, the FRA Manual cites an Air Force study that

<sup>31</sup> FRA Manual at 2-11.

<sup>32</sup> *Id* at 5-13.

## Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10265

indicates startle effect can occur when onset speeds reach 15 dBA/second<sup>33</sup> which (according to Figure 2-5) occurs when the “speed to distance” ratio is at approximately 2.5. Reconciling this 2.5 ratio to the Project’s 220 mph velocity envelope indicates that “startle” will occur when a person is actually 88 feet from the tracks (not 47). Surprisingly, and despite the presence of contradictory Air Force data, the FRA Manual “adopts” an onset noise threshold of 30 dBA/second as the basis for “establishing distances within which startle is likely to occur” even though Figure 2-5 presented in the FRA Manual reveals a 30 dBA/second threshold to be entirely implausible because it shows that no high speed trains (including Maglev trains) are even capable of achieving a 30 dBA/second onset rate<sup>34</sup>. Finally, this assessment by FRA’s is contradicted by various studies described above including a 2021 FRA study (indicating that startle effects are deemed excessive by the public when a high speed train’s average noise level measured 25 feet from the track centerline is only 90 dBA) and a 1974 study by the Federal Department of Transportation (demonstrating that human startle impacts can occur at noise levels that are as low as 81 dBA). The discussion of “startle” effects presented in the FRA Manual is arguably contradictory and not supported by technical evidence; thus, and by extension, the Draft’s conclusions regarding “startle” effect are groundless and should be accorded no weight.

4413-10266

Page 3.4-36 explains the methodology that the Draft adopts for assessing the significance of Project operating noise impacts pursuant to CEQA, and it establishes that a noise impact will only be significant if it generates noise levels that exceed Federal Railway Administration/ Federal Transportation Administration standards (which are referred to as “Noise Impact Criteria” and are set forth in Figure 3-1 and on page 3-4 of the FRA Manual). This is categorically unacceptable for the following reasons. First, the FRA “Criteria” are entirely inappropriate in quiet rural communities like Acton because they do not designate a project as having a severe noise impact unless it nearly **doubles** the average ambient noise level. This is clearly depicted in Figure 3-1, which shows that existing areas with average noise levels of 50 dBA are not deemed to be severely impacted unless train operations increase the average ambient noise level by nearly 10 dBA (which is a doubling of noise “loudness”<sup>35</sup>). It is neither reasonable nor appropriate for any Lead Agency to conclude that a project will not have a significant noise impact unless it doubles the ambient noise level in a quiet rural area. Second, the FRA “Criteria” are so lenient that they preclude any project from ever being designated as having a “severe” noise impact unless and until the project noise levels exceed the 55 dBA “outdoor activity” noise threshold which interferes with activities and creates annoyance<sup>36</sup>. This fact is clearly revealed by inspection of Figure 3.4-12 in the Draft which shows that noise levels must exceed 55 dBA before they can be considered “severe”. Another example of the inappropriate leniency that is “built into” the FRA “Criteria” is that it precludes projects from being designated as having a “severe” noise impact even if the project causes ambient noise

<sup>33</sup> FRA Manual at 2-7.

<sup>34</sup> According to Figure 2-5 in the FRA Manual, the maximum onset rate that steel wheel trains can achieve is less than 12 dBA/second; the onset rates achieved by Maglev trains are less than 25 dBA/second.

<sup>35</sup> FRA Manual at A-2.

<sup>36</sup> <https://www.epa.gov/archive/epa/aboutepa/epa-identifies-noise-levels-affecting-health-and-welfare.html>

4413-10266

levels to exceed the 65 dBA established by HUD as a “normally unacceptable living environment”<sup>37</sup>. This fact is clearly revealed by inspection of Figure 3.4-12 in the Draft which shows that project noise levels can exceed 65 dBA and still not be considered “severe”. The very notion that a project’s noise impacts are not deemed significant unless they interfere with outdoor activities or create annoyance or result in normally unacceptable living environments is fundamentally contrary to CEQA which requires that significance determinations be based on careful judgment, facts, and technical data. Third, a detailed analysis of the FRA “Criteria” was conducted in 2016 which revealed that they are largely based on urban-based studies (such as the infamous “Schultz” curve) and thus do not incorporate research data pertaining to quiet, rural (non-urban) areas like Acton. This analysis was submitted to CHSRA in comments that were provided in 2016 in response to CHSRA’s request for public input; it is included herein as Attachment 3. Importantly, this analysis demonstrates conclusively that the FRA “Criteria” used by the Draft to assess the significance of Project noise impacts may be applicable to urban environments, but they do not reflect the conditions or circumstances in quiet rural areas like Acton. Accordingly, application of FRA “Criteria” to Acton is utterly contrary to CEQA’s holding that criteria used to determine whether an activity will have a significance effect must be appropriate for the setting in which the activity will occur because “an activity which may not be significant in an urban area may be significant in a rural area” [Guidelines 15064(b)(1)]. Fourth, FRA “Criteria” are based on  $L_{dn}$  levels that are calculated average values and represent only “cumulative noise exposure from all events over a 24-hour period”<sup>38</sup>; therefore, the FRA “criteria” are only useful for assessing the cumulative noise effects of a project and cannot be used to assess the direct noise effects of a project. As discussed above, both CEQA and NEPA require a Lead Agency to assess the significance of a Project’s direct effects; this necessarily requires consideration of the “Sound Exposure Level” (“SEL”) that is experienced by a receptor **during** a “passby” event. Furthermore, a new set of criteria must be developed to assess the significance of these direct effects. Such a “direct effect” analysis would require a determination of whether a resident who lives 2,000 feet from, and has an unobstructed view of, the HSR tracks would be “significantly impacted” when he/she experiences an 86 dBA noise insult more than 400 times per day throughout the day and night (which is equivalent to a jack hammer going off 50 feet away<sup>39</sup>). The FRA “Criteria” are not based on the SEL standard and are thus useless for assessing the significance of direct noise effects of a train project. This reveals an additional deficiency in the Draft: not only does the Draft fail to properly evaluate direct noise impacts, it also fails to identify criteria with which to assess the significance of direct noise impacts. Fifth, the methodology established by the FRA Manual and the manner in which it masks the significance of noise events by averaging them over a 24 hour period render them facially deficient for assessing even indirect noise impacts. For instance, there is no question that a train project poses a “significant” noise impact if it forces a resident living 2,000 feet from the tracks to experience an 86 dBA noise insult (equivalent to a jack hammer going off) more

<sup>37</sup> The U.S. Department of Housing and Urban Development has designated the  $L_{dn}$  value of 65 dBA as the noise level above which a normally unacceptable living environment exists. <https://www.hudexchange.info/programs/environmental-review/noise-abatement-and-control/#:~:text=The%20%22Normally%20Unacceptable%22%20noise%20zone.65%20decibels%20to%2075%20decibels.>

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10266

than 460 times throughout the day and night, and any reasonable person would conclude that this impact is indeed “significant”. Yet, this scenario would not even be captured by the FRA methodologies adopted in the Draft because the Draft only considers “receptor sites” within 1,800 feet of the tracks. There are a number of residents in the Acton Valley who live within 2,000 feet of, and will have an unobstructed “line of sight” to, the elevated tracks that will be constructed under the Refined SR14 route, and they will routinely experience 86 dBA noise events if this route is selected; these residents will also experience a Project  $L_{dn}$  value greater than 66 dBA and as such, should be designated as “severely impacted” according to the FRA Manual [Page 3-4]. However, they are not accounted for in the Draft. In fact, according to Figure 3.4-18, the Draft concludes that only Acton residences located within 1,300 feet of the elevated tracks of the Refined SR14 route will experience “severe” noise impacts. Sixth, the FRA methodology for assessing train noise impacts does not represent the *actual* cumulative noise impact that an area will experience as a result of high speed rail operation because the  $L_{dn}$  value it calculates for train noise only considers train noise events and does not incorporate the area’s existing noise profile (in other words, it assumes a zero noise level during the portions of the 24 hour averaging interval when trains are not operating). This is perhaps one of the most egregious deficiencies of the FRA methodology; it isolates train noise events and calculates an  $L_{dn}$  value based solely on train operation and then merely compares this isolated train  $L_{dn}$  value to the existing cumulative noise profile in a community *thus it does not provide any indication of the actual cumulative (existing + project) noise levels that will occur in an area once train operations begin*. The FRA methodology is somewhat analogous to assessing the impacts of a tsunami at a particular location without regard for tidal influences<sup>40</sup>. This is not an ideal analogy because water waves and sound waves behave differently and because tsunamis typically only strike an area once and not 460+ times a day, but it makes the point that the quantification of cumulative noise levels in a community necessarily involves a calculation which *integrates* projected train noise events with existing ambient noise level and does not merely compare projected train noise levels with existing ambient noise levels. The FRA methodology does not achieve this integration; thus, the cumulative train noise  $L_{dn}$  values calculated per the FRA Manual are biased low. Finally, it is noted that the High Speed Rail Project is a California project funded largely by California taxpayers; thus, it is entirely inappropriate to adopt inapplicable federal criteria to assess the impacts of a state project, particularly given that the federal criteria are not representative of, and have no consideration for, the unique rural environments that will be affected by the Project (as discussed above).

4413-10267

Pages 3.4-60 to 3.4-70 concludes that up to 1,900 residences will experience significant noise impacts during Project construction, and that, despite implementation of mitigation measure N&V-MM#1 (which requires the contractor to prepare a noise-monitoring program describing how the contractor will meet the 80 dBA average daytime and 70 dBA average nighttime noise standards) “some receivers may still experience noise that would exceed acceptable limits”. Unfortunately, this analysis substantially underrepresents the number of residences that will experience significant adverse noise impacts from Project construction because the significance threshold is based on a federal standard which (as discussed above) is entirely too lenient to be sufficient for the purposes of CEQA. The Final EIR/EIS must correct this deficiency by adopting CEQA-compliant thresholds for determining significant construction noise impacts and using these revised thresholds to prepare a more accurate “count” of the number of residences that

<sup>40</sup> Tsunamis are much more damaging if they occur during a high tide interval.

4413-10267

will experience significant construction noise impacts; this will necessarily result in the identification of many more residences that will experience significant construction noise impacts. Another concern is that mitigation measure N&V-MM#1 will not protect Acton residents from significant construction noise impacts because it only requires the construction contractor to comply with the (too) lenient federal construction noise standards. In other words, many Acton residents will experience significant construction noise impacts even if the contractor successfully implements N&V-MM#1 and reduces construction noise in compliance with federal noise standards because the federal standards are absurdly lenient. This deficiency must be corrected by adopting more stringent performance standards for mitigation measure N&V-MM#1 which are applicable to areas like Acton.

4413-10268

Pages 3.4-75 to 3.4-76 address startle and annoyance impacts on humans, and assert that human startle impacts will only occur if train onset rates exceed 30 dBA/second; it is concluded that no startle impacts will occur. This conclusion is defective because it is based on criteria taken from the FRA Manual that are at best insupportable and at worst completely implausible (as discussed above). Because the Draft applies inappropriate and implausible thresholds of significance for startle and annoyance impacts and ignores technical studies showing human startle impacts can occur at noise levels as low as 81 dBA and annoyance impacts can occur at noise levels as low as 73 dBA, it improperly concludes that human startle and annoyance impacts are less than significant. The magnitude of this error becomes apparent when one considers that it means an Acton resident who lives half a mile from the tracks will never be annoyed or startled by any Project operations even though the Project will expose the resident to an 85 dBA noise insult more than 460 times per day; such a conclusion is ridiculous and the Draft is substantially defective for even suggesting it. This deficiency must be corrected by adopting reasonable and technically defensible noise thresholds for assessing human startle and annoyance effects and applying these thresholds to projected noise levels to properly quantify the scope and extent of the Project’s startle and annoyance impacts.

4413-10269

Pages 3.4-76 to 3.4-106 address the noise impacts of Project operations, and conclude that relatively few residents will experience significant noise impacts resulting from Project operations. This conclusion is defective because it is based on FRA “criteria” that do not comply with CEQA because they do not reflect local conditions or circumstances in rural communities like Acton (as discussed above). This conclusion is also incomplete because it is based on calculated  $L_{dn}$  values that only addresses “cumulative noise exposure” impacts which are perhaps germane for assessing the Project’s indirect noise effects but are not appropriate for assessing the Project’s direct noise effects. If the Draft had adopted CEQA-compliant noise impact thresholds, the noise analysis would have extended beyond the 1,300 foot boundary that was analyzed in Acton and far more residences would have been properly identified as receptor sites that will experience significant noise impacts. The Draft utterly fails in this regard, and because it substantially underreports the scope and extent of the Project’s noise impacts, it violates CEQA. These deficiencies must be corrected by 1) adopting reasonable and technically defensible noise thresholds for assessing direct noise impacts in rural, suburban, and urban environments; and 2) adopting reasonable and technically defensible noise thresholds for assessing indirect noise impacts in rural areas (because the FRA “Criteria” are only applicable to urban areas); and 3) applying these thresholds to projected noise levels to properly quantify the full scope and extent of the Project’s direct and indirect noise impacts.

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10270

Pages 3.4-89 and 3.4-98 summarize the noise impact result for all the “E” routes in the central section of the Project and simply assert that “no noise impacts on institutional uses (e.g., schools, libraries, theaters, and churches) were identified”. These pages give the impression that no residential properties in the central sections of all the “E” routes will be affected by Project noise; however, this impression is incorrect. A number of residences will experience significant noise impacts in the central sections of all the “E” routes and a number of them are in Acton (see Tables 3.4-32 and 3.4-33). These pages should be revised to properly reflect that all the E routes will result in significant noise impacts on non-institutional uses in the central section of the Project.

4413-10271

Page 3.4-144 through 3.4-149 summarize NEPA impacts of the Project. However, the Draft does not comply with NEPA because it fails to provide noise impact assessment methodologies and significance criteria which properly evaluate the direct noise impacts resulting from Project operations; it also relies on deficient and insupportable analyses pertaining to human and animal startle impacts.

4413-10272

Page 3.4-149 through 3.4-151 present CEQA significance conclusions indicating the Project will result in significant noise impacts. However, the Draft underrepresents the scope and extent of the Project’s significant noise impacts and it does not comply with CEQA because the Draft:

- Relies on inappropriately lenient federal standards that are not applicable to rural areas for assessing construction noise impacts.
- Relies on inappropriately lenient federal standards that are not applicable to rural areas for assessing cumulative noise impacts resulting from Project operations.
- Fails to provide noise impact assessment methodologies that properly evaluate the direct noise impacts that will result from Project operations.
- Fails to identify appropriate criteria for assessing the significance of the Project’s direct noise impacts.
- Adopts unsubstantiated and insupportable criteria for assessing the impacts of Project operations on domestic animals and wildlife
- Adopts unsubstantiated and insupportable criteria for assessing the startle and annoyance impacts of Project operations on humans.

4413-10273

**4.0 ANECDOTAL EVIDENCE DEMONSTRATES THAT L<sub>dn</sub> VALUES ARE USELESS FOR ASSESSING SIGNIFICANT NOISE IMPACTS.**

The Town of Acton was founded in the 1880s based on farming, mining and the railroad, so the residents of Acton have extensive experience with adverse noise impacts of rail operations. Because of the unique geography and geology of our community, coupled with a sparse vegetation profile, rail noises reverberate and do not attenuate in Acton. Residents who have no “line of sight” to the tracks are still awakened at 2 AM by rail traffic (even residents who live 2

4413-10273

miles from the tracks; indoor noise measurements taken during these “passby” events are typically 70 dBA). The anecdotal evidence that has been collected from affected Acton residents demonstrates that *adverse rail noise impacts occur when the train is transiting because that is when activity disruption occurs*. The Draft does not address the noise impacts that will occur in Acton during transit of a high speed train; therefore, the Draft fails to address the very circumstances under which the most significant Project noise impacts will occur. Accordingly, the Draft is utterly deficient.

The Draft reports that Acton’s baseline L<sub>dn</sub> is 60 dBA or less which (according to the FRA manual) means that Acton has no significant noise issues. However, nothing could be further from the truth because sleep disruption and activity interruption are routine occurrences in Acton because significant adverse noise impacts occur *during* rail “passby” events. This fact alone utterly controverts the premise established by the FRA Manual and adopted by the Draft that a 24-hour average noise value is an appropriate indicator of adverse noise impacts; it is not.

Rail operations in Acton have grown steadily over the years, and as a result, adverse noise impacts have also grown steadily; in fact, some residents have even moved because noise impacts have become too burdensome. At the request of residents, and because noise generated during rail “passby” events have become too disruptive, the Acton Town Council began a campaign nearly 10 years ago to have “quiet zones” installed along the rail corridor in Acton. The fact that the Community of Acton is diligently working to have “quiet zones” installed even though L<sub>dn</sub> values in the Community are 60 dBA or less is proof positive that L<sub>dn</sub> values are, frankly, useless for determining whether rail noise impacts are significant.

4413-10274

**5.0 CONCLUSION**

For the reasons set forth above, the noise analysis results presented in the Draft EIR/EIS prepared for the Palmdale to Burbank section is deficient and does not comply with CEQA or NEPA; these deficiencies must be corrected in the Final EIR/EIS and in particular, defects noted herein must be addressed. Without these corrections, the Final EIR/EIS will not comply with CEQA or NEPA. Alternatively, CHSRA could simply adopt the SR14A Route Alternative and avoid all noise impacts from Project Operations in the Community of Acton.

# Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

## ATTACHMENT 1

Noise analysis results for HSR Operations that were prepared in accordance with calculation procedures set forth in Chapter 5 and Appendix C of the FRA Manual and based on the train configuration data provided on Page 3.4-23 of the Draft. These calculations assume 1) The train operates at 220 mph at ground level; 2) the receptor has an unobstructed view of the tracks (no “shielding”); 3) the ground is acoustically “hard” and there is little vegetation; and 4) there is no ground attenuation for trains traveling in the aerodynamic regime.

4413-10277

**ATTACHMENT 3**

Excerpts From a Letter Submitted by the Acton Town Council to CHSRA in 2016 Analyzing the Efficacy of FRA “Noise Impact Criteria”.  
(Source: California High Speed Rail Authority)

**CALIFORNIA High-Speed Rail Authority** NOISE AND HIGH-SPEED RAIL • 2018

### How Do High-Speed Train Noise Levels Compare to Traditional Trains?

Four major factors make high-speed trains operate at generally quieter levels than conventional passenger and freight rail services.

**DURATION OF NOISE DISTURBANCE\***

<p><b>HIGH-SPEED TRAIN</b> TRAIN LENGTH: 1,100 FT. SPEED: 220 MPH</p>	<p><b>FREIGHT TRAIN</b> TRAIN LENGTH: 1-MILE SPEED: 50 MPH</p>
---	--

\*Based on typical train length and speed capabilities.

- 1. Train Speed**  
The duration of noise is brief for high-speed trains when compared to traditional train systems which take longer to pass.
- 2. Electric Trains**  
High-speed trains are powered by an electric propulsion system which, when compared to the more common diesel train engines, generate significantly less noise.
- 3. Auditory Warning Systems**  
Portions of high-speed train systems that operate on grade-separated track will not require sounding bells and warning horns that are necessary for traditional at-grade crossings.
- 4. Hours of Operation**  
Unlike some passenger train services and many major freight routes which operate through the night, there will not be any high-speed rail service scheduled between the hours of midnight and 5 a.m. when people are most sensitive to noise.

**THE SOUND OF HIGH-SPEED TRAIN TRAVEL**  
Typical Maximum Noise Levels Before Mitigation

Source	Approximate Noise Level (dB)
Normal Conversation	60
Food Blender	75
High-Speed Train @ 125 mph	75
Freight Train @ 50 mph	80
Commuter Train @ 75 mph	80
High-Speed Train @ 220 mph	85
A Person Shouting	90
Train Horns	100

Other sound sources shown include: Air Conditioner, Lawn Tiller, Lawn Mower, Air Compressor, Diesel Truck (Muffled), and Diesel Truck (Not Muffled).

\*A-weighted decibels (dB(A)) are an expression of the relative loudness of sounds in air as perceived by the human ear.

**FRA’s “Noise Impact Criteria” that will be Used in the Palmdale-Burbank DEIR Fail to Properly Consider Noise Impacts on Rural and other “Non-Urban” Areas.**

The HSR “Noise Impact Criteria” which CHSRA intends to implement for the Palmdale-Burbank segment EIR are published in the FRA Manual [Figure 3-1] and they establish three impact categories: “no impact”, “moderate impact”, and “severe impact”. It is understood that CHSRA will not consider project modifications or implement mitigation measures unless HSR noise impacts exceed the “severe” thresholds established by Figure 3-1, therefore, it is necessary to analyze these “severity” thresholds to ensure they properly consider the wide spectrum of existing ambient noise conditions that will be degraded by HSR operations. Because Acton is a relatively quiet rural community that has (on average) low ambient noise levels, the EIR will establish “severe” (aka “significant”) impacts based on what Figure 3-1 identifies as low existing noise exposure levels (reported as 24 hour “average”  $L_{dn}$  noise values) Therefore it is this low noise interval (40-55 dBA) that is considered herein.

First, it is noted that neither CHSRA nor FRA consider it “significant” if the HSR project triples the average noise level in a quiet area. This is clearly depicted in Figure 3-1, which shows that a 15 dBA noise increase (or a tripling of noise “loudness”) is not considered a “severe” impact in any quiet area that has an existing average noise level of 43 dBA. Even more surprising, Figure 3-1 establishes that no HSR noise impacts are ever deemed “severe” until they cause outdoor noise to exceed the 55 dBA “outdoor activity” protection level established by EPA and others (as discussed in more detail below). In other words, CHSRA and FRA consider it “insignificant” if the outdoor noise environment is degraded to such an extent that it impairs outdoor activities and even speech. Additionally, for rural areas that are currently at the 55 dBA limit for “acceptable” outdoor conditions, Figure 3-1 establishes that no significant degradation occurs even if the noise level increases above 61 dBA (which is higher than what is experienced by most urban dwellers<sup>2</sup>). It is clear that these “Noise Impact Criteria” are not intended to preserve the outdoor environment in quiet communities like Acton. To the contrary, they actively facilitate noise increases to such an extent that they successfully convert quiet rural environments into loud urban environments. To understand why these “Noise Impact Criteria” fail to prevent (or even consider) the degradation of rural outdoor environments, it becomes necessary to study how these criteria were developed.

According to Section A.3 of the FRA Manual, the “Noise Impact Criteria” thresholds were derived from “research” (in the form of the “Schultz Curve” depicted in Figure A-5), EPA findings, and “relevant literature” such as HUD standards and EPA publications. As set forth below, an analysis of these cited references reveals that the

<sup>1</sup> On average, each 10 dBA noise increase doubles the loudness of the noise [FRA Manual page 2-3]. Therefore a 10 dBA increase is generally perceived as doubling the “loudness”, and a 15 dBA increase essentially triples the “loudness”.

<sup>2</sup> See Figure 4 from the EPA “Levels Document” – Condensed version found cited on Page A-13 of the FRA Manual.

4413-10277

FRA “Noise Impact Criteria” only reflect circumstances which occur in the urban environment and do not take into account any of the cited research addressing quiet rural (non-urban) areas. In other words, the “research” cited by the FRA Manual *does not support* the application of FRA’s “Noise Impact Criteria” to non-urban areas (like Acton) which have existing ambient noise exposure levels at or below 55 dBA. Indeed, the “research” papers and reports cited in the FRA Manual draw a clear distinction between “significant” noise impacts in “quiet” environments and “significant” noise impacts in “loud” environments. These distinctions are completely obliterated by the FRA “Noise Impact Criteria”, which were derived solely from an “urban platform” and without consideration for the rural environment. These facts are set forth in detail over the following paragraphs, which carefully consider each and every “research” element cited as justification for the FRA “Noise Impact Criteria” in Sections A.2 and A.3 of the FRA Manual.

**The “Schultz Curve”:** The “Schultz Curve” (depicted in Figure A-5) was derived from a technical paper titled “Synthesis of Social Surveys on Annoyance” authored by T.J. Schultz and published in 1978 by the “Journal of the Acoustical Society of America” (“JASA”). The “Schultz Paper” was actually a compilation of 11 urban noise studies that measured human “annoyance” as a function of noise level. It considered noise profiles along urban streets in Paris, London, and elsewhere, and it also considered noise levels in urban areas surrounding airports in England, Switzerland, and various Scandinavian countries. Based on the urban research presented in the Schultz paper, the FRA Manual concludes that “very few people are highly annoyed when the  $L_{dn}$  is 50 dBA” and “an increase in  $L_{dn}$  from 50 to 55 dBA results in an average of 2 percent more people highly annoyed” [See Page A-14; bullet item 3]. These conclusions form the foundation of FRA’s “Noise Impact Criteria” (depicted in Figure 3-1) yet they are entirely unsupported by the Schultz Paper, and are completely erroneous:

- These conclusions are derived from the “low end” of the fitted “Schultz Curve” published in the JASA paper and depicted in Figure A-5 of the FRA Manual. However, the author (T.J. Schultz) himself admits that the “Schultz Curve” does not properly address the data collected “at the low end”, and he suggests various solutions to achieve a better “curve fit” which would (in some cases) be completely arbitrary (see JASA Vol 64 No. 2 page 391). Moreover, Mr. Schultz clearly identifies the 50 dBA  $L_{dn}$  noise level as being “outside the data range” anyway, and he explicitly argues against “extrapolating the fitted curve beyond the range of the given data set” [see page 391, column 1]. Therefore, the author’s own words explicitly contradict FRA’s conclusion that “very few people are highly annoyed when the  $L_{dn}$  is 50 dBA”
- The Schultz paper explicitly demonstrates that more than 10% of urban populations are so significantly disturbed by an average (“ $L_{dn}$ ”) noise level of 55 dBA that it interrupts conversation, disturbs sleep, and interferes with conversation [see Figure 23]. This fact unequivocally controverts FRA’s assertion that “an increase in  $L_{dn}$  from 50 to 55 dBA results in an average of 2 percent more people highly annoyed.” More importantly, there is no doubt that these

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10277

substantial adverse impacts on more than 10% of the population constitute a “significant effect on the environment” as that phrase is contemplated in CEQA. Therefore, and according to the Schultz Paper itself, projects which increase ambient noise levels to 55 dBA do indeed create “severe impacts” in every sense of the word. The FRA Manual ignores all of this, and it incorrectly concludes that the Schultz Paper somehow supports a conclusion that increasing noise levels to 55 dBA is not “significant”. This conclusion is abjectly false and is entirely repudiated by very same Schultz “research” that it purports to reflect.

- Figure A-5 shows very clearly that the fitted curve does not accurately represent the data points plotted for noise values below 55 dBA; all but one of the data points lie *well above the curve*. As Figure A-5 shows, four times more people are “highly annoyed” by noise levels approaching 55 dBA than what the “Schultz Curve” predicts. What this means is that the “Schultz Curve” demonstrably under-predicts human “annoyance” at noise levels below 55 dBA and *provides no basis* for FRA’s conclusion that “an increase in  $L_{dn}$  from 50 to 55 dBA results in an average of 2 percent more people highly annoyed”.
- With regard to what constitutes an “acceptable environmental noise exposure”, the Schultz paper explicitly clarifies that achieving and maintaining a Noise Standard of 55 dBA **is the desired condition** [see page 389 column 1]. Under no circumstance does the Schultz paper state (or even suggest) that it is reasonable to exceed the 55 dBA noise standard in areas that already meet the 55 dBA standard, and it certainly does not in any way advocate or support FRA’s contention (embodied in Figure 3-1) that areas which already meet the 55 dBA standard will not be “severely impacted” if ambient noise levels increase significantly and even exceed 61 dBA. Moreover, there is nothing in the Schultz Paper that supports FRA’s contention (reflected in Figure 3-1) that 55 dBA is merely the “lower bound” limit for determining the “significance” of noise impacts; to the contrary, the Schultz Paper affirmatively establishes 55 dBA as the “upper bound” limit for such determinations, and in fact it limits the consideration of increases beyond the 55 dBA standard only in those urban areas where existing conditions already exceed the 55 dBA standard.
- The Schultz Paper is essentially a compilation of urban noise studies addressing the “annoyance” responses of urban residents to different urban noise levels occurring within urban communities (such as Paris, London, Vienna, Copenhagen, Basel, Brussels, and 7 unnamed US cities) and adjacent to large urban airports (such as Heathrow and Munich). The Schultz Paper makes it clear that these studies assessed noise impacts exclusively in the urban environment, and measured human “annoyance” only in urban areas. Therefore, the Schultz Paper is narrowly constrained to consider human noise “reactions” only in urban areas where high noise profiles are already “woven into” the fabric of the community. It does not consider rural environments, and it certainly does not assess human “annoyance” to increased sound levels in essentially quiet areas (like Acton) where ambient  $L_{dn}$  noise levels are less than 50 dBA. The Schultz Paper clearly indicates 1) That its scope is constrained **only to urban** environments; and 2) That its conclusions regarding increases in “acceptable”

4413-10277

noise limits beyond 55 dBA ONLY APPLY to urban environments where the 55 dBA noise limit is already exceeded [see page 389]. The FRA Manual **ignores** all of these constraints that are clearly stated in the Schultz paper. Worse yet, the FRA Manual uses the urban data from the Schultz Paper to derive “noise impact criteria” which are applied uniformly to all environments (including rural and wilderness areas). The FRA Manual fails to consider that people living in quiet rural areas respond differently to increased noise levels than people living in urban areas where existing ambient noise levels are already quite high (see for example the “EPA Levels Document” discussed below). Moreover, the FRA Manual fails to cite *any* noise studies that address human noise “annoyance” response in areas where ambient noise levels are 50 dBA or less. Therefore, FRA has absolutely no basis for imposing on rural communities the urban-based “Noise Impact Criteria” that are depicted in Figure 3-1, and it certainly lacks any justification for the standard imposed by Figure 3-1 that rural areas with an ambient  $L_{dn}$  noise level of only 43 dBA are not “severely impacted” by a nearly threefold increase in ambient noise to 58 dBA.

- The “annoyance” reactions addressed in the Schultz Paper are demonstrably biased low because (as the paper itself admits) “annoyance” response data were often collected from people located **indoors** who were responding to noise events **outdoors** [page 378] Because these people hardly heard the noise, they provide a “low annoyance” response (which skews the results with a low bias). The Schultz paper found very poor correlation between noise levels and “annoyance” response when the respondents were located indoors with their windows closed. This seems like an obvious thing which should have been accounted for in the studies that were “synthesized” in the Schultz Paper, but apparently it was not. Schultz actually makes the following recommendation: “If one wishes to increase dramatically the correlation between the measured noise and the subjective response of the subjects, one should open the windows so that the official survey microphone and the noise to which the subjects are actually exposed are the same” [page 378]. The author also posits the argument that half of the sample population at each noise exposure who respond below the median may “have simply not heard the noise measured in the survey”. The “biasing” elements of the Schultz study (such as the fact that only indoor annoyance responses were addressed) are even more troubling when they are considered against the urban backdrop where these studies were conducted. Why? Because it renders them even more inapplicable to Acton’s quiet, rural environment where residents spend much of their time “outdoors”. It is flat out **impossible** to infer or predict the extent to which an Acton resident will be “annoyed” by an 85 dBA HSR noise event occurring every 3 minutes based on noise reactions from people sitting indoors who occasionally react to urban street noises outside their windows. Such an idea is absurd, yet, that is precisely what CHSRA and FRA are doing when they assess HSR noise impacts on Acton based on the “Noise Impact Criteria” set forth in Figure 3-1 of the FRA Manual.
- The FRA Manual considers all noise impacts through the “urban lens” of the Schultz Paper, and because it uses this “urban lens” to assess noise impacts on rural areas, it draws conclusions which utterly contradict the Schultz Paper itself.

## Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10277

For instance, the Schultz Paper states categorically that the standard for an “acceptable” environmental noise exposure is 55 dBA ( $L_{dn}$ ), and it does not under any circumstance recommend increasing this 55 dBA “acceptability” limit in any area where it is already met. Yet, incredibly, FRA’s “Noise Impact Criteria” deems an increase in ambient noise levels from 55 dBA to 61 dBA to be “insignificant”. In other words, the FRA Manual uses the urban studies considered in the Schultz Paper to shift the “acceptability” baseline from 55 dBA to 61 dBA for all areas (both rural and urban) in a manner that is utterly contrary to the foundational principals upon which the entire Schultz Paper is based. Worse yet, the “Noise Impact Criteria” (provided by Figure 3-1 of the FRA Manual and derived from the urban-based Schulz Paper) clearly establish that no area (whether it be a monument, a cemetery, or a wilderness) is considered “severely impacted” by a project unless the project results in ambient noise levels **exceed** the 55 dBA urban baseline!!! Clearly, the “low end of the FRA “Noise Impact Criteria” is utter nonsense because it *contradicts in every way possible* the very same “Schultz paper” that it purports to reflect.

- The Schultz paper designates the 55 dBA noise exposure level as not only an “acceptable” standard, but also a “desirable” standard for areas where existing ambient noise levels do not exceed 55 dBA [see page 389 column 1]. The Schultz Paper also expressly limits its consideration of the circumstances under which the 55 dBA noise standard could be exceeded to only those urban areas where the ambient noise level already exceeds 55 dBA. Yet incredibly, the FRA Manual **flat out ignores** all of Schultz’s research establishing 55 dBA as the acceptable and desirable standard for non-urban areas where ambient noise levels are at or below 55 dBA. Instead, it arbitrarily establishes 61 dBA as the “threshold of significance” for areas that meet the 55 dBA standard, and it declares that project noise levels below this 61 dBA threshold constitute “less than significant” impacts. In other words, the FRA Manual establishes that non-urban areas which already meet the 55 dBA standard (and therefore have an “acceptable environmental noise exposure”) are not “severely impacted” by any project unless noise levels rise above 61 dBA. The FRA “Noise Impact Criteria” essentially turned the Schultz Paper on its head by establishing that projects impacts are not “significant” even if they generate noise levels which exceed Schultz’s “desired and acceptable” 55 dBA standard! Nothing about the Noise Impact Criteria established by the FRA Manual for “quiet” (<55 dBA) areas is supported by the Schultz Paper. Indeed, the manner in which the FRA Manual incrementally increases the “acceptable noise threshold” in areas which meet the 55 dBA standard is entirely inconsistent with, and wholly unsupported by, the very Schultz study it purports to reflect.
- The Schultz Paper was published nearly 40 years ago before “high speed” trains exceeding 180 mph were developed, and it considered historic urban noise profiles predominated by mid- and high-frequency noise sources. It is firmly established that noise profiles of high speed trains traveling in excess of 200 mph differ significantly from slower trains, and that the noise profiles of faster trainsets include substantial low-frequency components [[http://www.uic.org/cdrom/2008/11\\_wcrr2008/pdf/S.1.1.4.4.pdf](http://www.uic.org/cdrom/2008/11_wcrr2008/pdf/S.1.1.4.4.pdf)]. The Schultz paper never

45

4413-10277

considered low-frequency noise levels introduced into the urban environment by 220 mph HSR trains, and it certainly never accounted for significant low-frequency aerodynamic noise elements introduced by HSR projects into rural areas like Acton. This further repudiates FRA’s reliance on the Schulz paper to establish appropriate HSR “Noise Impact Criteria” for rural communities like Acton.

The US. EPA “Levels Document” establishes that, to protect the “health and welfare” of farming and residential areas (like Acton) where people spend considerable amounts of time in the outdoors, the average noise levels (both “ $L_{dn}$ ” and “ $L_{eq}$ ”) *should remain below 55 dBA* [Table VII in the “EPA Levels Document – Condensed Version” at <https://nepis.epa.gov/>]. This is utterly contradicted by the FRA “noise impact criteria”, which *unequivocally* establish that it is “insignificant” if a project causes outdoor noise levels to exceed this 55 dBA “health and welfare” threshold (see FRA Figure 3-1). In fact, Figure 3-1 clearly establishes that FRA deems it acceptable to nearly the double the noise in areas that meet (or nearly meet) EPA’s recommended 55 dBA level. Moreover, the FRA “Noise Impact Criteria” also completely ignore the EPA’s explicit warning that urban community noise response factors should not be applied to non-urban areas (like Acton) which have a significantly quieter ambient environment [page 21 of “Levels Document” – condensed version]. There is no doubt that applying the urban-based FRA “Noise Impact Criteria” to Acton is utterly contradictory to the EPA’s “Levels Document” in every way possible. The **only way** to render FRA’s “Noise Impact Criteria” in a manner that is consistent with the EPA “Levels Document” is to revise the “Severe Impact” curve to intersect the point where the “Existing Noise Level” [x axis] value is 55 dBA and the “Project Noise Exposure” [y axis] is also 55 dBA.

HUD Standards are intended to achieve the goal of providing a suitable living environment. HUD has established that outdoor  $L_{dn}$  noise levels which exceed 75 dBA provide an unacceptable living environment, and does not authorize HUD development in such areas. HUD has also established that outdoor  $L_{dn}$  noise levels which exceed 65 dBA provide a *normally* unacceptable living environment, and requires that all new HUD construction in such areas include noise attenuation features to mitigate outdoor noise impacts. Yet, in a number of scenarios, the FRA “Noise Impact Criteria” do not consider project impacts to be “significant” even when they increase noise levels beyond the 65 dBA HUD threshold<sup>3</sup>. In fact, the FRA “Noise Impact Criteria” do not even consider the noise degradation impacts of HSR operation until the ambient noise level is 68 dBA as evidenced by Figure 3-1 (which deems moderate noise increases to be “insignificant” up until existing noise levels reach 68 dBA.) For all these reasons it is clear that FRA’s “Noise Impact Criteria” are patently inconsistent with adopted HUD standards.

<sup>3</sup> As clearly shown in Table 3-1 of the FRA Manual, an area with an existing average ambient noise level of 64 is not deemed significantly impacted until the average noise level exceeds 65.5 dBA, and an area with an average noise level of 65 dBA is not deemed significantly impacted until the project noise increase exceeds 66 dBA.

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10277

CHABA Guidelines: Address the “Health and Welfare” effects of noise in *urban and suburban* environments [page 33 paragraph 2 accessed via <https://nepis.epa.gov/>]. Regarding the “Health and Welfare” effects of noise on *urban/suburban* areas, the CHABA Guidelines advocate a “single indicator” method (page 34 para 2) that is based on the “Schultz Curve”, and calculated based on the 1978 Schultz Paper [Page 37 equation 2a]. The “Single Indicator” method recommended by the CHABA Guidelines for urban/suburban environmental is clearly embodied in the FRA “Noise Impact Criteria”. **However**, the CHABA Guidelines *do not recommend* the use of the “single indicator” method for assessing noise impacts on rural areas (see page 64 paragraph 2) or where “environmental degradation” can occur due to new noise sources being introduced in quiet areas (like Acton). In fact, the CHABA Guidelines clearly draw a “bright line” distinction between the assessment of noise impacts on urban/suburban areas (addressed in Section 2.2) and the assessment of noise impacts on rural and other areas that will experience “environmental degradation” due to project noise impacts (addressed in Section 2.4). CHSRA *completely ignores this distinction*, and it blindly applies the “single indicator” method to *all* environments by slapping the urban-based “Noise Impact Criteria” depicted in Figure 3-1 onto every single impact assessment that it prepares. For instance, CHSRA does not consider a serenely quiet areas with an existing ambient noise level of only 43 dBA to be “significantly impacted” by a project even if the average noise level is tripled! Equally important, the CHABA Guidelines explicitly identify the 55 dBA threshold as the “point of significant adverse noise effects” (page 31 paragraph 1). *This assertion is completely ignored by the FRA Manual*, which establishes that “significant adverse noise effects” do not occur until noise levels substantially *exceed* 55 dBA [Table 3-1]. There is no doubt that the FRA “Noise Impact Criteria” fail to comport with the CHABA Guidelines and in fact they explicitly contradict these guidelines in the manner in which they address “Environmental Degradation” and noise impacts on quiet rural areas like Acton.

DOT Report No UMTA-MA-06-0099-79-3: This document is cited in footnote 74 of the FRA Manual, and it considers urban noise impacts of conventional trainsets traveling through urban and suburban Paris and London, and slightly faster trainsets (126 mph) traveling through various Japanese communities. The urban study portions of this DOT report are not particularly relevant to the matters raised herein (which consider only impacts on rural areas). However, the portions of the DOT report that address the Japanese study are perhaps relevant because they appear to consider receptors outside of an urban environment. The DOT report notes that the receptor “annoyance” is driven by 2 independent factors: the peak noise exposure (SEL) and the train frequency (trips per day). According to the DOT report, the Japanese study indicates that high annoyance occurs even with relatively slow (126 mph) trains and at relatively low peak (SEL) sound levels (less than 75 dBA as shown in Table I). These results demonstrate that high annoyance will occur at receptors located more than 11,000 feet (or 2 miles) from a 220 mph train traveling on flat ground at grade in areas (like Acton) where there is little ground attenuation and receptors have a “direct line of site” to the HSR tracks (see attached calculation sheet marked Exhibit A). The Japanese data also shows that “startle” occurs even with slow (126 mph) trains and at peak sound levels (SEL) as low as 80 dBA [see Table I]. These results demonstrate that human “startle” reactions will occur at receptors located more than 5000 feet from a 220 mph train traveling on flat

4413-10277

ground at grade in areas (like Acton) where there is little ground attenuation and most receptors will have a “direct line of site” to the HSR tracks (see attached calculation sheet marked Exhibit B). Remarkably, none of this information is reflected *anywhere* in the FRA Manual. To the contrary, the FRA Manual categorically refuses to consider receptor noise impacts based on peak (SEL) noise levels, and instead considers only 24 hour “average” ( $L_{dn}$ ) noise levels (see Sections 3, 4 and 5 of the FRA Manual). The FRA Manual also refuses to acknowledge that “startle” effects can and will occur on receptors located more than 50 feet from a high speed train traveling at 220 mph (see Figure 4-2).

Other Publications: The FRA Manual cites two additional studies as justification for the “Noise Impact Criteria” that it adopts. One study is a 1991 paper that “updates” the original Schultz paper published in 1978 by the JASA, and the other is a “French High Speed Rail Noise Survey” of the TGV-Atlantique line published in 1993. The latter does not consider noise impacts of train speeds that exceed 180 mph, and merely points out that nighttime noise impacts should be factored into any “noise impact criteria” that are developed. This is not in dispute; therefore, the “French High Speed Rail Noise Survey” is not addressed further. However, the “Schultz Update” paper is foundationally important, and is therefore addressed in detail here. The “Schultz Update” considers 15 additional urban noise studies, and combines data from these additional urban noise studies with the urban noise data presented in the original “Schultz Paper” published in 1978. Like the original “Schultz Paper”, the “Schultz Update” Paper focusses exclusively on urban noise profiles, and it does not controvert any of the points addressed in the “bullet item” discussion presented above. However, the “Schultz Update” Paper does call into substantial question whether the “Original Schultz Curve” accurately represents “annoyance” response at noise levels below 60 dBA. First, the “Schultz Update” paper clarifies that, when a “Revised Schultz Curve” is fitted to the new data, it reveals that “annoyance” on the low-end of the noise range (below 60 dBA) is significantly higher than what was predicted by the “Original Schultz Curve” [see page 229 column 2]. For instance, it is noted that annoyance levels at a 57.5 dBA noise level are nearly twice as high as what is predicted by the “Original Schultz Curve” [See Figure 14]. The “Schultz Update” paper also includes a “95% confidence interval” analysis of the combined datasets [plotted in Figure 15] and the “annoyance response” [tabulated in Table III]. These “95% confidence interval” analyses reveal “considerable uncertainty” regarding “percentages of respondents highly annoyed” [page 231 column 2]. The “Schultz Update” paper does not attempt to reconcile the differences between the “Original Schultz Curve” and the “Revised Schultz Curve”; to the contrary, the “Schultz Update” Paper states categorically that these curves are “simply convenient data fitting functions, devoid of physical meaning” [page 233]. This statement is *simply extraordinary*, given the extent to which FRA and CHSRA have relied on the “Schultz Curve” to determine whether or not California citizens are “severely impacted” by the HSR Project. Not only does the “Schultz Update” Paper abjectly confirm each and every criticism levied previously herein (see the “bullet item” discussion above); but it also invalidates the FRA “Noise Impact Criteria” because it relegates the “Schultz Curve” upon which these criteria are based to nothing more than a “data fitted function” that is “devoid of meaning”! Above all, the “Schultz Update” Paper demonstrates that, in the ambient noise range applicable to quiet rural areas like Acton (<55 dBA) actual human “annoyance” response levels are *significantly higher* than what is predicted by the

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10277

urban-based “Schultz Curve”. The exceedingly high “error margin” embodied in the “Schultz Curve” at low ambient noise levels proves beyond the shadow of a doubt that the “Schultz Curve” is entirely unreliable in this “low noise” regime, and that both FRA and CHSRA grievously err in their reliance on the “Schultz Curve” to establish “noise impact criteria” for quiet rural areas like Acton.

All of the shortcomings of FRA’s adopted urban-based “Noise Impact Criteria” can only be corrected by developing Non-Urban “Noise Impact Criteria” based on “annoyance” studies conducted in areas that have ambient noise conditions below 60 dBA. Neither FRA nor CHSRA have taken these simple steps to ensure appropriate noise impact criteria are relied upon in the Palmdale-Burbank Segment EIR. Instead, they intend to (wrongly) apply the urban-based noise impact criteria established in Figure 3-1 of the FRA manual; thereby providing fertile ground for any number of successful CEQA and NEPA lawsuits.

**FRA’s HSR “Noise Exposure Assessment” Methodology Fails to Correctly Address Rural Community Noise Impacts**

To truly understand the extent to which FRA’s high speed rail “noise exposure” assessment methodology fails to properly address rural “community impacts”, it is useful to look at the results derived from FRA’s methodology through the lens of FRA’s “Noise Impact Criteria” set forth in Figure 3-1 of the FRA Manual. This is accomplished by a “scenario” analysis which considers various HSR operations in different “quiet” zones within a rural community like Acton:

Scenario 1: Existing noise levels is 56 dBA: A relatively quiet residential area that has an existing average (“L<sub>dn</sub>”) noise level of 56 dBA and is nearly a mile from the train with a “line of sight” view of the tracks will experience an 82 dBA noise event every 2.7 minutes starting at 6 AM according to CHSRA’s proposed operating schedule (Exhibit B). To be clear, an 82 dBA noise event is equivalent to a metro train traveling at 50 mph just 50 feet away. Nonetheless, according to the FRA’s “Noise Exposure Assessment” methodology, this noise impact is not deemed “significant”. The notion that a project does not pose “significant adverse impacts” on a quiet residential area when it clearly introduces noise levels equivalent to a metro train running by at least three minutes is **absurd on its face**. Yet, that is precisely what FRA’s methodology and “Noise Impact Criteria” conclude.

Scenario 2: Existing noise levels is 50 dBA: A very quiet residential area that has an existing average noise level of 50 dBA and is nearly two miles from the HSR train with a “line of sight” view of the tracks will experience a 79 dBA noise event every 2.7 minutes starting at 6 AM (Exhibit D). Though a 79 dBA noise event is louder than a blender operating just 3 feet away, the FRA’s “Noise Exposure Assessment” methodology does not deem this impact to be “significant”. The notion that a project does not pose a

4413-10277

“significant adverse impact” on a very quiet residential area when it continually introduces noise levels equivalent to a kitchen blender is **absurd on its face**. Yet, that is precisely what FRA’s methodology concludes.

Scenario 3: Existing noise levels is 45 dBA: A serenely quiet residential area that has an existing average noise level of 45 dBA and is more than 3 miles from the HSR with a “line of sight” view of the tracks train will experience 77 dBA noise events every 2.7 minutes starting at 6 AM (Exhibit E). A 77 dBA noise event is louder than a kitchen blender, yet this is not deemed to pose any noise impact on this serenely quiet area. The notion that a project does not pose a significant impact on such a quiet place when it clearly introduces noises that are louder than a kitchen blender on at least once every 3 minutes is **absurd on its face**. Yet, that is precisely what FRA’s methodology and “Noise Impact Criteria” conclude.

**CHSRA has not Developed Technically Credible or Legally Defensible “Noise Impact Criteria” for Assessing HSR Impacts on Animals**

The community of Acton is an equestrian community, but it is also a community that is home to a wide assortment of animal facilities and rescue operations. Animals that are cared for and housed in Acton facilities include llamas, emus, lions, cattle, pigs, ducks, cats, sheep, tigers, dogs, goats, chickens, turkeys, geese, doves, rabbits and donkeys. ALL of the proposed HSR alignments in Acton travel above ground through and over such facilities, and will generate significant low- and mid- frequency sound levels exceeding 100 dBA outside of the HSR “right of way” areas. CHSRA’s treatment of noise impacts across this wide spectrum of animal types is the same: no significant noise impacts are deemed to occur if the noise level in the vicinity of any animal is less than 100 dBA. CHSRA has absolutely no data to support this 100 dBA “animal impact criteria”; as FRA points out: “There are no established criteria relating high-speed train noise and animal behavior” [page 3-2 of the FRA Manual]. In fact, tabulated data provided by the FRA Manual clearly show that animal “disturbance” response thresholds can be as low as 77 dBA [Table A-1 in the FRA Manual]. What is most remarkable is that CHSRA has relied on this “interim” threshold for more than 8 years and has employed it *in every single project EIR/EIS that it has certified*, and in all that time, it has never done any studies or taken any steps to establish the efficacy or assess the reasonableness of this assumption. For all intents and purposes, CHSRA has implemented this “interim” threshold as if it had the full weight and authority of a formally adopted standard, and it has done so with impunity and without regard for whether it is reasonable or appropriate. *This is not acceptable for the Community of Acton, where noise levels exceeding 90 dBA will occur more than 600 feet from the tracks.* Prior to commencing any noise assessment of the Acton area, CHSRA must develop reasoned and defensible “animal response” thresholds that properly address the wide range of animals that call Acton “home”.

Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4413-10277

The Community of Acton is also home to a number of wild animals (both large and small), and it is the primary linkage between the Sierra Pelona range and the San Gabriel Mountains. Acton's large wildlife includes mountain lions, coyotes, deer, bobcats, and raptors such as red tailed and cooper's hawks. Acton is also home to a number of protected species such as the red legged frog and the San Diego coast horned lizard. ALL of the proposed HSR alignments in Acton travel above ground through and over habitat where these species are found, and all of the proposed alignments will create low frequency sound levels exceeding 100 dBA outside the HSR track "right of way". CHSRA has established a 100 dBA "interim" threshold to evaluate wildlife noise impacts, and has implemented this "interim" threshold for more than 8 years. In all that time, it had never conducted any studies to determine whether it reasonably represents an appropriate noise response indicator for the wide spectrum of wildlife that are present in all of the HSR corridors in Acton. In other words, CHSRA utterly lacks the information necessary to establish the technical credibility or legal sufficiency of this 100 dBA "interim" wildlife impact criteria, therefore it has no basis for relying on this "interim" criteria for assessing wildlife impacts in Acton.

**CHSRA and FRA are Required to Provide Noise Contour Maps (or Equivalent) of Predicted Sound Exposure Levels in Acton.**

CHSRA's "Environmental Methodology Guidelines" state (on page 3.4-14) that the EIR "shall conform to the requirements and topics set forth in Section 11.1 (The Technical Report on Noise and Vibration) and Section 11.1.1 (Organization of Technical Report) of the FRA 2012 guidance manual". Section 11.1.1 of the FRA Manual specifies that the computed noise levels predicted by the noise assessment model must be "tabulated AND illustrated by contours, cross sections, or shaded mapping" [page 11-2]. Despite these clearly stated reporting requirements, neither FRA nor CHSRA have ever provided any noise level illustrations in any of the HSR EIR/EIS documents certified to date. At most, CHSRA has reported a "range of noise levels" applicable to an entire segment, and it has mapped points of "severe" impact and "less than severe" impact without indicating any actual noise levels. Because of this, the public has been unable to analyze CHSRA's calculated results to confirm their accuracy or completeness. *This is unacceptable.* The DEIR/DEIS that is issued by FRA and CHSRA for the Palmdale Burbank segment must comply with CHSRA's and FRA's reporting standards, and include noise contour (or equivalent) illustrations which clearly establish the peak noise levels that Acton residents are projected to experience with and without mitigation. Consistent with DOT's *Railroad Noise Emission Compliance Regulations*, these illustrations must depict noise levels extending from the 100+ dBA level occurring at the HSR track right-of-way out to either the 73 dBA noise level (if  $L_{maxfar}$  data are plotted), or out to 73 dBA (if  $L_{maxslow}$  data are plotted).

4413-10277

Moreover, both CEQA and NEPA demand that actual noise projections be provided in the DEIR/DEIS because both require the environmental document to clearly identify the "effects" of a project on the environment<sup>6</sup> And, both CEQA and NEPA define "effects" to include "direct effects" which "are caused by the project and occur at the same time and place"<sup>7</sup> In other words, the only way that CHSRA and FRA can comply with CEQA and NEPA regulations is to include in the DEIR/DEIS the peak noise levels that will be created within Acton at the time that the HSR passes through Acton. These state- and federally-imposed requirements are not met by simply plotting " $L_{dn}$ " values because " $L_{dn}$ " values merely reflect "bulk" noise levels averaged over a 24 hour period; they do not in any way reflect actual noise levels occurring "at the time and place" of an HSR passby event. This has been pointed out time and again in writing and verbally at public meetings and stakeholder meetings with CHSRA and FRA staff. It is now pointed out again with this submittal and in a manner which makes clear that all administrative remedies regarding this issue have been exhausted.

<sup>6</sup> NEPA - 1502.16(a) of the CEQ Regulations for Implementing NEPA. CEQA - Guidelines Section 15126.2(a).

<sup>7</sup> NEPA - 1508.8 of the CEQ Regulations for Implementing NEP. CEQA - Guidelines Section 15358. 19.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022)

### 4413-10244

Commenter claims that the noise analysis is deficient under CEQA and NEPA and requests that the deficiencies be corrected in the Final EIR/EIS. This is general introductory material, and responses to specific comments about the Draft EIR/EIS's noise analysis made by this commenter in this comment letter are addressed in turn and demonstrate that the noise analysis presented in the Draft EIR/EIS is thorough and supported by substantial evidence and is therefore sufficient in complying with NEPA and CEQA. Under CEQA, EIR analysis and conclusions must be supported by substantial evidence. Under NEPA, an EIS must take a hard look at the environmental effects of an agency action. Both of those standards have been met here. As discussed under Impact N&V#6, the SR14A Build Alternative would result in only one moderate noise impact in or near the Town of Acton, from Soledad Siphon to Acton Canyon Road. This is because the SR14A Build Alternate would be in tunnel through the town of Acton, and noise and vibration would not be perceptible at the surface.

### 4413-10245

Refer to Standard Response PB-Response-GEN-7: Access to Technical Reports, PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter criticizes the noise modeling and analysis of noise impacts, and asserts, amongst other things, that the Draft EIR/EIS does not provide any specific information pertaining to the noise calculations performed for the project, and that the FRA Manual's noise impact criteria are "lenient" because of the use of Ldn and not appropriate for evaluating noise impacts of the project.

Relevant information about modeling inputs, assumptions, and methodology for the noise modeling and analysis are included in the Draft EIR/EIS in Section 3.4.4.3, on pages 3.4-21 to 3.4-24. Additional information is also included in Chapter 4 of the publicly available Noise and Vibration Technical Report (pp. 4-2 to 4-9). See also Standard Response PB-Response-GEN-7: Access to Technical Reports for more detail. This combined information includes the source noise levels for each component of the train, operational information specific to the project, and information about propagation and ground effects specific to the project, contrary to assertions made in footnote 2 of the comment.

The model equations methodology used for the noise analysis are included in the 2012 FRA Noise and Vibration Guidance Manual (aka, the FRA Guidance Manual). For a detailed explanation on the use of the FRA Guidance Manual, please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors. The Ldn noise descriptor, used by the FRA "to assess noise for residential land uses" (FRA Guidance Manual, p. 2-4), is almost universally accepted as the best way to measure human response to environmental noise and changes in noise. Ldn is a very effective metric because it includes information about how loud each event is, how long that event occurs, how often it occurs, and when the events occur (daytime vs nighttime) during a 24-hour period. If a noise assessment were to only use the maximum noise level at any given moment to assess impact, one event would be the same as 400 events, and an event that occurs for 3 seconds would be the same as one that occurs for an hour. Because Ldn takes all these factors into account, it is the best metric to assess human response to noise in the environment. Additional information regarding the Ldn metric can be found in Section 2.1.1 and Appendix A of the FRA Guidance

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10245

Manual.

At locations where the alignment would not be in tunnel, the effects of the track structure and elevation, as well as the ground effects, were taken into consideration in the assessment (see Draft EIR/EIS, p. 3.4-24; see also Noise and Vibration Technical Report, p. 4-6). To be conservative in the assessment, the effects of shielding from terrain were not included; although existing terrain shielding in the Acton and Agua Dolce areas would indeed result in a reduction in noise levels below those modeled in the Noise and Vibration Technical Report. The ground effect represents a small reduction in noise levels due to interference with the ground as the sound travels over it. The ground effect is based on the distance over which sound travels from the source to the receiver, and the path height of the sound, which takes into account both the height of the source and the height of the receiver. For sources of noise that are either higher on the vehicle (such as pantograph noise) or for elevated structures, the ground effect, or reduction in noise, is much lower than it would be for wheel/rail noise operating on non-elevated structures. The noise modeling takes this into account for each source of noise on the vehicle, the track height, and the receiver height. For the SR14A Build Alternative (the Authority's Preferred Alternative), much of the alignment would be underground, and when underground there would be no noise effects.

For additional detail on operational noise analysis and for a response to the comment on noise contour illustrations, please refer to Standard Response PB-Response-N&V-1.

In response to the commenter's independent assessment of noise impacts, referred to in the comment as Attachment 1 and discussed in footnote 4, as explained in detail below, the Authority has identified several errors in the commenter's analysis, resulting in falsely higher noise levels than those reported in the Draft EIR/EIS.

The commenter provides noise calculations that it modeled and alleges that the noise calculations provided in the Draft EIR/EIS are inaccurate, specifically that residences that have "an unobstructed 'line of site [sic]' view to the train tracks" (within 3,600 feet, and up to 5,300 feet, of elevated tracks, as discussed in Comment # 10246) under specific conditions, will experience severe noise levels. For its noise analysis, the Draft EIR/EIS used a screening distance of 1,200 to 1,800 feet (please refer to Standard Response PB-Response-N&V-1 for more details). Screening distances are conservative

### 4413-10245

by design to fully capture the potential for impacts in the study area (see Section 4.1 of the FRA guidance manual). A larger screening distance is not required under these conditions by FRA or by any other potentially applicable standard, even where there may exist an unobstructed line-of-sight from an elevated train track to a residence, and, notably, the commenter does not suggest one. Furthermore, a larger screening distance would not change the Draft EIR/EIS impact conclusions, which found a significant and unavoidable impact to residential receptors in the Central Subsection (in which Acton and Agua Dolce are located) for all alternatives, despite some amount of impact reduction with implementation of mitigation measures (see discussion under Impact N&V#6: Operational Train Noise Impacts). Moreover, several errors within the commenter's modeling, discussed just below, result in inaccurately inflated train noise levels which, in turn, appear to have resulted in the commenter's inaccurate conclusion that residences located up to 5,300 feet away from elevated portions of the train would encounter severe noise levels. There is no scenario for HSR operations, even at the highest speeds, in which there would be severe noise impacts over one mile from the tracks, given the existing noise levels measured in the area.

The first error identified by the Authority is the commenter's incorrect use of "hard" ground in its model. In almost all cases, outside of pavement, ground is considered acoustically "soft" when modeling noise levels, including dirt and other ground types. The ground effect has a slight reduction in noise level with distance based on the source and receiver height above ground. Hard ground will overestimate noise levels by an increasingly large amount as the distance increases. The noise model in the Draft EIR/EIS used "soft" ground in the assessment, with the correct source heights for each component of the HSR noise, as appropriate. Hard ground is defined by the International Organization for Standardization (ISO), in ISO 9613-2-1996(E) (Acoustics —Attenuation of sound during propagation outdoors —Part 2: General method of calculation) as ground types which include paving, water, ice, concrete and all other ground surfaces having a low porosity. This definition does not describe the potentially affected areas in the Acton and Agua Dulce, which may include a small amount of pavement and concrete between the source and the receiver, but the primary ground type would be acoustically soft. The same reference defines soft ground as ground types that include ground covered by grass, trees or other vegetation, and all other ground surfaces suitable for growth of vegetation, which describes the majority of the

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10245

ground type at issue.

The second error identified by the Authority is a more than doubling of the HSR operations in the commenter's model. In the Noise and Vibration Technical Report (p. 4-5), the volumes of trains are stated as 189 trains during the daytime, 28 trains during the nighttime, and 14 trains during peak hours. These numbers are for "both" directions in total, and not in each direction. In the text of the Draft EIR/EIS noise section (page 3.4-23), the volumes of trains were inadvertently incorrectly reported as 189 trains during the daytime in "each" direction, 28 trains during the nighttime in each direction and 14 trains in each direction during the peak hour. This represents a total of 217 trains (in both directions) that would operate daily during a 24-hour period. However, the correct train volumes were reported in the noise and vibration technical report. The use of these doubled numbers in the commenter's independent assessment erroneously inflated its resultant noise levels. Because Ldn is a cumulative noise metric, the Ldn values will increase with a larger number of trains. Although the noise section in the Draft EIR/EIS contained an inadvertent error in language usage, the correct number of daily trains was used in the actual modeling and assessments presented in the Draft EIR/EIS, which relied on accurate modeling and data contained in the Noise and Vibration Technical Report (a copy of which the commenter possessed when preparing these comments, see Comment # 4413-10247; see also Noise and Vibration Technical Report, pp. 4-2 to 4-9). For the purposes of clarification, the noise section of the Final EIR/EIS has been revised to properly characterize the total number of trains that would operate daily. The correct number of trains, as reported in the Technical Report, is 189 trains during the daytime, 28 trains during the nighttime and 14 trains during peak hours. This change does not result in any other changes to the calculations or analysis presented in the Draft EIR/EIS.

The third error identified by the Authority is that the commenter mistakenly used the peak trains as an addition to the daytime trains, when in fact, the peak hour trains are a subset of the daytime trains, used for calculations for institutional receivers. With the error in the addition of peak trains and the doubling of the train volumes, the noise levels in the commenter's assessment are overstated significantly, by at least 8 dB, with a larger increase in the error at greater distances.

### 4413-10245

The fourth error identified by the Authority is that the commenter used the assumption that all receptors have an unobstructed view of the tracks (i.e., no "shielding"). This is not an accurate assumption because there are certain locations where shielding occurs. Shielding (non-terrain) was used in the Authority's noise model where appropriate. For example, where prominent features, such as berms, walls, and rows of buildings were present, a shielding adjustment was included in the noise modeling, consistent with FRA guidance (see Draft EIR/EIS, p. 3.4-24; see also Noise and Vibration Technical Report, p. 4-7; FRA Guidance Manual, p. 2-12). See also the "line of sight" discussion above.

In its independent analysis, the commenter did correctly note, however, that its calculations assumed that there is no ground attenuation for trains traveling in the aerodynamic regime. This is consistent with the Authority's modeling, which included the assumption that aerodynamic sources, which are only present at the highest speeds, do not include ground effects in the calculations.

The benchmark results, presented in Section 4.3.4 of the Noise and Vibration Technical Report show that the results from the noise assessment for the Palmdale-Burbank Section are accurate with regards to the standard input parameters used on all segments of the California High Speed Rail Project. The assessment for Palmdale to Burbank used site specific parameters along the corridor with the approved, benchmarked model. Thus, the noise levels reported in the Draft EIR/EIS are correct and there are no additional impacts on any of the alternatives that weren't identified in the Draft EIR/EIS.

Also briefly mentioned in footnote 4 of the comment is Attachment 2 of the comment submission, containing a 2018 brochure produced by the Authority on the noise levels of various train types (and equipment). Please refer to Standard Response PB-Response-N&V-1 for a discussion on the comparison of train noises.

In response to the comment's concluding remark that the noise analysis will not withstand judicial review, the Authority disagrees. There is ample substantial evidence, between the Draft and Final EIR/EIS, these responses to comments, standard responses, and the applicable technical report, supporting the EIR/EIS's noise analysis and impact conclusions.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4413-10245**

Finally, please note that the SR14A Build Alternative is the Authority's preferred alternative, and the majority of the alignment would be in tunnel. There would be no noise impacts in locations with tunnels; thereby rendering the bulk of the commenter's concerns moot.

### **4413-10246**

The commenter provides noise calculations that they modeled (comment submission Attachment 1) and expresses concerns regarding the accuracy of the noise calculations provided in the Draft EIR/EIS, amongst other things, specifically that residences within 3,600 feet and up to 5,300 feet of elevated tracks, under specific conditions, will experience severe noise levels.

For a discussion on Attachment 1, and associated and other issues that arise in this comment, such as the screening distance for noise analysis, the provision of technical data in the Noise and Vibration Technical Report, and the conservative nature of the Draft EIR/EIS modeling, please refer to response to comment #10245.

In response to the comment that the Draft EIR/EIS "does not properly report 'severe' impact thresholds established by the FRA Manual", the measured noise levels and impact thresholds reported in the Draft EIR/EIS are rounded to the nearest decibel in the tables. The actual measured noise levels and criteria to the nearest tenth of a decibel are used in the assessment and the criteria are calculated using the equations in Section A.3.3 of the FRA guidance manual, rather than using the approximations shown on page 3-4 of the FRA manual.

In response to the comment that the Draft EIR/EIS analysis "may have failed to properly account for the lack of vegetation and sparse development profile in Acton and therefore assumed incorrect noise attenuation parameters," refer to response to comment #10245 regarding hard and soft ground types.

Lastly, the commenter mischaracterizes its modeling by calling it "conservative." The term conservative is used when modeling makes potential impacts seem worse than they actually will be. Here, however, the commenter's modeling does not "factor in the incrementally higher noise levels attributed to elevated tracks," which means that the commenter's modeling would present impacts to be better than they actually will be. Nevertheless, this further demonstrates that the commenter's analysis is inaccurate.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10247

The commenter is concerned about noise levels near Aliso Canyon in Acton (intersection of Aliso Canyon Road and Avenue Y-8) due to the E1, E1A, E2, and E2A Build Alternatives and potential impacts to receivers in this area that were not identified in the Draft EIR/EIS. The commenter also states that an existing noise measurement for location "N8" was not included in the noise analysis in the Draft EIR/EIS.

The commenter referenced the use of three 1-hour noise measurements of existing noise at this location, rather than a 24-hour noise measurement. The three 1-hour noise measurements method is described in Appendix B of the FRA's High Speed Ground Transportation Noise and Vibration Impact Assessment manual and appropriately used for the project here. This method is used when a 24-hour noise measurement cannot be conducted, as occurred here, because physical access was not obtained for this type of measurement. For a 24-hour noise measurement, the typical procedure is to secure noise monitoring equipment on private property for the duration of the noise measurement, which provides security for the equipment. Because the Authority did not have permission to access private property at this location, the Authority conducted three 1-hour measurements from public right-of-way, consistent with FRA guidance. A 24-hour noise measurement at this location was not feasible because noise monitoring equipment could not be left unattended in public right-of-way, and the Authority did not have permission to access private property to secure noise monitoring equipment.

Because of the way the Ldn is calculated from the 3 measurements, this method returns lower noise levels than a corresponding 24-hour measurement. A lower existing noise level increases the likelihood of identifying impacts at a particular location; therefore, the methodology used here resulted in a more conservative analysis. At this location, the closest sensitive receivers to the E1, E1A, E2, and E2A Build Alternatives alignments are more than 2,200 feet from the alignment. The FRA guidance manual has a maximum screening distance of 1,300 feet for identifying the potential for noise impacts. For this project, in the rural areas, this distance was increased to 1,800 feet, as described on page 3.4-38 of the Draft EIR/EIS. Because the receivers in question are significantly outside this already-extended screening distance, no impact assessment was conducted, per FRA guidance. Because no assessment was conducted at this location, the noise measurement in question was not used in the noise analysis or reported in the Draft EIR/EIS.

### 4413-10247

Additionally, the commenter is concerned that there should be impacts at this location, based on the commenter's analysis. Please refer to Response to Comment #10246, which describes errors that the Authority has identified in the commenter's analysis that result in higher noise levels than those reported in the Draft EIR/EIS. The commenter correctly notes that the SR14A Build Alternative (the Authority's preferred alternative) would not have noise impacts to Blum Ranch or in Acton.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4413-10248**

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter states that the Draft EIR/EIS does not comply with CEQA and NEPA requirements because it does not provide any indication of how the Project will alter the existing noise environment, because it does not include specific noise impacts, and because the Draft EIR/EIS does not report noise effects “at the same time and place” they occur. The commenter also notes that the Draft EIR/EIS does not contain noise contours.

The Authority respectfully disagrees with the characterization made by the commenter. The Authority has described how the Project could alter the existing noise environment through a methodology using FTA and FRA criteria. Please see Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which addresses operational noise impacts; provides additional information about why HSR has chosen to use the FRA and FTA Guidance; describes why noise contours are not necessary; and points to the places in the Draft EIR/EIS where the commenter and the public can review the geographic location of noise impacts.

The commenter also offers specific locations of concern for noise impacts and offers expected noise levels; however, the noise levels are not correct, as detailed in the Response to Comment #10245, which describes errors that the Authority has identified in the commenter’s analysis. The commenter states that the Draft EIR/EIS does not explain that the Project will result in 80 dBA more than 400 times per day at residences within a mile of elevated tracks; noise exceeding 100 dBA at equestrian trails in Acton under elevated tracks; or that noise at Vazquez High School will exceed 85 dBA and will require staff to wear hearing protection while outdoors.

Regarding the commenter’s concern about noise impacts at residences, it is unclear how the numbers provided by the commenter were developed. Regardless, please note that there would not be 400 daily trains, as a result of the project. There would only be 189 total daily trains during daytime hours and 28 daily trains during nighttime hours. Please refer to both the Standard Response PB-Response-N&V-1: Operational Noise

### **4413-10248**

and Impacts to Sensitive Receptors, for a discussion of how the Authority considered noise impacts on sensitive receptors, including residences.

Regarding the commenter’s concern about impacts on equestrian trails, the Authority respectfully disagrees that the Draft EIR/EIS did not disclose potential impacts on use of equestrian trails. Impact N&V#7 in Section 3.4, Noise and Vibration of the Draft EIR/EIS discloses the potential locations where noise impacts could occur at equestrian trails and identified mitigation (Mitigation Measure N&V-MM#8) in order to reduce this impact to a less than significant level. Please also refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which provides additional information on noise impacts on domestic animals, including horses.

Regarding the commenter’s concern about impacts on Vazquez School, the Authority has identified five schools, for which there could be significant and unavoidable construction noise impacts. This includes Roscoe Elementary School, Maclay Middle School, Hillary Broadous Early Education Center, and Hillery T. Broadous Elementary School for the E1, E1A, Refined SR14 and SR14A Build Alternatives. This also includes the Stonehurst Avenue Elementary School for the E2 and E2A Build Alternatives. The Draft EIR/EIS found that construction noise impacts on Vazquez School would not be significant or severe. Additionally, regarding the commenter’s independent assessment, referred to in the comment as Attachment 1, please refer to Response to Comment #10245, which describes errors that the Authority has identified in the commenter’s analysis, which result in noise levels that are higher than those reported in the Draft EIR/EIS. Based on the analysis conducted in the Draft EIR/EIS, the impacts to Vazquez School were found to not be significant or severe.

The commenter also states that Ldn does not provide an adequate basis for asserting direct noise impacts. The Ldn noise descriptor is almost universally accepted as the best way to measure human response to environmental noise and changes in noise. Noise from a single event does not correlate with human response to noise, and noise levels from single events are not described in the Draft EIR/EIS, as they are not a part of the FRA noise and vibration guidance. The Ldn is a very effective metric because it includes information about how loud each event is, how long that event occurs, how often it occurs and when the events occur (daytime vs nighttime). If a noise assessment were to

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10248

only use the maximum noise level to assess impact, one event would be the same as 400 events, and an event that occurs for 3 seconds would be the same as one that occurs for an hour. Because more events would be a greater impact on a receiver and longer duration events would also be a greater impact on a receiver, using a single event metric would not fully capture the impacts at a location. Because Ldn takes all these factors into account, it is an appropriate metric to assess human response to noise in the environment. Please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which further addresses this issue.

Furthermore, the commenter states that the issues they identified in their comment would be moot if the Authority selects the SR14A Build Alternative. The SR14A Build Alternative is the Authority's preferred alternative.

### 4413-10249

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-4: Tunneling Impacts (Noise and Vibration) under Homes and Businesses.

The commenter states that the model for the noise assessment was not properly validated and lists several specific reasons purportedly supporting this claim. These comments are addressed in turn below.

The commenter first states what it believes is necessary to properly validate a model, and asserts that the project's benchmark test did not do this and therefore the model is "not valid or accurate." Notably, the comment does not cite any sources or expert references to support its idea of how to validate a noise model. The FRA Guidance Manual serves as the basis for the project's benchmark validation. The reference noise levels in the FRA Guidance Manual, which are used as the basis of the benchmark validation model, are based on extensive real-world noise measurements ("actual physical measurements," to use the language in the comment) of high-speed trains operating in Europe (see FRA Guidance Manual, Section 5.2.1). The equations in the FRA Guidance Manual are based on these actual measurements and standard acoustical models for train events. The data and equations in the FRA Guidance Manual underwent an extensive peer review process to ensure they were appropriate (please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors). The data has been used on HSR projects throughout the country (please refer to Standard Response PB-Response-N&V-1). The benchmark tests were created at the onset of the environmental analysis for the California HSR Program to ensure that each project section uses the same input data and obtains the same results. The benchmarks were set up to capture a wide range of situations, including elevated structures, noise barriers, and different speeds. Accordingly, each benchmark is based on acoustical models included in the FRA Guidance Manual, which are based on real world measurements and a peer review process. The Authority then reviewed these benchmarks and determined they accurately reflect the situations described.

In response to the commenter's questions on the output results used for the benchmark test, Table 4-2 and 4-3 in the Noise and Vibration Technical Report shows both the benchmark results established by the Authority for 28 different operating scenarios at

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10249

different speeds, distances, and track/receiver height combinations and the modeled results. The benchmarks are compared with the modeled results to ensure that the models used in each section of the project are consistent with the Authority benchmark and with each other. The benchmarks are not meant to reflect a specific operating scenario in the Palmdale to Burbank Project Section, but rather a standard set of general scenarios to test the models used in the assessment and ensure that they are consistent with the benchmark results.

In response to the commenter's questions on one particular benchmark model with a 63-foot-high barrier, this height is relative to the ground level and represents the distance from the ground level to the elevated structure, plus the elevated structure, plus a 4-foot barrier on top of that structure. It does not represent a barrier beginning on the ground level. The HSR source elevation shown in Tables 4-2 and 4-3 in the Noise and Vibration Technical Report is referenced in the header as relative to the ground level, and the barriers are correspondingly referenced to the ground level. For the purposes of clarity, the Authority has revised the Noise and Vibration Technical Report by adding a footnote to Tables 4-2 and 4-3 explaining that the 63 feet represents the aforementioned measurements (distance from ground to elevated structure plus elevated structure plus 4-foot barrier).

The commenter also questions the noise barriers present in each benchmark model. The 4-foot barrier height represents the standard edge of the track structure that is present but would only provide minimal shielding for wheel/rail sources.

Lastly, regarding the commenter's independent assessment, referred to in the comment as Attachment 1, please refer to Response to Comment #10245, which describes several errors that the Authority has identified in the commenter's analysis, resulting in higher noise levels than those reported in the Draft EIR/EIS.

Additionally, please note that the SR14A Build Alternative is the Authority's preferred alternative, and the majority of the alignment would be in tunnel. There would be no noise impacts in locations with tunnels (see PB-Response-N&V-4: Tunneling Impacts (Noise and Vibration) under Homes and Businesses). The commenter is correct that project operations for the SR14A Build Alternative would have no noise impacts in

### 4413-10249

Acton.

The comment concludes by stating that the noise analysis and results in the Draft EIR/EIS are not accurate or reliable but, as demonstrated above, and in each response to comment prepared for this letter, the noise analysis performed is indeed accurate, reliable, and supported by substantial evidence.

### 4413-10250

Refer to Standard Response PB-Response-GEN-7: Access to Technical Reports.

The commenter states that the technical reports were not provided to the public and were not filed with the State Clearinghouse, which violated the CEQA and NEPA policies of open and public processes. Please see Standard Response PB-Response-GEN-7: Access to Technical Reports, which addresses this issue.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10251

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter questions information on page 3.4-8 of the Draft EIR/EIS and asserts that the Authority will apply European noise standards instead of federal standards to project noise generation and that the project will not comply with federal noise standards. Although the comment does not specify, it is presumed that the commenter refers to the information contained in the section entitled "United States Environmental Protection Agency Railroad Noise Emission Standards (40 C.F.R. Part 201)" on page 3.4-8 within section 3.4.2, Laws, Regulations, and Orders in the Draft ER/EIS. This section does not state that the project will not comply with applicable federal standards, it states that these USEPA limits may not apply to HSR, as the project is not an interstate carrier subject to federal noise standards. This section further states that any trainsets used for HSR that would comply with USEPA standards would, by default, comply with the European noise standard because European standards comply with USEPA standards, and not that the European standard would be used as the commenter suggest. The European standard is a set of emission noise limits applied to HSR operations across Europe for all HSR trainsets, regardless of country. The standards are summarized in the FRA document "High Speed Rail Noise Standards and Regulations" Report DOT/FRA/ORD-21/02, February 2021. Because any trainset would need to meet European noise limits to be used in Europe, those limits would by default also apply to any US project because they comport with the USEPA standard. This section also states that no HSR trainsets currently manufactured anywhere in the world meet the USEPA limit above 200 mph as a result of the limitations of current technology. Please also refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which addresses the FRA and FTA criteria used to assess noise impacts and their use of American, not European, standards.

Lastly, the commenter notes that there is no rule requiring HSR to operate at 220 mph and no rule preventing it from operating at 190 mph. For a discussion on HSR operating speeds in Acton and Agua Dolce, which will be as slow as 180 mph, please refer to response to comment #10245.

### 4413-10252

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter states that the CEQA requires that lead agencies identify all instances in which the Project is inconsistent with adopted planning documents; identifies perceived inconsistencies with the Los Angeles County General Plan based on calculations the commenters made in "Attachment 1"; and requests that the EIR/EIS be revised to show how the Project would interfere with the County's objectives of reducing excessive noise impacts.

With regards to the project's consistency with local policy and zoning regulation, please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which identifies how the project is not subject to local government general plan policies or zoning regulations, as well as how the Authority has endeavored to develop a project design that minimizes local impacts. Although the project would not be subject to local government general plan policies or zoning regulations, the Draft EIR/EIS did disclose that the project would be inconsistent with certain provisions of the Los Angeles County General Plan, as described in Table 3.4-2 of the Draft EIR/EIS.

The commenter raises specific noise concerns from the commenter's independent assessment, referred to in the comment as Attachment 1. Please refer to Response to Comment #10245, which describes errors that the Authority has identified in the commenter's analysis, which result in noise levels that are higher than those reported in the Draft EIR/EIS.

In addition, at the end of this comment, the commenter states that their concern would be eliminated if the Authority selects the SR14A Build Alternative. The Authority's Preferred Alternative is the SR14A Build Alternative.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10253

The commenter states that text in the Draft EIR/EIS related to the Los Angeles County General Plan, referring to the Los Angeles County Code for direction on and definition of specific noise criteria, is incorrect. The Los Angeles County General Plan has the same noise criteria as the Los Angeles County Municipal Code. Table 11.2 in the General Plan Noise Element (page 195) outlines the community noise criteria for the county. The source for the table is cited as "Section 12.08.390 of the Los Angeles County Code (a portion of the Noise Control Ordinances)." As such, the General Plan does refer to the Code for specific noise criteria, and the statement in the EIR/EIS is correct.

### 4413-10254

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter states that although the project is a State project, it should still evaluate impacts based on local land use and zoning regulations as required by CEQA. The commenter also states that the Draft EIR/EIS fails to mention that the Project is inconsistent with the Los Angeles County General Plan 2035's 70-dBA noise objective, does not address the inconsistency or offer mitigation measures to ameliorate it, and does not comply with CEQA.

As discussed in Section 3.4.3 of the Draft EIR/EIS, the Authority is a state agency and therefore is not required to comply with local land use and zoning regulations and, therefore, not required to evaluate impacts based on local and regional land use regulations. However, it has endeavored to design and construct the HSR project to be consistent with land use and zoning regulations wherever possible. For more detail on this issue, please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors. The noise and vibration impact assessment completed for the Palmdale to Burbank Project Section is consistent with both FRA and FTA guidance.

### 4413-10255

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter claims that, except for the SR14A Build Alternative, all the Build Alternatives will have substantial noise impacts to the Acton community. The commenter also claims Project's noise profile in Acton will not be consistent with local laws and plans. Additionally, the commenter claims that N&V-MM#1 is impermissible under CEQA, because it defers the development of mitigation measures to reduce significant noise impacts until after the Project is approved and that noise mitigation policies provided in Appendix 3.4-C do not actually reduce noise impacts in most areas.

As a matter of clarification, the Authority's preferred alternative is the SR14A Build Alternative. As discussed in Section 3.4, Noise and Vibration, sensitive receivers for the E1, E2, E1A, E2A, and the Refined SR14 alignment would experience moderate to severe noise impacts along areas near the Antelope Valley Freeway (Refined SR 14) and near the Vincent Substation (E1, E1A, E2, and E2A). Please see Figure 3.4-18, Figure 3.4-28, and Figure 3.4-31 for exact noise impact locations. Mitigation Measures N&V-MM#3 through N&V-MM#6 would be implemented to reduce noise from HSR operations. Additionally, as discussed in Chapter 8, Preferred Alternative, the Authority identified SR14A as the Preferred Alternative, as the alternative balances functional, technical, economic, and constructability factors with minimized impacts on natural resources and human communities. Noise impacts were considered in the process of determining the preferred alternative.

With regards to the project's consistency with local policy and zoning regulation, the Authority is a state agency and therefore is not required to comply with local land use and zoning regulations (see discussion in Section 3.4.3 of this Final EIR/EIS); however, it has endeavored to design and construct the HSR project so that it is consistent with land use and zoning regulations. The noise and vibration impact assessment completed for the Palmdale to Burbank Project Section is consistent with both FRA and FTA guidance. Please refer to Standard Response N&V-1: Operational Noise and Impacts to Sensitive Receptors, which provides additional information about why HSR has chosen to use the FRA and FTA Guidance.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10255

Additionally, as discussed in Section 3.4.7, the project will implement Mitigation Measure N&V-MM#1. Under N&V-MM#1, prior to construction (any ground-disturbing activities), the contractor will prepare a noise-monitoring program for Authority approval. The noise-monitoring program will describe how, during construction, the contractor will monitor construction noise to verify compliance with the noise limits (8-hour equivalent sound level (Leq) dBA noise limits are 80 dBA during the day and 70 dBA at night for residential land use; 85 dBA both day and night for commercial land use; and 90 dBA both day and night for industrial land use) where a noise-sensitive receptor is present. This can be done by either prohibiting certain noise-generating activities during nighttime hours or providing additional noise control measures to meet the noise limits. In addition, the noise-monitoring program will describe the actions required of the contractor to meet required noise limits including use of low-noise emission equipment, use of high-grade engine exhaust silencers, and other noise reducing measures. As described in N&V-MM#3, where noise barriers are not suitable, other noise reducing measures such as sound insulation and noise easements may be applied.

The Authority would commit to its mitigation through adoption of an Mitigation Monitoring and Reporting Plan; mitigation includes specific performance standards (i.e., specific noise levels that shall be reached); and identifies the actions that can be achieved to meet performance standards (actions are listed in each mitigation; for example, N&V-MM#1 has a bullet list of actions). For these reasons, mitigation for noise and vibration is not deferred.

### 4413-10256

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter claims that none of the proposed route alternatives except for SR14A will meet the Los Angeles County General Plan noise standards in Acton. The commenter is requesting that Table 3.4-2 be revised to state that it “will not be possible to meet standards” in the Los Angeles County Plan and further clarify that this constitutes a significant environmental impact.

As clarification, the Authority's Preferred Alternative is the SR14A Build Alternative. As documented by the commenter, the SR14A Build Alternative would minimize noise and other impacts in Acton.

Regarding the commenter's independent assessment, referred to in the comment as Attachment 1, please refer to response to comment #10245, which describes errors that the Authority has identified in the commenter's analysis, which result in noise levels that are higher than those reported in the Draft EIR/EIS.

As discussed in Section 3.4.3 of the Draft EIR/EIS, the Authority is a state agency and therefore is not required to comply with local land use and zoning regulations. However, the determination statements in Table 3.4-2 use the word “may” because, despite inconsistencies with regional and local noise policies, the Authority has endeavored to design and construct the HSR project so that it is consistent with land use and zoning regulations. The noise and vibration impact assessment completed for the Palmdale to Burbank Project Section is consistent with both FRA and FTA guidance. Please see Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which addresses operational noise impacts.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4413-10257**

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter disagrees with a statement on page 3.4-14 of the Draft EIR/EIS that the project is consistent with the majority of regional and local noise policies and plans. Please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which identifies how the project is not subject to local government general plan policies or zoning regulations, as well as how the Authority has endeavored to develop a project design that minimizes local impacts. The statement that the project is consistent with the majority of regional and local policies and plans has been removed from the Final EIR/EIS. While this statement has been removed, please note that the Authority will continue to endeavor to work with local jurisdictions to develop a project design that minimizes local impacts and is made as consistent with local plans as possible.

### **4413-10258**

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter claims that except for the SR14A Build Alternative, noise impacts from project operations within the Community of Acton will not be reduced by any IAMFs or mitigation measures. The commenter is requesting that the Draft EIR/EIS be revised to clarify that, even with IAMFs and mitigation measures, the project will not meet most local policy objectives.

Regarding the comment about the project not meeting local policy objectives for Los Angeles County and Acton, please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which identifies how the project is not subject to local government general plan policies or zoning regulations, as well as how the Authority has endeavored to develop a project design that minimizes local impacts. The noise and vibration impact assessment completed for the Palmdale to Burbank Project Section is consistent with both FRA and FTA guidance. As noted in the standard response, Section 3.4.3, Consistency with Plans and Laws, and Table 3.4-2 in Section 3.4, Noise and Vibration, of the Draft EIR/EIS, which discloses that it may not be possible to meet all local noise standards.

Note also that the commenter's independent noise analysis, upon which it bases much of its comments, including this one, uses incorrect assumptions. For more detail, please refer to Response to Comment #10245.

Finally, note that the Authority's Preferred Alternative is the SR14A Build Alternative, which the comment acknowledges will not result in significant noise impacts in the community of Acton that might conflict with local policies; thereby rendering the bulk of the commenter's concerns moot.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10259

The commenter expresses concern about construction noise and perceived deficiencies in NV-IAMF#1.

The noise and vibration assessment evaluated noise and vibration impacts from temporary construction activities for all the HSR Build alternatives. The assessment is based on the criteria and methodology contained in the FTA and FRA noise and vibration guidance manuals. Because specific equipment, methods and durations of construction activities cannot be fully defined in the EIR/EIS stage, NV-IAMF#1 requires the Authority's construction contractor to prepare a noise and vibration technical memorandum documenting how the Federal Transit Administration and Federal Railroad Administration guidelines for minimizing construction noise impacts will be employed when work is being conducted within 1,000 feet of sensitive receivers. Although NV-IAMF#1 would reduce construction noise, noise impacts would temporarily or periodically substantially increase ambient noise levels in the project vicinity above levels existing without the project. As discussed in Section 3.4.7, the project will implement Mitigation Measure N&V-MM#1. Under N&V-MM#1, prior to construction (any ground-disturbing activities), the contractor will prepare a noise-monitoring program for Authority approval. The noise-monitoring program will describe how, during construction, the contractor will monitor construction noise to verify compliance with the noise limits (8-hour equivalent sound level (Leq) dBA noise limits are 80 dBA during the day and 70 dBA at night for residential land use; 85 dBA both day and night for commercial land use; and 90 dBA both day and night for industrial land use) where a noise-sensitive receptor is present. This can be done by either prohibiting certain noise-generating activities during nighttime hours or providing additional noise control measures, such as barriers, to meet the noise limits. In addition, the noise-monitoring program will describe the actions required of the contractor to meet required noise limits, including use of low-noise emission equipment, use of high-grade engine exhaust silencers, and other noise reducing measures. As described in N&V-MM#3, where noise barriers are not suitable, other noise reducing measures such as sound insulation and noise easements would be applied.

CEQA Guidelines Section 15126.4 (B) states: "...formulation of mitigation measures shall not be deferred until some future time. The specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to

### 4413-10259

include those details during the project's environmental review provided that the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be considered, analyzed, and potentially incorporated in the mitigation measure." The Authority would commit to its mitigation through adoption of a Mitigation Monitoring and Reporting Plan; mitigation includes specific performance standards (i.e., specific noise levels that shall be reached); and identifies the actions that can be achieved to meet performance standards (actions are listed in each mitigation measure; for example, N&V-MM#1 has a bullet list of actions). For these reasons, mitigation for noise and vibration is not deferred.

Regarding the commenter's concern about impacts on Vazquez School, the Authority has identified five schools, for which there could be significant and unavoidable construction noise impacts. This includes Roscoe Elementary School, Maclay Middle School, Hillary Broadous Early Education Center, and Hillery T. Broadous Elementary School for the E1, E1A, Refined SR14 and SR14A Build Alternatives. This also includes the Stonehurst Avenue Elementary School for the E2 and E2A Build Alternatives. The Draft EIR/EIS found that construction noise impacts on Vazquez School would not be significant or severe.

Regarding the commenter's concern about use of federal thresholds, please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which identifies why the Authority chose the FRA and FTA thresholds.

At the end of the comment, the commenter indicates that the Authority could select the SR14A Build Alternative to avoid the impacts they are concerned with. The Authority's preferred alternative is the SR14A Build Alternative.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10260

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter is concerned with startle effects to domestic animals. Please refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which addresses this issue and provides detailed information regarding this topic. The assessment methodology for animal startle effects are in Section 3.4.4.3 of the Draft EIR/EIS, on page 3.4-34. The information contained in the Draft EIR/EIS is based on information contained in Appendix A of the FRA guidance manual, which synthesizes information related to animal response to startle effects. The FRA startle effects are based on the data available and has been peer reviewed and used on dozens of HSR projects across the country. Some of the projects include the Texas High Speed Rail project, the Florida High Speed Rail project, and the Northeast Corridor project, among many others. Based on the threshold of 100 dBA SEL and the operational parameters of the CAHSR project, animal startle effects would occur within approximately 50 feet of the tracks. For human response to startle noise, please refer to PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which discusses operational noise impacts and the use of federal noise thresholds. Additionally, the methodology for addressing startle effects is also contained in Section 3.4.4.3. of the Draft EIR/EIS, on page 3.4-33. Startle effects related to humans are based on information contained in Appendix A of the FRA guidance manual. The FRA guidance is based on data from the Air Force and research into noise effects from mag-lev trains. The commenter refers to a study from 1974 by Theodore Shulzte, which was an early attempt to correlate human annoyance with noise levels. There is one instance where Japanese residents were asked if they were startled by train noise; however, the parameter for startle are not well defined in this report. The commenter does not reference another document until the 1992 Air Force Study, which is one of the underlying documents used by the FRA guidance manual for discussing startle effects. All the research, including the Air Force Study and the 2021 FRA paper and others, have clearly defined startle effect as a result of the onset rate (change in noise level) and not the overall noise level, as the commenter states numerous times. While higher noise levels will cause annoyance (which is included in the operational noise assessment), mixing annoyance from high noise levels and startle from a high onset rate is not correct. The 1974 report has been

### 4413-10260

superseded by numerous studies and is not considered a reference document on startle effects on humans. The Air Force study, as stated previously, is one portion of the information that was used to determine startle and onset rates for the FRA, but not the only one. The Air Force study was combined with a study on mag-lev noise to determine the startle effects in Appendix A of the FRA guidance manual. The Air Force study does not contradict the FRA guidance, but rather is one part that was used in the FRA guidance. The 2021 study cited by the commenter does not suggest that noise at the levels stated by the commenter cause startle. The study refers to a survey in the Netherlands, where people complained of startle effects, but there was no correlation to noise levels. Research into human startle effects looks at the onset rate (increase in noise) as a factor in startle, and not the noise level itself. The 2021 paper did not evaluate the onset rate as a correlation with annoyance, and clearly states that onset rate is the factor in startle, and not the overall noise level. Based on the information in Appendix A of the FRA guidance manual, human startle effects at 220 mph would occur within 45 feet of the tracks. At lower speeds, the distances would be less. Finally, the SR14A Build Alternative is the Authority's preferred alternative, and the majority of the alignment would be in tunnel. There would be no startle effects in locations with tunnels, thus rendering the majority of the commenter's concerns moot.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10261

The commenter expresses concern that blasting will be used to construct the tunnels in Acton for the E1, E1A, E2, and E2A Build Alternatives, noting potential noise impacts and startle impacts to horses, livestock, and other domesticated animals. The commenter states that the Draft EIR/EIS does not disclose whether blasting techniques would be used in Acton, does not adequately analyze impacts of blasting, and does not identify mitigation to reduce impacts from blasting.

Smaller segments of tunnels may not use tunnel boring machines (TBMs) but instead rely on “conventional” methods to build the tunnels. This does not imply that the tunnel will be excavated using explosives, as there are many other different “conventional” excavation methods for tunnels, and the selection of the method depends mainly on the type of rock or soil to be excavated. A tunnel built with a “conventional” method of construction is also referred to as a “mined tunnel.” As noted in Section 2.9.5.3 in the Draft EIR/EIS, this may include drill-and-blast or mechanical excavators, depending on the strength of the ground being excavated. The drill-and-blast method of excavation involves the controlled use of explosives to break rock. Drill-and-blast tunneling is a form of subsurface construction and can be used as an option to mine tunnels using sequential excavation methods or TBMs. Drill-and-blast is used mostly to mine through hard rock, where it is more cost and time effective.

The typical cycle of excavation by blasting is performed in the following steps: (1) drilling blast holes and loading them with explosives; (2) detonating the blast, followed by ventilation to remove blast fumes; (3) removal of the blasted rock (mucking); (4) scaling crown and walls to remove loosened pieces of rock; (5) installing initial ground support; (6) advancing rail, ventilation, and utilities. When used in tunnel construction, blasting is controlled. The individual blasting rounds are usually designed and calculated by a blasting specialist. The design is reviewed by the engineer for compliance with specifications. Controlled blasting is performed with a careful design and selection of all aspects of the round-geometry of the tunnel, hole diameter, hole charges, hole spacings and burdens, and delay. Controlled blasting allows a few feet of excavation to advance on each individual blasting round.

In the areas noted in the comment (around Foreston Drive and Aliso Canyon Road), conventional mining may be used, including drill-and-blast techniques.

### 4413-10261

As noted above, any drill-and-blast would occur underground and would not occur in the open where noise could adversely affect livestock or people. Section 2.9.5.3 of the Draft EIR/EIS explains that conventional mining techniques including drill-and-blast are typically used for tunnels less than 3 miles in length that present suitable conditions. The tunnel in the area referenced in the comment (around Foreston Drive and Aliso Canyon Road) is approximately 1.6 miles in length. If drill-and-blast techniques are used, it would occur underground in a controlled environment; the blasting would produce no external noise due to the natural sound attenuation properties of the surrounding ground, which prevents noise from traveling to the surface. For noise generated underground, whether it is from construction or from operations, there is no pathway for that noise to be heard on the surface. Because of that, industry professionals do not quantitatively assess noise from underground sources (i.e., because there is no pathway for that noise to be heard on the surface). As such, any blasting would not result in significant noise impacts such as those asserted by the commenter. Vibration at sensitive receptors from drill-and-blast methods would depend on many factors, including the size of the charge, the distance from the charge to a receiver, the type of rock, and any focusing or damping used to direct the charge. NV-IAMF#1 requires the contractor to prepare a noise and vibration technical memorandum that documents how the FTA and FRA guidelines for minimizing construction vibration impacts will be employed when work is being conducted within 1,000 feet of sensitive receptors. Finally, please note that the SR14A Build Alternative is the Authority’s Preferred Alternative.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10262

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter expresses concern regarding the use of FRA construction noise standards, and notes concern for continuous exposure to noise levels in rural communities. The commenter believes the Draft EIR/EIS fails to comply with CEQA directives due to the Authority's use of federal standard instead of considering local conditions. The commenter suggests the SR14A Build Alternative should be chosen to eliminate noise impacts to Acton.

The noise and vibration assessment in the Draft EIR/EIS evaluated noise and vibration impacts from temporary construction activities for all the HSR Build Alternatives. The assessment is based on the criteria and methodology contained in the FTA and FRA noise and vibration guidance manuals. Please refer to Standard Response N&V-1: Operational Noise and Impacts to Sensitive Receptors, which provides additional information about why HSR has chosen to use the FRA and FTA Guidance.

Because specific equipment, methods and durations of construction activities cannot be fully defined in the EIR/EIS stage, NV-IAMF#1 requires the Authority's construction contractor to prepare a noise and vibration technical memorandum documenting how the Federal Transit Administration and Federal Railroad Administration guidelines for minimizing construction noise impacts will be employed when work is being conducted within 1,000 feet of sensitive receptors. Although NV-IAMF#1 would reduce construction noise, noise impacts would temporarily or periodically substantially increase ambient noise levels in the project vicinity above levels existing without the project. Mitigation Measure N&V-MM#1 (discussed in Section 3.4.7 of this Final EIR/EIS) will require the Authority's construction contractor to prepare a noise-monitoring program describing how the contractor will monitor construction noise to verify compliance with the noise limits. Mitigation Measure N&V-MM#1 includes specific actions that would be implemented to reduce construction noise. The noise-monitoring program will describe the actions required of the contractor to meet required noise limits of 80 dBA Leq during daytime hours and 70 dBA equivalent sound level (Leq) during nighttime hours. In addition, the noise-monitoring program will describe the actions required of the contractor to meet required noise limits. In addition, the noise-monitoring program will

### 4413-10262

describe the actions required of the contractor to meet required noise limits. However, due to the Build Alternatives' proximity to sensitive receptors, some receptors may still experience noise in exceedance of acceptable noise limits.

Finally, the Authority's preferred alternative is the SR14A Build Alternative, which would avoid noise impacts to the community of Acton (as identified by the commenter).

### 4413-10263

The commenter questions the total number of trains used in the assessment. Please refer to Response to comment #10245, which provides an explanation and clarification of the number of trains used in the analysis, including how peak trains are a subset of the total daytime trains. In summary, the text at the bottom of page 3.4-23 in the Draft EIR/EIS has been modified. It now reads that for the Palmdale to Burbank Project Section, a total of 217 trains (in both directions) would operate daily during a 24-hour period.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4413-10264**

Refer to Standard Response PB-Response-N&V-2: Noise Mitigation and selection of Proposed Sounds Barriers.

The commenter expresses concerns about the use of ground effects in the noise assessment and the effectiveness of barriers for aerodynamic sources on the HSR trainsets.

The ground effect represents a small reduction in the noise levels due to interference with the ground as the sound travels over it. The ground effect is based on the distance over which the sound travels from the source to the receiver, and the path height of the sound, which considers both the height of the source and the height of the receiver. For sources of noise that are either higher on the vehicle (such as pantograph noise) or for elevated structures, the ground effect, or reduction in noise, is much lower than it would be for wheel/rail noise operating on non-elevated structures. The sources of noise on the HSR vehicle change with speed. At lower speed regimes, the wheel-rail noise (which is very low on the vehicle) dominates the noise, and the ground effects would be greater. At the highest speed regimes, aerodynamic and pantograph noise (which are much higher up on the vehicle) dominate the noise, and the ground effects would be much less. The noise modeling takes this into account for each source of noise on the vehicle, the speed regime, the track height, and the receiver height. The CAHSR Noise Mitigation Guidelines, which are included as Appendix 3.4-C of the Draft EIR/EIS, outline where noise barriers would be constructed. Barriers would need to achieve between 5 and 15 dB of noise reduction and meet cost thresholds to be considered reasonable and benefit a minimum number of impacted locations. In areas where barriers are not effective or not feasible, sound insulation of buildings could be considered. In some cases, the mitigation measures may not be fully effective, and locations exist where sound walls would not be feasible, based on the mitigation guidelines. Some unavoidable adverse noise effects would result from implementation of the Build Alternatives. For the SR14A Build Alternative (the Authority's Preferred Alternative), much of the alignment would be underground. Only areas of the Build Alternative alignment that contain sensitive receivers are analyzed in Section 3.4, Noise and Vibration of the Draft EIR/EIS because areas of the alignment where there are no sensitive receivers would not experience noise impacts, as described in Section 3.4.5, Affected Environment. Similarly, locations where the Build Alternative alignment would

### **4413-10264**

be in a tunnel are omitted from the noise impact discussions because there would be no increase in surface noise where trains would operate in a tunnel (Authority 2019). For additional information, please refer to Standard Response PB-Response-N&V-2: Noise Mitigation and selection of Proposed Sounds Barriers.

### **4413-10265**

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter is concerned with startle effects to domestic animals. Please refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which addresses this issue.

The assessment methodology for animal startle effects is in Section 3.4.4.3 of the Draft EIR/EIS, on page 3.4-34. The information in the Draft EIR/EIS is based on information in Appendix A of the FRA guidance manual, which synthesizes information related to animal response to startle effects. The FRA startle effects are based on the data available and has been peer reviewed and used on dozens of HSR projects across the country. Some of the projects include the Texas High Speed Rail project, the Florida High Speed Rail project, and the Northeast Corridor project, among many others. Based on the threshold of 100 dBA SEL and the operational parameters of the project, animal startle effects would occur within approximately 50 feet of the tracks. For human response to startle noise, please refer to PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which addresses operational noise impacts and the use of federal noise thresholds. Additionally, the methodology for addressing startle effects is also contained in Section 3.4.4.3. of the Draft EIR/EIS, on page 3.4-33. Startle effects related to humans are based on information contained in Appendix A of the FRA guidance manual. Please refer to comment #10260 for more information regarding FRA guidance.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4413-10266**

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter is concerned about the methodology used in the Draft EIR/EIS to assess noise impacts, the validity of the FRA noise impact criteria, and operation noise impacts to sensitive receptors, amongst other things. Please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which addresses these issues. Please refer also to response to comment #10245.

As stated in response to comment #10245, while the commenter may criticize the basis of the FRA criteria, it has suggested no alternative basis or criteria. Indeed, the Authority is not aware that any better criteria or basis has been developed. Furthermore, there is no basis for constructing a new set of criteria for one type of location, as the commenter suggests. The FRA criteria were developed for urban and suburban areas, as the commenter points out, as well as rural (see FRA Guidance Manual, e.g., Table 4-1). However, to characterize the noise environment in areas in Acton, where some HSR alignments would be above ground, as rural noise environments (as the comment does), is not correct. The existing noise levels in Acton are between 57 and 60 dBA Ldn, due largely to the proximity of SR14. These levels are above typical "rural" noise levels, which usually do not exceed 50 dBA Ldn (see Figure from Appendix B of the FTA Noise and Vibration Guidance Manual; see also FRA Guidance Manual, Appendix G). Thus, noise levels between 57 and 60 dBA Ldn are well within the range of expected urban or suburban noise levels. The commenter then remarks that the noise analysis is contrary to CEQA Guidelines 15064(b)(1) because FRA criteria are not appropriate for use with the Acton noise setting, but this is not true. FRA Criteria were developed for use in a myriad of settings, including settings like Acton where existing noise levels can be as high as 60 dBA Ldn.

One factor the commenter fails to mention is the existence of a "rail bonus." It has been well documented in research that the annoyance response to rail noise is lower to much lower as compared to other modes of transportation and the Shultz curve itself (see The Railway Noise Bonus - Discussion paper on the noise annoyance correction factor, Final Report, International Union of Railways, November 2010). While this effect has been known for some time, it was not included in the development of the FTA (and FRA)

### **4413-10266**

noise criteria; thus, likely making the analysis in the Draft EIR/EIS more conservative.

Regarding the comment referencing Attachment 3 of this comment submission, please refer to Response to Comment #10277.

Regarding the commenter's independent assessment, referred to in the comment as Attachment 1, please refer to Response to Comment #10245, which describes errors that the Authority has identified in the commenter's analysis that result in higher noise levels than those reported in the Draft EIR/EIS. Finally, please note that the SR14A Build Alternative is the Authority's preferred alternative, and the majority of the alignment would be in tunnel. There would be no noise impacts in locations with tunnels; thereby rendering the bulk of the commenter's concerns moot.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10267

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter states that the Draft EIR/EIS underrepresents noise impacts due to the Authority relying on federal thresholds. The commenter also expresses concern that Mitigation Measure N&V-MM#1 would not protect Acton residents due to the use of federal standards.

The noise and vibration assessment evaluated noise and vibration impacts from temporary construction activities for all the project alternatives. The assessment is based on the criteria and methodology contained in the FTA and FRA noise and vibration guidance manuals. Please refer to Section 3.4.4. of the Draft EIR/EIS, which provides the rationale for why the criteria used in its analysis is appropriate. In addition, please see Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which provides additional information about why the Authority has chosen to use the FRA and FTA guidance.

Because specific equipment, methods, and durations of construction activities cannot be known at this environmental review stage of the project, NV-IAMF#1 requires the Authority's construction contractor to prepare a noise and vibration technical memorandum documenting how the Federal Transit Administration and Federal Railroad Administration guidelines for minimizing construction noise impacts will be employed when work is being conducted within 1,000 feet of sensitive receivers. Although NV-IAMF#1 would reduce construction noise, noise impacts would temporarily or periodically substantially increase ambient noise levels in the project vicinity above levels existing without the project. Mitigation Measure N&V-MM#1 (discussed in Section 3.4.7 of the Draft EIR/EIS) will require the Authority's construction contractor to prepare a noise-monitoring program describing how the contractor will monitor construction noise to verify compliance with the noise limits. Mitigation Measure N&V-MM#1 includes specific actions that would be implemented to reduce construction noise. The noise-monitoring program will describe the actions required of the contractor to meet required noise limits of 80 dBA equivalent sound level (Leq) during daytime hours and 70 dBA Leq during nighttime hours. However, due to the Build Alternatives' proximity to sensitive receivers, some receivers may still experience noise in exceedance of acceptable noise

### 4413-10267

limits.

### 4413-10268

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter is concerned with startle effects on humans.

Please refer to PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which discusses operational noise impacts and the use of federal noise thresholds. Additionally, the methodology for addressing startle effects is also contained in Section 3.4.4.3. of the Draft EIR/EIS, on page 3.4-33. Startle effects related to humans are based on information contained in Appendix A of the FRA guidance manual. Please refer to comment #10260 for more information regarding FRA guidance.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4413-10269**

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter expresses concern about operational noise impacts to sensitive receptors and criticizes the noise impact methodology in the Draft EIR/EIS. The commenter asserts that the use of the FRA criteria is defective and states that conclusions in the Draft EIR/EIS are incomplete because the analysis used Ldn values. Please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, and response to comment #10245. See also response to comment #10266 for a discussion on the nonexistence of other criteria, the commenter's improper characterization of Acton's noise environment as rural, and the existence of a "rail bonus."

Finally, for the SR14A Build Alternative (the Authority's Preferred Alternative), much of the alignment would be underground, where there would be no operational noise effects; thereby rendering the bulk of the commenter's concerns moot.

### **4413-10270**

The commenter cites text from the Draft EIR/EIS indicating that the E1, E1A, E2, and E2A Build Alternatives would not impact institutional uses and states that the Draft EIR/EIS gives the impression that the E1, E1A, E2, and E2A Build Alternatives would not result in significant noise impacts on residences. The commenter requests that the Final EIR/EIS be revised to reflect that the E1, E1A, E2, and E2A Build Alternatives would result in significant noise impacts on non-institutional uses.

The noise analysis in the Draft EIR/EIS evaluates noise impacts for residences and institutional receivers separately. The summaries for the E1, E1A, E2, and E2A Build Alternatives show residential impacts from project operations, and those impacts are clearly identified in the tables and summary sections in the E1, E1A, E2, and E2A Build Alternatives operational noise assessment sections (see Tables 3.4-32 and 3.4-33 of the Draft EIR/EIS). The columns under "Number of Effects" count the number of locations where the noise level threshold is exceeded because of project operations.

The Authority completed the same analysis for institutional impacts. The text identified by the commenter (pages 3.4-89 and 3.4-98 in the Draft EIR/EIS) that no institutional impacts were identified is simply to point out that unlike the residential impacts, there are no institutional impacts. No revisions are needed in the Final EIR/EIS.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10271

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter states that the Draft EIR/EIS does not comply with NEPA due to a lack of providing noise impact assessment methodologies and significance criteria and that it relies on deficient and insupportable analyses pertaining to human and animal startle impacts.

Regarding the comment about noise impact assessment methodologies and significance criteria, the Draft EIR/EIS does include this information. Please refer to Sections 3.4.4 in the Draft EIR/EIS, which addresses both the methodologies and significance criteria used for the Draft EIR/EIS noise and vibration analysis.

Regarding the comment about startle impacts, please refer to Impact N&V#5 in the Draft EIR/EIS, which analyzes potential impacts related to startle effects, and Impact N&V#7, Noise and Vibration Impacts on Domestic Animals. Additional detail is also provided in Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

For analysis of startle effects on humans, please refer to PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which discusses operational noise impacts and the use of federal noise thresholds. Additionally, the methodology for addressing startle effects is also contained in Section 3.4.4.3. of the Draft EIR/EIS, on page 3.4-33. Startle effects related to humans are based on information contained in Appendix A of the FRA guidance manual. Please refer to comment #10260 for more information regarding FRA guidance.

### 4413-10272

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter expresses concern with the CEQA significance conclusions due to the commenter's belief that federal standards are not applicable for rural areas in assessing cumulative noise impacts, that the noise impact assessment methodologies did not properly evaluate the direct noise impacts that will result from project operations, and that the noise criteria are insupportable for assessing operation impacts on domestic animals, wildlife, and humans (i.e., startle and annoyance). Please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which discusses operational noise impacts and why it is appropriate to use federal noise thresholds. Please also refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which addresses affects to domestic and wild animals from noise.

For analysis of startle effects on humans, please refer to PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which discusses operational noise impacts and the use of federal noise thresholds. Additionally, the methodology for addressing startle effects is also contained in Section 3.4.4.3. of the Draft EIR/EIS, on page 3.4-33. Startle effects related to humans are based on information contained in Appendix A of the FRA guidance manual. Please refer to comment #10260 for more information regarding FRA guidance.

Additionally, most of the project features that comprise the SR14A Build Alternative (the Authority's preferred alternative) are located either in tunnels, where there would be no noise effects, or close to SR14, which has much higher existing noise levels than other parts of Acton. These features are in areas more like urban areas, based on the noise levels generated by traffic on the roadway. At locations where severe noise impacts have been identified, mitigation measures, as described in Section 3.4.7 of the Draft EIR/EIS, will be implemented in accordance with the CAHSR Noise Mitigation Guidelines, which are included as Appendix 3.4-C of the Draft EIR/EIS. As acknowledged in the Draft EIR/EIS, the mitigation measures may not be fully effective and sound walls would not be feasible in some locations, based on the mitigation

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4413-10272**

guidelines. For example, barriers would need to achieve between 5 and 15 dB of noise reduction and meet cost thresholds to be considered reasonable and benefit a minimum number of impacted locations. In areas where barriers are not effective or not feasible, sound insulation of buildings could be considered. Because the mitigation measures may not be fully effective, and locations exist where sound walls would not be feasible, some unavoidable adverse noise effects would result from implementation of the Build Alternatives. These residual effects following mitigation are described in Section 3.4.8, NEPA Impacts Summary and in Section 3.4.9, CEQA Significance Conclusions in the Draft EIR/EIS. Nonetheless, as shown in Figure 3.4-18 in Section 3.4, Noise and Vibration of the Draft EIR/EIS, there would be some severe and moderate noise impacts associated with portion of the Refined SR14 Build Alternative that would be at grade and elevated. However, as shown in that same figure, the SR14A Build Alternative alignment (the Authority's Preferred Alternative) would be underground through Acton, and when underground there would be no operational noise effects. As documented in the Draft EIR/EIS, the Authority's preferred alternative would not have moderate or severe operational noise impacts in Acton from operation of the SR14A Build Alternative.

### **4413-10273**

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter is concerned about operations noise impacts to sensitive receptors in the Town of Acton, specifically referencing existing railway operations, and calling into question the use of the Ldn metric for assessing noise impacts. Please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, which addresses these issues.

The commenter references the unique geography and vegetation in Acton. The noise modeling takes into account the ground type, which in this case is "soft" ground. The noise model in the Draft EIR/EIS used "soft" ground in the assessment, with the correct source heights for each component of the HSR noise, as appropriate. Hard ground is defined by ISO 9613-2-1996(E) as ground types which include paving, water, ice, concrete and all other ground surfaces having a low porosity. The same reference defines soft ground as ground types that include ground covered by grass, trees or other vegetation, and all other ground surfaces suitable for growth of vegetation. The model did not include any corrections for ground shielding, in order to be more conservative and overestimate the HSR noise levels. In response to Acton's "anecdotal evidence," which derives from observations of freight and commuter trains (given that HSR does not exist in Acton, or anywhere in California yet), please see the discussion on the differences between HSR and the freight or commuter trains that currently travel through Acton in Standard Response PB-Response-N&V-1. Notably, as stated in Standard Response PB-Response-N&V-1, freight and commuter trains can be 20-30 dB louder than HSR because of the sounding of their horns, which occurs at grade crossings throughout Acton. The HSR system, however, would be fully grade-separated in the Palmdale to Burbank Project Section and, therefore, would not have any need to sound horns regularly at grade crossings (because there would be no grade crossings). Overall, the HSR system, which will be largely underground going through Acton if the Authority selects the Preferred Alternative, will be much quieter than existing railway operations that pass through Acton. In addition, please refer to Response to Comment #10245 regarding ground effects and attenuation.

Please note that at locations where severe noise impacts have been identified,

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10273

mitigation measures, as described in Section 3.4.7 of the Draft EIR/EIS, will be implemented in accordance with the Authority's Noise Mitigation Guidelines, which are included as Appendix 3.4-C of the Draft EIR/EIS. The Authority's Noise Mitigation Guidelines outline where noise barriers would be constructed. Barriers would need to achieve between 5 and 15 dB of noise reduction and meet cost thresholds to be considered reasonable and benefit a minimum number of impacted locations. As shown in Figure 3.4-18 in Section 3.4, Noise and Vibration, of the Draft EIR/EIS, some severe and moderate noise impacts would be associated with portions of the Refined SR14 Build Alternative that would be at-grade and elevated. However, as shown in that same figure, the SR14A Build Alternative alignment (the Authority's Preferred Alternative) would be underground through Acton, and when underground there would be no noise effects. As documented in the Draft EIR/EIS, the Authority's Preferred Alternative would not have moderate or severe noise impacts in Acton from operation of the SR14A Build Alternative; thereby rendering the bulk of the commenter's concerns moot.

### 4413-10274

The commenter claims that the noise analysis is deficient under CEQA and NEPA and requests that the deficiencies be corrected in the Final EIR/EIS. Responses to specific comments raised by the commenter are addressed in Response to Comment #10245 through Comment #10277 and demonstrate that the noise analysis presented in the Draft EIR/EIS is sufficient in complying with NEPA and CEQA.

The commenter also suggests that the Authority could adopt the SR14A Build Alternative and avoid noise impacts from operations in Acton. The Authority has identified the SR14A Build Alternative as its preferred Alternative. As discussed under Impact N&V#6, the SR14A Build Alternative would result in only one moderate noise impact from Soledad Siphon to Acton Canyon Road. This is because the SR14A Build Alternate would be in a tunnel underneath the town of Acton, and noise and vibration would not be perceptible at the surface. As described, only severe noise impacts are considered significant effects under CEQA.

### 4413-10275

The commenter notes the assumptions of the noise analysis they prepared, including the assertion that it was prepared in accordance with FRA guidance. Regarding the commenter's independent assessment, referred to in the comment as Attachment 1, please refer to Response to Comment #10245, which describes errors that the Authority has identified in the commenter's analysis, which result in noise levels that are higher than those reported in the Draft EIR/EIS. Finally, please note that the SR14A Build Alternative is the Authority's preferred alternative, and the majority of the alignment would be in tunnel. There would be no noise impacts in locations with tunnels.

### 4413-10276

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter attached an Authority brochure on high-speed train noise, which is first introduced in footnote 4 of the comment submission. This attachment explains some differences between high-speed train noise and traditional train noise. For discussions on and related to this attachment, please refer to responses to comments #10245 and #10273 and Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

## Response to Submission 4413 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4413-10277

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

This comment consists of an attachment containing excerpts of a letter sent from the Acton Town Council to the Authority in 2016. This attachment was first introduced in comment #10266 of this submission as Attachment 3. In this previously submitted material, the commenter is concerned about the validity of the FRA noise impact criteria and about operation noise impacts to sensitive receptors, amongst other things. Please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors and responses to comment #10245 and #10266 which address this and other issues, including the commenter's inaccurate independent assessment of impacts.

The comment also discusses several publications that appear in Section A.3 of the FRA Guidance Manual as "Relevant Literature" and argues that these publications only reflect an urban noise environment and, therefore, do not reflect the noise environment in Acton, and, seemingly, that because the FRA Guidance Manual's noise impact criteria are supposedly based on these publications, those criteria are not applicable to the Town of Acton. This logic, however, is flawed. First, the publications discussed by the commenter are not the totality of the literature consulted by the FRA when developing its criteria—they are noted in the FRA Guidance Manual as only "particularly relevant" but not as the definitive and dispositive resources for the creation of FRA guidance (FRA Guidance Manual, p. A-12). Indeed, the FRA Guidance Manual contains references to many other noise assessment resources within the body of the document (not relegated to an appendix) that the commenter does not discuss (see, e.g., footnotes on pp. 1-1, 2-1, 2-6, 2-8, 2-13, 2-14, 4-12, 5-6, 5-10, 5-13, 6-39). Second, some of the publications discussed by the commenter, per its assessment in this attachment, look at noise environments with existing noise levels that fall below the existing noise environment in Acton, which is between 57 and 60 dBA Ldn (see response to comment #10266). For example, per the commenter, the "Schultz Curve" included noise environments with levels as low as 45 dBA Ldn. The "U.S. EPA 'Levels Document'" also looked at environments with existing noise levels at similarly low levels. This leads to the third flaw in the commenter's logic, the Acton noise environment does not align with standard rural

### 4413-10277

noise environments. For a discussion on this, please refer to response to comment #10266. Regardless, as stated in Standard Response PB-Response-N&V-1, "[t]he criteria are based on the best available data on human response to both absolute noise levels and changes in noise levels and are appropriate for urban, suburban, and rural areas."

The comment then asserts that the Authority has not developed credible noise impact criteria for assessing HSR impacts on animals. For a response to this comment, please refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife. Please note that the commenter's statement that "ALL of the proposed HSR alignments in Acton travel above ground through and over [domestic animal] facilities" is incorrect. The majority of the SR14A Build Alternative (the Authority's Preferred Alternative) would be underground.

In response to the comment that the Draft EIR/EIS is required to include noise contour maps, please refer to Standard Response PB-Response-N&V-1.

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

**ANALYSIS OF THE “PUBLIC UTILITIES AND ENERGY” SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT.**

4414-8402

**1.0 INTRODUCTION**

The utilities and energy impact assessment presented in Chapter 3.6 of the Draft Environmental Impact Report/Environmental Impact Statement (hereafter referred to as “the Draft”) that was prepared by California High Speed Rail Authority (“CHSRA”) and the Federal Railway Administration (“FRA”) for the Palmdale-Burbank Segment of the High Speed Rail Project (“Project”) has been evaluated and numerous material deficiencies, factual errors and other substantial insufficiencies have been identified. These deficiencies, errors, and insufficiencies are set forth in the comments provided below; they demonstrate that the Draft does not comply with either the California Environmental Quality Act (“CEQA”) or the National Environmental Protection Act (“NEPA”). Please note: These comments were prepared by a competent engineer with more than 35 years of environmental engineering experience and they present expert opinion supported by fact pertaining to the significant environmental effects that will be caused by the Project and which must be mitigated. Accordingly, the comments provided herein constitute “substantial evidence” as that term is defined by the CEQA Statute [California Public Resources Code §21080(e)(1)] and Guidelines [California Code of Regulations Section 15064(f)(5)]. These comments also demonstrate that CHSRA/FRA have failed to conduct a substantive ‘hard look’ review of the Project’s environmental impacts as required by NEPA.

**2.0 MAJOR DEFICIENCIES NOTED IN THE DRAFT**

4414-8403

**2.1 The Draft Fails to Properly Account for Project Water Sources and Water Supply.**

All of the alternative routes proposed for the Project will involve extensive tunnel construction and require significant volumes of water to cool the drill heads, transport “spoils”, and maintain necessary equipment operations. Construction at each tunnel portal will require two Tunnel Boring Machines (“TBMs”) operating in parallel to produce the twin tunnels that are necessary to accommodate the 462 train trips per day that are projected to occur between Palmdale and Burbank<sup>1</sup>, and according to Page 3.6-78 of the Draft, each TBM will require 366 acre-feet per year (approximately 1 acre-foot per day). The SR14A and Refined SR14 route alternatives will involve four TBMs operating simultaneously in Acton and Agua Dulce and all the “F-Route” alternatives will involve two TBMs operating simultaneously from Acton<sup>2</sup>; accordingly, Project water demand during construction in Acton and Agua Dulce will be at least 732 acre-feet per year, and could be as much as 1,464 acre-feet per year. Both NEPA and CEQA

<sup>1</sup> Page 3.4-23 states (with emphasis added) “For the Palmdale to Burbank Project Section, it is assumed that there would be 189 trains per day in each direction during the daytime hours (7:00 a.m. to 10:00 p.m.), 28 trains per day in each direction during the nighttime hours (10:00 p.m. to 7:00 a.m.), and 14 trains in each direction during the peak hours”; these data indicate that 231 daily train trips are projected to occur in each direction. Therefore, the Project will result in 462 train trips through Acton each day.

<sup>2</sup> The SR14A alternative and the Refined SR14 alternative will have two TBMS drilling from Acton towards Palmdale and two TBMs drilling from Agua Dulce towards Acton; all the “E-Route” alternatives will have two TBMs drilling from Acton towards Burbank.

4414-8403

require that CHSRA properly account for all the water resources needed for the Project and address the environmental impacts resulting from obtaining these water resources and distributing them throughout the project area; unfortunately, the Draft does not meet this requirement.

**2.1.1 The Draft Incorrectly Presumes that Sufficient Water Resources will be Available from the State Water Project for Tunnel Construction in Acton and Agua Dulce.**

Table 3.6-21 of the Draft asserts that project construction on the Central section (where the Communities of Acton and Agua Dulce are located) will rely on water resources supplied by the Antelope Valley-East Kern Water Agency (“AVEK”) and according to Table 3.6-10, AVEK obtains water allocations from the State Water Project (“SWP”) to serve an average annual water demand of 56,400 acre-feet per year. Additionally, Table 3.6-21 asserts that AVEK can supply its customers with 46,750 acre-feet of water under “Single Dry Year” circumstances and 74,350 acre-feet under “Multiple Dry Year” circumstances; these data suggest that it is reasonable to infer that AVEK is capable of supplying all the water required for project construction activities in Acton and Agua Dulce. However, the data presented in Tables 3.6-10 and 3.6-21 are incorrect; in fact, for the last several years, AVEK has only received 7,242 acre feet per year from the SWP, which is only 5% of the allocation it is supposed to receive<sup>3</sup>. Furthermore, the meager allocation that AVEK receives each year is already largely subscribed by the hundreds of thousands of customers in East Kern County and North Los Angeles County that AVEK already serves. In other words, the AVEK water resources which the Draft asserts will be available for Project construction do not actually exist and, contrary to what is presumed in Tables 3.6-10 and 3.6-21, AVEK does not demonstrably have the water resource capacity required to supply the nearly 1,500 acre-feet per year needed to construct the preferred SR14A Alternative.

Page 3.6-77 presents conclusions regarding water supply impacts created by the Project which suggest that CHSRA appears to understand that AVEK does not reliably receive water allocations from the SWP and that AVEK may not have water resources that are sufficient to serve CHSRA’s construction needs (particularly during “dry years”) because it states “the impact from construction water demand is conservatively assumed to result in a significant impact under CEQA”. Unfortunately, the mitigation measure that addresses this significant impact (which is referred to as PUE MM#1 and merely consists of developing a plan after the Project is approved and securing additional water allocations from water agencies<sup>4</sup>) is completely infeasible and therefore deficient. For instance, SWP allocations are restricted by State Law and are based on extant environmental circumstances in the Sacramento Delta; thus, it is impossible for CHSRA to unilaterally obtain additional water supply allocations from the SWP. PUE MM#1

<sup>3</sup> <https://www.avek.org/dwr-announces-5-allocation-for-swp-contractors>. AVEK does not have higher water allocations during “Multiple Dry Years” than “Single Dry Year”; Department of Water Resources cuts water allocations with successive “Dry Years”. Accordingly, Table 3.6-21 can be accorded no weight.

<sup>4</sup> PUE MM#1 states “The Authority will prepare an updated water supply analysis for the selected Build Alternative that identifies the detailed water supply needs for construction. Based on the results of this water supply analysis, the Authority would coordinate with relevant water agencies to determine if allocations for additional water supply are needed for construction. In the event that additional water supply is needed from the State Water Project, the Authority shall pay the water agencies its fair share of the State Water Project fees (per acre-foot of their allocations), which are used for constructing and operating the State Water Project conveyance facilities. In addition, the Authority will be required to utilize non-potable water during construction, to the extent feasible.” (Page 3.6-90).

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4414-8403

also presumes without basis that the SWP has excess water resources which will be made immediately available to CHSRA upon request, when in fact nothing could be further from the truth. In other words, *CHSRA cannot purchase water allocations that do not exist*. Moreover, if CHSRA uses some sort of preemptive power to force water agencies to sell water which is intended for residential and municipal purposes, this will produce profound water shortages on the communities that have had their water “co-opted” for Project construction purposes. In short, implementing mitigation measure PUE-MM#1 by compelling AVEK to provide water for Project construction will result in significant environmental impacts on the municipal water customers who will have their water service cut by AVEK; these impacts are completely ignored by the Draft, therefore PUE-MM#1 is deficient and does not comply with CEQA or NEPA.

PUE-MM#1 also establishes that CHSRA will be **required** to utilize non-potable water for tunnel construction “to the extent feasible”; this means that AVEK water will not be used for tunnel construction in Acton and Agua Dulce. The Draft fails to explain the contradictions this mitigation measure contains (stating on the one hand that AVEK water will be used, and on the other, that groundwater will be used). It also does not describe what these non-potable water sources are and it certainly provides no indication of what factors will be considered in determining the “feasibility” of using non-potable water resources. Non-potable water generally comes from two sources: partially treated municipal (sewage) wastewater or untreated groundwater extracted from local groundwater basins. If the former is used for tunnel construction, it will result in the direct injection of partially treated sewage water into the ground where it will contaminate (and thus have significant adverse impacts on) all the aquifers, perched water, and other groundwater resources that the tunnel passes through. The Draft is substantially deficient because it fails to address the significant environmental impacts that this would have on local groundwater quality and the rural residents with residential wells who rely on these groundwater resources for drinking water. Notably, there are no municipal wastewater facilities located in Acton or Agua Dulce or anywhere else in the vicinity of the 20+ mile long HSR routes proposed between Palmdale and Santa Clarita; so, there are no sources of partially treated municipal wastewater available for most of the Central section of the Project. Accordingly, it can only be concluded that local groundwater resources will be tapped to supply the non-potable water that is referenced in PUE-MM#1 for tunnel construction in Acton and Agua Dulce; this will involve constructing new groundwater extraction facilities and increasing groundwater extraction rates in the communities of Acton and Agua Dulce which, as discussed below, will introduce new and significant stresses on local groundwater supplies and directly affect well yields in rural communities where residents rely on individual domestic wells. Moreover, the groundwater quality in certain areas of Acton and Agua Dulce is highly variable and several areas experience high nitrate and arsenic levels which exceed adopted water quality standards<sup>5</sup>; if groundwater containing high nitrate or arsenic levels is utilized for tunnel construction, then nitrate contamination will occur in all the aquifers, perched water, and other groundwater resources through which the tunnels pass. Furthermore, using local groundwater resources to construct the E1, E1A, E2, and E2A routes at the “window” proposed on property owned by The Nature Conservancy in Soledad Canyon will have a profound effect on riparian

<sup>5</sup> Nitrate concentrations extracted from local municipal wells in Acton are reported in Attachment 1. Also, arsenic is found in Agua Dulce groundwater (in fact, “Agua Dulce” or “sweet water” in Spanish is an historic term for water contaminated with arsenic. A study conducted by the Los Angeles County Health Department indicates many wells in Agua Dulce have detectable levels of arsenic and in some wells, the presence of Arsenic exceeds the MCL of 10 ppb [<http://file.lacounty.gov/SDSInter/hos/supdocs/65110.pdf>].

3

4414-8403

habitat and vernal pools in the Santa Clara River. In other words, mitigation measure MM PUE#1 is both impractical and infeasible because it 1) Relies on AVEK water resources that do not exist; and 2) it will result in significantly adverse environmental impacts to local groundwater levels, groundwater quality, and rural drinking water resources. Moreover, none of these impacts are even mentioned in the Draft and they are certainly not addressed as required by CEQA and NEPA. The only way to avoid these impacts is to adopt a mitigation measure which asserts that Project construction will not rely on local groundwater resources and that tunneling will only be conducted using AVEK water resources during years when AVEK has water allocations which exceed their customer demand.

*2.1.2 The “Utilities Relocation Plans” Provided by the Draft Contradicts the Draft’s Claim that AVEK Water Will be Used for Tunnel Construction in Acton and Agua Dulce.*

The intention expressed in Table 3.6-21 that construction on the Central section of the Project (where the Communities of Acton and Agua Dulce are located) will rely on AVEK water resources is utterly controverted by the “Utility Relocation Plans” presented in Volume 3 of the Draft which clearly demonstrate that CHSRA does not intend to utilize AVEK’s water resources for constructing the central portion of the Project. Specifically, the “Utility Relocation Plans” definitively establish that CHSRA does not plan to connect to any AVEK facilities; they further indicate that local groundwater resources will be used for constructing all the Route Alternatives in Acton and Agua Dulce. For instance, Sheet UT-C4024-14A and Sheets UT-C4066-14A through UT-C4068-14A of the “Utility Relocation Plan” indicate that the water line serving the “Acton Window” construction site for the SR14A Alternative will originate in downtown Acton near an existing small waterline operated by Waterworks District 37 that connects to a local municipal well in the floodplain; there is no AVEK connection in downtown Acton. In fact, the nearest AVEK connection is located approximately 5 miles northwest of downtown Acton, and according to Sheet UT-C4013-14A, CHSRA does not intend to construct any water connections at that location. Similarly, Sheet UT-C4039-14A and Sheets UT-C4084-14A through UT-C4088-14A demonstrate that the water line that will serve the TBMs operating from the portal east of Agua Dulce Canyon Road to construct the SR14A and Refined SR14 Route alternatives will not connect to AVEK either; instead, the water line originates in the middle of Agua Dulce along Escondido Canyon Road. Sheets UT-C4031-E2, UT-C4032-E2, and UT-C4543-E2 through UT-C4547-E2 demonstrate that the water that will be used to operate the TBMs at the “Arrastre Canyon Window” location in South Acton for constructing all the “E” Route Alternatives will not come from AVEK either; instead, CHSRA will construct two new 16 inch water lines that originate at a location adjacent to the Santa Clara River floodplain near the intersection of Crown Valley Road and Arrastre Canyon Road where Waterworks District 37 has a small 12 inch water line that connects to a local municipal well to serve its customers. In other words, all of the “Utility Relocation Plans” presented in the Draft demonstrate that project tunneling and construction in Acton and Agua Dulce will rely on local groundwater resources either directly (by extracting water from the local basin) or indirectly (by connecting to Waterworks District 37 facilities that extract water from the local basin); this blatantly contradicts all the assurances provided in Section 3.6 that AVEK water resources will be used for tunnel construction in Acton and Agua Dulce. These contradictions provide abundant basis for legal challenge. It is not clear why Section 3.6 of the EIR/EIS substantially misrepresents material facts regarding the water resources that will be used for Project construction; the subterfuge is far too substantial to be a mere error. What is certain is that, the Draft neatly sidesteps the obligation imposed by CEQA and NEPA to assess potential environmental impacts

4

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4414-8403

on local groundwater quality, groundwater basins, and riparian habitat by declaring that Project construction along the Central section will rely on AVEK resources. This deception is unacceptable and substantial revisions are required to bring the Draft into compliance with CEQA and NEPA; the revisions must properly address the following significant environmental impacts that will result from using local groundwater for tunnel construction in Acton and Agua Dulce:

*Impacts to groundwater levels:* Many domestic well yields in Acton and Agua Dulce have been reduced over the last few years because of persistent drought conditions, thus extracting an additional 1,500 acre feet per year from local basins will further exacerbate these problems. This constitutes a significant environmental impact on all residents of Acton who rely on domestic residential wells for drinking water. The most recent complete hydrology study of the Acton groundwater basin is provided in Attachment 2 and is referred to hereafter as the “Slade Report”; it was conducted decades ago and thus does not reflect the severe drought conditions that Acton has experienced since 2008. According to the Slade Report, during years when precipitation occurs, the Acton drainage area can provide a groundwater recharge rate of 5,200 acre-feet per year or more. Unfortunately however, much of this groundwater recharge is already fully subscribed. For instance, and as indicated in Attachment 3: Waterworks District 37 has historically extracted up to 2,000 Acre-feet per year; it has also informed the community that it wishes to extract an additional 1,000 acre-feet pe year. Our local water hauling businesses that supply drinking water to residents who have dry or inoperable wells extract approximately than 400 acre-feet per year<sup>6</sup>. According to data obtained from the Los Angeles Regional Water Quality Control Board, the local “1000 Trails Campground” extracted approximately 400 acre-feet during 2020 when it was operating at only 25% because of COVID; at full operation, this campground (which is authorized to accommodate more than 10,000 campers<sup>7</sup>) will easily extract more than 1,200 acre-feet per year. Several thousand Acton residents rely on private domestic well that also pull from the Acton groundwater basin; these users are estimated to extract an additional 1,000 acre-feet per year. In total, these existing users in Acton’s groundwater basin already use at least 5,100 acre-feet per year (2,000 from WWD37, 400 from the water haulers, 1200 from “1000 Trails” and 1,000 from domestic residential wells); thus, there is little excess capacity in the local groundwater basin to serve the Project’s construction needs even during years when precipitation occurs. These statistics clearly demonstrate that there will be insufficient groundwater available to sustainably provide the water resources required for tunnel construction in Acton even during years when precipitation occurs; they also demonstrate that, under the drought conditions that Los Angeles County has experienced for the last 10 years<sup>8</sup>, there is not even sufficient groundwater recharge to sustain existing uses. Accordingly, if the Project that CHSRA advances does rely on groundwater extraction to support tunnel construction in Acton and Agua Dulce, the EIR/EIS must be revised to include 1) a complete and accurate hydrology study of the Acton basin and

<sup>6</sup> The Conditional Use Permits (“CUPs”) Issued to the Acton Water Company and the Lunde Water Company in 2021 limit each water hauler’s extraction rate to 133 acre-feet per year. The Carson Water Company CUP is still pending, but it is assumed that it will also be limited to 133 acre-feet per year. Thus, the water haulers are presumed to collectively extract no more than 399 acre-feet per year from Acton.

<sup>7</sup> The CUP issued for the “1000 Trails” Campground authorizes more than 1,100 campsites and permits 10 campers per site.

<sup>8</sup> See the “U.S. Drought Monitor Map” for Los Angeles County provided in Attachment 4.

4414-8403

the Agua Dulce basin that is based on projected drought conditions resulting from climate change and accounts for all existing uses in these basins; and 2) a detailed assessment of the effects that Project construction will have on groundwater levels in the Acton basin and the Agua Dulce basin.

*Impacts to Residential and Municipal Wells in Acton and Agua Dulce:* The results of the hydrology study described above must be used to assess the significant environmental impacts that the Project will have on residential and municipal well operations and local groundwater quality profiles. For instance, according to the statistics presented above, the Project will adversely impact local well yields because it will extract an unsustainable amount of groundwater from the basin; this concern must be addressed. Also, because the Project will essentially “compete” with domestic and municipal wells for scarce groundwater resources, it could result in contaminant migration within the basin which may cause local wells that currently produce relatively clean and potable groundwater to produce less clean (and perhaps even undrinkable) water. Also, the Project could introduce new contaminants into new locations where contaminants currently do not exist; this circumstance would result from tunnel construction using non-potable groundwater extracted from areas that have high levels of nitrates, arsenic, or other contaminants. All of these impacts must be fully and properly addressed and mitigation measures offered.

*Impacts to Perennial Streams and Riparian Habitat:* Because the Project will re-locate groundwater from the extraction location to a tunneling location far downgradient, it has the potential to significantly impact ephemeral and perennial streams in the Acton-Agua Dulce area which will in turn affect riparian habitat and the endangered Unarmored Three Spine Stickleback in Arrastre Canyon and the threatened Red-Legged Frog in Aliso Canyon [50 CFR § 17.11]. All of these impacts must be fully addressed and proper mitigation measures offered.

*Avoiding These Impacts:* It would be preferable for the Project to simply avoid all the impacts described above rather than develop strategies to mitigate them. This can be easily achieved by 1) Revising PUE-MM#1 to preclude the use of local ground water and non-potable water resources for tunnel construction in Acton and Agua Dulce; and 2) by revising all the “Utility Relocation Plans” to show that the water lines constructed to serve all tunnel portals in Acton and Agua Dulce are connected exclusively to AVEK facilities.

*2.1.3 Recent Statements by CHSRA Staff Assert that Local Groundwater will be Used Instead of AVEK Water Resources for Tunnel Construction in Acton and Agua Dulce.*

At a meeting that occurred on November 4, 2022 between members of The Nature Conservancy, local landowners, and CHSRA engineers and representatives, it was announced that CHSRA will **not** rely on AVEK water for constructing the tunnels in Acton and Agua Dulce and that local groundwater resources will be utilized instead. This was a shocking announcement which utterly contradicts the analysis presented in Section 3.6 of the Draft; it was apparently motivated by the belief that it would be a “waste” to use clean water to operate the TBMs and that local residents do not wish CHSRA to use AVEK water for tunnel construction. CHSRA’s announcement that tunnel construction in Acton and Agua Dulce will rely on groundwater resources also appears to have been made without regard for, or an understanding of, the impacts to local groundwater basins that will result from extracting nearly 1,500 acre-feet of groundwater per year (as described above). This is all exceedingly untenable,

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4414-8403

and contradictions between CHSRA’s statements and the Draft must be resolved in the Final EIR/EIS in a manner which affirms without equivocation that only AVEK water resources will be used for tunnel construction in Acton and Agua Dulce. The Final EIR/EIS must also address the impacts that this will have on AVEK’s customers if AVEK’s allocation of SWP water resources is insufficient to serve the Project and all of AVEK’s existing customers.

*2.1.4 The Draft Fails to Address the Growth Inducing Impacts of the Extensive Water Distribution Facilities that will be Extended into Undeveloped Areas.*

The Project will result in the construction of extensive new water distribution facilities and water infrastructure throughout numerous undeveloped and underdeveloped areas in the Communities of Acton and Agua Dulce, and CHSRA has asserted publicly that these facilities would be made available to the County Waterworks District to supply water for development projects. For instance, the two 16-inch water lines that are proposed for construction of all the “E” Route Alternatives in Acton will have the capacity to carry more than 3 million gallons of water per day through an area that has remained largely undeveloped due to limited water supplies. If these water lines are turned over to the local waterworks district after Project construction, they can (and will) be used to support new development. Accordingly, the water infrastructure required for Project construction will have growth inducing impacts in the rural communities of Acton and Agua Dulce; CEQA and NEPA demand that these growth inducing impacts be addressed, but they are completely ignored by the Draft. This deficiency must be corrected and the Draft revised to address these impacts.

4414-8404

**2.2 The Draft Fails to Consider Project Impacts to Private Water Systems.**

The Draft fails to adequately address potential impacts to private drinking water systems or residential well facilities<sup>9</sup> even though CHSRA received hundreds of public comments at public workshops, meetings, and in written scoping comments which expressed concerns regarding impacts to private well systems and requesting that these impacts be addressed. The Project threatens private water systems in three different ways: 1) it will result in reduced groundwater levels if Project construction relies on local groundwater resources; 2) tunnel construction can actually destroy a well shaft and well infrastructure and render a domestic well inoperable; and 3) tunnel construction can alter the configuration of groundwater and perched water resources and in turn cause a domestic well to “dry up”. It is *astounding* that the Draft does not properly consider the domestic well concerns that were clearly expressed in extensive public comments made by many Acton and Agua Dulce residents and does not offer any mitigation measures to address them. These deficiencies are also discussed in detail in comments we have submitted in response to Section 3.8 “Hydrology and Water Resources” (which are hereby incorporated herein by reference and made a part hereof<sup>10</sup>). The Draft must be revised to incorporate the following elements to address the significant environmental impacts that the Project will have on private water systems and residential wells: 1) A clear

<sup>9</sup> The impacts contemplated by the Draft are summarized on pages S-58 through S-82 of the Executive Summary; none of the impacts address private water systems or residential wells.

<sup>10</sup> Comments titled “ANALYSIS OF THE “HYDROLOGY AND WATER RESOURCES” SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT”, pages 5-8.

4414-8404

statement that there is insufficient evidence to conclude that the impacts of tunnel construction on private water systems, residential wells, and groundwater resources in Acton and Agua Dulce will be less than significant; and 2) A mitigate measure to address the impacts of tunnel construction on private water systems, residential wells, and groundwater resources in Acton and Agua Dulce which includes an “Adaptive Management and Monitoring Plan” (“AMMP”) that establishes protocols to determine baseline conditions of ground water levels at all wells in Acton and Agua Dulce that are located within 1/2 mile of any tunnel and detects changes in groundwater conditions at these locations which are related to tunnel construction to ensure timely implementation of remedial measures; these remedial measures must include supplying supplemental water to all affected well owners until baseline levels are restored or drilling new wells that comply with all applicable local and state requirements.

The primary purpose of “Scoping” in both CEQA and NEPA is to inform the Lead Agency regarding significant impacts of a Proposed Project that are not addressed or set forth in the Notice of Intent; accordingly, the Lead Agency is supposed to identify these impacts in the environmental review, assess their significance, and mitigate them. The Draft makes no mention of the residential well impact concerns raised by the public during Project Scoping and it certainly does not offer any mitigation measures. The Final EIR must correct these substantial CEQA and NEPA violations by 1) clearly identifying the adverse impacts that Project construction will have on residential wells; 2) establishing a “threshold of significance” in which the impact is considered significant if a single well is affected by project construction; and 3) adopting the mitigation measure described to groundwater levels and well yields and for all wells within 1/mile of reduce impacts on private water systems, residential wells, and groundwater resources in Acton and Agua Dulce to a level that is less than significant.

4414-8405

**2.3 The Draft Improperly Directs the Project’s Stormwater Runoff Facilities to be Used for Wastewater Treatment.**

The Draft address wastewater impacts during construction on pages 3.6-78 to 3.6-79, and it concludes that wastewater impacts will be less than significant because two “impact avoidance and minimization features” (HYD-IAMF#1 and HYD-IAMF#3) will be implemented and because the project will adhere to applicable dewatering regulation permitting requirements; this will ensure that “dewatering discharges during construction would not contribute to exceedances of water quality standards”. This conclusion is erroneous for several reasons. First, HYD-IAMF#1 and HYD-IAMF#3 apply to stormwater runoff and require the development of stormwater management facilities and the implementation of a “Stormwater Pollution Prevention Plan” (SWPPP)<sup>11</sup>; they are not relevant to, and have nothing to do with, wastewater treatment. Stormwater is merely rainwater that lands on the earth and flows downhill, and in rural communities like Acton where there are few impervious areas, stormwater is generally clean with few contaminants other than sediment. Wastewater on the other hand is process water that is contaminated with oils, chemicals, and other constituents

<sup>11</sup> HYD-IAMF#1 is “Stormwater Management—This IAMF describes the Authority’s commitment to coordinate with the contractor to prepare a stormwater management and treatment plan, prior to construction” and HYD-IAMF#3 is “Prepare and Implement a Construction Stormwater Pollution Prevention Plan—This IAMF describes the Authority’s commitment to coordinate with the contractor to comply with the SWRCB Construction General Permit requiring preparation and implementation of a SWPPP, prior to construction (ground disturbing activities). See page 3.8-11.

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4414-8405

and it generally requires substantially more processing than rainwater to render it clean. In other words, “wastewater” and “stormwater” are two very different and completely unrelated project impacts that the Draft has improperly conflated; CHSRA cannot rely on the relatively small capacity of, and the limited treatment capabilities provided by, the Project’s stormwater management facilities or its SWPPP to treat the significant wastewater volumes that will be generated at each tunnel portal location. For example, consider the “Acton Window” location that will occupy approximately 330,000 square feet; the capacity of the stormwater runoff facilities that will be required to accommodate a “1 inch” rain event at this location is only 27,500 cubic feet; this is a small fraction of the 130,000 gallons of wastewater that will be generated every day during tunnel construction at the “Acton Window”<sup>12</sup>. In other words, stormwater treatment facilities do not have either the capacity or the infrastructure required to properly clean the significant volumes of process wastewater that will be generated during construction; accordingly, the Draft errs in presuming that stormwater treatment facilities will mitigate wastewater impacts to a level that is “less than significant”.

Second, meeting water quality standards is not the only factor that is relevant to determining whether wastewater impacts during construction will be less than significant; this is particularly true in rural areas where adverse impacts on downstream properties can be significant if the character, location, or flowrate of either stormwater or wastewater discharges result in new runoff patterns/conditions. The “Best Management Practices” (BMPs) and SWPPP measures that are described on page 3.6-79 may be perfectly reasonable for treating stormwater runoff in urban areas where the land surface is almost completely impervious and where extensive concrete drainage facilities capture and divert stormwater to large concrete-lined channels which carry the water to the ocean, but they are entirely inappropriate in rural communities like Acton where nearly all the roads are dirt and where natural drainage courses are relied upon almost exclusively because runoff infrastructure is virtually non-existent (as discussed in more detail below). The BMP described on page 3.6-78 is particularly alarming because it states that CHSRA will “minimize discharges of sediment” from all the tunnel construction sites; this means that CHSRA will discharge clean, “sediment free” wastewater and stormwater into the natural drainages surrounding the construction sites in Acton and Agua Dulce. These “sediment free” discharges will flow into the adjacent natural drainage courses and pick up sediment as they gain speed and flow toward the Santa Clara River<sup>13</sup>. Because this “sediment free” water will pick up sediment as it flows, it will cause significant erosion on the properties that are downstream of all tunnel portal and “window” construction locations. This will pose significant adverse erosion impacts on structures and residences located downstream of Project construction sites. For example, and as indicated on Sheets UT-C44023-14A and UT-C44024-14A, the “Acton Window” construction site is adjacent to, and immediately uphill from, an entire residential neighborhood and, as indicated in the drainage map provided in Attachment 5, there are several drainages across the “Acton Window” site that pass very close to the homes that are immediately south of, and downhill from, the construction site. If the BMPs

<sup>12</sup> Two TBMs will be operating from the “Acton Window”, and according to page 3.6-78, each TBM will require 366 acre-feet per year; this will result in 653,500 gallons per day used at the “Acton Window”. According to page 12 of Appendix 3.8-D, 20 percent of this water (or 130,700 gallons per day) will flow back and require treatment as contaminated wastewater.

<sup>13</sup> This is the principal characteristic of “two phase flow” conditions: clean water flowing over a natural surface will pick up sediment from the surface until an equilibrium is reached; the equilibrium is a measure of the sediment transport capacity of the flow.

4414-8405

and SWPPPs described in the Draft are employed at the “Acton Window” site, then the drainage channels adjacent to these homes will be widened by erosion to such an extent that these homes will be substantially damaged. Similar problems are likely to occur at other tunnel and “window” construction sites located in rural residential areas. Accordingly, CHSRA must not utilize the BMPs and SWPPP measures that are described in the Draft in rural communities like Acton; instead, they must devise new BMPs for rural areas which provide discharges with sediment levels that are at equilibrium to prevent erosion on downstream properties.

**2.4 The Draft Does Not Properly Describe Stormwater Runoff Characteristics in Rural Areas or Accurately Portray Conditions in Acton and Agua Dulce.**

The Draft asserts on page 3.6-51 that “Generally, storm drain systems are more prominent in developed urban areas. In rural areas, roadside ditches, irrigation canals, and natural drainages convey stormwater runoff.” This description of storm runoff characteristics in rural areas does not clearly reflect circumstances in most of Acton. Runoff patterns in much of Acton have remained unchanged for millennia; stormwater is typically sediment laden (because Acton is surrounded by mountains and most roads are dirt, thus rainwater runoff picks up and carries sediment down the hillsides to the Santa Clara River), it is generally not “conveyed” anywhere (because it flows naturally toward the Santa Clara River) and drainage paths in Acton are not irrigation canals or roadside ditches (though in some places the flood plain and drainage paths are adjacent to paved roadways). In a few areas, concrete v ditches have been installed to direct stormwater flows, but such facilities have caused terrible erosion problems on downhill properties because they remove sediment from the runoff and release “clean” water which picks up sediment as it flows downhill and thus erodes downhill properties (the Forecast Home development along Desert Road is an area where this is a particular problem).

Drainage patterns have generally dictated where development has occurred in Acton over the last 135 years; thus, to protect existing developments, it is critical that drainage patterns and characteristics remain unchanged. This, coupled with the fact that the only forces which alter drainage patterns in Acton are development and earthquakes, is why the community generally opposes stormwater “conveyance” facilities and works diligently to ensure that developments do not alter runoff patterns or characteristics. There are culverts under a few paved roads (the 14 Freeway, Escondido Canyon Road, Sierra Highway, and Soledad Canyon Road) but these culverts are located where natural flows occurred before the roads were built and they do not have sediment removal facilities; they simply carry sediment laden flows from one side of the road to the other and do not cause erosion or generally alter flow patterns. It is particularly important that the Final EIR clearly assert that the Project will not alter any stormwater runoff patterns or characteristics in Acton because of the devastating impact that such alterations would have on downstream properties. This is particularly true for the “Acton Window” location that will be constructed under the “preferred” SR14 A alternative because the residential neighborhood located just south of, and downhill from, the location has been configured with dirt roads and designed to accommodate existing flow patterns and characteristics. Any increase in flowrate or change in flow pattern will threaten these homes with inundation, and any decrease in sediment levels will threaten these homes with erosion. As indicated in the drainage map for this location provided in Attachment 5, homes are located near natural drainage swales that have not changed in many decades; the EIR must clarify that these drainage patterns and characteristics will be preserved.

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4414-8406

**2.5 The Energy Impact Analysis Provided by the Draft is Substantially Deficient and Violates Both CEQA and NEPA.**

Various statements and conclusions regarding electrical generation capacities, transmission capacities, natural gas capacities, and other “energy issues” are spread throughout Section 3.6 of the Draft, but they are internally inconsistent, rambling, and fail to address salient issues required by CEQA. For instance, the section titled “Existing Electric Power Generation Capacity” states that, as of 2017, California had an installed in-state generation capacity of 292,039 GWhr. However, this is contradicted by the paragraph above this section which indicates that, in 2016, California’s in state generation capacity was only 195,027 GWhr (70,857 GWh from governmental and utility-owned in-state facilities and 124,170 GWh from commercial in-state generation facilities). It is known with certainty that the State of California did not add more than 100,000 GWhr of generation capacity between 2016 and 2017, so one of the values reported by the Draft is erroneous. It is assumed that the error is in the 292,039 figure which appears to represent “Nameplate” generation capacity rather than *actual* generation capacity. CEQA requires that a discussion of the energy demand and energy resources that are required to support a Project be realistic and “actual”; thus, CEQA conclusions pertaining to energy issues should never be based on “nameplate” generation capacity. This is particularly true for renewable resources which typically have “nameplate” generation capacities that are much higher than their *actual* generation capacities<sup>14</sup>.

Section 3.6 also fails to provide the information required to conduct a thorough CEQA and NEPA energy impact analysis; it also fails to assess whether Project operations can be accommodated by existing and planned generation resources or whether it will affect statewide electricity reserves and transmission capacity or whether Project operation will require the addition of more generation and transmission capacities than what is already planned. This is particularly important given that CHSRA has stated that the Project will operate using 100% renewable energy; this will be very challenging given that there are insufficient renewable resources available to serve existing and projected energy demand (let alone satisfy the Project’s energy requirements). The Draft must be revised to include a renewable energy assessment that complies with CEQA and NEPA; this will require an analysis of the following factors: 1) A realistic assessment of what the projected “non-Project” electrical generation capacity will be when the Project comes on line and when it is operating at “full buildout”; 2) A realistic assessment of what the projected “non-Project” electrical demand will be when the Project comes on line and when it is operating at “full buildout”; and 3) A realistic assessment of the Project’s electrical demand when it comes on line and when it achieves full buildout. These factors must be reconciled to assess whether Project operations will require additional renewable generation beyond what is planned. It is likely that this analysis (if properly conducted<sup>15</sup>) will reveal that there will not be sufficient renewable generation capacity available

<sup>14</sup> A 1 MW wind turbine can theoretically generate 8,760 MWhr/year; thus, it has a very high “nameplate” generation capacity. However, high winds do not always blow and mechanical equipment is not always efficient; so the *actual* generation capacity of a wind turbine is much lower than the nameplate capacity. Many windturbines have capacity factors  $\leq 30\%$  [[https://windexchange.energy.gov/maps\\_data/332](https://windexchange.energy.gov/maps_data/332)].

<sup>15</sup> Specifically, the “non Project” electrical demand (factor 2) should be added to the Project’s expected electrical demand (factor 3) and this sum should be compared to the projected “non-Project” electrical demand (factor 1); if the sum exceeds factor 3, then there will not be sufficient renewable generation capacity available to serve the Project when it comes online.

4414-8406

to serve the Project when it comes online, and if so, the Final EIR must assess the environmental impacts that will result from creating the additional renewable generation capacity required for Project operation. This number will not be small: as indicated above, the Project is anticipated to result in more than 462 trips per day between Palmdale and Burbank. Unfortunately, the Draft fails to provide a CEQA/NEPA-compliant energy analysis; it also fails to provide the information necessary to perform such an analysis. Instead, the Draft simply declares (without basis or quantitative justification) that the Project will “not affect statewide electricity reserves or transmission capacity” because the will just “obtain electricity from the statewide grid” (page 3.6-86). Merely stating that the Project will not impact the State’s electrical system does not meet CHSRA’s burden to *demonstrate* that it will not. And, given that California’s current energy landscape is so anemic and so inadequate that it is demonstrably incapable of reliably serving Californians today<sup>16</sup> it is profoundly likely that the substantial amounts of renewable electricity which will be required to operate the Project will indeed worsen California’s electrical grid problems.

The Draft ignores all of this, and instead merely contends that the Project will “not affect statewide electricity reserves or transmission capacity” because “An industry survey in April 2013 indicated that there is sufficient renewable energy capacity to meet the system demand” (page 3.6-86). Notably, this “industry survey” is not included in the studies posted with the Draft, so the claim that the Project will “not affect statewide electricity reserves or transmission capacity” is unverifiable. Furthermore, in 2013, California only required 20% of electricity retail sales to be served by renewable resources; thus, any survey conducted in 2013 would reflect this low renewable energy target, and at that time, it could reasonably conclude that there would be sufficient renewable capacity to serve the Project. Now however, California has much more aggressive renewable energy goals<sup>17</sup> which the state is struggling to meet<sup>18</sup>; accordingly, there will be no surplus renewable generation capacity available to serve the Project and the Draft errs substantially in assuming that there will be. In other words, CHSRA’s obligation to address the Project’s impacts on local, regional, and statewide grid operations is not satisfied by a mere citation to some vague “industrial survey” conducted a decade ago that is not even available to the public and which presumes an energy landscape that simply does not exist. Oddly enough, the Draft obliquely admits that Project operations will require the development of significant amounts of new renewable energy resources because it states on page 3.6-86 that CHSRA is developing an entire “renewable energy procurement plan” requiring “extensive collaboration” to ensure sufficient power procurement. This suggests that Project operations will require the development of extensive new renewable resources; thus, CEQA and NEPA demand that impacts resulting from these renewable energy developments be assessed and mitigated.

This is no small thing; because the State of California has chosen to achieve its renewable goals via energy procurements from remote, utility-scale renewable energy farms rather than relying on more reliable, more resilient, and more environmentally responsible distributed generation facilities, hundreds of thousands of acres of desertland has already been decimated

<sup>16</sup> For several years now, brownouts and blackouts are routinely threatened during the summer because California has insufficient generation resources to meet energy demand. These facts must be represented in the Final EIR.

<sup>17</sup> SB100 (adopted 2018) requires 100 percent of electric retail sales be renewable/zero-carbon in 2045.

<sup>18</sup> Because electrical supply does not meet demand, Californians are threatened with Summer blackouts.

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4414-8406

and massive new transmission facilities have already been constructed through high fire hazard areas<sup>19</sup>. This is an ongoing trend which will eventually eliminate millions of acres of desertland. Accordingly, and given CHSRA's stated intent to develop a renewable energy procurement plan in order to secure sufficient renewable energy to operate the Project, it is certain that the Project will result in substantial decimation of desert resources. Both CEQA and NEPA require that the Project EIR address and mitigate the impacts associated with developing the utility scale renewable energy resources required to serve the Project.

**3.0 ADDITIONAL SUBSTANTIVE DEFICIENCIES NOTED IN THE DRAFT**

For simplicity and to facilitate review, additional deficiencies and factual errors noted in the Draft are presented sequentially by page number below.

4414-8407

Page 3.6-10 identifies the Los Angeles County General Plan as a community plan that is pertinent to public utility issues addressed in the Draft, but it only identifies the "Public Services and Facilities Element" of the General Plan as being relevant; it fails to consider other equally important plan elements that pertain to utility issues (particularly in regards to water uses). For instance, and as indicated above, CHSRA has evinced a clear intent to substantially rely on local groundwater resources to construct all the tunnels for all 6 proposed routes through Acton and Agua Dulce; CEQA demands that CHSRA's plan to utilize local groundwater resources be evaluated through the lens of applicable goals and policies that have been adopted by the County but are omitted from consideration on Page 3.6-10. For example, Goal C/NR 6 (Protected and usable local groundwater resources) and Policy C/NR 5.6 (Minimize point and non-point source water pollution) should both be considered; they are from the Conservation and Natural Resources Element of the County General Plan. Goal C/NR 6 is relevant because the residents of Acton and Agua Dulce rely on local groundwater resources for their water supply; thus, protecting local groundwater resources in a sustainable manner is critical to our communities. Over the years, the "depth to groundwater" measured by the local waterworks district in Acton has increased and Acton and Agua Dulce residents have experienced reduced well yields and been forced to supplement their water supply by purchasing water from licensed water haulers; CHSRA's plan to utilize local groundwater for Project construction will further strain local groundwater resources and thus exacerbate this already significant problem. Accordingly, the Final EIR must address Goal C/NR 6 and assess Project impacts resulting from the use of local groundwater supplies to operate the TBMs. Additionally, General Plan Policy C/NR 5.6 pertaining to the minimization of point and non-point source water pollution is also relevant because contaminants will be distributed throughout the project area if groundwater containing excessive with nitrates or arsenic concentrations are utilized for TBM operations because the TBMs will pierce water channels and aquifers that serve as both public and private drinking water sources and inject unclean water directly into these groundwater sources. Accordingly, the Final EIR must address Policy C/NR 5.6 in assessing the impacts of TBM operation on

<sup>19</sup> The State of California intends to achieve its renewable energy goals via utility scale generation rather than distributed generation. For example, consider the map prepared by the California Energy Commission ("CEC") [Attachment 6] showing where streamlined approvals for renewable energy development is expressly encouraged; the map demonstrates that the CEC recommends that virtually all of unincorporated Antelope Valley be converted to renewable energy purposes. The lands earmarked for renewable projects currently support thriving wildlife and numerous rural communities; the CEC did not assess the impacts that these massive industrial energy projects will have on rural residents or the extent to which the stripping and fencing of huge tracts of land will decimate habitat and wildlife corridors.

4414-8407

drinking water systems. Finally, the Draft fails to identify the Antelope Valley Area Plan or discuss its relevance to the Public Utilities section of the Draft; the policies that are particularly relevant include Policy COS 2.7 (Limit use of groundwater sources to their safe yield limits) and Policy COS 3.5 (Protect underground water supplies by enforcing controls on sources of pollutants); the relevance of these policies to the public utility issues related to the Project is self-evident. Accordingly, the Draft must be expanded to address Antelope Valley Area Policies.

4414-8408

Page 3.6-10 discusses the Los Angeles County General Plan but it does not specifically identify Policy PS/F 6.6 pertaining to the undergrounding of new utilities; in fact, the Draft only addresses this Policy in a very rudimentary and cursory manner because it only commits to undergrounding *relocated* utilities to the extent feasible<sup>20</sup> and makes no commitment to underground any *new* utility infrastructure that will be constructed for the Project. This is a substantial deficiency that is of particular concern to the Communities of Acton and Agua Dulce which are located in Very High Fire Hazard Severity Zones (VHFHSZs) and experience frequent and lengthy power shutoffs by Southern California Edison. The Project must not result in the construction of new electrical facilities in the Communities of Acton and Agua Dulce that are located above ground for two critical reasons: 1) above ground electrical utilities pose a very real and significant fire risk in VHFHSZs; and 2) above ground electrical utilities are susceptible to frequent power shutoffs that can last for days<sup>21</sup> and which will cause extensive service interruptions on HSR lines. Accordingly, the Final EIR must adopt a mitigation measure stating definitively that any above ground electrical facilities that are constructed in the Communities of Acton and Agua Dulce as part of the Project shall be installed underground. The new 230 kV line that is proposed in Northeast Acton is of particular concern because it will be constructed in a new "right of way" and it introduces a new ignition source within the Community of Acton. To ensure consistency with Policy PS/F 6.6, this new 230 kV line must be undergrounded.

4414-8409

Page 3.6-13 addresses Project consistency with adopted County and local plans, and it defers to a "consistency analysis" presented in Appendix 2-H which concludes that the Project is consistent planning documents pertaining to the County of Los Angeles [pages 2.0-H-10 to 2.0-H-12]. However, the consistency analysis presented in Appendix 2-H is deficient. First, it does not even mention Goal C/NR 6 from the County General Plan or Policy COS 2.7 from the Antelope Valley Area Plan pertaining to protected and usable local groundwater resources which (as discussed above) are particularly relevant to Acton and Agua Dulce. Using local groundwater resources in Acton and Agua Dulce to operate the TBMs will conflict with Goal C/NR 6 and Policy COS 2.7; accordingly, these conflicts must be addressed and mitigation measures must be developed to resolve them. Second, Appendix 2-H does not even mention Policy C/NR 5.6 from the County General Plan or and Policy COS 3.5 from the Antelope Valley Area Plan pertaining to the protection of water supplies from pollution. Using non potable water for TBM operation will conflict with Policy C/NR 5.6 and Policy COS 3.5; accordingly, these conflicts must be addressed and mitigation measures must be developed to resolve them.

4414-8410

Page 3.6-14 asserts that the goals and policies enumerated in various county and city General Plans which apply to the Draft's discussion of "Public Utilities and Energy" relate to "reducing demands for natural resources, ensuring that public infrastructure is developed so that sufficient

<sup>20</sup> Appendix 2.0-H-12.

<sup>21</sup> Most power shutoffs in Acton last more than 20 hours and often range from 36-48 hours.

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4414-8410 | utilities are provided for the regional growth anticipated, and conserving energy”. This statement is incorrect. As indicated above, there are a number of goals and policies in planning documents that have been adopted for unincorporated Los Angeles County which address protection of drinking water source, groundwater supplies, fire hazards, and electrical reliability and thus are directly applicable to “Public Utilities and Energy” matters. Page 3.6-14 must be revised to address these goals and policies which are entirely unrelated to “reducing demands for natural resources, ensuring that public infrastructure is developed so that sufficient utilities are provided for the regional growth anticipated, and conserving energy”.

4414-8411 | Page 3.6-14 asserts that “the project is consistent with the majority of regional and local policies and plans” and that “IAMFs (Impact Avoidance and Minimization Features) and mitigation measures will generally minimize utilities impacts and would ultimately meet the overall objectives of the local policies”. This statement is incorrect. If CHSRA uses local groundwater supplies in Acton and Agua Dulce to supply water for TBM operation or if CHSRA does not underground all new and relocated utilities in Acton and Agua Dulce, the Project *will not* “meet the overall objectives of the local policies”; to the contrary, it will actively controvert such policies. Such circumstances would constitute a significant impact under CEQA and would require mitigation to render the project consistent with adopted “local policies”.

4414-8412 | Page 3.6-18 addresses “Utility Demands for Project Construction” and asserts that water supply estimates are compared to water supply forecasts from Urban Water Management Plans (“UWMPs”). However, no UWMP has ever been prepared for the communities of Acton and Agua Dulce, therefore CHSRA lacks the information it requires to accurately assess water supply estimates for approximately half of all the route alternatives. This deficiency must be corrected and the Final EIR must properly assess utility demands for project construction and compare it to accurate and representative data pertaining to water resource availability.

4414-8413 | Page 3.6-19 presents Table 3.6-4 which asserts each TBM will require 55,000–105,000 gallons/day per tunnel boring machine; this equates to 0.17 - 0.32 acre feet per day or 61 – 117 acre feet per year. These values are inconsistent with the values reported on page 3.6-78 which states that “each TBM operating from each twin tunnel portal would require a total of 1,829 acre-feet (366 acre-feet per year)”. There is an enormous discrepancy between the TBM water requirements described on page 3.6-19 and the TBM water requirements described on page 3.6-78; this discrepancy must be explained and corrected.

4414-8414 | Page 3.6-21 addresses “Construction Energy Uses” and though it describes how construction energy usage was estimated, it does not assert what the construction energy usage will actually be or whether local infrastructure in rural areas like Acton are sufficiently robust to serve the Project’s energy demand during construction. Acton is served by a very small electrical substation that is fed by two 66 kV subtransmission lines; power is distributed from this substation via three distribution circuits (<16 kV) which traverse Acton’s 100 square mile area; power service is not always reliable and power shutoffs lasting 20 hours to 48 hours or more are common (particularly in the Fall and Winter). The Draft does not address these concerns, and it does not assess whether the capacity of the local Acton distribution station is sufficient to serve electrical demand for Project construction. Thus, the Draft fails to assess whether electrical service to Acton residents will be interrupted to maintain CHSRA’s construction activities (particularly during peak demand); it also fails to identify mitigation measures to address such impacts. These deficiencies must be addressed in the Final EIR/EIS.

4414-8415 | Page 3.6-21 also addresses “Operation Energy Uses” but it does not actually identify the amount of energy required to support high speed train operation (particularly given the projected 462 trips per day operating schedule between Palmdale and Burbank); it also fails to address whether the capacities of existing local and regional electrical facilities are sufficient to maintain Project operations. The CEQA Guidelines establish that EIRs are supposed to discuss the potential energy impacts of proposed project operations and, in particular, address whether the project will place a substantial demand on energy supplies or require additional capacity or increase peak electricity demand; as indicated above, the Draft fails to discuss any of these concerns and does not even identify an impact associated with such concerns. This deficiency must be corrected in the Final EIR/EIS.

4414-8416 | Page 3.6-30 reports that Los Angeles County Waterworks District 37 (the local waterworks district in Acton that serves less than half of Acton residents) is supplied by the Metropolitan Water District, it is 473 square miles in area, and it has an annual average water demand of 659,000 acre feet. None of this is correct. Waterworks District 37 obtains its water from AVEK and from local municipal water wells, it serves an area that is less than 50 square miles and its annual water demand is approximately 2,000 acre feet. The Draft must be revised to reflect these facts.

4414-8417 | Page 3.6-31 indicates that much of Central and North Acton does not have a natural gas pipeline; this is incorrect. Many areas in North, East, Central, and South Acton are served by a natural gas pipeline.

4414-8418 | Page 3.6-41 indicates that much of Central and North Acton is not served by a water pipeline; this is incorrect. Numerous areas in North, East, Central, and South Acton are served by a water pipeline.

4414-8419 | Page 3.6-45 asserts “The Acton Water Treatment Plant is a water treatment facility owned by AVEK. After treatment, the Acton Water Treatment Plant pumps about 4 million gallons of water per day from the plant site into a Los Angeles County Waterworks pipeline”. This is incorrect. While the capacity of the Acton Water Treatment Plant is 4 million gallons per day, it does not operate at this rate; to the contrary, it pumps approximately 1 million gallons per day.

4414-8420 | Pages 3.6-52 to 3.6-53 provide figures of “stormwater facilities” in Acton in the vicinity of all the proposed routes. Unfortunately, these figures fail to show most of the culverts in Acton which, as described above, release sediment-laden stormwater flows onto downstream properties. It is particularly worrisome that the figure provided on page 3.6-53 does not show the numerous culverts under the 14 Freeway that discharge sediment flows onto the property where the “Acton Window” is proposed for construction under the “preferred” SR14A Alternative; this suggests that CHSRA is unaware of these culverts. These figures must be revised to properly show the location of these culverts and the Final EIR must evince a clear plan which demonstrates that the Project will not alter any runoff flow patterns or flow rates or flow characteristics at any location in Acton.

4414-8421 | Pages 3.6-58 to 3.6-59 provide figures of “electrical lines” in Acton in the vicinity of all the proposed routes. These figures show the location of high voltage transmission lines but they omit all the 66 kV subtransmission lines that serve the Acton substation and most of the 12 kV distribution lines in Acton. To ensure that CHSRA is aware of these facilities, they are indicated

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4414-8421

in the figure provided below. The Draft must be revised to properly show the location of electrical facilities in the vicinity of all proposed route alternatives in the Community of Acton.

Subtransmission and Distribution Circuits in Acton

4414-8422

Page 3.6-63 discusses “Existing Electricity Demand” in California. Much of the information presented does not reflect current conditions and some of it is simply incorrect. For example, and contrary to what the Draft asserts, Statewide electrical consumption has actually dropped in recent years and was 277,764 GWhr in 2021<sup>22</sup>; this is approximately the same demand experienced in 2010. There are many reasons for this reduction: more “behind the meter” distributed generation resources have been installed, the California population has dropped, and skyrocketing electrical costs are forcing people to use less electricity. Furthermore, the Draft reports that the highest recorded peak demand (which it describes as “the amount of generation needed to keep electrons flowing in the electricity system at any given moment of peak demand”) was 60,713 MW in 2016; this is incorrect. The California Independent System Operator (CAISO) is responsible for keeping “electrons flowing in the electricity system” and according to CAISO, the highest peak demand on the California grid was 52,061 MW<sup>23</sup> recorded on September 6, 2022. There are no definitive citations provided in the draft for the 60,713 MW value that it reports, however it appears to have been obtained from a forecast study prepared by the California Energy Commission which made significant “adjustments” to historic data to project possible non-coincident peak loads under a variety of possible scenarios; such forecasts do not report actual peak demand and they cannot be relied upon for such information.

<sup>22</sup> <https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/2021-total-system-electric-generation>

<sup>23</sup> <https://www.caiso.com/documents/californiaisopeakloadhistory.pdf>

4414-8423

Page 3.6-64 provides a Section titled “Existing Electricity Generation Capacity”, but the associated paragraph merely describes the sources of electrical generation and does not materially address electrical generation capacity.

4414-8424

Pages 3.6-85 to 3.6-90 address the impacts of Project operations on energy demand. As discussed above, the impact analysis of project operation on energy resources presented in the Draft is substantially deficient; instead of analyzing the extent to which the electrical demand of Project operation will impact the local, regional, and national electrical system (as required by CEQA), the Draft presents a completely erroneous “net change in energy use” in which the Project’s electrical usage is compared to hypothetical projections of fossil fuel reductions that could accrue from reduced vehicle and airline trips. The comparison is ludicrous and it fails to address the salient issue in CEQA; namely: will High Speed Rail operations adversely affect local, regional, or national electrical grids by drawing more electricity than the grids can provide? And if so, what measures has CHSRA developed to mitigate this significant adverse impact and what further impacts will result from implementing these mitigation measures? Answering these questions require CHSRA to look at Project energy demand and local and regional power systems. For example, the “Utility Relocation Plan” indicates that CHSRA intends to construct a new 33 kV power line along Aliso Canyon for all the “E” routes and a new powerline of unknown voltage and ampacity along Crown Valley Road for the SR14A routes; yet, the Draft fails to even consider whether the local electrical facilities in Acton are even sufficiently robust to serve these new powerlines, and it certainly does not provide any mitigation measures if the electrical facilities in Acton are insufficient for CHSRA’s purposes. Insofar as the Community of Acton is aware, there are no 33kV service facilities anywhere near Acton; therefore, substantial substation modifications and transformer additions will be required to provide the 33 kV power that the Project construction apparently requires. These are the issues that must be analyzed pursuant to CEQA, not whether the Project will result in a “net change in energy use”.

Furthermore, it is certain that the Project will adversely impact the electrical grid and the availability of renewable resources because CHSRA is apparently making plans to procure sufficient renewable resources to operate the High Speed Rail system (as discussed above). CHSRA’s procurement of additional renewable resources will result in the development of thousands of acres of utility scale solar and wind farms which, in turn, will result in the destruction and fencing of thousands of acres of pristine desert habitats and the elimination of extensive wildlife corridors. The Draft fails to account for any of these impacts; in fact, it does not even report how much electricity is required to operate the Project. These are all substantial deficiencies which must be corrected. Specifically, the Final EIR/EIS must report the Project’s construction energy demand and the Project’s operating peak demand and total annual power demand at full buildout and reconcile these values with credible engineering factors to 1) determine what new electrical infrastructure will be required in Acton to supply electrical demand for both Project construction and Project operation; and 2) determine how much desertland will be converted to renewable energy farms to generate sufficient renewable energy for Project operation. For example, the Institute of Electrical and Electronics Engineers (“IEEE”) estimates that 2.2 acres of solar panels are required to generate 1 GWh per year<sup>24</sup> (though this estimate does not account for the transmission lines and the battery storage

<sup>24</sup> <https://ieeexplore.ieee.org/stamp/stamp.jsp?tp=&arnumber=9676427>

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4414-8424

that will be required to make energy continually available to the Project, therefore it is biased low). Additionally, the Final EIR must include measures to mitigate the significant impacts created by these utility scale generation, storage, and transmission projects (such as the ambient dust that these projects will create, elimination of habitat and wildlife corridors, etc.). Alternatively, the Final EIR can incorporate a mitigation measure that commits CHSRA to using distributed generation to supply electricity for the project rather than utility scale generation; this will eliminate all desertland and transmission impacts.

4414-8425

Page 3.6-91 through 3.6-97 present NEPA and CEQA significance conclusions which assert that the Project will “avoid, minimize, reduce, or compensate for all impacts on utilities and energy” (page 3.6-91) and that “Public utilities and energy impacts would be reduced to a less than significant level under CEQA with the implementation of the mitigation measures identified in this section”. These statements are incorrect for the reasons set forth above and because:

- It is highly likely that sufficient water supplies will be unavailable from AVEK to construct the all the route alternatives within Acton and Agua Dulce. This is a significant environmental impact that is not addressed by the IAMFs or mitigation measures offered by the Draft; instead, the IAMFs and mitigation measures assume (wrongly) that AVEK will have excess water resources to sell to CHSRA when construction is initiated. If CHSRA uses its authority to compel AVEK to sell water for project construction, then AVEK’s customers will be severely impacted; yet, the Draft fails to address these impacts.
- The use of local groundwater extracted from Acton and Agua Dulce for Project construction will severely impact local groundwater levels, local groundwater quality, and both municipal and residential well yields. These impacts are completely ignored by the Draft.
- Section 3.6 of the Draft states explicitly that AVEK water resources will be used for Project construction in Acton and Agua Dulce. Yet, the Project’s “Utility Relocation Plans” indicate that the Project will not connect to AVEK facilities or use AVEK resources for Project construction in Acton and Agua Dulce; this has been confirmed by recent public statements made by CHSRA officials. These glaring inconsistencies demonstrate that the Project is neither stable nor finite; this, combined with the paltry environmental impact analysis provided by the Draft, this makes it impossible for the public to provide meaningful comment and it will prevent the decisionmakers from properly contemplating the Project and its associated impacts.
- The Draft fails to address the hundreds of scoping comments submitted by the public that expressed concerns regarding Project impacts on local well facilities.
- The Draft fails to assess the impacts of Project operation on local and regional electrical grids and the impacts of all the new utility scale generation projects that will be required to supply electricity for Project Operations.
- The Draft improperly relies on stormwater treatment facilities to treat the significant wastewater flows that will be generated during project construction.
- The Draft adopts BMPs and SWPPP measures that are entirely inappropriate for rural areas and which, if implemented, will result in significant erosion on downhill properties.

4414-8426

Sheet ~~UT-C4537-E1~~ indicates that the water needed to construct the tunnel portals adjacent to Aliso Canyon Road for all the “F” route alternatives will not come from AVEK and will instead be supplied by a 16-inch water main that is supposedly proposed by Waterworks District 37 and which will extend from Avenue Y-8 out to Aliso Canyon; however, no such water line has been proposed insofar as the Community of Acton is aware.

4414-8427

Sheet ~~UT-C4028-S14~~ indicates that the water needed to construct the tunnel portal adjacent to Red Rover Mine Road for the SR14A Route Alternative will not come from AVFK and will instead be supplied by a 16-inch water main adjacent to Hypotenuse Road that is supposedly proposed by Waterworks District 37; however, no such water line has been proposed insofar as the Community of Acton is aware.

4414-8428

Sheet ~~UT-C4026-14A~~ has mislabeled Hisey Ranch Road as Salty Dog Road; the house under which the 14A tunnel is located on the west side of this Sheet is on Hisey Ranch Road and not Salty Dog Road.

4414-8429

**4.0 CONCLUSION**

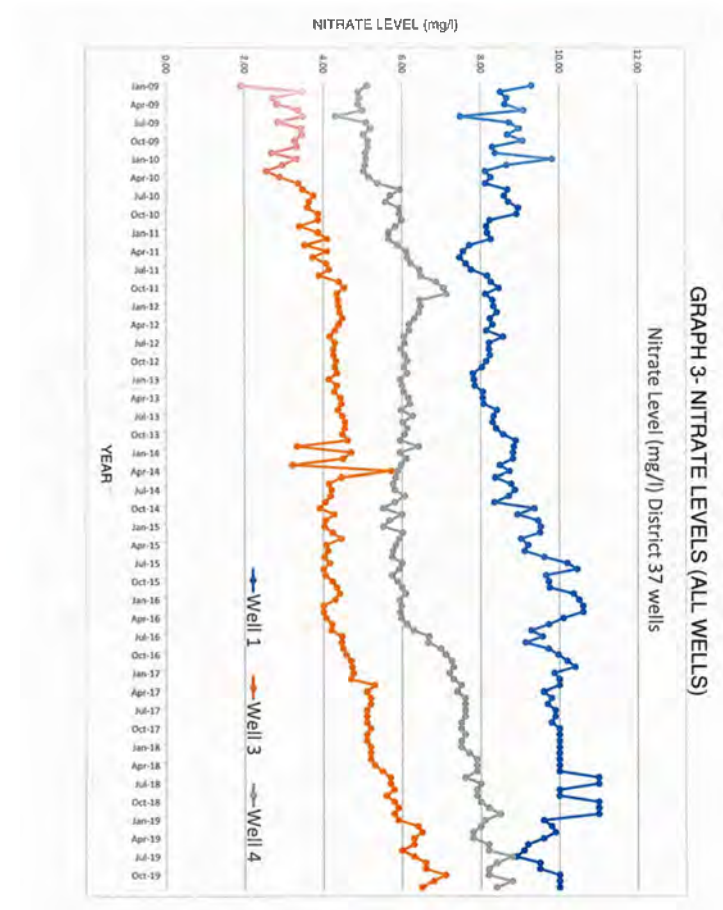

For the reasons set forth above, the Draft EIR/EIS prepared for the Palmdale to Burbank section is deficient and does not comply with CEQA or NEPA; these deficiencies must be addressed and the impacts identified herein must be fully mitigated in the Final EIR issued for the Project.

INTRODUCTION

GENERAL STATEMENT

Presented in this report are the findings, conclusions and recommendations regarding our assessment of the hydrogeologic conditions within the alluvial and stream terrace deposits along the upper reaches of the Santa Clara River in the Acton area, Los Angeles County, California. Particular regard is given in this report to the groundwater storage capacity within the alluvial and terrace deposits and to potential locations for new wells.

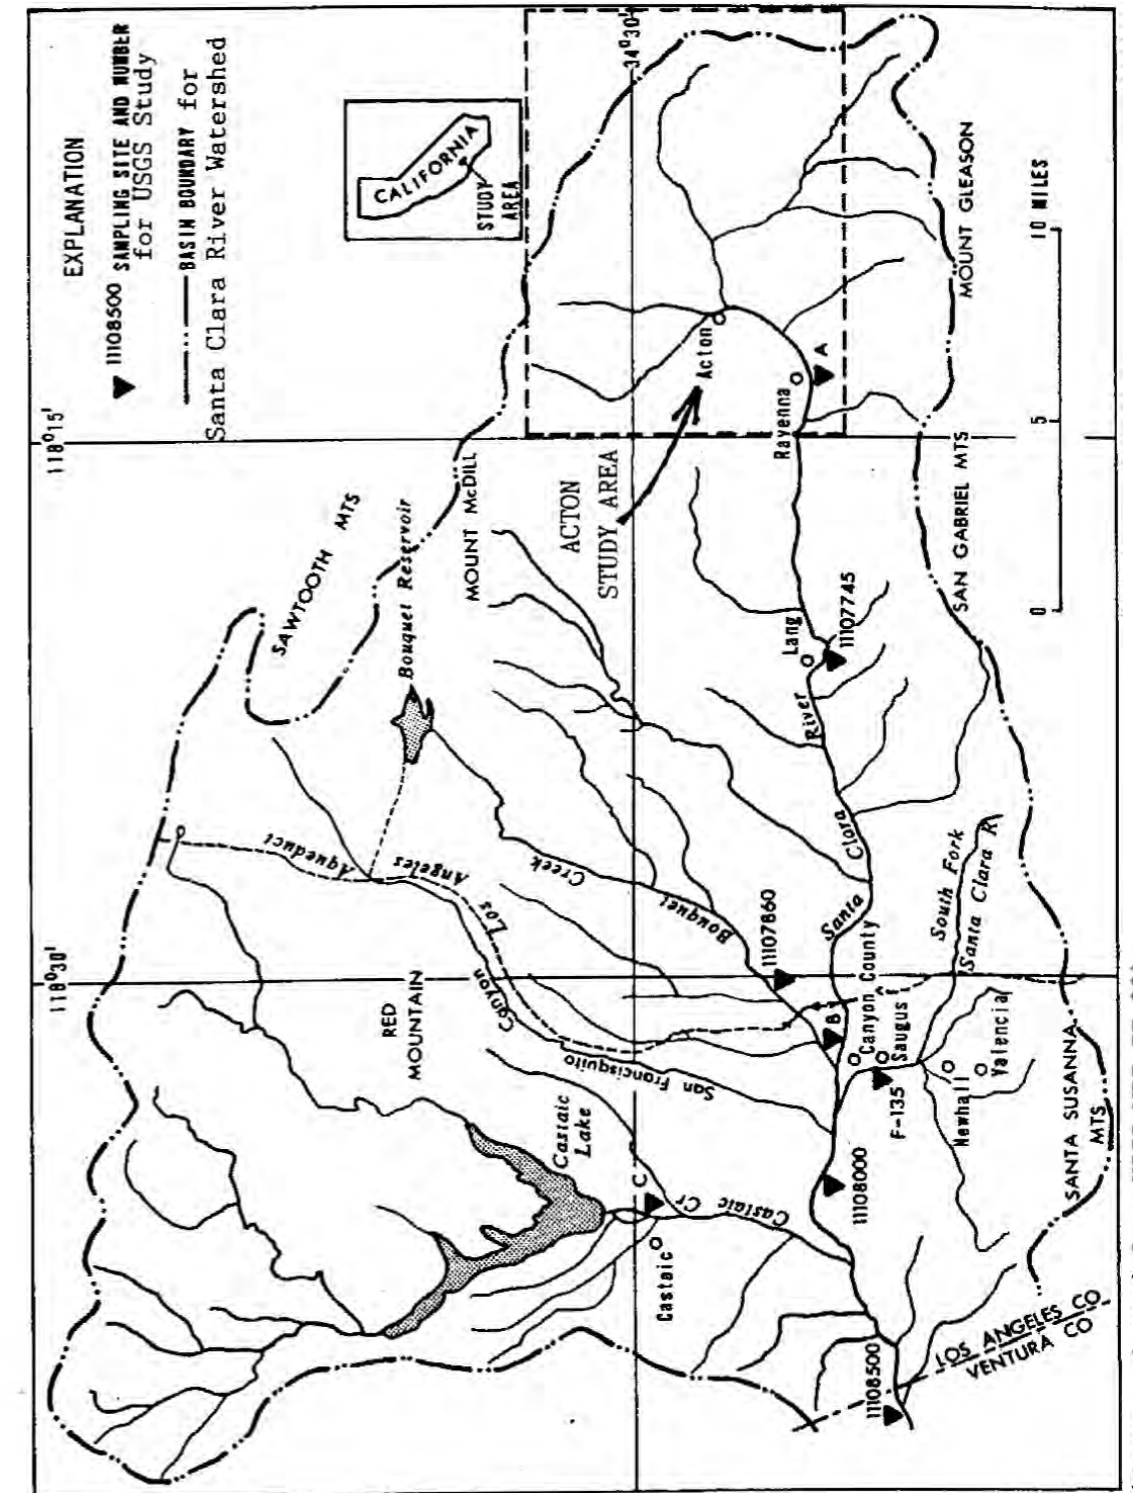

As depicted on Figure 1 - Location Map - the approximately 80-square-mile, rectangular-shaped mapped area includes a main study region centered around the community of Acton. This latter area consists of approximately 16 square miles enclosed within the boundaries of the service area of Los Angeles County Waterworks District No. 37-Acton. The mapped area is located between the narrows within Soledad Canyon on the southwest and the San Andreas fault on the northeast, and between the Sierra Pelona on the north and the western San Gabriel Mountains on the south.

This report has been provided with a list of references which have been specifically reviewed and/or cited during the course of this study. Plates which accompany this report are bound at the end of this text.

PURPOSE AND SCOPE

This hydrogeologic study has been undertaken to evaluate the alluvial and terrace aquifer system underlying Soledad Canyon and its tributaries in the Acton area with particular regard to: determining the surface boundaries and three-dimensional configuration of the local groundwater basin; assessing local hydrogeologic conditions within these deposits; determining their groundwater storage capacity; assessing general water quality conditions; and identifying regions for possible future groundwater development.

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

2

This project has been conducted for the Los Angeles County Department of Public Works and for ASL Consulting Engineers. The scope of work was outlined as five tasks in our letter of proposal dated October 27, 1989, to Mr. Thomas O'Laughlin of ASL Consulting Engineers. A summary of the five work tasks performed for this investigation is as follows:

Task 1 - Acquisition of Available Basic Data

- Collect basic geologic, hydrogeologic, land use, rainfall and water-well records and data.
- Develop a screened mylar, topographic base map for all proposed plates in the final report.

Task 2 - Field Reconnaissance

- Conduct field visits to assess locations of active and inactive water wells and to validate topographic and geologic conditions.
- Review and verify geologic exposures and rock types, and observe local topography and watersheds.
- Obtain non-pumping water levels in active water wells, if possible.
- Collect water samples from active wells, if necessary.

Task 3 - Hydrogeologic Conditions

- Hydrogeologically analyze all available data.
- Prepare hydrogeologic maps and cross-sections.
- Prepare maps showing current and historic water level elevations.
- Assess general water quality, quality problems and problem areas in the region.
- Prepare hydrographs from selected water wells.
- Correlate electric logs of recently-drilled test holes in the region, if possible.

S8931 - Acton Report

3

- Assess the three-dimensional configuration of the local groundwater basin.
- Identify the surface boundaries of the local groundwater basin.
- Assess the quantity of groundwater in storage for current conditions and for basin-high and basin-low conditions.
- Identify potential sites for new water wells.

Task 4 - Analyses and Reports

- Write and prepare our report with conclusions and recommendations regarding historic and current groundwater conditions in the basin.
- Provide supporting maps, figures and tables to document our findings.

Task 5 - Meetings and Consultation

- Provide hydrogeologic consultation during the project to ASL and to the Los Angeles County Department of Public Works via meetings, telephone communications, etc.

Analyses for this project relied solely on available background data and reports. No subsurface exploration or well testing was conducted for this study. Reports specifically reviewed for this project are shown on the list of References Reviewed.

Field work consisted solely of field meetings with County and Acton-Camp staff, and of reconnaissance geologic field mapping to more accurately define the surface boundaries of alluvial and terrace deposits in the project area. The field meetings occurred in December 1989, while the field mapping took place on January 12, 1990. On this latter date, which was prior to any significant rainfall in the area, we also made estimates of subsurface water runoff, if any, in various creeks in the region.

Throughout the remainder of this report, there will be numerous discussions of water wells in the region. The major purveyor in the region, the Los Angeles County Waterworks District No. 37-Acton is a public agency, and it uses its wells to meet local

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

4

domestic water needs. In addition, Acton-Camp, which is located on the east side of Soledad Canyon approximately two miles south of Acton, uses a few wells to meet the domestic and irrigation needs of the Camp. The Big Dipper Water Delivery and Carson Brothers are local purveyors which each operate at least one well along Soledad Canyon south of Acton. These purveyors do not provide water for municipal purposes through a distribution system. Instead, both companies haul or provide bulk water for grading and individual home tanks which are used for domestic, irrigation and fire protection purposes.

In addition to the wells discussed above, there are an unknown number of wells used by private homeowners, ranches, new housing tracts, and/or commercial establishments in the area. For the purposes of this report, wells owned by this group of users will be called privately-owned wells.

This report has been written for the Los Angeles County Department of Public Works and for ASL Consulting Engineers with specific application to the hydrogeologic assessment of the alluvial and terrace deposits aquifer systems in the Acton area. This report has been prepared in accordance with the care and skill generally exercised by reputable professionals, under similar circumstances, in this or similar localities. No other warranty, either expressed or implied, is made as to the professional opinions presented herein.

#### AVAILABILITY OF BASIC DATA

Previous studies. Because the study area does not overlie any major oilfields and/or ore deposits, there has not been an extensive history of published and unpublished geologic reports and maps dealing with surface and subsurface geologic conditions. Other than a driller's log and well history from a wildcat oil well drilled to a depth of 1650 ft in 1926, there are no subsurface data for the area available from oil industry sources. This well

S8931 - Acton Report

5

predates geophysical electric logs, therefore, no electric log is available to serve as control for correlation with the few available electric logs for shallower water wells in the area.

The earliest significant literature, dating from the 1920s and 1930s, addresses the petrography and relationships of the crystalline and metamorphic rocks in the western San Gabriel Mountains, immediately south of the study area (Miller, 1934). These rocks also occur in the Acton area and were the focus for reports which describe placer and gold mining operations that occurred north and south of Acton during the late 1800s and early 1900s (Simpson, 1934).

Investigations during the 1930s and 1940s provided the initial efforts at naming and mapping the surface exposures of the stratigraphic units and structure in the eastern part of the Ventura basin. The eastern Ventura basin is also referred to as the Soledad basin in reports prepared for the comprehensive geology of California presented in Bulletin 170 by the California Division of Mines and Geology (Jahns, 1954).

Adaptation of the geologic maps provided in Bulletin 170 and from investigations conducted by Noble (1953) and Dibblee (1960, 1967) permitted the preparation of Plate 1 - Geologic Map - in this report. Portions of the geologic conditions shown on Plate 1 were modified and updated from work recently available as a university thesis (Hendrix, 1986).

Published hydrogeologic and hydrologic information for the region is similarly limited. There have been essentially no previously-published studies detailing aquifer characteristics, well testing, water level fluctuation or groundwater variations in water wells in the Acton area.

The few hydrologic studies of the region that were reviewed for this project included a report published in 1967 by the United States Geological Survey in conjunction with the Antelope Valley-East Kern Water Agency (Bloyd, 1967) which included the Acton area

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

6

in the extreme southwest portion of their study area. Generalized geology and water-level contours in the Acton area for the period 1958-1965 are shown on maps included with that study, but data were insufficient for the Acton area to permit that investigator to prepare maps showing average specific yield of sediments and specific capacity of wells in our study area. That report itself focuses on the region northeast of the San Andreas fault so there is little information specifically applicable to the Acton area.

Previous assessments of hydrogeologic conditions in the region are limited to those by: the Regional Water Quality Control Board for the Los Angeles Region (1975) in preparing the water quality control plan for the Santa Clara River basin; Williams (1979) which provided an evaluation of sediment discharge in the Santa Clara River basin for Ventura and Los Angeles Counties; and Bowers and Irwin (1978) which summarized water-quality data collected during a reconnaissance study in the upper Santa Clara River basin during August 1974 through June 1976.

A groundwater report on current water quality and the effects of private sewage disposal systems on that quality within the Acton area has recently been prepared for Acton Builders by Brockmeier Consulting Engineers, Inc. (Feb. 1990).

Water Well logs. Historically available records reveal that at least 90 water wells have been drilled in the basemap area for domestic, agricultural, and stock-watering purposes. As seen on Plate 2 - Basin and Water Agency Boundaries and Well Location Map - most of these wells have been drilled within the area of the alluvial or stream terrace deposits which underlie the channels of the upper reaches of the Santa Clara River and its major tributaries. It should be noted that well locations illustrated on Plate 2 are those adopted from maps on file at the Department of Water Resources (DWR) and the Los Angeles County Flood Control District (LACFCD). In addition to these, there is also a small

S8931 - Acton Report

7

number of monitoring holes and/or test holes drilled for water well tests or other study purposes.

Most of the 90 wells are shallow (less than 200 to 250 feet) and are probably completed solely in alluvial and/or terrace deposits. Of these wells, about 26 drillers' logs and only two geophysical electric logs are available for analysis of subsurface conditions. Electric logs are available for Acton Camp Test Hole No. 4, which was completed into Los Angeles Co. Waterworks District (LACWWD) Well No. 37-3, and for Griffin Homes Test Hole No. 2, approximately located in the area of Township 4 North, Range 12 West, Section 32F.

The electric log below 110 ft for LACWWD No. 37-3 appears to show the extremely high resistivity characteristic of crystalline rocks. The sedimentary section in this well is too thin to correlate with any degree of certainty to the electric log for Griffin Homes Test Hole No. 2, which is located several miles to the northeast. Therefore, for the Acton area there is no geophysical data control on the subsurface configuration of sediments, and all lithologic assessments have to rely on interpretation of surface geology using drillers' logs.

Water Level and Water Quality Data. The historic collection and filing of basic hydrogeologic data for the study area has been sporadic and random in terms of the date and location of well monitoring. There is no comprehensive basin-wide program to provide consistent and periodic monitoring of water levels, quality, specific capacity and/or well efficiency on an on-going basis. In general, data are not available prior to about 1950. Most well records of water levels have a ten-year gap in data from roughly 1965 to 1975, with additional shorter data gaps during other time intervals. Water levels and pumping rates are obtained on a more or less monthly basis in LACWWD Well 37-1, and date from about 1970.

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

8

Scrutiny of the water level data record for the area reveals occasional measurements which are anomalously low; these anomalously low water levels are considered to not be directly related to climatological fluctuations. Such anomalies are considered to relate to either monitoring error, the reporting of pumping levels or partial recovery levels instead of true static (non-pumping levels), or the monitoring of a water level in a well affected by mutual drawdown interference from another, nearby well.

For our assessment of water levels, we have plotted nine hydrographs, three of which consist of two nearby wells (one of which is LACWWD Well 37-1) each with pre-1965 and late-1960s/early-1970s to recent data in order to span the large data gaps found so consistently throughout the Acton area. Water-level contours from monitoring data on file with the LACFCD were independently prepared for water level high and low periods as identified by the hydrographs. For our assessment of water quality, we have relied on recent State data for nine wells, plotted on a trilinear analysis diagram later in this text. The only surface water data available, at Lang along the Santa Clara River downstream from Acton-Camp dates from January, 1969, and is also included on the trilinear diagram.

Agencies Contacted. Data repositories and persons contacted during this investigation included the following:

1. Los Angeles County Waterworks Districts - Department of Public Works: Mssrs. Gary Hartley, Joe Aja, and Ken Roseander. Data collected here included drillers' logs, water levels and water quality for wells owned by the Waterworks District and by Acton-Camp.
2. Los Angeles County, Flood Control District: Mr. George Farag for drillers logs, for historic water level data, for recently monitored water levels in the area, for possible surface water quality data, and for precipitation data from long-term rainfall stations.
3. California Department of Water Resources: Mr. Ed Lowe, for historic water level and water quality data, and for water well location maps.

S8931 - Acton Report

9

4. California Division of Oil and Gas: office staff. Data collected included information on wildcat oil well (drillers' log and well history), wildcat well location map and reports published on various oil fields in the surrounding region.
5. California Division of Mines and Geology: Mr. Bob Hill, for published and unpublished geologic reports and maps for the various rock types in the mapped area.
6. United States Geological Survey: office staff. Basic data relating to any possible geologic and hydrogeologic maps and reports for the region.
7. University of California at Los Angeles Geology Library: office staff. Basic data relating to geologic maps and reports, and for any geologic theses for the region.

#### AREA OF INVESTIGATION

##### PROJECT LOCATION AND PHYSICAL FEATURES

As shown on Figure 1 - Location Map - the rectangular-shaped mapped area encompasses approximately 80 square miles along the upper reaches of the Santa Clara River within Soledad Canyon in north-central Los Angeles County. The mapped area includes the alluvial and stream terrace deposits within the nearby reach of the Santa Clara River and its tributaries, as well as a portion of the hills to the north and south of the river itself.

The Soledad basin is a topographic low as well as a basin of deposition. It lies north of the San Gabriel Mountains, south of the Sierra Pelona, and is bounded by the San Gabriel and San Andreas faults on the southwest and northeast, respectively. The Acton study area is located in the eastern portion of the Soledad basin (Muehlberger, 1958).

Geomorphically, the study area consists of the relatively wide and flat lands along the course of the east-west trending Santa Clara River (Soledad Canyon) and the hills and low-lying mountains which border both sides of the river. Elevations along the river valley in the study area range approximately from 2460 ft at

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

10

Ravenna to 3200 ft at the river's headwaters in Soledad Pass near Vincent. The overall river gradient across this 8.3-mile long reach is on the order of 0.017 ft/ft (about 94 ft per mile). Maximum elevations in the hills north of the river are on the order of 4700 ft at Harold Beacon, while maximum elevations to the south are approximately 4400 ft, southeast of Kentucky Springs. Kentucky Springs Canyon represents the main tributary in the headwaters area of the Santa Clara River.

Acton, the only community in the area, has historically been a rural and equestrian-oriented development. Development consists of a school and a main commercial area near the intersection of Crown Valley Road and Soledad Canyon Road. Additional developments include Acton-Camp, a County-owned facility along Soledad Canyon Road south of Acton, a large trailer and recreational vehicle park and campground located just southwest of Acton-Camp, and numerous single-family homes and ranches scattered throughout the main valley and its tributary canyons. In the past few years, a few large residential tracts of single-family dwellings have been built and/or proposed.

At present, private subsurface disposal of onsite-generated sewage has been the sewage disposal alternative used throughout most of the region. Acton Camp reportedly discharges approximately 30,000 to 50,000 gallons per day of secondary-treated sewage effluent to Soledad Canyon. Commercial areas within the community of Acton, including at least one laundry, utilize subsurface disposal of their sewage effluent also. Another area for effluent disposal via leachfields is the large recreational vehicle park located within Soledad Canyon just downstream from Acton Camp.

### GROUNDWATER BASIN BOUNDARIES

To facilitate analysis of water supply problems, the California Department of Water Resources established names and locations of groundwater basins along the course of the Santa Clara River in

S8931 - Acton Report

11

both Los Angeles and Ventura Counties (1953, 1975 and 1980). Hydrologic unit boundaries were delineated principally on the basis of topography and watershed divides, and as such, included both alluviated valleys and the adjoining hills and mountains. Each hydrologic unit was further divided, using similar bases, into hydrologic subunits for further definition of runoff and other hydrogeologic conditions.

As a result of these studies, the principal hydrologic unit in the study area is known as the Santa Clara River Valley Unit. Within the region, it has been subdivided in Los Angeles County into the Eastern Subunit and the Acton Valley Subunit.

For detailed assessments of hydrogeologic conditions, DWR further delineated various groundwater basins within each of the above hydrologic units and subunits. Basin boundaries were selected on the basis of such features as faults, groundwater divides, exposures of bedrock in the hills, or at areas of rising water caused by the presence of bedrock shallowly underlying river alluvium. Where none of these types of conditions were determined to exist, arbitrary or even political divides were occasionally selected as groundwater basin boundaries.

The boundary between the Acton Valley and Eastern Subunits was selected by DWR along an arbitrary narrowing of the river channel (caused by exposures of nonwater-bearing bedrock) located between Ravenna and Lang. However, for the purposes of this study, only that portion of the Acton Valley basin, southwesterly to a narrows within the river channel that lies approximately 3000 ft northeast of Ravenna, is included in the analysis. This is because the area southwest of this position does not contribute to groundwater storage or recharge to the LACWWD-Acton area. The upstream boundary of the local groundwater basin for this study is considered to be the narrows through Soledad Pass, since surface and groundwater northeast of the narrows do not flow toward the LACWWD-Acton area. As shown on Plate 1 - Basin Boundaries and Water

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

12

Service Area - the LACWWD-Acton area groundwater basin is comprised by the alluvial and stream terrace deposits which lie along the Santa Clara River and its tributaries between the Soledad Pass narrows and 3000 ft northeast of Ravenna.

CLIMATE

The climate of the Santa Clara River basin varies from a moist, Mediterranean-type near the Pacific Coast to a near-desert-type at the extreme eastern boundary, near the study area (Williams, 1979). Climate within the study area is characterized by long, dry summers and relatively short, wet winters. Typical temperatures in the area range from maximums of approximately 100° F during the summer to minimums as low as 30° F, or less, occasionally in the winters. Mean monthly temperatures range between approximately 77° F in summer to 48° F in the winter.

Though not reproduced herein, an isohyetal contour map prepared by Los Angeles County-Department of Public Works, has been reviewed to assess mean annual precipitation in the Acton watershed area (Nov. 1988 report). That isohyetal map was prepared for a period of record of 1897-98 through 1946-47, and it reveals the following for the area mapped on our base maps:

- a. Mean annual precipitation in the hills and mountains on the northerly and westerly side of Soledad Canyon (the Sierra Pelona) is relatively low. For the period of record, mean rainfall has ranged from about 8 inches per year in the northeastern portion of this watershed to about 12 inches per year in the southwestern portion of this watershed.
- b. Mean annual precipitation in the hills and mountains on the southerly side of Soledad Canyon (the San Gabriel Mountains) is relatively high. For the period of record, mean annual precipitation has ranged from about 32 inches near the watershed divide on the south to about 12 inches along the foothills of these mountains on the north

S8931 - Acton Report

13

Rainfall data have been obtained from Los Angeles County Flood Control District for two rainfall gages, one near Blum Ranch in Aliso Canyon (Station No. 341, elevation 2900 ft) and one near Acton-Camp (Station No. 250D, elevation 2625 ft). Locations for the gage stations are shown on Plate 2. These data, which are presented in Tables 1.1 and 1.2, respectively, have been graphed (Figures 2.1 and 2.2, respectively) to show the accumulated departure in percent from the mean annual rainfall, for each station.

Review of the annual rainfall and cumulative departure data reveals the following:

1. Blum Ranch Gage (upstream area):
  - a. The average rainfall over the 1914-15 to 1987-88 period of record is 9.91 inches.
  - b. The historic high was 24.09 inches and occurred in 1977-78; 22.99 inches occurred in 1982-83 and 22.38 inches in 1940-41.
  - c. The historic low was 3.56 inches in 1959-1960; 3.79 inches occurred in 1950-1951.
2. Acton-Camp Gage (downstream area):
  - a. The average rainfall over the 1929-1930 to 1987-88 period of record is 10.22 inches.
  - b. The historic high was 26.96 inches in 1977-1978; 24.3 inches occurred in 1982-83.
  - c. The historic low was 2.97 inches in 1959-1960; 3.09 inches occurred in 1950-1951.

Approximately 80 percent of the average annual precipitation in the region occurs between November and March. Moreover, the bulk of these winter storms last for one to only a few days; relatively long periods of clear weather typically occur between these storms. Notable on Figures 2.1 and 2.2 is that the precipitation fluctuates widely from year to year.

Figure 2.1  
Rainfall Cumulative Departure Curve

Figure 2.2  
Rainfall Cumulative Departure Curve

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

14

As seen on the cumulative departure curves, there have been pronounced periods of dry years followed by periods of wet years. However, no rhythmical or fixed cycle of fluctuations is detectable. For these cumulative departures, a positive (or upward) slope for each curve indicates above-normal rainfall, while a negative (or downward) slope indicates below-normal rainfall, regardless of the position of the curve with respect to the ordinate representing the long-term mean (*i.e.*, the zero percent cumulative departure).

For example, the period 1936 through 1946 on the cumulative departure curve for the Blum Ranch gage is characterized by positive (upward to the right) slopes; this is indicative of a hydrologically wet period which was characterized by an accumulation of years of average or above-average precipitation.

In contrast, the period 1947 through 1977 on the curves for both rainfall stations display a protracted, hydrologically dry period that was characterized by an accumulation of generally average or below-average rainfall (a negative or downward-sloping curve). The curves for both rain gages reveal a generally upward trend from 1977 to 1983, but since that time, the data appear to have begun a generally downward trend; deficient precipitation has occurred in the area in the past three to four years, including 1989-1990.

DRAINAGE

Regional drainage across this portion of Los Angeles County, and continuing westerly across Ventura County to the Pacific Ocean, is provided by the Santa Clara River (see Figure 1). The Acton area is located in the upper portion of Soledad Canyon, relatively near the headwaters of the Santa Clara River. The local watershed area comprises a total of approximately 55,600 acres (about 86 square miles), based on data presented by Brockmeier Consulting

S8931 - Acton Report

15

Engineers, Inc. (1990, in conjunction with Geraghty & Miller, Inc.).

The nearest gage to measure surface water runoff in the Santa Clara River lies at Lang, several miles downstream from Acton (see Figure 1 for location of Lang). This gage (Station No. F93B-R) has a tributary drainage area of approximately 157 square miles. DWR (1968) reported that runoff in the Santa Clara River has ranged from nearly 550 percent of the mean to less than one percent. CRWQCB (1975) indicated that severe storms may cause river discharge to increase from nearly zero flow to flow as high as thousands of cubic feet per second within a few hours.

Principal tributaries draining in a southerly direction to their confluence with the Santa Clara River in Soledad Canyon include, from east to west across the study area: Soledad Pass, Acton Canyon, unnamed canyons leading to the Governor, Red Rover and Puritan Mines, and Jones Canyon. Principal tributaries which drain in a northerly direction to their confluence with the river include, from east to west: Kentucky Springs Canyon, Aliso Canyon, Arrastre Canyon, Bootleggers Canyon and Mattox Canyon.

Because the headwater areas of these drainages do not extend into high mountainous areas, and because the local climates preclude the buildup of large snowpacks in the watersheds, flow in all the stream canyons is considered to be ephemeral only and, thus, diminishes rapidly after most rainfall events.

For example, LACFCD records for the Santa Clara River gaging station near Lang date from 1949-50 and, through 1981-82, reveal the following information about flow variations:

- a) Mean daily flows ranged from a low of 0.2 cubic feet per second (cfs) in 1976-77, to a high of 29.3 cfs in 1951-52. One cfs equals about 450 gallons per minute. There are no data for 1968-69 which is known to have had very high rainfall and runoff.

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

16

- b) Peak flows ranged between about 2 cfs (in 1950-51 and in 1956-57) to an estimated 5900 cfs in 1968-69.
- c) Total runoff ranged between 147 acre-feet (AF) in 1976-77 to 21,230 AF in 1950-51

In addition, during our field reconnaissance of January 12, 1990, the following runoff information was noted (this date was prior to any significant rainfall in the area): the channel of the Santa Clara River and all of its tributaries in the area mapped on Plate 1 - Basin Boundaries and Water Service Area - contained no surface water runoff, except as noted below (all these channels are wholly unlined in the study area). Surface flows were observed as follows:

1. A flow of about 15 to 20 gpm was observed in Arrastre Canyon about 300 ft southeast of (upstream from) its confluence with the Santa Clara River in Soledad Canyon. Just upstream from this confluence, and including the channel near Acton Camp, there was no runoff in the channel of the Santa Clara River.
2. Just downstream from the above confluence, and very near the center of Section 11, T4N, R13W, surface flow in the Santa Clara River was estimated at 20 to 30 gpm.
3. Within the river channel and about 700 ft downstream from (southwest of) the center of Section 11, surface flow in the river was estimated to be at least 200 gpm.
4. Within the river channel and about 1000 ft downstream from the site in No. 3 above, surface flow was also estimated to be at least 200 gpm.
5. In the river channel just south of Ravenna, runoff was estimated at 75 gpm.
6. About 2500 ft downstream from Ravenna, surface runoff in the river was again estimated to be at least 200 gpm.

S8931 - Acton Report

17

LOCAL WATER PURVEYORS

The study area lies within the service area of the Los Angeles County Waterworks District No. 37-Acton. As seen on Plate 1, the approximately 16-square mile service area of this District occupies the heart of the Acton region. The service area extends along the Santa Clara River-Soledad Canyon and includes Acton Camp at its southwesterly boundary. Much of the service area of the District extends northerly from the main river channel. Metered groundwater production data for 1989 for District well No. 37-1 was 1223 AF. Plate 1 shows this well lies near the intersection of Crown Valley Road and Soledad Canyon Road.

Other major producers in the study area include: Acton Camp which reportedly produced approximately 115 AF of groundwater from its two active wells in 1989 (see Plate 1 for locations; neither of these wells are metered); Big Dipper Water Delivery which lies just north of Acton Camp and which reportedly produced an estimated 107 AF from its unmetered well in 1989; Carson Brothers, which lies just north of the Big Dipper Water Delivery and which reportedly produced an estimated 75 AF of groundwater from its unmetered well in 1989; and the Acton School well, currently used for irrigation purposes only due to high nitrates and which, reportedly, produced on the order of 20 AF in the 1989 irrigation season.

Hence, groundwater extractions by major producers for municipal purposes in 1989 may reasonably be assumed to total about 1520 AF. An additional 20 AF were pumped for irrigation by the single Acton School well, and an unknown additional volume of groundwater was pumped from the remaining active wells in the main river channel and its tributaries to meet all remaining domestic, irrigation, and stock watering needs in the entire study area.

18

GROUNDWATER GEOLOGY

GENERAL STATEMENT

Geologic materials depicted on Plate 2 - Hydrogeology Map - have been divided according to their relative water-bearing characteristics, that is, to their relative ability to contain, transmit, and yield groundwater to wells. As such, two divisions can be recognized: a water-bearing sediment group (map symbols Qal and Qt) and a relatively nonwater-bearing rock group (all other geologic unit map symbols). Plate 2 provides the exposures and areal extent of these materials, together with local geologic structure, including some folds and bedding attitudes for sedimentary units and the alignment of major faults.

Depending on water levels, the water-bearing sediments can become saturated, thereby permitting them to provide water to wells. Thus, they constitute the groundwater reservoir of the study area. Underlying the water-bearing sediments in the valley areas, and exposed on all adjoining hill and mountain areas, is the relatively impermeable, nonwater-bearing bedrock.

WATER-BEARING SEDIMENTS

This group comprises two units, as follows:

- a. Undifferentiated Alluvium, of Holocene age (map symbol Qal). "Younger" alluvium consists of unconsolidated, poorly- to well-stratified clay, silt, sand and gravel and includes alluvial fan, flood-plain and streambed deposits.
- b. Terrace deposits and older valley fill, of Pleistocene age (map symbol Qt). Terrace deposits generally consist of porous well-drained silt, sand and gravel capped by fairly well-developed soil where the upper surfaces are preserved.

In general, these water-bearing strata are geologically younger, more permeable, less consolidated and less structurally

S8931 - Acton Report

19

deformed than the nonwater-bearing underlying bedrock. The water-bearing sediments have been penetrated to various depths by wells in the basin and historically have provided virtually all of the groundwater extracted by these wells.

Analysis of available drillers' logs reveals that these sediments are composed of extensively interlayered and inter-fingered mixtures of gravel, sand, silt and clay with variable concentrations of cobbles and boulders. Due to its unconsolidated to poorly-consolidated condition, and its lack of cementation, Holocene alluvium is subject to rapid erosion. Correlation of individual strata from one well to another is difficult due to the manner of deposition of these stream-deposited alluvial deposits.

Alluvial sediments lie within and along the course of the upper Santa Clara River in Soledad Canyon and its main tributaries (refer to Plate 2 and Plate 3 - Hydrogeologic Sections A-A' and B-B'), while terrace deposits are located along the low lying flanks of the foothills and upper reaches of the tributaries. Thickness of alluvial sediments varies along the river, but the maximum appears to be approximately 225 ft, located near the community of Acton. Typically, the alluvium tends to be thickest near the central portion of the river and thins or pinches out as the flanks of the adjoining hills are approached (refer to cross sections also).

Alluvial thicknesses in all of the tributary canyons are considered to be less than that in the main river valley of Soledad Canyon. In general, larger watershed areas such as Arrastre, Aliso and Kentucky Springs Canyons are underlain by more areally extensive and thicker accumulations of alluvium than the smaller tributary canyons, which generally contain only terrace deposits. In the larger canyons, the maximum alluvial thickness occurs near the confluence with the main river valley and is on the order of 90 to 200 ft (see Plates 2 and 3).

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

20

Older alluvium of late-Pleistocene age has been mapped to include the exposures of sediments that have been elevated onto mesas and terraces along the main river valley. These terrace deposits (map symbol Qt, on Plates 2 and 3) are considered to be of the same general composition as Holocene alluvium and were formed in much the same manner. Regional uplift and continued downcutting of the creeks and washes have left these terrace deposits elevated with respect to current stream gradients.

In general, the terrace sediments are more deeply weathered and characteristically reddish-brown in color; due to chemical and mechanical breakdown of the minerals within these sediments, there also tends to be light to moderate cementation by clays and/or iron oxides. These sediments are in relatively topographically-elevated positions in the study area, but appear to be in hydraulic continuity with the alluvial sediments, based on water level data. Maximum thicknesses of terrace deposits are approximately 195 ft in the Kentucky Springs area and 210 ft in the wide valley just north of the community of Acton (see Plates 1 and 3).

#### NONWATER-BEARING ROCKS

Underlying the water-bearing sediments in the study area are a series of consolidated, cemented sedimentary rocks of Tertiary geologic age, and/or an assemblage of crystalline or metamorphic rocks of pre-Tertiary age. This group is composed of the following units, from youngest to oldest:

- a. Punchbowl Formation, of Miocene and Pliocene age (map symbol Tpb). The formation is confined to the northeastern portion of the study area and consists of white, buff to pink sandstone, grey to red siltstone and clay shale, and grey to red conglomerate.
- b. Vasquez Formation, conglomerate and sandstone units (map symbol Tv), and volcanic rocks associated with the Vasquez Formation (map symbol Tvv), of Oligocene to Miocene age. The formation consists of up to 12,500 ft of red to light-brown, non-marine sandstone to cobble-boulder conglomerate units interlayered with nearly 4,200

S8931 - Acton Report

21

ft of volcanic flows and volcanic sills of greenish-black basalt and dark reddish-brown andesite.

- c. Granitic rocks, of Jurassic and/or Cretaceous age (map symbol gr). Crystalline granitic rocks in the area are usually medium- to moderately-coarse-grained, orange- to pinkish-grey, quartz-rich and massive to crudely-foliated.
- d. Diorite, quartz diorite and granodiorite, of Jurassic and/or Cretaceous age (map symbol gd). These crystalline rocks are grey-white, massive, medium-grained and weather grey-buff from iron-oxide staining.
- e. Quartz-bearing syenite, of pre-Cambrian age (map symbol sy). The crystalline syenite appears to be a differentiation product of the original anorthositic magma. Iron-bearing units are light-brown to grey, massive and medium-grained.
- f. Mafic gabbroic rocks, of pre-Cambrian age (map symbol gb). Gabbroic rocks are part of the anorthosite-gabbro-syenite layered intrusive complex. These crystalline rocks may be mottled to very dark, banded, with coarse-to fine-grained texture.
- g. Anorthosite, of pre-Cambrian age (map symbol an). These rocks are white, bluish-grey to light grey, medium- to coarse-grained and consist almost entirely of plagioclase feldspar.
- h. Gneissic metamorphic rocks, of pre-Cambrian age (map symbol gn), are composed of blue-quartz-feldspar gneiss with some recrystallized limestone and quartzite.
- i. Pelona schist, of pre-Cambrian age (map symbol ps). This metamorphic unit consists of silvery-grey to dark green, strongly foliated mica and chlorite-actinolite schist with a few beds of quartzite and marble.

In general, the older sedimentary and/or volcanic units (Punchbowl and Vasquez Formations) are exposed along the flanks of the hills and mountains which border the Santa Clara River valley in Soledad Canyon while the older crystalline and metamorphic rocks crop out in the upper watershed areas of the Sierra Pelona and the San Gabriel Mountains. The pre-Cambrian units consist of an

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

22

anorthosite-gabbro-syenite layered intrusive complex which intruded into older gneissic metamorphic rocks. The Pelona schist is confined to the northern part of the study area, along the southern flank of the east-west-trending Sierra Pelona Mountains.

Due to their cemented and/or crystalline nature, the above rocks possess only secondary porosity and may contain groundwater only along bedding planes, joints, shears or fractures. As a result, and due to their structural complexity and low permeability, these rocks are not considered capable of yielding water readily to wells. Moreover, they have a very limited storage capacity, and their ability to provide long-term sustained yields to wells is unpredictable. These cemented and/or crystalline rocks are not considered part of the groundwater reservoir in the Acton study area.

GEOLOGIC STRUCTURE

The principal geologic structures in the Plate 2 mapped area are the northwest to southeast-trending Kashmere Valley and Acton faults and the west to northeast-trending Soledad fault system. In the northeast corner of the mapped area is a small portion of the Nadeau fault, a branch of the northwest to southeast-trending San Andreas fault. The Acton area consists, essentially, of a relatively thin mantle of alluvial and terrace deposits overlying vast thicknesses of Miocene to Pliocene sedimentary and volcanic rocks, intrusive crystalline basement and older metamorphosed country rock.

The faults, as mapped by others, are recognized as rupturing certain bedrock formations of relatively old geologic age and/or juxtaposing separate bedrock formations of different geologic ages. However, those previous investigators did not reveal whether or not any of these faults are active or potentially active, and they did not definitively state whether or not any of these faults are considered to offset the geologically young alluvium or stream

S8931 - Acton Report

23

terrace deposits in and along Soledad Canyon. Further, it is not within the scope of work for this investigator to determine the relative degree of activity for any of the faults in the area mapped on Plate 2.

As a result wherever any of the fault traces cross the alluvium or terrace deposits on Plate 2, the fault alignment is indicated by a dotted pattern. Such a pattern reveals the fault alignment in that area is either not known with certainty, and thus inferred, or is doubtful and questioned.

Because of the active scouring and/or alluviation of the youthful alluvial river deposits, it is probable that the faults neither intersect the alluvium nor create any groundwater barriers within the alluvium in the study area; this includes such faults as the Soledad, the Kashmere Valley, and the Acton faults (see Plate 2). Groundwater contours inferred within Soledad Canyon as discussed later in this report, do not clearly reveal the presence of any groundwater barriers created by faults displacing the alluvium.

HYDROGEOLOGY

GROUNDWATER OCCURRENCE, RECHARGE AND DISCHARGE

Within the saturated zone of the water-bearing alluvial and terrace deposits of the Acton basin, groundwater occurs in the pore spaces and voids between the individual sedimentary grains. In general, water table conditions appear to prevail throughout the alluvial and terrace deposits, although semi-perched conditions may exist locally in portions of the main river valley and its tributary canyons, particularly within the terrace deposits. Due to the mode of deposition of these materials, sedimentation of thick and areally extensive clay layers has been precluded; as a result, confined artesian conditions have not been developed.

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

24

Natural sources of recharge to the groundwater reservoir within the alluvium and terrace deposits include: deep percolation of direct precipitation; infiltration of stream runoff in the river valley and its tributaries; and subsurface inflow, depending on water levels from the adjoining hill and mountain areas. The relative magnitude of each of these recharge sources has not been quantified for this investigation, due principally to a lack of requisite data.

Man-made sources of recharge to the alluvium and terrace deposits systems include: deep percolation of irrigation returns and returns from private subsurface sewage disposal systems. No artificial recharge operations, either by direct surface spreading basins or by shallow well injection, have historically been utilized in the river valley to make use of excess surface runoff, or of imported water, for purposes of augmenting water levels in the alluvium or terrace deposits.

Outflow or discharge from the alluvium and terrace deposits occurs by water well extractions by LACWWD-Acton, by Acton Camp, and by the various private water companies, housing tracts and ranches in the region. Additional discharge is known to occur by: subsurface outflow to the downstream Eastern Groundwater Basin to the west; surface outflow from the area of rising water within the alluvium located downstream from the Acton Camp; subsurface outflow, depending on water levels, to the permeable or fractured portions of the Vasquez Formation and older crystalline or metamorphic rocks which underlie the alluvium and/or terrace deposits; and evapotranspiration in areas of phreatophytes that grow in the downstream reaches of the main river valley where rising water is known to occur.

The approximate zone(s) of rising water and roughly estimated amounts of rising water (as observed during a field reconnaissance on January 12, 1990) were discussed previously in the Drainage section of this report. Also, the only estimates of natural

S8931 - Acton Report

25

recharge to the Acton area were provided by Geraghty & Miller, Inc. (in the Brockmeier report, dated Feb. 1990). In that report, they determined the annual recharge to the Acton area to be approximately 11,100 acre-feet per year (AF/yr), calculated as the difference, over the entire Acton region, between annual rainfall (10.42 inches for their period of record) and the average groundwater recharge threshold value (they used 8 inches of rainfall).

Their total watershed area was determined to be approximately 55,600 acres, defined as follows:

- a. 45,000 acres of watershed which drains into Soledad Canyon from the watershed divides to the north in the Sierra Pelona and to the south in the San Gabriel Mountains, as measured from the narrows on the northeast at Soledad Pass, just southwest of Kentucky Springs Canyon, to the narrows on the southwest located between Arrastre Canyon and Bootleggers Canyon. (Plate 6 later in this report uses these same two narrows locations in Soledad Canyon for boundaries used herein for calculations of groundwater in storage.) Recharge from this watershed represents 9000 AF/yr of the 11,100 AF/yr total annual recharge.
- b. An additional 10,600 acres in the northeast which consists of the watershed that drains into upper Soledad Canyon from the Soledad Pass area and Kentucky Springs Canyon. Recharge from this watershed represents the remaining 2100 AF/yr of the total 11,100 AF/yr of recharge described above.

For comparison, a typical "rule-of-thumb" estimate of annual recharge within a watershed is to multiply the total watershed size (55,600 acres), by the average annual rainfall on the entire watershed area (about 12 to 16 inches, or 1.0 to 1.3 ft), by a factor of about 10 percent (0.10). Such a calculation suggests a total annual recharge to the area of about 5600 to 7200 AF/yr.

Average annual basin outflow as measured at the narrows locations within Soledad Canyon just downstream from Arrastre Canyon were calculated by Geraghty & Miller, Inc. (Brockmeier report of Feb. 1990) to be approximately 11,100 AF/yr. That calculation included: 2100 AF/yr of subsurface outflow through the

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

26

alluvium in the canyon itself; and an additional 900 AF/yr of surface water runoff at that location.

For our assessment of subsurface groundwater outflow from the alluvium within the narrows of Soledad Canyon just downstream from Arrastre Canyon, we relied on the Darcy equation. Here, subsurface outflow,  $Q$  (gallons per day, gpd) is equal to the product of: the permeability  $P$  of the sediments (gpd per square foot, gpd/ft<sup>2</sup>); the groundwater gradient  $I$  (feet per foot, ft/ft); and the cross sectional area of saturated flow  $A$  (square feet, ft<sup>2</sup>).

Hence, the relationship used was  $Q = PIA$ . Our estimates of alluvium permeability are on the order of 1000 gpd/ft<sup>2</sup>. The groundwater gradient, as discussed later in this text and as adapted for this downstream reach of Soledad Canyon, ranges between approximately 0.017 ft/ft for a relatively wet hydrologic period (November 1983 to May 1984) and 0.012 ft/ft for a relatively dry hydrologic period (November 1964 to December 1965).

Also, the cross sectional area of flow, as discussed later in this text and as taken at the location of this same narrows in the canyon, is determined by the product of: the width of the alluvium at the narrows, which is approximately 1500 ft; and the thickness of the zone of saturated alluvium, which ranges from 100 ft in a relatively wet period to about 60 ft in a relatively dry period (as adapted from data on storage units and subunits later in this text). The least well known of the variables is the value for sediment permeability.

Regardless, the requisite calculations for subsurface outflow within the alluvium at the downstream terminus of the Acton basin, as defined herein, show the following:

- a. for a relatively wet period, an outflow of about 2800 AF/yr;
- b. for a relatively dry period; an outflow of about 1200 AF/yr.

S8931 - Acton Report

27

WATER LEVELS

To evaluate the status of groundwater levels and flow directions in the study area, the elevation of the water table at numerous points must be obtained. When lines connecting points of equal water table elevation are drawn, the lines represent contours of equal elevation of the water table. Construction of water level contour maps requires obtaining non-pumping water depth measurements for a specific time period from wells spaced throughout the study area. These water level depths are then corrected for elevation, plotted on a map, together with the well location and well identification, and then contoured.

Groundwater flows from high head to low head, and hence, flow directions are perpendicular to the contour lines themselves. However, it should be noted that because most wells in the region contain relatively long lengths of continuously perforated casing, groundwater enters the well bore from all strata encountered by the well. This precludes analysis of water movement in individual aquifers. Also, because there is not an even distribution of wells throughout the study area, there are numerous data gaps and contour lines must be interpolated in these areas. Lastly, it should be noted that some reported water levels are questionable and likely relate to some form of measuring error.

For this investigation, two time periods were selected to represent basin-wide groundwater conditions and the direction of groundwater flow. The period from November 1964 to December 1965 was selected because it represents that period of time for which water level data are available when water levels in the study area were at or near their all-time low (a hydrologically dry period). The period from November 1983 to May 1984 was selected because it represents the all-time high period (a hydrologically wet period) for which water level data are available in the project area.

S8931 - Acton Report

28

As shown on the rainfall cumulative departure curves (Figures 2.1 and 2.2), the all-time high for precipitation appears to have occurred from 1944 to 1947. However, no water level data for this period are available, therefore, the second period of high water levels which occurred in response to above-average precipitation during the period 1978 to 1983 was used to represent high water levels.

Data was obtained for the low and high groundwater level contour maps from basic water level readings for wells in the region that were on file at LACFCD. These readings were annotated for each water well monitored, and then contoured as illustrated on Plates 4 and 5 - Groundwater Contours - for the periods November 1964 to December and 1965 to November 1983 to May 1984, respectively.

As described in other sections of this report, the alluvium and terrace deposits in the study area are divided into numerous subunits, or storage units, the boundaries of which have been selected on the basis of geologic and topographic features. However, in describing groundwater movement, the alluvial and terrace deposits are considered to be a single entity across the study area from the Soledad Pass watershed divide on the east, to the narrows at the downstream end of the study area which lies approximately 3000 ft northeast of Ravenna on the southwest side of the study area. The location and areal extent of the alluvium and terrace deposits are shown on Plate 1 (and in further detail later in this text on Plate 6).

During the water level low period of November 1964 to December 1965, groundwater levels in the investigation area varied in elevation from 3050 ft above sea level at the easterly limits of the study area in Soledad Pass to 2450 ft at the westerly limits near Ravenna. Highest groundwater elevations were exhibited in terrace deposits in the upper portions of Kentucky Springs Canyon, where groundwater reached a maximum elevation of 3950 ft above sea

S8931 - Acton Report

29

level. Groundwater movement was to the west in the main channel of the Santa Clara River in Soledad Canyon, generally to the south in tributary canyons lying north of the river, and to the north in the southern tributaries.

Depth to water in the terrace deposits during the water level low period of November 1964 to December 1965 period in the study area is considered to be moderately deep, with typical water levels being 150 to 200 ft below ground surface, except in Arrastre and Aliso Canyons, where typical water levels were on the order of 25 to 50 ft below ground surface. Depth to water in the alluvium during this low water level period ranged from 100 to 180 ft below ground surface except for the area of rising groundwater near Acton Camp, where depth to water ranged from 40 to 60 ft below ground surface.

During the water level high period of November 1983 to May 1984, groundwater levels in the study area varied in elevation from 3150 ft above sea level in Soledad Pass to 2450 ft near Ravenna. Highest groundwater elevations of 4000 ft above sea level occurred in terrace deposits in Kentucky Springs Canyon. Depth to water in the terrace deposits during this period ranged from 20 to 70 ft below ground surface, while depth to water in the alluvium was on the order of 10 to 40 ft below ground surface except in the river channel southwest of Acton Camp, where water levels were just below, or occurred at ground surface as rising waters.

Notable in an analysis of water level contour data for both the low period of November 1964 to December 1965 and the high period of November 1983 to May 1984 is the fact that water levels in the alluvial and terrace deposits fluctuated rapidly and to a large degree in response to wet and dry conditions; this occurred not only in individual areas or individual wells, but in general throughout the entire study area. Such a condition of rapid and/or large scale water level fluctuation results from a combination of

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

30

sediments with high permeability, and aquifers of limited areal extent and/or of limited storage capacity.

Review of the groundwater contours for the hydrologically dry and wet periods (Plates 4 and 4) indicates that the gradients for any particular canyon are relatively similar regardless of the climatic period. The overall gradient, *I*, within the alluvium of the river from the northeast to the southwest limits of the Acton basin, as defined herein, are approximately: 0.014 ft/ft, about 73 ft/mi for the dry period (Plate 4); and 0.016 ft/ft, about 86 ft/mi for the wet period (Plate 5).

Similar calculations, but only for the reach of the river near Acton Camp, near the downstream end of the basin, reveal the following:

- a. in the dry period, *I* = 0.012 ft/ft, or about 64 ft/mi;
- b. in the wet period, *I* = 0.017 ft/ft, or about 91 ft/mi.

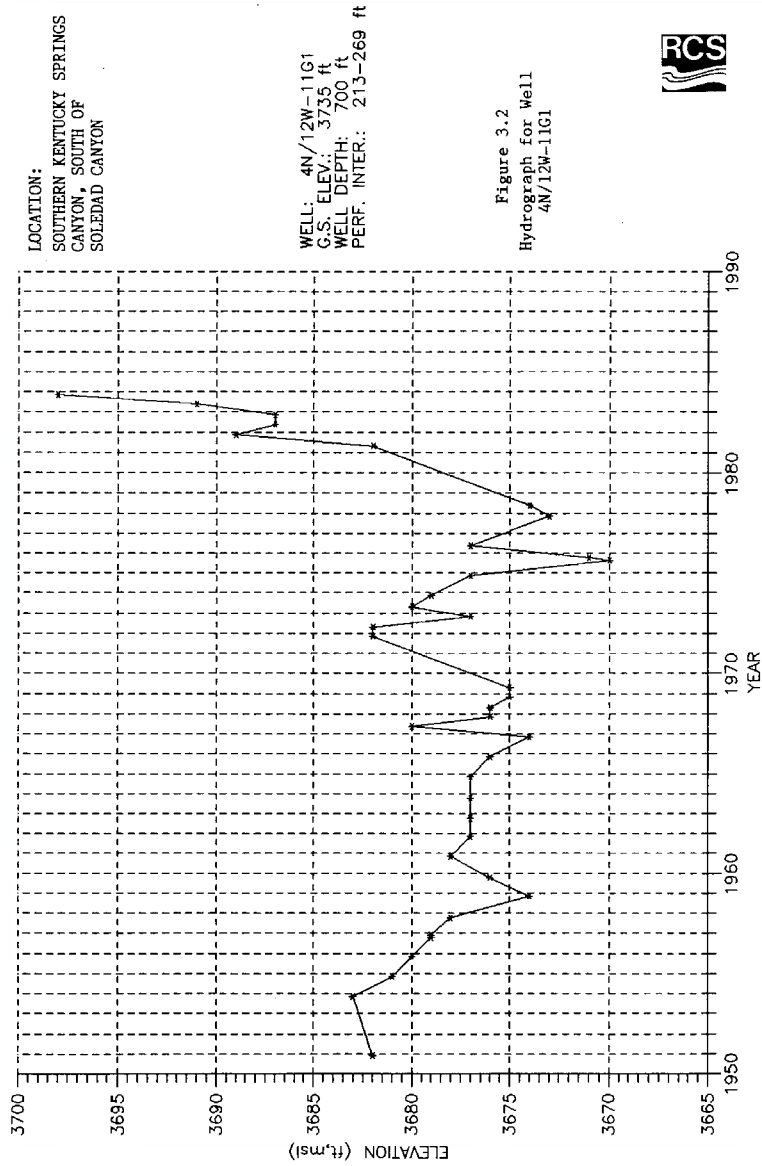

This indicates that the subsurface outflow from the basin below Acton Camp would be greater by the ratio of 91/64, or about 1.42 times larger in the wet period compared to the dry period, assuming that the other two variables in the Darcy equation were constant (specifically, the thickness of the saturated zone of the flow, and the permeability of the alluvial sediments). It should be noted that the thickness of the saturated zone does change depending on long-term climate (see discussion of storage subunits later in this report) and on sediment permeability. The least known and/or tested of these variables is sediment permeability.

**HYDROGRAPHS**

Water level fluctuations in 12 wells in the study area were obtained from various data repositories and plotted versus time to construct water level hydrographs. The hydrographs, as presented in Figures 3.1 to 3.9, reveal the continuous adjustment of groundwater in storage to changes in basin-wide recharge and discharge. The hydrographs permit the assessment of both long-term and short-

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

31

term seasonal changes occurring within the aquifer systems comprised by the alluvium and by the terrace deposits.

Due to the sporadic nature of water level data collection in the Acton area, three of the hydrographs consist of pairs of nearby wells, the first well covering the period from the early 1950s to the mid-1960s, and the second well covering the period from the late 1960s or early 1970s to the present. Of the remaining six wells, five have data gaps from the mid-1960s to the mid-1970s.

Assessment of the hydrographs is supplemented with the use of precipitation data shown on Tables 1.1 and 1.2 and the cumulative rainfall departure curves on Figures 2.1 and 2.2, for Blum Ranch and Acton Camp, respectively.

The specific wells for which hydrographs have been prepared include (see well locations on Plate 1):

- a. Wells 4N/12W-2E1 and -2E2 which are located in the central portion of Kentucky Springs Canyon, south of Soledad Canyon (Fig. 3.1).
- b. Well 4N/12W-11G1 located in the southern portion of Kentucky Springs Canyon (Fig. 3.2).
- c. Well 4N/12W-5G2 located in Aliso Canyon, south of Soledad Canyon (Fig. 3.3).
- d. Well 5N/12W-28F3 located in the zone of terrace deposits which lies near the Vincent Fire Station, just north of Soledad Canyon (Fig. 3.4).
- e. Well 5N/13W-25C1 located in the zone of terrace deposits near the freeway, north of Acton and Soledad Canyon (Fig. 3.5).
- f. Well 5N/13W-25L1 located in the terrace deposits, between Acton and the freeway, north of Soledad Canyon (Fig. 3.6).
- g. Wells 4N/13W-1C1 and -1C2 (also known as LACWWD Well No. 37-1), located at Acton, within the deposits of the Santa Clara River (Fig. 3.7).
- h. Well 4N/13W-12C3 (also known as Acton Camp No. 3), located within the deposits of the Santa Clara River (Fig. 3.8).

S8931 - Acton Report

32

- i. Wells 4N/13W-10R1 and -15A1, located in Soledad Canyon, near Ravenna (Fig. 3.9).

Inspection of the water level fluctuations on Figures 3.1 to 3.9 indicates that changes in groundwater in storage in the study area occur both in the short-term (seasonal) and in the long-term (period of several years).

Short-term, seasonal water level fluctuations are typically in the range of 2 to 10 ft, except for well 4N/12W-5G2 (Fig. 3.3) which displays several seasonal fluctuations in recent years of 20 to 30 ft. For the hydrographs, annual water level highs tend to occur in the spring months (following increased recharge and decreased groundwater pumpage), while the water level lows tend to occur in the fall months (following decreased recharge and increased groundwater pumpage). Rapid and large scale water level rises are commonly observed immediately following large rainfall and/or surface runoff water events and/or rainfall seasons (e.g., see the large rise in early 1978 for well 4N/12W-5G2 on Fig. 3.3 following very high winter-spring rains).

Longer term water level fluctuations reveal the results of basin-wide trends in long-term rainfall, runoff, and deep percolation (recharge). Typical long-term trends for the hydrographs include: a general water level declining period extending (data permitting) from the 1950s, through the 1960s and into the mid-1970s; this is followed by a relatively rapid period of rising water levels into the mid-1980s; and following that, a return to a period of water level declines. Figures 3.1, 3.2, or 3.7 depict these relationships effectively. It is notable that these water level "trends" are analogous to the trends in the cumulative rainfall departure curves (Fig. 2.1 and 2.2).

#### THEORETICAL AQUIFER PARAMETERS

To assess well yields and aquifer parameters, the water transmitting, or hydraulic properties of the aquifers must be

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

33

evaluated. These aquifers represent the water-bearing zones in the groundwater reservoir; that is, those strata comprised of permeable sandy or gravelly materials, or both, which are mixed with lesser concentrations of silt and clay. The arrangement, sorting, shape, and size of the individual grains in the aquifers control the ability of water to move through the strata.

Characterizing the water transmitting properties of the aquifers are the aquifer coefficients of transmissivity (symbol T, in gallons per day per foot of aquifer, gpd/ft), and storativity (S, in cubic feet per square foot per foot, ft<sup>3</sup>/ft<sup>3</sup>). An additional parameter, permeability (P, in gallons per day per square foot, gpd/ft<sup>2</sup>) can be calculated from T values, or is determined by field tests or by soils laboratory testing of aquifer samples.

Transmissivity and permeability will be discussed in this section of the report. Storativity, the amount of storage in the reservoir, will be discussed in the Geohydrology section.

Typically, T is calculated from aquifer tests conducted in the field on individual pumping wells (based on water level drawdown and recovery measurements versus time). Due to a virtual absence of requisite field data in the basin, such direct calculations of transmissivity were not possible.

Instead, an empirical method of assessing T values was used for this project in order to review the relative ability of the local aquifers in the basin to yield water to wells. This method determines the theoretical value of transmissivity by relating T to the specific capacity of the well.

For the assumed water table conditions in the study area, the empirical relationship is approximately:

Theoretical T = 1750 Q/s, where Q/s is the specific capacity of the well;  
 Q is the well yield in gpm;  
 s is the amount of drawdown, in feet, created in the well by that pumping rate;  
 1750 is an empirical constant.

S8931 - Acton Report

34

Actual values of Q and s are generally obtainable from data on drillers' logs or from efficiency tests conducted on local wells by the Edison Company. Again, however, data are meager.

Using data from the well logs, and based on the empirical formula above, theoretical T values for a few wells were then calculated. Because aquifer T values are additive, it follows that if wells were drilled deeper into the alluvium and/or terrace deposits, then the overall T value would increase at that particular location.

It must be recognized that such calculations of theoretical T relate directly to the age, efficiency, condition, and design of the well and its perforations. This is because the key factor in the calculation is well drawdown (symbol, s). Drawdown, in turn, is a measure of the head loss for water entering the well perforations as a result of pumping. Wells that are old, have inefficient designs, that contain precipitates or encrustation on perforations, or that have limited open areas in their perforated intervals will have larger head losses (drawdown) than wells with the opposite of such conditions.

Using existing information for specific capacity, the following are derived:

- a. A new well for Acton Camp (No. 4; 130 ft deep, perforations from 40 to 100 ft) was reportedly test pumped in late-1989 (information from Brockmeier Consulting Engineers, Inc.), and produced 800 gpm with a drawdown of 60 ft, and 1100 gpm with a drawdown of 104 ft (initial static level = 18 ft); the length of the tests is not known. Resulting specific capacities are 13.3 and 10.6 gpm per foot of drawdown, respectively. These data suggest T values in the range of 23,000 and 18,500 gpd/ft, respectively. The decrease in the T value at the higher pumping rate indicates that the 1100 gpm is excessive for this well. In addition, both pumping rates created pumping levels (78 ft and 122 ft, respectively) that are below the uppermost perforations in this well (40 ft).
- b. Acton Camp Well No. 3, drilled in 1962, displayed an original pumping rate of 1000 gpm from a pumping level of

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

35

95 ft, after 50 hours of pumping according to well log records (static level of 37 ft; top of perforations at 42 ft). These data indicate a specific capacity of 17.2 gpm per foot of drawdown, and a transmissivity of about 30,100 gpd/ft. At a pumping rate of 700 gpm, the well showed a specific capacity and transmissivity of 16.3 gpm per foot of drawdown and 28,500 gpd/ft, respectively.

A 1984 Southern California Edison Company efficiency test of this well showed a pumping rate of 249 gpm from a pumping level of 10 ft (water levels were high in the area in the early-1980s). This calculates to a specific capacity and transmissivity of approximately 65 gpm/ft of drawdown and 114,000 gpd/ft, respectively.

- c. Several miles upstream near the intersection of Carson Mesa Road and Aliso Canyon Road, a 354-foot deep well drilled in September 1989 (perforations from 134 to 354 ft) reportedly revealed a specific capacity of 70 gpm per foot of drawdown, at a pumping rate of 350 gpm. If accurate, this would suggest a T value on the order of 120,000 gpd/ft.
- d. A 260-foot deep well drilled in September 1989 for Acton I Builders Group revealed pumping rates of 400 to 500 gpm, specific capacities in the range of 10.2 to 10.5 gpm per foot of drawdown, and T values of 17,800 to 18,400 gpd/ft, respectively. This well also lies in the main portion of Soledad Canyon, relatively near the one discussed above.
- e. LACWWD Well No. 37-1 (232 ft deep, perforations from 70 to 209 ft) is located in the river area near Acton, and showed a pumping rate of 1000 gpm from a depth of 90 ft when first drilled in 1967 (static level = 75 ft). These data show a Q/s = 66.6 gpm per foot of drawdown and a T = 116,700 gpd/ft.

To evaluate sediment permeability, it is necessary to utilize transmissivity (T) and the relationship  $T = Pm$ , where P = permeability (in units of gallons per day per square foot, gpd/ft<sup>2</sup>), and m = aquifer thickness (in ft). This relationship must be used for Acton because no laboratory permeability test data are available in the literature. Also, when the full aquifer thickness is not known, it is possible to have m = total footage of perforations in the well.

S8931 - Acton Report

36

Hence, for the wells discussed above, theoretical permeability values would be as follows:

- a. For the 60 ft of perforations in the new Acton Camp well, P would be approximately 400 to 300 gpd/ft<sup>2</sup>, respectively.
- b. For Acton Camp No. 3 (100 total feet of perforations) theoretical P would be approximately 300 gpd/ft<sup>2</sup> for the original 30,000 gpd/ft transmissivity. For the 1984 Edison test, theoretical P would be approximately 1140 gpd/ft<sup>2</sup>.
- c. For the new well near Carson Mesa and Aliso Canyon roads (220 ft of perforations), P would be approximately 550 gpd/ft<sup>2</sup>.
- d. For the Acton I Builders Group well (150 ft of perforations), theoretical P would be approximately 120 gpd/ft<sup>2</sup>.
- e. For LACWWD Well No. 37-1 (139 ft of perforations), the theoretical P value would be on the order of 840 gpd/ft<sup>2</sup>.

#### GROUNDWATER QUALITY

Concentrations of dissolved mineral constituents in groundwater are influenced by the quantity and quality of groundwater which percolates into the groundwater reservoir. Once in the ground, the water quality is influenced by such factors as: the lithology and age of the sediments through which it flows; the rate of groundwater flow; the rates and locations of recharge; fluctuation in basin-wide water levels; well construction and abandonment techniques; methods of water sampling; the locations for and qualities of any artificially-recharged waters; and the proximity to sources of potential degradation such as irrigation-return waters, and industrial discharges, or deep percolation of sewage effluent from the multitude of leachfields in the Acton region.

Identification of the chemical character of groundwater in the Acton area has been determined by the construction of a Trilinear Analysis Diagram - Figure 4. Trilinear diagrams are prepared using the percent reactance values of the principal cations and anions

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

Job S8931

S8931 - Acton Report

37

Figure 4  
Trilinear Analysis Diagram

listed in the original laboratory analysis of the well water. Total dissolved solids (TDS) values used in this study are for total filterable residues and not the higher values historically reported as the summation of constituents; this is consistent with TDS values currently reported by local laboratories.

Figure 4 presents the results of the required calculations for: two relatively deep wells drilled in the region of terrace deposits which may also contain perforations within and produce some water from fractured bedrock (diagram symbols 1 and 2); for two wells probably producing only from terrace deposits (diagram symbols 4 and 5); and for five wells probably producing only from alluvium (diagram symbols 3, 6, 7, 8 and 9). The well represented by symbol no. 9 is located at the western limits of the study area, near Ravenna. Well data is the most recent available and ranges from June, 1988 to July, 1989. The only surface water samples available date from January, 1969, and represent pre- and post-flood periods for a station at Lang, a few miles downstream (diagram symbols 10 and 11).

All the samples show similar calcium-magnesium-bicarbonate character except Nos. 4 and 5, which show calcium-magnesium sulfate character due to a higher sulfate ion concentration. These two wells are located in the broad valley north of Acton community and are part of a four-well group (diagram symbols 3, 4, 5 and 6) situated in the more developed parts of the Acton basin which also display elevated nitrate ion concentration (as NO<sub>3</sub>) ranging from 17.0 to 24.7 mg/l. In contrast, the remaining wells on Figure 4 display nitrate levels ranging from 3.9 to 11.0 mg/l. An evaluation of the present nitrate situation in the Acton area, together with an assessment of possible future changes in this ion with time due to proposed developments in the Acton area, are provided in the Geraghty & Miller, Inc. report for Brockmeier Consulting Engineers, Inc. (Feb. 1990).

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

38

Total dissolved solids concentrations for existing data range from 279 to 480 mg/l while total hardness (TH) ranges from 172 to 271 mg/l. There does not appear to be any obvious relationship between TDS or TH concentrations for wells producing from terrace deposits versus alluvial wells.

Comparison of historical quality data with hydrographs of water levels for nearby wells (Plate 2, Figures 3.1-3.9), suggests that TDS may have responded inversely to precipitation (recharge). That is, as water levels rose within the alluvium and terrace deposits in response to direct and rapid infiltration of precipitation and stream runoff, the TDS content in wells tended to decline because of large dilution effects of recharge. Similarly, the surface water samples at Lang (symbols 10 and 11, Figure 4) for January 20 and 21, 1969, show a decrease in TDS and TH with an increase in flow from 10 cubic feet per second (cfs) to an estimated 500 cfs, after heavy rainfall and flooding.

#### GEOHYDROLOGY

##### GENERAL STATEMENT

Within a groundwater basin, the available groundwater storage capacity represents the total volume of water that can be held in underground storage at a given period of time and that can become readily available for extraction by wells. For the water table environment in the Acton area, the groundwater storage capacity potentially available for extraction by wells depends on the total volume of the alluvial and terrace deposits that are, or can become, saturated in the groundwater reservoir, and on the specific yield of those sediments. Hence, groundwater in storage is a constantly changing value which fluctuates in response to both seasonal and long-term changes in recharge to, and discharge from, the groundwater reservoir. A rising water table increases the thickness of the saturated water-bearing section, which results in

S8931 - Acton Report

39

a greater volume of groundwater in storage; the reverse is true for a declining water table (a decreasing saturated thickness).

To be usable, the void space or reservoir space for groundwater storage in a given volume of sediments must have at least two capabilities: it must be economically capable of being dewatered during periods of deficient surface supply; and it must be capable of being re-saturated either naturally or artificially during periods of excess surface supply. Thus, the groundwater reservoir must contain usable water, which may be defined as that having a satisfactory quality for prevailing beneficial uses and that occurring in sufficient quantity in the underground reservoir to be available without uneconomic yield or excessive drawdown.

Within the water table conditions in the study area, the amount of water available for use at the beginning of the pumping season is dependent entirely upon the amount of water which the formations will yield by gravity when the water levels are depressed by pumping.

For this investigation, it was necessary to assess the quantity of groundwater in storage during periods of average or above-average rainfall; from these calculations, it is then possible to determine the change in storage in response to the quantity of precipitation.

Also, the aquifer system within the study area is comprised of alluvial and terrace deposits derived from the surrounding highland areas and deposited as interfingering lenses of clay-, silt-, sand-, gravel- and boulder-sized sediments. The materials vary in composition and grain size vertically as well as horizontally, and tracing of individual beds or units was not possible. Because the aquifer system is both heterogeneous and non-isotropic, it was considered unreliable to merely select an average thickness for the alluvial and terrace deposits and to apply this value throughout the study area. Likewise, it was deemed inadvisable to select one value of specific yield for all of the alluvial and terrace

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

40

deposits and to utilize this single value for computational purposes.

GROUNDWATER STORAGE CAPACITY

To quantify the volume of groundwater in storage that is potentially available for extraction, it is necessary to multiply the total volume of water-bearing sediments by the specific yield of the various strata. In this assessment, specific yield represents the ratio of the volume of water which can be drained by gravity from a saturated stratum to the unit volume of that stratum. The procedure for calculating storage capacity involved the following steps:

1. Subdivision of the study area into individual groundwater storage units within the alluvium and also within the terrace deposits.
2. Assessment of the total thickness of potentially saturated sediments in each of the two storage units.
3. Grouping of earth materials described on drillers' logs into categories based on grain size.
4. Assignment of specific yield values to each category of earth materials.
5. Computation of groundwater storage capacity (SC) using  $SC = AmS_y$ , where A = surface area of the storage unit, m = thickness of potentially saturated deposits in that unit, and  $S_y$  = the assigned specific yield.

STORAGE UNITS AND SEDIMENT THICKNESSES

The first step in determining storage capacity is to subdivide the study area into individual groundwater storage units. To accomplish this, boundaries of the storage units were selected to coincide with either surface or subsurface geologic features or topographic features such as canyon "narrows," obvious surface "divides," or similar features. The purpose of using such subdivisions was twofold: first, our study area was too large and

S8931 - Acton Report

41

had to be divided into smaller, more-easily-managed units; and second, hydrogeologic features varied markedly throughout the investigation area.

As a result, two separate storage units were selected: Unit No. 1, alluvium (map symbol Qal) and Unit No. 2, terrace deposits (map symbol Qt). Unit No. 1 was divided into nine separate subunits and Unit No. 2 was divided into 18 separate subunits. As illustrated on Plate 6 - Groundwater Storage Units, the two storage units are of different areas and geometry. Based on our field reconnaissance in January 1990, the alluvial and terrace deposits contacts on Plates 2 and 5 have been modified from the published geology (as shown on Plate 1) in order to more accurately represent the surface extent of the alluvial and terrace deposits that are being studied for this investigation. Our interpretation of the relationship between the alluvium and the terrace deposits, and the surrounding older nonwater-bearing rocks, is presented in cross-sections A-A' and B-B' (Plate 3). Locations of the cross-sections are shown on Plate 2.

To assess the quantity of groundwater in storage at any given time that is potentially available for extraction by wells, it was necessary to assign specific yield values to each subunit and to multiply this figure by the volume of saturated sediments in the subunit. The volume of saturated material is a product of the area of the individual subunit and the saturated thickness of the material underlying the particular subunit, multiplied by a correction factor to take into account the fact that: the sides of the subunits are not vertical; and the base of the subunit is not a horizontal plane. The total planimetered surface area in each subunit was reduced by a factor of 25 percent to account for the reduction in volume of the subunit caused by the sloping sides of the canyon walls which adjoin the channels and valleys.

To ascertain the thickness of the saturated material, it is necessary to determine the base of the fresh water-bearing

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

42

sediments and the elevation of the water table at a specific time period within each of the subunits. Maps depicting the elevation of the water table for specific time periods (November 1964 to December 1965 and November 1983 to May 1984, as seen on Plates 4 and 5) were used for these purposes. The initial interval represents a water-level low period which had been preceded by a series of dry years while the second interval represents a water-level high period following several years of above-average precipitation.

Lastly, the following important assumptions were used:

1. All surface boundaries were considered to be sloping planes.
2. The depth to water in each storage subunit was averaged across the subunit to create a flat water table and a uniform thickness of saturated sediments across each particular subunit.
3. The base of fresh water for each storage subunit was averaged across that subunit to create a flat bottom for each particular subunit; however, the volume of saturated material was corrected, as described above.

#### SPECIFIC YIELD VALUES

Specific yield in water table environments represents the quantity of water that a unit volume of the material will release from storage when drained by gravity. The part of the water that is not removed by gravity during drainage is held against the force of gravity by such conditions as molecular attraction and capillarity; this water is not available to wells.

For this investigation, drillers' logs or other lithologic data were available for approximately 30 wells and test holes. Those locations completed as wells are shown on Plate 1. Specific yield values were obtained from studies of sediments similar to those at Acton where terms from drillers' logs had been empirically matched to specific yield for the wells in question.

S8931 - Acton Report

43

Specific yield values were determined to range from 10 to 19 percent in the alluvium and from three to five percent in the older, more highly weathered terrace deposits. The higher values of specific yield were found to be restricted to only a few alluvial storage units. Once a determination was made of the specific yield values for selected wells, each storage subunit was assigned a single value which was considered to best represent that entire subunit.

#### ESTIMATED QUANTITY OF GROUNDWATER IN STORAGE

The estimated quantity of groundwater in storage that is potentially available for extraction within the investigation area was computed by multiplying the area of each storage subunit by the saturated thickness of that storage subunit (based on the water table elevation for that particular period), and by the specific yield value, in percent, assigned to the subunit. Tables 2.1 and 2.2 - Groundwater Storage Calculations - present the results of our calculations of groundwater in storage for Storage Unit Nos. 1 and 2 for the periods November 1964 to December 1965 and November 1983 to May 1984. To provide a detailed summary breakdown of the groundwater in storage in the alluvium and terrace deposits storage units, the reader is referred to Table 3 - Summary of Groundwater Storage Calculations.

Review of Table 2.1 for Storage Unit No. 1 (the alluvium aquifer system) reveals the following:

1. The alluvial aquifer system in the Santa Clara River and its tributaries in the Acton area (see exposure area on Plates 1 and 6) has a total area of 1587 acres, or 2.5 square miles.
2. Total groundwater in storage ranged from a low of approximately 9783 ac-ft during the low water level period November 1964 to December 1965 to a high of approximately 22,271 ac-ft during the high water level period November 1983 to May 1984.

Job S8931

3. During periods of low groundwater, the upper reaches of the alluvium (Storage Subunits 1a and 1b, Plate 6) and a shallow canyon on the north side of the area (Storage Subunit 1e) may be virtually dry, with water levels at or below the base of the alluvial aquifer.

Review of Table 2.2 for Storage Unit No. 2 (the stream terrace deposits aquifer system) indicates the following:

1. The terrace deposits aquifer system in the Acton area has a total area of 11,144 acres, or 17.4 square miles (refer to Plates 1 and 6).
2. Total groundwater in storage ranged from a low of approximately 5100 ac-ft during the water level low period of 1964 to 1965, to a high of 12,124 ac-ft during the water level high period of 1983 to 1984..
3. During periods of low groundwater, the water table may be at or below the base of the terrace deposits throughout most of the aquifer system. The exceptions are likely to be the large canyons in the foothills of the San Gabriel Mountains (Kentucky Springs, Aliso and Arrastre Canyons; Storage Units 2d, 2f, and 2i) and the wide valley north of Acton community (Storage Units 2k and 2l).

Summary Table 3 indicates that total surface area for both the alluvial and terrace deposits is 12,731 acres (19.9 mi<sup>2</sup>) and that total groundwater in storage that is potentially available for extraction from the two aquifer systems ranges approximately between: 14,900 AF during the water level low period between November 1964 and December 1965; and 34,400 AF during the water level high period between November 1983 and May 1984. Cumulative departure data for Blum Ranch and Acton Camp (Figures 2.1 and 2.2, respectively) indicate that rainfall for the 1944-47 period was significantly more than for the 1983-84 period, and therefore, the November 1983 to May 1984 groundwater storage calculations likely represent above-average groundwater storage, but likely not the all-time high. The period of November 1964 to December 1965 appears to represent a period at or near the all-time low for water levels in the area.

Table 3 - Summary of Groundwater Storage Calculations

Storage Unit Name	Total Planimetered Surface Area of Aquifer (acres)	Effective Surface Area of Aquifer (acres)	Groundwater in Storage 11/64 - 12/65 (acre-feet)	Groundwater in Storage 11/83 - 5/84 (acre-feet)
Alluvial Aquifer System (No. 1)	1587	1191	9783	22,271
Stream Terrace Aquifer System (No. 2)	11,144	8360	5100	12,124
TOTAL	12,731	9551	14,883	34,395

NOTES: 1) See Plate 6 for locations of storage units and subunits.  
 2) Effective surface area taken at 75% of the planimetered surface of aquifer in each storage unit (see text).

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

45

It should be noted here that groundwater levels in the terrace deposits lying along the foothills of the western San Gabriel Mountains, south of the Santa Clara River, are considerably higher during dry periods than are groundwater levels in the terrace deposits along the foothills of the Sierra Pelona, to the north of the Santa Clara River. Isohyetal contours prepared for the 1897 to 1947 period for the entire Santa Clara River drainage system (CRWQCB, 1975) show a maximum rainfall zone (32 inches per year) over the western San Gabriel Mountains, which decreases markedly to approximately 10-12 inches per year along the course of the river and to 8-10 inches per year in the northern part of the Acton area. This large rainfall decrease is considered to account for the relatively low groundwater levels during dry periods in the northern part of the Acton area.

In comparison to the groundwater storage volumes potentially available for withdrawal, as calculated for this investigation, we note that Geraghty & Miller, Inc. (in Brockmeier, 1990) also calculated the magnitude of total groundwater in storage. Their calculations were based on the following assumptions and/or criteria:

- a. A 75-foot average thickness of saturated flow within the alluvium.
- b. A porosity of 0.30 (30%) for the alluvium.
- c. A 25-foot average thickness of saturated flow within the terrace deposits.
- d. A porosity of 0.20 (20%) for the terrace deposits.
- e. An area of alluvium of 2480 acres as identified from published geologic maps.
- f. An area of terrace deposits of 10,400 acres as identified from published geologic maps.
- g. The upgradient boundary (at Soledad Pass) and the downgradient boundary (about 3000 ft northeast of Ravenna) selected by Geraghty & Miller, Inc. for the

S8931 - Acton Report

46

alluvium within Soledad Canyon are the same as used by this investigator.

- h. The use of porosity (instead of specific yield) allows them to calculate total water in storage, which is not the quantity of water available for withdrawal as has been calculated for our report.

As a result of the above, Geraghty & Miller, Inc. calculated a total volume of groundwater in storage in their alluvium area of 56,000 AF, and a total volume of groundwater in storage in their terrace deposits area of 52,000 AF. Hence, their total volume of groundwater in storage in the basin is approximately 108,000 AF. They also recognized that basement rocks contain little water, although some wells may produce some water from such rocks.

CONCLUSIONS AND RECOMMENDATIONS

Based upon review and analyses of existing data for the region, we submit the following conclusions and recommendations.

1.0 DATA BASE

Only a limited number of drillers' logs and/or electric logs are available for water wells in the Acton region. Only a very few wells are monitored for water levels and/or water quality. Data gaps in these water level records include information for a) prior to 1950; and b) for the period between 1965 to 1975.

2.0 HYDROGEOLOGY

2.1 Water-Bearing Sediments. The local groundwater reservoir in the Acton region is known as the Acton Valley Basin (or Acton Basin). Comprising this groundwater reservoir for the purposes of this study are all the potentially water-bearing alluvium and stream terrace deposits along and adjacent to Soledad Canyon (the Santa Clara River) and its major tribu-

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

47

taries. Plates 1 and 6 identify the surface exposures of these sediments as mapped for this project. These materials extend northeasterly along Soledad Canyon to the narrows at Soledad Pass, and southwesterly along the canyon to a narrows located about 3000 ft northeast of Ravenna.

Alluvium attains a maximum thickness of perhaps 175 to 225 ft in the Acton community area and is comprised of coarse-grained and permeable materials that are readily subject to scour and erosion by the river. Terrace deposits appear to attain a maximum thickness of about 210 ft in the wide valley north of Acton community and are comprised of porous, well-drained silt, sand and gravel. Because of their greater age and degree of weathering, the terrace deposits are likely more clay-rich than the alluvium.

2.2 Bedrock. Underlying the potentially water-bearing sediments, and exposed within the hills and mountains adjacent to Soledad Canyon, are a series of cemented sedimentary rocks, volcanic rocks, and/or crystalline or metamorphic rocks. The geologically older rocks are considered to be bedrock, and they may contain groundwater generally only along bedding planes, fractures, shears or joints. Their permeability is low and they are not considered capable of readily yielding water on a sustained basis to wells.

2.3 Geologic Structure. Several faults traverse the hills in the southwestern portion of the region. Based on water level data in the alluvium, these faults do not appear to create any groundwater barriers within Soledad Canyon.

Water, which was observed to be flowing in the lower reach of Soledad Canyon southwest of Acton Camp on January 12, 1990 (prior to any rainfall in the area), is considered to represent rising water. Such rising water is lost to the basin. This was the only reach of the Santa Clara River in the study area where surface flow was observed on that date.

S8931 - Acton Report

48

It results from a change in the cross sectional area within the zone of saturation in the alluvium in this region. Bedrock highs created by faulting and/or lack of deep erosion exist in this reach of the canyon, thereby creating a reduced cross sectional flow area.

2.4 Groundwater Occurrence and Movement. Water table conditions exist in the alluvium and in the terrace deposits. Due to their mode of deposition, confined (artesian) conditions are not expected to occur in these sediments. Wells drilled by others deep into the underlying bedrock will likely encounter various degrees of confinement.

Historically, and at present, groundwater in these sediments within Soledad Canyon flows from northeast to southwest across the study area. In the Acton area, the November 1964 to December 1965 interval represents approximately the all-time water level low, while the interval November 1983 to May 1984 represents a realistic water level high.

In the wetter period, depth to water in the alluvium ranged from 10 to 40 below ground surface while depth to water in the terrace deposits ranged from 20 to 70 below ground surface. In the drier period (November 1964 to December 1965) depths to water in the alluvium and in the terrace deposits ranged between 100 to 180 ft and between 150 to 200 ft below ground surface, respectively. Even within the drier period it was probable that rising water still occurred in Soledad Canyon downstream from Acton Camp.

Water level fluctuations seen on hydrographs closely follow long-term hydrologic (climatic) conditions in the area. Water levels tend to fluctuate rapidly and to a large degree in response to wet conditions (recharge); response to drier periods are somewhat more subdued. Such responses result from a combination of sediments with high permeability and aquifers

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

49

of limited areal extent and/or of limited storage capacity. That water levels do not decline as rapidly as they do for recharge events indicates that discharge from the basin (by pumping and/or natural subsurface outflow) is of a lesser magnitude than recharge to the basin (by deep percolation of rainfall and of stream runoff).

As a result, the amount of groundwater in storage in the basin can be expected to fluctuate seasonally and year-to-year, depending mainly on rainfall and surface water runoff characteristics. Periods of excess rainfall and runoff will tend to rapidly fill the basin, while periods of deficient rainfall and reduced runoff will tend to gradually cause a reduction in basin-wide water levels.

Shallow wells and/or wells with a shallow depth to their uppermost perforations will notice such fluctuations more rapidly and to a larger degree than wells with the opposite conditions. Water quality problems, if any, would also tend to be noticed more rapidly and to a larger degree in shallow wells and/or in wells having shallow perforations. Furthermore, the rapid and large scale recharge induced by periods of rainfall will tend to flush out and/or induce dilution to certain kinds of water quality problems in the groundwater reservoir should they occur.

2.5 Groundwater Recharge and Discharge. Principal sources of natural recharge to the groundwater reservoir are deep percolation of direct precipitation and infiltration of stream runoff. Estimates of recharge from precipitation range from 5600 to 7200 AF/yr (using a factor of 10 percent of the rainfall volume as being available for deep percolation), to 11,100 AF/yr (using the Brockmeier report). No separate estimates of stream runoff infiltration have been made to date by any other investigators. Rising water of at least 200 gpm was observed in the river channel just downstream from Acton

S8931 - Acton Report

50

Camp at a time (January 1990) that includes three prior years of deficient rainfall and runoff.

Man-made sources of recharge include deep percolation of irrigation returns and returns from private subsurface sewage disposal systems. There are no estimates of these quantities available due to a lack of requisite data. There are no artificial recharge spreading basins or injection wells in the region.

Discharge (subsurface outflow) from the basin occurs by water well pumpage, subsurface outflow to the next downstream groundwater basin, deep percolation into underlying bedrock, and evapotranspiration of shallow waters by phreatophytes.

Metered and/or estimated groundwater extractions for 1989 totaled approximately 1540 AF, as produced by: the County Waterworks District; the two privately-owned companies that supply bulk water to their customers; and the Acton school. The volume produced by all other privately-owned wells to meet all remaining domestic, irrigation, and stock-watering needs in the region is unknown, but is probably less than 1000 AF/yr.

Subsurface outflow from the alluvium at the downstream end of the Acton basin was calculated for this study to range approximately between 2800 AF/yr for a relatively wet period (November 1983 to May 1984) to about 1200 AF/yr for a relatively dry period (November 1964 to December 1965). Geraghty & Miller, Inc. (Brockmeier report) reported a subsurface outflow at the same location downstream from Acton Camp of approximately 2100 AF/yr.

The amounts of outflow by deep percolation into bedrock and by evapotranspiration are unknown.

2.6 Theoretical Aquifer Parameters. Using empirical relationships, due to meager requisite data, theoretical aquifer transmissivity for wells within the alluvial deposits ranges

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

51

between 20,000 gpd/ft and 120,000 gpd/ft. The wide latitude of these values results from such factors as: the age of the well; the efficiency of the well; the type of well perforations; and the location of the well within the alluvium of Soledad Canyon.

Because alluvium thickness appears to be generally greater in the reach of the canyon easterly from the community of Acton, it can be assumed that aquifer transmissivity may be larger in this region also.

Transmissivity, together with pumping rates and specific capacity within alluvial wells, will tend to vary directly with changes in saturated thickness. That is, when water levels are high (during periods of excess recharge) T, Q, and Q/s will tend to increase. When water levels are low (during periods of deficient rainfall and recharge), these aquifer and water well parameters will tend to decline.

- 2.7 Water Quality: A calcium-magnesium-bicarbonate character and TDS values in the range of 280 to 480 mg/l are representative of groundwater within the alluvium and the terrace deposits, except in the area in the wide valley north of Acton community where the water appears to be degraded with an increase in sulfate ion concentration. Nitrate values are elevated in the more developed parts of the Acton area, and range from 17.0 to 24.7 mg/l while the rest of the basin displays nitrate values ranging from 3.9 to 11.0 mg/l. There do not appear to be any definitive long-term and/or continuous trends toward poorer groundwater quality (such as increasing nitrate concentrations) discernible from available data.

Surface water quality was found to be similar to groundwater quality, but with less tendency for increased sulfate ion concentration. Much of the recharge to the groundwater is by deep percolation of surface water runoff.

S8931 - Acton Report

52

Shallow wells, wells with shallow perforations and/or wells with inadequate cement seals will be affected more rapidly and to a greater degree by surface spills and contamination than wells with the opposite conditions.

### 3.0 GEOHYDROLOGY

- 3.1 Groundwater Storage Capacity. Using a total surface area of alluvial and terrace deposits in the study area of 12,731 acres, a specific yield of 10 to 19 percent for alluvium and three to five percent for terrace deposits, and variable thicknesses based on basin location (maximum thickness of 225 ft), the following storage capacities were calculated in the alluvium: 9783 ac-ft for the period November 1964 to December 1965 (basin-low) and 22,271 ac-ft for the period November 1984 to May 1985 (basin-high); and in the terrace deposits: 5100 ac-ft (basin-low) and 12,124 ac-ft (basin-high).

Hence, the total groundwater in storage in the two aquifer systems in the Acton study area ranged from a low of approximately 14,900 AF in the basin-low period of November 1964 to December 1965, to a high of approximately 34,400 AF in the basin-high period of November 1983 to May 1984.

It is likely that problems will develop in the basin for groundwater levels higher than those measured during the November 1983 to May 1984 basin-high period. Such high groundwater levels probably occurred during the all-time higher period following the 1944-1947 interval of high rainfall, although there are no water-level records from that time period to confirm this probability.

### 4.0 FUTURE WATER DISTRICT WELLS

- 4.1 Feasibility. Additional groundwater development by Los Angeles County Waterworks District No. 37 appears feasible in the Acton area based on the difference between calculated

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

53

volumes of groundwater in storage available to wells and presently estimated volumes of annual groundwater extraction.

- 4.2 General Locations. General locations for new Waterworks District-owned wells include those areas of alluvium along the Santa Clara River in the vicinity of and easterly from existing Well No. 37-1. In this reach of the river (groundwater storage units 1d and 1h), alluvial thicknesses and, hence, the potential for greater thicknesses of saturated sediments, are larger particularly in the center portion of the alluvial area, away from the valley walls. Such greater thicknesses would improve the opportunity for maximizing production rates, transmissivity, and specific capacity in future wells. In addition, such greater thicknesses of saturated sediments tend to: increase the amount of available drawdown in the wells; permit the wells to be deeper; and allow for a greater depth to the uppermost perforations.

New wells are not recommended in areas that contain stream terrace deposits at ground surface.

If more than one well is desired in a given area, construction should be conducted in phases, with the first well being drilled, completed, developed, and thoroughly tested prior to selecting the final sites and design criteria for additional wells in that given area. New wells should be spaced at least 1000 ft apart, based on limited evaluation of mutual drawdown interference criteria using existing data.

- 4.3 General Well Parameters. New alluvial wells in the recommended areas are likely to be capable of producing in the range of 500 to 800 gpm without inducing excessive amounts of drawdown during wetter hydrologic periods. Production rates are likely to decline, and pumping levels are expected to drop during drier hydrologic times.

Typical completed well depths are expected to be on the order of 250 ft. Fourteen-inch diameter well casing (pump

S8931 - Acton Report

54

house casing) and 12-inch diameter well screen (either well screen or louvers) are considered acceptable for the anticipated pumping rates. Such well screen (or louvers), utilized with an appropriate gravel pack, will preclude sanding conditions in new wells.

A minimum 50-foot deep cement sanitary seal is essential. If, based on evaluation of the drill cuttings and electric log, a deeper seal can be constructed without adversely impacting production rates, then such a seal could be useful in minimizing possible impacts of nitrates or other possible quality impairment.

- 4.4 Down-Hole Quality Testing. The opportunity does exist during pilot hole drilling to conduct limited down-hole water sampling of individual aquifers in the open borehole in an effort to determine whether or not contamination exists at the well site; however, collecting conclusive data by this procedure is difficult. That is, such select aquifer sampling is typically conducted by airlifting techniques and can cost on the order of \$4,000 to \$7,000 per aquifer test zone for mobilization and airlifting alone. Airlifting, however, is not considered appropriate for sampling of volatile organic compounds. Moreover, airlifting typically is conducted at low rates of discharge (less than 50 to 75 gpm) and for relatively short time periods (less than three to four hours). Long-term pumping (several hours to a day or more) is not possible in an open borehole under such circumstances due to the risks of collapsing the borehole and losing the sampling equipment.

A contamination plume, if it existed, would have to be virtually at the well site in order to be intercepted by such low capacity, short-term down-hole sampling. A more distant plume could require hours, days, weeks or even months of pumping at high rates to be intercepted, assuming such a plume exists at all. Naturally-occurring inorganic water quality

## Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

55

problems are capable of being identified by down-hole testing since these contaminants often occur throughout the entire aquifer.

- 4.5 Construction Operations. Future wells should be drilled using either direct rotary or reverse rotary drilling methods. Cable-tool drilling is not recommended.

Depending on the site(s) selected, a potential problem will be the availability of water for drilling purposes, especially for the reverse circulation method which may require 100 to 300 or more gallons per minute of continuous supply. If the direct rotary method is used, particular care must be given to control of drilling fluid properties so as to not induce permanent damage to the aquifers.

Detailed geologic mud logs should be prepared from drill-cuttings data as monitored by field geologists during the drilling. At the completion of the pilot bore, an electric log survey is essential in order to define available aquifers and potential locations for the well perforations.

Well screen slot widths and gravel pack grain sizes are to be selected based on analysis and grain size distribution of the drill cuttings from each pilot hole.

Important to well site selection and well site usage will be the wellhead protection utilized for the permanent well. This is because the optimum well sites for alluvial wells lie within the active course of the river and, hence, within the flood hazard zone. It is recommended that you work closely with your engineers in designing the wellhead and appurtenances (pipelines, electrical, etc.) for each well.

- 4.6 Construction Costs. Approximate costs at this time for a contractor to drill, install casing, develop, and test pump one new well on the order of 250 ft in depth will likely be on the order of \$100,000 to \$125,000. A more detailed and

S8931 - Acton Report

56

refined breakdown of costs can be provided when the site(s) for eventual wells is(are) selected.

In addition to the drilling costs, there also will be costs for the final pumping equipment, chlorination facilities, electrical appurtenances and transmission lines, property and/or rights-of-way for the new wells, wellhead protection for flood hazard, and for required hydrogeologic services during construction.

#### 5.0 GROUNDWATER MANAGEMENT

Existing extraction data are incomplete because not all water purveyors meter their production for their individual wells. In addition, the number, locations, and production from privately-owned wells in the basin are not known.

To better understand the hydrogeologic regime in the region, the following are recommended:

- a. Accurately establish the locations of each well on U. S. Geological Survey quadrangle maps.
- b. Install accurate flow meters (both instantaneous rate and totalizer volume meters) on each well.
- c. Establish a permanent reference point on all wells from which future depth-to-water measurements can be taken; use a surveyor to obtain accurate elevations for these reference points.
- d. Monitor water levels on a regular basis (at least twice per month); ensure that these are true static levels, not partial recovery levels.
- e. When abandoning wells, make sure that accurate records are kept as to which well, its location, etc., and the methods used for abandonment. Methods for abandonment should comply with State of California requirements (DWR Bulletin 74-81). Wells which will not be used in the future for monitoring, pumping, etc. should be destroyed instead of abandoned (DWR Bulletin 74-81).
- f. Verify that active wells have State-approved sanitary seals; remove from active service those domestically-used wells which do not meet minimum sealing standards;

Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

S8931 - Acton Report

57

- consider abandonment of those wells with very high perforations in the alluvium.
- g. Conduct Edison efficiency tests on a regular basis in all wells (at least once or twice per year).
  - h. Plot water level hydrographs and graphs of specific capacity vs time for all wells; monitor water for inorganic and organic constituents on a regular basis.
  - i. Conduct a well canvass of the entire region to verify the existence, location, viability, and usage of all active and potentially active municipal and private wells.
  - j. Establish a key well monitoring program for wells in the region.
  - k. Perform operation and maintenance (O & M) on the wells on a regular basis. Such O & M is essential to maintain well efficiency and to return declining specific capacities to their original values. The wells should be periodically surged in order to prevent clogging of the gravel pack by silt or clay.
  - l. Because of the propensity of the alluvium to be easily contaminated, become cognizant of present and future land use in and along the alluvium; work with the RWQCB to recognize landfill problems, runoff from hazardous waste sites, migration of gasoline from leaky underground service station tanks, or even potential problems from wastewater effluents. Locate all industrial dischargers, if any, on a map and determine the types and amounts of such discharges.
  - m. Coordinate, with the appropriate regulatory agencies, current and future planned programs for any possible lining of the Santa Clara River or its tributaries for flood protection; maximize the potential for recharge in the river by allowing for percolation of low-flow runoff in any possible future lining operation plans.

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022)

### 4414-8402

The commenter indicates that Section 3.6, Public Utilities and Energy, of the Draft EIR/EIS has been evaluated by a “competent engineer with more than 35 years of environmental engineering experience” and asserts they have identified material deficiencies, factual errors, and substantial insufficiencies. The Authority has provided a specific response to each of the comments in Response to Comments #8403 through #8429. Please refer to each of these responses.

### 4414-8403

The commenter begins the comment indicating that construction at each tunnel portal will require two Tunnel Boring Machines (“TBMs”) operating in parallel to produce the twin tunnels that are necessary to accommodate the 462 train trips per day that are projected to occur between Palmdale and Burbank. The number of train trips per day cited by the commenter is incorrect. To clarify, the text at the bottom of page 3.4-23 in the Draft EIR/EIS has been modified. It now reads that for the Palmdale to Burbank Project Section, a total of 217 trains (in both directions) would operate daily during a 24 hour period.

The commenter also expresses concern related to water use during construction of the project, including the availability of water supplies for the project; the feasibility of PUE-MM#1; concerns related to use of non-potable water, including impacts on groundwater quality; concerns related to the use of groundwater; and concerns related to growth inducement from development of new water infrastructure. Regarding the comments related to the availability of water supplies for the project, the feasibility of PUE-MM#1, and concerns related to the use of groundwater, please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage. Regarding the comments about groundwater quality, PUE-MM#1, discussed in Section 3.6 of the Draft EIR/EIS, will require the Authority to utilize non-potable water from regional water utility service providers for construction activities where feasible. Non-potable water will be required to meet the standards included in the Water Recycling Criteria, Title 22, Division 4, Chapter 3 of the California Code of Regulations, which specifies requirements for water used for various purposes. For example, water classified in this Code as Disinfected Secondary-23 can generally be used for soil compaction, mixing concrete, dust control, street cleaning and other industrial and construction activities where water will not come into contact with workers; whereas water classified as Disinfected Tertiary according to this Code may be used in processes where water may come into contact with workers. The commenter expresses concern specifically about the use of partially treated municipal wastewater or untreated local groundwater (which may be high in nitrate and arsenic) during tunnel construction in Acton and Agua Dulce, noting that either source may contaminate local groundwater. As noted in Section 3.6 of the Draft EIR/EIS, water is required for tunneling to increase the water content of soil, which optimizes tunnel boring. As such, activities involving tunnel boring machines (TBMs) would have significantly higher water demand than other construction activities. If recycled water is

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8403

used during tunneling, it would be required to meet the standards listed above, which would prevent the pollution of aquifers, perched water zones, or other groundwater sources. These water quality standards have been noted in a new footnote to PUE-MM#1 in Section 3.6 of the Final EIR/EIS to indicate that non-potable water will meet the standards included in the Water Recycling Criteria, Title 22, Division 4, Chapter 3 of the California Code of Regulations. In addition, HWR-MM#1 in Section 3.8, Hydrology and Water Resources of the Draft EIR/EIS, would require that any groundwater contamination encountered during construction be isolated, monitored, and treated based on RWQCB permit conditions. As such, HWR-MM#1 would prevent the spread of existing contamination that may be encountered during tunneling. In addition to meeting water quality standards and preventing the spread of existing contamination, potential groundwater contamination from tunneling would be minimized through the nature of TBM operation. As noted under Impact PUE#4 in Section 3.6 of the Final EIR/EIS, water used for operation of TBMs would mix with the soil as it is extracted from the tunnel construction areas and would be treated as wastewater. Further, as noted in HWR-MM#1, water used for tunnel construction and water coming out of tunnel construction areas could be recycled/reused for construction purposes. As such, water used during tunneling would exit the tunnel and be treated or reused, and thus would not contaminate the aquifers, perched water, or other groundwater resources through which the tunnels pass, as purported by the commenter. Regarding the comment about growth inducement from the construction of new water distribution facilities and water infrastructure, the commenter does not provide details regarding where or when the Authority purportedly stated that facilities would be made available to the County Waterworks District. To clarify, the Authority does not intend to construct new water infrastructure that could be used by the local water districts to promote growth and development. The water conveyance facilities constructed by the project would convey water from domestic water sources (nearest domestic water service providers) to specific construction sites. As such, these water conveyance facilities would be for the sole use of the project during construction and operation as needed. As such, the project would not induce growth in this regard. The commenter also includes Attachment 1: Nitrate levels in local groundwater in Acton; Attachment 2: Hydrology Report of the Groundwater Basin under the Community of Action ("The Slade Report"); Attachment 3: Waterworks District 37 Historical Groundwater Extraction Rates for the Municipal Wells Operated in Acton; Attachment 4: Historic Drought Monitor Data for Los Angeles

### 4414-8403

County; Attachment 5: Drainage Map of the Area Where the "Acton Window" Will be Constructed Under the Environmentally Preferred SR14A Route Alternative; and Attachment 6: California Energy Commission "Energy Map". These attachments provide background information for the comments that the commenter has made. The Authority has considered these attachments in preparing the responses to the comments in this letter (Responses to Comments #8402 through #8429).

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8404

Refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF, PB-Response-PUE-3: Water Demand and Usage.

The commenter states that the Draft EIR/EIS failed to adequately address impacts to private drinking water systems or residential wells due to (1) reduced groundwater levels if construction relies on local groundwater resources; (2) destruction of well shafts and infrastructure that can render a domestic well inoperable due to tunneling; and (3) effects on the configuration of groundwater and perched water resources that could result in causing wells to “dry up” due to tunneling. The commenter requests that edits be made to the Final EIR/EIS regarding impacts to domestic/private wells.

Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail the options that the Authority would consider to address impacts to private water supply wells outside the ANF, including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. Please refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest regarding impacts to wells and corresponding measures to address any such impacts.

Regarding the comment about the Authority relying on groundwater, the Authority does not anticipate using groundwater for the project. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides additional information about water supplies for the project.

### 4414-8405

The commenter is concerned about the treatment of project water discharges and erosion caused by water runoff from construction activities. HYD-IAMF#3 requires preparation and implementation of a Construction Stormwater Pollution Prevention Plan (SWPPP) in compliance with the statewide General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities to insure that adequate sediment and erosion control measures will be taken during and after construction. HYD-IAMF#3 also requires the contractor to comply with the State Water Resources Control Board Construction General Permit to avoid or minimize temporary hydraulic impacts associated with construction activities at all construction sites and in adjacent areas during construction. These project features would reduce impacts from stormwater during construction activities through the preparation and implementation of the construction SWPPP, including best management practices (BMP) to provide hydromodification controls to maintain pre- Palmdale to Burbank Project Section hydrology and to manage the amount of stormwater runoff emanating from the construction sites. Section 3.6 of Final EIR/EIS indicates that any water generated from the tunnel construction would be treated and reused or hauled off-site. Management of any water generated from construction activities would be in accordance with federal and state regulations and would prevent any discharge from impacting water quality standards. The construction contractor would recycle and reuse water on-site to reduce water consumption for construction of the tunnels. Some of this wastewater would also be collected in water retention ponds or treated in the same capacity, and like the tunnel spoils, would be hauled off-site. None of the water discharged from the tunneling activities would be directly piped back into local wastewater treatment facilities, collection systems, or treatment plants.

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8406

The commenter indicates that there is an error in the in-state electric generation capacity values provided in Section 3.6 of the Draft EIR/EIS. Page 3.6-65 of the Draft EIR/EIS reads the following: "According to the CEC, California had an installed in-state electric generation capacity of 292,039 GWh in 2017". The paragraph above this, indicates "[i]n-state generation capacity in 2016 equaled 70,857 GWh from governmental and utility-owned in-state facilities and 124,170 GWh from commercial in-state generation facilities (CEC 2020a)." The sum of 70,857 GWh and 124,170 GWh is 195,027. The commenter correctly identifies an error in the numbers provided on page 3.6-65 of the Draft EIR/EIS. In 2017, the total system electric generation, including imports was 292,039 GWh; however, the in-state electric generation capacity was 206,411 in 2017 (CEC 2020a). This number has been corrected in Section 3.6 of the Final EIR/EIS. This correction does not result in any changes to the impact conclusions in the Final EIR/EIS. As explained below, the Authority has identified that there is sufficient renewable energy capacity to meet the system demand.

The commenter also raises a concern about renewable generation capacity required for operating 462 trips per day between Palmdale and Burbank. The number of train trips per day cited by the commenter is incorrect. To clarify, the text at the bottom of page 3.4-23 in the Draft EIR/EIS has been modified. It now reads that for the Palmdale to Burbank Project Section, a total of 217 trains (in both directions) would operate daily during a 24-hour period.

It should be noted that In September 2008, the Authority adopted a policy goal of utilizing renewable energy for all traction power. An industry survey in April 2013 indicated that there is sufficient renewable energy capacity to meet the system demand (Authority 2014b). Under the 2013 Policy Directive POLI-PLAN-03, the Authority has adopted a goal to purchase 100 percent of the HSR system's power from renewable energy sources (Authority 2016b). The Authority's policy goal is to use 100 percent clean, renewable electricity for the operation of the HSR. This goal can be achieved through purchase agreements with power suppliers, and through the design of project buildings and facilities to meet Leadership in Energy and Environmental Design (LEED) Silver Level certification. California utilities are required to achieve a state-mandated 33% renewable portfolio within the time frame of projected operation of the HSR. This will offer new opportunities for obtaining clean, renewable energy from those sources.

### 4414-8406

Furthermore, the Authority has entered into a Memorandum of Understanding (MOU) with FRA, EPA, and the U.S. Department of Energy to support common sustainability goals. These include minimizing air and water pollution, energy usage, and other environmental impacts. This MOU is located on the Authority's website. The signatory agencies recognize that construction and operation of the HSR System would require a large amount of energy, and that ample opportunities exist to promote energy efficiency and renewable energy.

As indicated in Section 3.6 of the Draft EIR/EIS in Impact PUE#11, the Authority has designated staff working to collaborate with utilities and renewable energy developers (who may construct facilities that contribute wind, solar, or other renewable sources to the power grid). The utilities coordination staff have a strong understanding of HSR system electricity demands and of how these demands impact negotiations with utilities and renewable energy developers. Furthermore, the Authority is developing a strategic renewable energy procurement plan that requires extensive collaboration and can be supported through stakeholder engagement, internal and external working groups, and the creation and selection of efficient and effective instruments for power procurement. The Authority will continue to gather and synthesize information to develop this plan for the California HSR System (Authority 2011). As described in PUE-IAMF#1, the California HSR System design incorporates utilities and design elements that minimize electricity consumption (e.g., regenerative braking, energy-saving equipment on rolling stock and at station facilities, implementation of energy-saving measures during construction, and automatic train operations to maximize energy efficiency during operations). With the implementation of PUE-IAMF#1, the project would not place substantial demand on regional energy supply, require significant additional capacity, or significantly increase peak- and base-period electricity demand, nor would it conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8407

Refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF, PB-Response-PUE-3: Water Demand and Usage.

The commenter raises concerns about the project's consistency with elements of the Los Angeles County General Plan that pertain to utility issues, particularly in regard to water use. The commenter's statement that "CHSRA has evinced a clear intent to substantially rely on local groundwater resources" is incorrect. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which describes that the project would not directly use groundwater and that any indirect use of groundwater (from local water supply purveyors that include groundwater as one of their sources) would not affect sustainable groundwater management or the ability of residents that receive water from these suppliers to receive water that includes groundwater.

The commenter raises concerns about TBM operations using groundwater containing excessive nitrates or arsenic, and potential impacts to public and private drinking water sources that could result. Potential groundwater contamination from tunneling would be minimized through the nature of TBM operation. As noted under Impact PUE#4 in Section 3.6 of the Draft EIR/EIS, water used for operation of TBMs would mix with the soil as it is extracted from the tunnel construction areas and would be treated as wastewater. Further, as noted in PUE-MM#1, water used for tunnel construction and water coming out of tunnel construction areas could be recycled/reused for construction purposes. As such, water used during tunneling would exit the tunnel and be treated or reused, and thus would not contaminate the aquifers, perched water, or other groundwater resources through which the tunnels pass, as purported by the commenter. In addition, HWR-MM#1 in Section 3.8, Hydrology and Water Resources of the Draft EIR/EIS, would require that any groundwater contamination encountered during construction be isolated, monitored, and treated based on RWQCB permit conditions. As such, HWR-MM#1 would prevent the spread of existing contamination that may be encountered during tunneling.

Regarding potential impacts to private drinking water wells, Pursuant to the Authority's 2019 Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest and 2019 Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest (referenced in Section 3.8 of the EIR/EIS),

### 4414-8407

based on observed impacts on groundwater from past tunnel projects, no impacts to wells are expected to occur outside the tunnel construction RSA (more than 1 mile from the centerline of each Build Alternative). Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail the options that the Authority would consider to address impacts to private water supply wells outside the ANF, including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. Please refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest.

In addition, the commenter states that the Authority should consider goals and policies in the Los Angeles County General Plan, including Goal C/NR 6 and Policy C/NR 5.6, and policies in the Los Angeles County Antelope Valley Area Plan, including Policy COS 2.7 and Policy COS 3.5. Please refer to Appendix 2-H of the Final EIR/EIS, which includes a consistency analysis with Policy C/NR 5.6, as well as pertinent policies under Goal C/NR 6, including Policy C/NR 6.1, C/NR 6.2, and C/NR 6.5. Appendix 2-H focuses on consistency with applicable policies, not overarching goals. As such, Goal C/NR 6 has not been added to the appendix in the Final EIR/EIS. Appendix 2-H of the Final EIR/EIS also includes a consistency analysis of pertinent policies in the Conservation and Open Space Element (COS) in the Los Angeles County Antelope Valley Area Plan 2035. As discussed above, the Authority would not substantially rely on groundwater resources; therefore, Policy COS 2.7 would not apply and is therefore not included in Appendix 2-H. Policy COS 3.5, regarding protecting underground water supplies by enforcing controls on sources of pollutants, is similar to Policy C/NR 5.6, which is included in Appendix 2-H. As described in Appendix 2-H, the Authority would limit water pollution through implementation of IAMFs requiring a stormwater management and treatment plan (HYD-IAMF#1) and implementation of a Stormwater Pollution Prevention Plan (HYD-IAMF#3). Therefore, the project would be consistent with Policy COS 3.5,

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

**4414-8407**

which has been added to Table 2.0-H-1, Regional and Local Policy Consistency Analysis, in Appendix 2-H of the Final EIR/EIS as requested by the commenter.

**4414-8408**

The commenter states that the Draft EIR/EIS fails to consider consistency with Los Angeles County General Plan Policy PS/F 6.6 pertaining to the undergrounding of new utilities, which the commenter frames as a substantial deficiency. The commenter further expresses concern about electrical facilities to be constructed in the communities of Acton and Agua Dulce, specifically the new 230 kV line, due to increased fire risk in the area. The commenter requests that a mitigation measure be added to the Final EIR/EIS requiring utilities in the Communities of Acton and Agua Dulce be underground. The Draft EIR/EIS does address consistency with Policy PS/F 6.6, specifically on page 2.0-H-12 of Appendix 2-H, Regional and Local Policy Consistency Analysis. Policy PS/F 6.6 states: "Encourage the construction of utilities underground, where feasible." This policy includes non-mandatory, flexible language by encouraging undergrounding utility lines only where feasible, but not requiring it. Under state law, a proposed project is only inconsistent with a general plan if it "conflicts with a general plan policy that is fundamental, mandatory, and clear." (see, e.g., *Families Unafraid to Uphold Rural El Dorado County v. El Dorado County Bd. of Supervisors* (1998) 62 Cal.App.4th 1332,1341-1342; see also *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 782). As noted in Appendix 2-H, the Authority would relocate utilities in unincorporated Los Angeles County underground where feasible. Thus, the Project is consistent with this policy.

The 230kV overhead line mentioned by the commenter is proposed for the SR14A alignment, running from the Southern California Edison's (SCE)-Vincent substation to Portal 1A north of the Pearblossom interchange. This permanent power line would provide power to the substation located on Portal 1A from Vincent Substation for the SR14A Build Alternative. This new power line will be designed in accordance with California Code of Regulations (CCR) Title 14, Section 1250, "Fire Prevention Standards for Electric Utilities," which specifies utility-related measures for fire prevention, including firebreak clearance standards. According to the California Public Utilities Commission (CPUC) Regulations (Rule 20 Undergrounding Programs Current Proceedings, Electric Tariff Rule 15 for SCE), undergrounding for power lines is not required. Additionally, the CCR does not include any requirements to underground power lines. Note also that construction of underground electrical lines is challenging due to more complicated repairs in case of failure and the much higher construction cost. It is estimate that the cost of a buried electrical line is at least 5 times more expensive than an overhead line,

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8408

which can make undergrounding cost prohibitive in some circumstances. This, undergrounding is not required by rules and regulations and presents many more challenges than above-ground utility lines.

The commenter's concern regarding fire risk in Acton and Agua Dulce is noted. Wildfire impacts from project operation are addressed in Draft EIR/EIS Impact S&S#19: Fire and Wildfire Hazards from Operations and Maintenance in Section 3.11, Safety and Security. On page 3.11-59 of the Draft EIR/EIS, the text describes that "High-risk facilities, including pipelines and other utilities within the project footprint, will be removed, relocated, or protected in place during construction. The Safety and Security Management Plan (SSMP) developed under SS-IAMF#2 will include procedures for removal, relocation, or protection of high-risk facilities within the footprint. Pursuant to utility agreements negotiated between the Authority and the utility service providers, the Authority will work with utility owners during final engineering design and construction of the Build Alternatives to remove or relocate utilities within the right-of-way or protect them in place within the right-of-way. The contractor will establish a construction safety management plan and SSMP (SS-IAMF#3) that will establish safety guidelines to be implemented during construction, including procedures for construction activities near the identified overhead or underground utility lines. The Authority will conduct a Preliminary Hazard Analysis (PHA) (SS-IAMF#3) that will evaluate the impacts of high-risk facilities on the project. The Authority will incorporate project features into the design and construction of the project. The Security and Emergency Preparedness Plan (SEPP) developed under SS-IAMF#2 will identify potential hazards from high-risk facilities within the vicinity of the Build Alternatives that will be removed, relocated, or protected in place during construction, and will identify methods to mitigate or eliminate hazards associated with high-risk facilities. Further, inclusion of PUE-IAMF#2 through PUE-IAMF#4 will ensure that project construction will be coordinated or phased to minimize or fully eliminate utility service disruptions." Ultimately, wildfire impacts were found to be less than significant, with the presumption of above-ground lines.

### 4414-8409

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF, PB-Response-PUE-3: Water Demand and Usage.

The commenter expresses that the Draft EIR/EIS consistency analysis is deficient because it does not include a discussion of Goal C/NR 6 and C/NR 5.6 from the Los Angeles County General Plan, and Policy COS 2.7 and COS 3.5 from the Antelope Valley Area Plan. Additionally, the commenter is concerned about use of local groundwater resources and non-potable water for TBM operation.

Goal C/NR 6, Protected and usable local groundwater resources, is addressed in Appendix 2.0-H of the Draft EIR/EIS by its supporting policies, specifically Policy C/NR 6.2, Protect natural groundwater recharge areas and regional spreading grounds. Appendix 2.0-H indicates that the project would be consistent with this policy, as the Authority would create new detention facilities to maintain existing levels of groundwater recharge. In addition, the Authority has addressed overall how it would minimize impacts on local groundwater resources. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which identifies the sources of water for the project; that the project would not directly use groundwater; and that any indirect use of groundwater (from AVEK, which includes groundwater as one of its sources) would not affect sustainable groundwater management or the ability of residents that receive water from AVEK to receive water that includes groundwater. Please also refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, which identifies the potential impacts on groundwater resources within the ANF and how those impacts would be minimized and mitigated to a less than significant level. Please also refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest, which identifies the IAMFs that would minimize groundwater seepage. The project is consistent with Goal C/NR 6 because it is consistent with its supporting policies.

Regarding Policy C/NR 5.6, this policy is included in Appendix 2.0-H (see page 2.0-H-27) of the Draft EIR/EIS. HYD-IAMF#3 requires the contractor to comply with the State

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4414-8409**

Water Resources Control Board Construction General Permit to avoid or minimize temporary hydraulic impacts associated with construction activities at all construction sites and in adjacent areas during construction. These project features would reduce impacts from stormwater during construction activities through the preparation and implementation of the construction SWPPP, including best management practices (BMPs) to provide hydromodification controls to maintain pre-project hydrology and to manage the amount of stormwater runoff emanating from the construction sites.

Section 3.6, Public Utilities and Energy, of the Draft EIR/EIS indicates that any water generated from the tunnel construction would be treated and reused or hauled off-site. This would include non-potable water, which can be used for tunneling purposes. Management of any water generated from construction activities would be in accordance with federal and state regulations and would prevent any discharge from impacting water quality standards. The construction contractor would recycle and reuse water on-site to reduce water consumption for construction of the tunnels. Some of this wastewater would also be collected in water retention ponds or treated in the same capacity, and like the tunnel spoils, would be hauled off-site. None of the water discharged from the tunneling activities would be directly piped back into local wastewater treatment facilities, collection systems, or treatment plants. For these reasons, the Build Alternatives would be consistent with Policy C/NR 5.6 (Minimize point and nonpoint-source water pollution).

The commenter also indicates that Appendix 2.0-H fails to identify the Antelope Valley Area Plan (AV Plan) or discuss its relevance to the Project. The Draft EIR/EIS includes an assessment of the project's consistency with the Los Angeles County Antelope Valley Area Plan 2035 (2015) (see page 2.0-H-17 in the Draft EIR/EIS). As described in Standard Response PB-Response-PUE-3: Water Demand and Usage, the project would not directly use groundwater and any indirect use of groundwater (from AVEK, which includes groundwater as one of its sources) would not affect sustainable groundwater management. As such, the Authority would be consistent with Policy COS 2.7 to limit use of groundwater sources to their safe yield limits. In addition, as described above, the Authority has identified measures to minimize pollution and for the same reasons for the project's consistency with Policy C/NR 5.6, the project would be consistent with Policy COS 3.5.

### **4414-8410**

The commenter identifies that there are a number of goals and policies that have been adopted for unincorporated Los Angeles County, which address protection of drinking water sources, groundwater supplies, fire hazards, and electrical reliability. The commenter requested that these goals and policies be addressed. Page 3.6-14 of the Draft EIR/EIS provides a summary of the Authority's evaluation of consistency with policies and plans, which is contained in Appendix 2-H. For a discussion of the consistency analysis for goals and policies related to protection of drinking water source and groundwater supplies, please refer to Response to Comment #8409. For a discussion of the consistency analysis for goals and policies related to wildfire, please refer to Response to Comment #8408. Regarding electric reliability, the commenter does not identify a specific policy that should have been addressed in the Draft EIR/EIS. Regardless, the Draft EIR/EIS did include a consistency analysis for policies related to energy (see page 2.0-H-12, policy 9.29.3). In addition, consistent with CEQA and NEPA, the Authority evaluated the project's impact on energy demand in Impact PUE#11: Permanent Operations Energy Demand in Section 3.6.6.3 of the Draft EIR/EIS.

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8411

The commenter indicates that if the project either uses local groundwater supplies in Acton and Agua Dulce to supply water for TBM operation or if the project does not underground all new and relocated utilities, the project will not meet the overall objectives of the local policies, therefore, making the statement on Page 3.6-14 in the Draft EIR/EIS regarding the project's consistency with local policies and plans, incorrect. The use of local groundwater to supply water for TBM operation is not anticipated. As indicated in Impact PUE#3 in Section 3.6 of the Draft EIR/EIS, water used during construction activities would be obtained from existing permitted commercial sources in the cities of Palmdale, Santa Clarita, Burbank, and Los Angeles, as well as unincorporated Los Angeles County. Regarding new and relocated utilities, the Authority's preferred alternative, the SR14A Build Alternative would require tunneling in Acton and Agua Dulce (see Section 2.3.4.5 and Figure 2-2 in Chapter 2 of the Draft EIR/EIS), which would avoid the relocation of utilities due to the depth of the tunnel. In addition, Impact PUE#7 in Section 3.6 of the Draft EIR/EIS clarifies that the HSR right-of-way would be fenced and secured after construction. Underground utilities that conflict with the HSR right-of-way would be relocated or reinforced underneath the HSR right-of-way inside a casing pipe strong enough to carry the California HSR System utilities, and that would allow for utility maintenance access from outside the HSR right-of-way. Underground wet utilities such as water, sewer, storm drains, gas, and petroleum lines are conveyed inside pipeline material with a service life that is typically 50 years or more. Dry utilities such as electrical, fiber optics, and telephone lines are encased in a durable pipeline—for example, one made of steel—that protects the dry utilities from deterioration and has a service life of 50 years or more. If the utility conveyance pipeline needs repair or replacement, the casing pipe would stay in place so that HSR operations would continue while the utility agency maintained the line. Before field visits, it is common practice for utility agencies to coordinate with the owner of the property in which their facilities lie. Additionally, Appendix 2-D (Section 14.6) in the Draft EIR/EIS clarifies that for Los Angeles Department of Water and Power (LADWP) electrical lines to be proposed or relocated crossing the CHSR Alignment, it is the Agency's policy to underground the electrical facility to benefit transportation services by eliminating track or busway closures when LADWP facilities need to be accessed and provides a safe working environment for LADWP working crews. Whenever existing overhead lines are crossing a new railroad, or a transit project located in a dedicated right-of-way, the overhead lines should be replaced with an

### 4414-8411

underground system. Furthermore, Appendix 2-H of the Draft EIR/EIS included a consistency analysis with local plans. Appendix 2-H includes a consistency analysis of the Los Angeles County General Plan 2035 (Acton and Agua Dulce are in unincorporated Los Angeles County). As indicated on page 2.0-H-12, the Project would be consistent with Policy PS/F 6.6 in the Los Angeles County General Plan 2035, which encourages the construction of utilities underground, where feasible. Page 2.0-H-12 notes that the Authority would relocate utilities in unincorporated Los Angeles County underground where feasible.

### 4414-8412

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter states that no Urban Water Management Plan (UWMP) has been prepared for the communities of Acton and Agua Dulce and that the Draft EIR/EIS lacks the information required to assess water supply alternatives.

The communities of Acton and Agua Dulce obtain water from private domestic wells. In addition, portions of the communities of Acton and Agua Dulce are in the Antelope Valley-East Kern (AVEK) Water Agency service area, and some residents receive water from AVEK. AVEK's Service Area can be accessed here:  
<https://avekwa.maps.arcgis.com/apps/instant/interactivelegend/index.html?appid=56629432a7cf437ba95696dd1510e08f>.

Table 3.6-2 in Section 3.6, Public Utilities and Energy of the Draft EIR/EIS lists the UWMPs that would be relevant to the analysis. Table 3.6-2 includes the AVEK UWMP; as such, the analysis in the Draft EIR/EIS did consider the UWMP that would be relevant for the areas in Acton and Agua Dulce that receive water from AVEK.

For the areas in Acton and Agua Dulce that are not served by AVEK (i.e., those areas that rely on private domestic wells), the Authority considered the potential impact that the Project could have from its water demand. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which identifies the potential sources of water for the Project.

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4414-8413**

The comment identifies a discrepancy in the data provided for the TBM water requirements. Values included on Table 3.6-4 are correct. Values in Impact PUE#4 in Section 3.6, Public Utilities and Energy, of the Final EIR/EIS have been corrected to be consistent with values presented on Table 3.6-4. The Authority has estimated that each TBM operating from each twin tunnel portal would require between 55,000 to 105,000 gallons/day. Incorrect values originally provided on page 3.6-78 were much larger than correct values presented on Table 3.6-4. Therefore, this correction does not change the analysis and the conclusion remains valid. Changes to the EIR/EIS are not considered significant new information as it just corrects an inconsistency in the text.

### **4414-8414**

The commenter indicates that the EIR/EIS does not assert what the Project's construction energy usage will be. The commenter also expresses concern regarding Acton's local infrastructure capacity to serve the Project's energy demand during construction. Lastly, the commenter indicates that the EIR/EIS fails to assess whether electrical service to Acton residents will be interrupted to maintain Project construction activities. Construction energy is discussed in Impact PUE#6 and Section 3.6.8.3, in Section 3.6, Public Utilities and Energy, of the Draft EIR/EIS. Construction of the Project would not require additional electricity capacity nor significantly increase peak- or base-period demands for electricity. Construction period energy use is calculated and provided in Table 3.6-23 in Section 3.6. The Draft EIR/EIS concludes that construction of the Palmdale to Burbank Project Section would temporarily increase energy consumption. The Authority has adopted a sustainability policy under PUE-IAMF#1 in Section 3.6 as part of the Build Alternatives that establishes design elements and policies intended to reduce energy consumption, including but not limited to, energy-saving equipment and energy-saving measures during construction. With adherence to the Authority's policy on sustainability under PUE-IAMF#1, construction of the Build Alternatives would not result in a substantial demand on regional energy supplies, require additional energy capacity, or substantially increase peak or base period electricity demand. Additional Traction-Power Electrical Lines, as shown in the Draft EIR/EIS Volume 3 PEPD Record Set Utility Relocation Plans, are proposed to supply energy to the HSR project. Draft EIR/EIS Appendix 2-D (Section 2.2.2.3) clarifies that the Palmdale to Burbank Project Section would not include the construction of a separate power source, but it would require the extension of underground or overhead power transmission lines to a series of power substations positioned along the HSR corridor. These power substations would be needed to even out the power feed to the train system. Working in coordination with power supply companies and per design requirements, the Authority has identified frequency and right-of-way requirements for these facilities. Regarding the assessment of whether electrical service to Acton residents will be interrupted to maintain Project construction activities, the Authority will implement PUE-IAMF#3 and PUE-IAMF#4, described in Section 3.6 of the Draft EIR/EIS, which would require notifications to the public for any planned outages, as well as the preparation of a technical memorandum documenting how construction activities would be coordinated with service providers to minimize or avoid interruptions.

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8415

The commenter indicates that the EIR/EIS fails to identify the amount of energy required to support high speed train operation. The commenter also indicates that the EIR/EIS fails to address whether the capacities of existing local and regional electrical facilities are sufficient to maintain Project Operations.

The commenter asserts that the Authority intends to operate 462 trips per day between Palmdale and Burbank. The number of train trips per day cited by the commenter is incorrect. To clarify, the text at the bottom of page 3.4-23 in the Draft EIR/EIS has been modified. It now reads that for the Palmdale to Burbank Project Section, a total of 217 trains (in both directions) would operate daily during a 24-hour period.

Section 3.6.5.10 in the Draft EIR/EIS also presents existing and projected statewide energy demand for the State of California, including the implementation of the Build Alternative. The electrical demands due to propulsion of the trains, stations, and Maintenance Facility were calculated for the Build Alternatives. Peak-period electricity demand was calculated in terms of kilowatt-hours and compared to current estimates of peak demand and supply capacity within the grid controlled by the California Independent System Operator. As described in Impact PUE#11 in the Draft EIR/EIS, the proposed California HSR System would obtain electricity from the statewide grid. None of the Build Alternatives would involve construction of a separate power source, but instead, would require the extension of existing power lines to traction power substations positioned along the HSR corridor. Impacts that might result from the proposed California HSR System would not affect statewide electricity reserves or transmission capacity. In September 2008, the Authority adopted a policy goal of utilizing renewable energy for all traction power. An industry survey in April 2013 indicated that there is sufficient renewable energy capacity to meet the system demand (Authority 2014b). Under the 2013 Policy Directive POLI-PLAN-03, the Authority has adopted a goal to purchase 100 percent of the HSR system's power from renewable energy sources (Authority 2016b). The Authority has designated staff working to collaborate with utilities and renewable energy developers (who may construct facilities that contribute wind, solar, or other renewable sources to the power grid). The utility coordination staff have a strong understanding of HSR system electricity demands and of how these demands impact negotiations with utilities and renewable energy developers. Furthermore, the Authority is developing a strategic renewable energy procurement plan that requires

### 4414-8415

extensive collaboration and can be supported through stakeholder engagement, internal and external working groups, and creation and selection of efficient and effective instruments for power procurement. The Authority will continue to gather and synthesize information to develop this plan for the California HSR System (Authority 2011). As described in PUE-IAMF#1, the California HSR System design incorporates utilities and design elements that minimize electricity consumption (e.g., regenerative braking, energy-saving equipment on rolling stock and at station facilities, implementation of energy-saving measures during construction, and automatic train operations to maximize energy efficiency during operations). The net change in energy use (i.e., after the energy savings from reduction in roadway vehicle miles travelled (VMT) and in air trips are factored in, inclusive of the Palmdale Subsection and the Maintenance Facility) would result in statewide energy savings of 15,427,699 MMBtu per year under the medium ridership scenario and 23,641,108 MMBtu per year under the high ridership forecast compared to the 2040 No Project Alternative (Table 3.6-26 in Section 3.6 of the Draft EIR/EIS).

### 4414-8416

The commenter indicates possible errors in Table 3.6-10 in Section 3.6 of the Draft EIR/EIS. Table 3.6-10: Los Angeles County Waterworks District 37, Acton: For Water Treatment and Recycled Water, has replaced "X" with "N/A." For Service Area, the Authority has replaced 473 with 23. For Average Annual Demand, the Authority has replaced 659,000 with 2,200. Los Angeles County Waterworks District 40, Lancaster: For Service Area, the Authority has replaced 660 with 88. For Average Annual Demand, the Authority has replaced 2,402 with 46,000. These corrections were clarified in Comment #9141 by the Los Angeles County Public Works Office. These corrections do not change the Draft EIR/EIS analysis, as the revisions relate to the service area and current average annual demand of water distributors and suppliers within the utility resource area. Under PUE-MM#1 in Section 3.6, the Authority is to prepare an updated water supply analysis for the selected project alternative. Revised water distributors' service area and average demand do not change document conclusions and are not considered significant new information as they clarify errors in the text.

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8417

The commenter indicates that natural gas pipelines extend further than what is currently shown in Figure 3.6-1 of the Draft EIR/EIS.

While the commenter indicates that areas in North, East, Central, and South Acton are served by natural gas pipelines, the commenter does not provide any specific locations or specific areas where they believe there could be a conflict with a natural gas pipeline. At this time, the Authority does not have additional information to indicate that there would be additional conflicts with natural gas pipelines, beyond those already identified in Figure 3.6-1 of the Draft EIR/EIS. Figure 3.6-1 is based on information provided by the utility providers. As indicated in the figure note "The mapping data available at this time shows an approximation of utility alignments and no information on the size of the utility line. Where available in other formats (i.e., hard-copy maps, as-builts, etc.), details on the size of the utility lines are summarized in the High Risk and Major Utility Impact Report."

Although no information has been presented to the Authority to indicate that there would be additional natural gas pipelines that could be affected by the project, the Draft EIR/EIS identifies that the Authority is required to comply with California Government Code 4216 (see Impact PUE#2 in Section 3.6, Public Utilities and Energy). Government Code 4216 would require the Authority to contact a regional notification center prior to excavation, which will then result in the regional notification center to mark the specific location of facilities. Compliance with this Government Code would ensure that any unknown utilities, including natural gas lines are marked before construction begins. In addition, the Authority would continue coordinating with utility providers, as required by PUE-IAMF#4. Through compliance with these requirements, the Authority would ensure that any conflicts with any currently unknown utilities are addressed.

### 4414-8418

The commenter states that the Draft EIR/EIS indicates that much of Central and North Acton is not served by a water pipeline. Figures 3.6-10 and 3.6-11 in Section 3.6 the Draft EIR/EIS show water transmission and distribution lines based on data obtained from Utility providers. These maps are not intended to show all water service lines serving individual residences, or neighborhoods, but larger transmission and distribution lines within the study area. As indicated in the Figure note: "The mapping data available at this time shows an approximation of utility alignments and no information on the size of the utility line. Where available in other formats (i.e., hard-copy maps, as-builts, etc.), details on the size of the utility lines are summarized in the High Risk and Major Utility Impact Report". The mapped waterlines in Figures 3.6-10 and 3.6-11 are understood to be pressurized waterlines which are considered high risk or major utilities. The figures do map some of these facilities in North Acton and north of the SR14 freeway. The Authority will continue to coordinate with utility providers during subsequent project stages to ensure accurate information is reflected, as required by PUE-IAMF#4. Please also refer to Impact PUE#1 in Section 3.6 of the Draft EIR/EIS, which identifies how the Authority would address any potential conflicts with water pipelines.

### 4414-8419

The commenter asserts that operational rates of the Acton Water Treatment Plant are inaccurately represented in Section 3.6.5.5, Water Supply Infrastructure and Facilities, of the Draft EIR/EIS. Specifically, they state that while the capacity of the Acton Water Treatment Plant is 4 million gallons per day, it does not operate at this rate. In response to this comment and based on additional review of available information regarding the Acton Water Treatment Plant on AVEK's website (<https://www.avek.org/acton-water-treatment-plant-pwd-intertie>), the discussion of the Acton Water Treatment Plant has been revised in the Final EIR/EIS to clarify that the facility's capacity (not the average daily operational rate) is 4 million gallons per day. This clarification did not result in any changes to the impact analysis or conclusions in the Final EIR/EIS.

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4414-8420**

The commenter notes that Figure 3.6-18 and 3.6-19 do not show the existing culverts in Acton. The commenter additionally requests that the Project not alter any runoff flow patterns or flow rates or flow characteristics at any location in Acton. Please note that these figures show existing underground stormwater pipelines. Surface drains and culverts are not reflected in these figures as these are above ground facilities. The Authority will comply with Section 13260(a) of the California Water Code for any water discharge within any region, other than to a community sewer system, and which could affect the quality of the Waters of the United States. All General WDRs must implement RWQCB Water Quality Control Plan (Basin Plan) for the Region affected by the discharge. More detailed plans will be developed during the detailed design phase in coordination with the utility providers. For a discussion of impacts related to runoff flow patterns, rates, and characteristics, please refer to EIR/EIS Section 3.8: Hydrology and Water Resources. As discussed in Impact HWR#1 (Section 3.8.6.3), HYD-IAMF#1 and HYD-IAMF#2 will require that preconstruction hydraulic capacity be maintained after construction of surface water crossings through the implementation of on-site stormwater management BMPs that provide for runoff dispersion, infiltration, detention, and evaporation. Implementation of these IAMFs during Build Alternatives' construction would reduce impacts on hydraulic capacity by minimizing alterations to watercourses, implementing erosion control BMPs, and maintaining existing stormwater patterns. HYD-IAMF#3, which involves the preparation and implementation of a SWPPP, would ensure that changes to drainage, stormwater, and erosion patterns during construction would be avoided and minimized. Hydromodification management procedures would emphasize site retention of stormwater runoff during preconstruction and verify maintenance, using measures such as flow dispersion, infiltration, and evaporation (supplemented by detention where required). In addition, BMPs would retain stormwater runoff on-site per the stormwater management and treatment plan, as outlined in HYD-IAMF#1.

### **4414-8421**

The commenter notes that the figures on pages 3.6-58 and 3.6-59 of the Draft EIR/EIS do not show the 66 kV sub-transmission and 12 kV distribution lines in Acton and suggests that the Authority add these electrical facilities to the Final EIR/EIS. Both Figures 3.6-22 and 3.6-23 in the Draft EIR/EIS illustrate the approximate location of electrical lines that are classified as High Risk. Please see the asterisk (\*) note on each figure, which states the following: "The mapping data available at this time shows an approximation of utility alignments and no information on the size of the utility line. Where available in other formats (i.e., hard-copy maps, as-builts, etc.), details on the size of the utility lines are summarized in the High Risk and Major Utility Impact Report." The Draft EIR/EIS focuses on High Risk and Major utilities, rather than voltage, because these facilities may have unique requirements for relocation, including environmental impacts associated with the relocation, if necessary. Low-voltage distribution lines, less than 69kV, are considered low-risk utilities. These low-risk electrical facilities do not typically require substantial relocation efforts nor affect broad areas that High Risk facilities would. Effects to these low-risk facilities would typically be brief and only during any potential relocation period. Any conflict with low-risk electrical facilities would be conducted in coordination with the utility provider and with prior public notification, and utility service levels would remain unchanged after construction work is completed.

### **4414-8422**

The commenter questioned data in Section 3.6.5.10, Energy. The source of the electrical usage and demand information presented in the Draft EIR/EIS are the 2018 Integrated Energy Policy Report Update (CEC 2018a), the updated energy consumption and peak demand values from the California Energy Demand 2014-2024 Final Forecast (CEC 2013), and the California Energy Demand 2018-2030 Revised Forecast (CEC 2018b). While the commenter cites other sources for similar data, the data is not substantially different between sources and does not affect the Authority's assessment of impacts of the project. Further, the use of earlier data is appropriate. The baseline year for the analysis of project impacts was established after the Notice of Preparation was filed on July 24, 2014, just after the public scoping period for the project was completed and at the onset of environmental analysis (see Draft EIR/EIS, pp. S-7, 3.3-23 to 3.3-24). CEQA Guidelines section 15125(a)(1) explicitly supports establishing baseline physical conditions in this manner.

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8423

The commenter indicates that Page 3.6-64 in Section 3.6 of the Draft EIR/EIS provides a section titled "Existing Electricity Generation Capacity" but that the associated paragraph does not address electrical generation capacity. The subsection "Existing Electricity Generation Capacity" presents information regarding the sources and quantities of energy consumed to generate electricity in California in Table 3.6-17 and summarizes the electrical generation capacity in California in Figure 3.6-28. Both types of information are relevant to characterizing the existing electricity generating capacity in California.

### 4414-8424

The commenter expresses concern regarding project energy consumption and suggests the Draft EIR/EIS does not adequately identify impacts. As indicated in Draft EIR/EIS Appendix 2-D, Design Baseline Report, the Authority has coordinated with Pacific Gas and Electric Company and SCE and determined that network upgrades would be required to meet the projected power demands of the 345-mile portion of the California HSR System within the two utilities' respective service territories. Detailed engineering of electrical interconnections and network upgrade components has not been undertaken and would not be completed until closer to the time of construction. Network upgrades could include modifications to existing infrastructure such as expansion of existing substations and reconductoring of existing electrical lines (i.e., replacement of power structures [poles and lattice steel towers] and electrical conductors with taller structures and more efficient electrical wires or new electrical lines). Anticipated network upgrades are included in the Build Alternative footprint and would be implemented pursuant to California Public Utilities Commission General Order 131-D.

The Authority's methodology for analyzing operational energy effects is appropriate. The Project's operational effects on energy consumption are a function of reducing long-distance, city-to-city travel along freeways and highways throughout the state, as well as long-distance, city-to-city aircraft takeoffs and landings. The project would also affect electricity demand throughout the state and within the Palmdale to Burbank Project Section expanded utility RSA. The Authority's methodology appropriately compares the energy consumption for the Project to the No Project condition. The analysis calculates the corresponding energy reductions from reduced vehicle miles traveled (VMT) and airplane travel, against the electrical energy demand of operating the HSR project system. The resulting calculations show a substantial energy reduction when comparing the with Project scenario to the No Project condition (See Table 3.6-26 in Section 3.6 of the Draft EIR/EIS).

Regarding Project Energy Consumption, please refer to Standard Response PUE-1. Additionally, the Authority, under Impact PUE#11 in Section 3.6, Public Utilities and Energy, has designated staff working to collaborate with utilities and renewable energy developers (who may construct facilities that contribute wind, solar, or other renewable sources to the power grid). The utilities coordination staff have a strong understanding of HSR system electricity demands and of how these demands impact negotiations with

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8424

utilities and renewable energy developers. Furthermore, the Authority is developing a strategic renewable energy procurement plan that requires extensive collaboration and stakeholder engagement, internal and external working groups, and creation and selection of efficient and effective instruments for power procurement. The Authority will continue to gather and synthesize information to develop this plan for the California HSR System (Authority 2011). As described in PUE-IAMF#1 (see Section 3.6, Public Utilities and Energy), the California HSR System incorporates utilities and design elements that minimize electricity consumption (e.g., regenerative braking, energy-saving equipment on rolling stock and at station facilities, implementation of energy-saving measures during construction, and automatic train operations to maximize energy efficiency during operations).

In summary, the Authority's methodology for analyzing operational energy effects is consistent with CEQA Guidelines, Appendix F, and provides the information CEQA requires regarding project energy demand versus supply. No revisions to the EIR/EIS are required.

### 4414-8425

Refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF, PB-Response-PUE-3: Water Demand and Usage.

The commenter states that the impact conclusions in Section 3.6, Public Utilities and Energy, of the Draft EIR/EIS are incorrect, stating that they believe it is highly likely that sufficient water supplies will be unavailable from AVEK; that the project will severely impact groundwater levels, groundwater quality, and municipal and residential well yields; that there are inconsistencies in the statement that AVEK water resources will be used for project construction; that the Draft EIR/EIS does not address scoping comments expressing concerns regarding project impacts on local well facilities; that the Draft EIR/EIS does not assess project operational impacts on electrical grids and new electrical utility generation projects required for the project; that the Draft EIR/EIS improperly relies on stormwater treatment facilities to treat construction wastewater; and that the Draft EIR/EIS adopts best management practices (BMPs) and Stormwater Pollution Prevention Plan (SWPPP) measures that are inappropriate for rural areas and will result in significant erosion.

Please refer to responses to comments #8402 through #8424, which respond to these assertions.

Regarding the comment about water supplies and sources, please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides additional information about water supplies for the project.

Regarding concerns about use of groundwater and potential impacts on groundwater levels, groundwater quality, and municipal and residential well yields, please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which explains that the project would not directly use groundwater and that any indirect use of groundwater (from a supplier, such as AVEK, that obtains parts of its supply from groundwater) would not affect sustainable groundwater management or the ability of residents to receive water from AVEK that includes groundwater.

Regarding concerns about impacts to residential water supply wells, Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8425

concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail the options that the Authority would consider to address impacts to private water supply wells outside the ANF, including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. Please refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest for additional information regarding impacts to wells and correlating IAMFs.

Regarding the comment on project operational impacts on electrical grids and new electrical utility generation projects required for the project, such impacts are addressed in Impact PUE#11 in Section 3.6, Public Utilities and Energy, of the Draft EIR/EIS. As noted therein, with implementation of PUE-IAMF#1, the project would not place a substantial demand on regional energy supply, require significant additional capacity, or significantly increase peak- and base-period electricity demand. Further, during operation, the HSR Build Alternative as part of the Phase 1 system would contribute to a net savings in energy expended for transportation, which is a project benefit. As discussed in response to comment #8424, the Authority's methodology for analyzing operational energy effects is consistent with CEQA Guidelines, Appendix F, and provides the information CEQA requires regarding project energy demand versus supply.

Regarding the comment about reliance on stormwater treatment facilities, Impact PUE#4: Effects from Wastewater Generated during Construction in Section 3.6, Public Utilities and Energy, of the Draft EIR/EIS explains that construction wastewater would not be piped back into local wastewater treatment facilities, collection systems, or treatment plants. IAMFs incorporated into the Build Alternatives include effective measures to minimize potential impacts on water quality during construction. HYD-IAMF#1 requires on-site stormwater management facilities to capture runoff from pollutant-generating surfaces. Potentially contaminated runoff will be captured and

### 4414-8425

treated within these stormwater management facilities prior to discharge. HYD-IAMF#3 requires the contractor to comply with the State Water Resources Control Board Construction General Permit to avoid or minimize temporary hydraulic impacts associated with construction activities at all construction sites and in adjacent areas during construction. These project features would reduce impacts from stormwater during construction activities through the preparation and implementation of a construction SWPPP, including BMPs to provide hydromodification controls to maintain pre-project hydrology and to manage the amount of stormwater runoff emanating from the construction sites.

Regarding the comment that BMPs and the SWPPP (required by HYD-IAMF #3, Prepare and Implement a Construction Stormwater Pollution Prevention Plan) would result in erosion of downhill properties in rural areas, the intent of the BMPs is to minimize potential short-term increases in sediment transport caused by construction, including erosion control requirements and stormwater management. Measures will address practices to reduce erosion of exposed soil, including soil stabilization, regular watering for dust control, perimeter siltation fences, and sediment catchment basins; and avoiding areas that may have substantial erosion risk, including areas with erosive soils and steep slopes, where feasible. The commenter does not provide evidence to indicate why these measures would not be appropriate or effective, nor explain how they would result in erosion of downhill properties.

The Authority considers the Palmdale to Burbank Project Section project description to be stable. The project is clearly defined and described in detail in Chapter 2, Alternatives and the engineering documents provided in Volume 3 of the Draft EIR/EIS. The environmental analysis is extensive and detailed, as noted in this response and other responses to this commenter's concerns, and addresses the items identified in the scoping process.

## Response to Submission 4414 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4414-8426

The commenter indicates that a water pipeline for construction shown on sheet UT-C4537-E1 has not been proposed insofar as the Community of Acton is aware. The water pipeline shown on PEPD Record Set REV02 Utility Relocation Plans Volume II of II Sheet UT-C4537-E1 is a pipeline proposed by the Authority to provide water to the tunnel portal. This plan will be revised to show the Authority as the owner of this proposed water line, instead of LADWP that was mistakenly labeled as owner. This water line is proposed for Build Alternative E1 and included in EIR/EIS Appendix 3.6 Page 3.6-A-39. This proposed pipeline is not part of the Preferred Alternative SR14A.

### 4414-8427

The commenter indicates that sheet UT-C4028-S14 shows a pipeline that has not been proposed insofar as the Community of Acton is aware. Please note that the comment incorrectly correlates Drawing number and Alternative Route. For SR14A utility drawings please refer to the EIR/EIS Volume 3 PEPD Record Set Addendum SR14A/E1A/E2A Utility Relocation Plans. The water pipeline shown on sheet UT-C4028-S14 is a pipeline proposed by the Authority to provide water to the tunnel portal. This plan will be revised to show the Authority as the owner of this proposed water line, instead of LADWP that was mistakenly labeled as owner. This water line is proposed for Build Alternative Refined SR14 (see EIR/EIS Appendix 3.6-A Page 3.6-A-36 Item No. 212) and therefore is not part of the Preferred Alternative SR14A. The preferred alternative SR14A would be tunneled south of Refined SR14 alignment with no water-main adjacent to Hypotenuse Road (See PEPD Record Set Addendum SR14A/E1A/E2A Sheet TT-D1017-14A).

### 4414-8428

The commenter identifies a road as mislabeled on Sheet UT-C4026-14A in EIR/EIS Volume 3 PEPD Record Set Addendum SR14A/E1A/E2A Utility Relocation Plans.

After further review it is confirmed that Drawing UT-C4026-14A is correct, Hisey Ranch Road is located north of indicated property.

### 4414-8429

The commenter questions the adequacy of the Draft EIR/EIS due to reasons stated in Comments #8402 through #8428 and requests that the issues raised in those comments are addressed and mitigated in the Final EIR/EIS. Please refer to Response to Comment #8402 through #8428, which addresses the specific issues raised by the commenter.

Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

**ANALYSIS OF THE “HYDROLOGY AND WATER RESOURCES” SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT.**

**1.0 INTRODUCTION**

4415-8719

The “Hydrology and Water Resources” impact assessment presented in Chapter 3.8 of the Draft Environmental Impact Report/Environmental Impact Statement (hereafter referred to as “the Draft”) that was prepared by the California High Speed Rail Authority for the Palmdale-Burbank Segment of the High Speed Rail Project (“Project”) has been evaluated and numerous factual errors and material deficiencies have been identified. These errors and deficiencies are set forth in the comments presented below; they demonstrate that the Draft does not comply with either the California Environmental Quality Act (“CEQA”) or the National Environmental Protection Act (“NEPA”). Please note: These comments were prepared by a competent engineer with more than 35 years of environmental engineering experience and they present expert opinion supported by facts pertaining to the significant environmental effects that will be caused by the Project and which must be mitigated. Accordingly, the comments provided herein constitute “substantial evidence” as that term is defined by the CEQA Statute [California Public Resources Code §21080(e)(1)] and Guidelines [California Code of Regulations Section 15064(f)(5)]. These comments also demonstrate that CHSRA/FRA have failed to conduct a substantive ‘hard look’ review of the Project’s environmental impacts as required by NEPA.

**2.0 MAJOR DEFICIENCIES NOTED IN THE DRAFT.**

4415-8720

**2.1 The “Best Management Practices” That Will be Used for Project Construction Will Result in Significant Erosion and Alter Flow Characteristics Downstream of Project Construction Sites.**

Section 3.8 of the Draft concludes that the Project will have a “less than significant impact” on hydrology because it will employ “Impact Avoidance and Minimization Features” (“IAMFs”) and utilize standard “Best Management Practices” (“BMP”) and implement “Stormwater Pollution Prevention Plans” to control and direct stormwater runoff from project construction sites and thereby not alter surface drainage patterns [Page 3.8-39]. The Draft is very much mistaken. The BMPs and SWPPP elements that are enumerated in the Draft were developed for urban areas where the land surface is almost entirely impervious and where extensive infrastructure (concrete drainage infrastructure, culverts, impervious ditches, channelized facilities, etc.) capture and divert stormwater to either the ocean or detention (dam) facilities or large “spreading grounds”; these BMPs and SWPPS are entirely inappropriate in rural areas that have dirt roads, few impervious areas and no drainage infrastructure and where natural drainage patterns have been maintained and preserved for hundreds of years. For example, a primary purpose of the BMPs and SWPPPs is to control sediment flows and eliminate sediment from stormwater discharges (see pages 3.8-76 and 3.6-78<sup>1</sup>); this is important in urban areas because sediment impairs the operation of stormwater capture and conveyance infrastructure

<sup>1</sup> According to pages 3.8-76 and 3.6-78, the Project will employ IAMFs to control sediment and BMPs will minimize discharges of sediment in stormwater released from construction sites.

4415-8720

by accumulating in conveyance channels and detention basins reducing system capacity. However, rural areas like Acton and Agua Dulce have no stormwater capture or conveyance infrastructure; so, sedimentation is not a problem. In fact, if the Project does remove sediment from stormwater flows in Acton and Agua Dulce, it will cause tremendous erosion problems on all downstream areas because the “sediment free” stormwater discharged from the construction site into natural drainage courses will pick up sediment as it gains speed on its path toward the Santa Clara River<sup>2</sup>. And, where it picks up sediment as it flows across downstream properties, it causes significant erosion. This is not conjecture; it is fact. The Forecast subdivision between McEnnery Canyon Road and Desert Road in Acton installed stormwater capture and sediment removal facilities (including debris basins and detention basins) that discharged sediment-free water to the natural drainage courses downhill from the subdivision, and when it rained, the “sediment free” water picked up significant amounts of sediment as it flowed across downhill properties the resulted in significant erosion; some downhill properties lost large areas of their back yards. Therefore, IAMFs, BMPs and SWPPs that result in “sediment free” stormwater discharges will cause significantly adverse erosion impacts in Acton and Agua Dulce.

The problem with employing standard IAMFs, BMPs and SWPPP measures at construction sites in Acton and Agua Dulce can perhaps best be illustrated by analyzing a statement found on page 3.8-37 which asserts “Drainage facilities would be specifically designed to convey stormwater runoff, which would result in minimal direct drainage impacts related to these facilities”. According to this statement, the Project will not cause drainage impacts because the Project will be designed to “convey stormwater runoff”; the problem is, neither Acton nor Agua Dulce have stormwater infrastructure to accept the “storm water runoff” that the Project “conveys”. Neither Acton nor Agua Dulce have stormwater culverts or concrete drainage facilities or stormwater capture infrastructure or channelized flow areas, so the “stormwater runoff” that is “conveyed” by the Project *has nowhere to go*. And, if it is just dumped into the natural drainage courses in these communities, it will cause extensive erosion (as discussed above). To be clear, stormwater runoff is *never* “conveyed” in Acton or Agua Dulce; instead, stormwater merely flows to the Santa Clara River along natural drainage courses that have remained unchanged for millennia. The fundamental premise which underlies the Draft’s conclusions that hydrologic impacts will be less than significant because the Project includes BMPs and SWPPs to ensure “drainage facilities would be specifically designed to convey stormwater runoff” is only reasonable in urban/suburban areas where there is channelized drainage infrastructure to accept the conveyed stormwater; it is entirely unreasonable and inapplicable to Acton and Agua Dulce. Accordingly, the Draft is patently incorrect to conclude that the Project will have “less than significant” hydrologic impacts in Acton and Agua Dulce.

It is important for CHSRA to understand that natural drainage patterns have generally dictated the location and configuration of all development in Acton and Agua Dulce over the last 150 years; thus, it is critical that drainage patterns and characteristics in these communities remain preserved and unchanged to protect existing developments. Other than an earthquake, the only activity that can alter drainage patterns in Acton and Agua Dulce is development involving stormwater capture, sediment removal, and stormwater control; this is why such developments are precluded in Acton and why all the IAMPFs, BMPs, and SWPPS that are identified in the

<sup>2</sup> This is the principal characteristic of “two phase flow” conditions: clean water flowing over a natural surface will pick up sediment from the surface until an equilibrium is reached; the equilibrium is a measure of the sediment transport capacity of the flow.

Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4415-8720

Draft are completely inappropriate for Acton. To better understand how the natural drainage patterns are preserved in Acton and Agua Dulce, the following description is offered:

- Most roads in Acton are dirt and have no stormwater capture or diversion infrastructure; they are maintained by the residents. This does make the roads occasionally impassable during inclement weather, but residents quickly repair the roads and restore access.
- There are culverts under a few paved roads in Acton (the 14 Freeway, Escondido Canyon Road, Sierra Highway, and Soledad Canyon Road) but these culverts are located where natural flows occurred before the roads were built *and they do not have sediment removal facilities*; they simply carry sediment laden flows from one side of the road to the other and do not alter flow patterns or cause erosion on downstream properties.
- Every new residential development complies with applicable stormwater regulations by constructing a natural bioswale on site which is appropriately sized to capture and retain sufficient water to offset the impervious surface area that the development creates; no impervious stormwater capture facilities or sediment removal basins are constructed.

Concerns regarding the use of standard IAMFs, BMPs, and SWPPP measures are particularly acute at the “Acton Window” location which lies immediately adjacent to, and uphill from, an entire residential neighborhood. As indicated in the drainage map that is provided in Attachment 1, there are several natural drainage courses across the “Acton Window” parcel; some of these drainage courses are very near homes that are south of, and just downhill from, the “Acton Window” site. As shown in the figures below, sediment-laden stormwater flows off the “Acton Window” parcel via the natural drainages and passed the homes without eroding or flooding the homes. If the Project employs the BMPs and SWPPPs that are described in the Draft at this location, then significant downhill erosion will occur and the homes will be substantially damaged. It should be noted that, at one time, a residential subdivision was proposed for the large parcel that will be used for the “Acton Window”; the subdivision was configured to connect to Antelope Woods Road at the same location and in the same manner as what is now proposed for the SR14A Alternative. The developer had proposed the use of “Conspan” arch bridges to traverse the unique onsite drainage courses that emanate from under the 14 Freeway in a manner that would not alter any characteristics of runoff from the property. A copy of the subdivider’s “post-development” plan is provided in Attachment 2. The efficacy of the developer’s proposal to utilize arch bridges to prevent alterations to existing drainage characteristics and patterns was never fully vetted because the subdivision map was withdrawn; however, the information provided in Attachment 2 demonstrates just how essential it is for CHSRA to ensure that Project construction and operation at the “Acton Window” does not modify drainage characteristics or drainage locations at the Acton Widow site.

Taken together, the abovementioned facts demonstrate that implementation of the BMPs and SWPPP measures that are identified in the Draft within the Communities of Acton and Agua Dulce will not reduce impacts from alterations of surface drainage patterns to a level that is less than significant; to the contrary, they will amplify and exacerbate such impacts. Thus, it is particularly important that the Final EIR clearly assert that the Project *will not* adopt standard BMPs and SWPPP measures in rural communities like Acton and Agua Dulce because they are only applicable to urban/suburban areas where there are extensive impervious surfaces and

4415-8720

Photos of sediment laden stormwater flowing off the “Acton Window” property.

sufficient stormwater conveyance facilities to accommodate them. It is also critical that the Final EIR identify and describe the rural-appropriate IAMFs, BMPs, and SWPPP measures that will be utilized to ensure that the Project does not modify existing stormwater runoff patterns or alter the location of, or the flowrate in, or the sediment characteristics of, any natural watercourses in Acton and Agua Dulce.

**2.2 The Draft Improperly Conflates Stormwater Treatment with Wastewater Treatment and Fails to Address the Impacts of Wastewater Pollutants on Water Resources.**

Section 3.8 of the Draft provides extensive discussions regarding the stormwater treatment infrastructure will be employed to protect water resources at all the Project’s tunnel portal sites; however, it fails to discuss the wastewater treatment infrastructure that will be employed to address the significant volumes of wastewater that will be generated every day during tunnel construction. It also does not identify any measures that will be used to protect groundwater resources from wastewater contamination. In fact, the word “wastewater” appears only three times in Section 3.8! Wastewater concerns are mentioned briefly in Section 3.6 of the Draft, but the wastewater treatment approach it describes is lacking because it relies on the Project’s stormwater treatment facilities to clean up process wastewater resulting from tunnel construction<sup>3</sup>. In other words, the Draft improperly conflates *wastewater treatment* with *stormwater treatment*. The Project’s stormwater facilities will operate only during rare rain events, and in rural communities like Acton and Agua Dulce, stormwater facilities are not particularly complex because stormwater runoff is generally clean with few contaminants (though stormwater does contain sediment which, as discussed above, is naturally occurring and

<sup>3</sup> Pages 3.6-78 – 3.6-79 concludes that wastewater impacts will be less than significant because of the BMPs and SWPPP measures that will be implemented for the Project’s stormwater treatment program.

Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4415-8721

not a “contaminant”). In contrast, the Project’s wastewater treatment facilities will have to be substantially more robust than stormwater treatment facilities because every day, the Project will generate more than one hundred thirty thousand<sup>4</sup> gallons of process wastewater contaminated with the constituents that are released by operations of the tunnel boring machines (“TBM”)<sup>5</sup>. None of this is discussed in the Draft. It is essential that the Final EIR/EIS correct this deficiency and include language which ensures that the Project’s wastewater treatment program will be properly configured to clean the wastewater and maintain existing drainage patterns, characteristics, and sediment discharge profiles in Acton and Agua Dulce and thus avoid downstream erosion and the other runoff problems described above.

4415-8722

**2.3 The Draft Fails to Address the Project’s Significant Adverse Impacts on Local Water Resources and Drinking Wells in Acton and Agua Dulce.**

Section 3.8 of the Draft is supposed to analyze the Project’s impacts on water resources; however, it does not properly address impacts to local water resources and well systems that will result from tunnel construction. In fact, the Project threatens local water resources and drinking water wells in Acton and Agua Dulce in several ways; yet, the Draft fails to address any of them. For instance, tunneling (whether done with TBMs or “traditional methods”) will destroy all well facilities that lie in the tunnel path; residences that rely on these well facilities will have their water source immediately curtailed. According to the tunnel route maps, all the routes travel under homes in rural areas that rely on domestic residential wells; yet the Draft does not address the impacts to these homes that would result if a TBM bored through a resident’s well. This impact must be addressed and a mitigation measure must be offered in which CHSRA drills a new well that meets all local health department standards or connects the property to municipal water.

Another water resource impact that is not addressed in the Draft pertains to groundwater levels and how they will be affected by tunnel construction. Specifically, Section 3.6 asserts that tunnel construction will rely on water resources provided by the “Antelope Valley-East Kern” Water Agency (“AVEK”), but it also states that non-potable water (i.e., groundwater or partially treated sewage) will also be used to the extent feasible; this means that, in Acton and Agua Dulce, both AVEK resources and local groundwater will be used for tunnel construction (because there are no municipal sewage treatment facilities in Acton or Agua Dulce). However, the Draft fails to address or even mention the significant impacts that will result from extracting more groundwater from the already scant local groundwater supplies in Acton and Agua Dulce. Recently, these concerns were substantially elevated when CHSRA announced at a public meeting on November 4, 2022, that AVEK resources *will not* be used for tunnel construction and that the Project will instead rely entirely on local groundwater resources in Acton and Agua Dulce; this news was shocking. If groundwater resources for tunnel construction are used instead of AVEK resources, then each tunnel portal site will require the extraction of more than

<sup>4</sup> Two TBMs will be operating from each portal and, according to page 3.6-78, each TBM will require 366 acre-feet per year; this will result in 653,500 gallons per day used at each portal. According to page 12 of Appendix 3.8-D, at least 20 percent of this water (or 130,700 gallons per day) will flow back and require treatment as contaminated wastewater.

<sup>5</sup> According to Page 3.8-41, the water in the tunnels could be contaminated with drilling muds, sediments, and lubricants.

4415-8722

650,000 gallons *per day*<sup>6</sup>. The Project will also require the construction of new and extensive groundwater extraction facilities. It will also substantially increase groundwater extraction rates in Acton and Agua Dulce which will introduce new and significant stresses on local groundwater supplies that are already stretched thin due to recent drought conditions. This in turn will directly affect local well yields, cause residential wells to “dry up”, and drive people from their homes. Because the Draft fails to analyze or even mention these impacts, it substantially violates both CEQA and NEPA deficiencies. More extensive remarks regarding the significantly adverse environmental impact that will result from using local groundwater resources rather than AVEK resources for tunnel construction are provided in the comments that have been submitted pursuant to Section 3.6; those comments are incorporated herein by reference. The only way to avoid these significant environmental impacts is to preclude the use of groundwater resources for tunnel construction in Acton and Agua Dulce and mandate that AVEK resources be utilized instead.

Another impact that is not properly addressed by the Draft is the significant environmental effects on residential wells in Acton and Agua Dulce that will result from subterranean alterations caused by tunnel construction. Specifically, and as expressed in comments submitted by hundreds of residents of Acton and Agua Dulce before, during, and after Project Scoping, tunnel construction can impact groundwater and perched water resources and thus permanently interrupt domestic water supplies. These concerns are supposed to be addressed as part of “Impact HWR#4”, but the analysis of “Impact HWR #4” is superficial, incoherent, and internally inconsistent. For instance, pages 8.6-47-8.6-49 assert: 1) “when tunnel depths are above the known groundwater table, effects on groundwater and groundwater dependent resources would be minimal to none”; 2) “Where tunnel depths may coincide with the groundwater table, there could be impacts”; 3) “tunneling activities required for each of the six Build Alternatives could encounter shallow groundwater south of the California Aqueduct and north of the ANF” [referring to Acton and Agua Dulce] 4) “Not enough groundwater information is available at this time to identify the extent to which the tunnels may be below the water table. There may be perched groundwater or seasonal springs in the vicinity of these tunnels (Figure 3.8-A-21); therefore, local water inflows during portal and tunnel excavations are anticipated in this area”; 5) “Private wells occur within 1 mile of each of the six Build Alternatives outside of the ANF (Figure 3.8-A-21, Figure 3.8-A-22, and Figure 3.8-A-23). Changes in groundwater during tunnel construction could affect water supply to these private supply wells”; 6) “Because of the presence of groundwater, perched groundwater, and seasonal springs, tunneling could provide a conduit for groundwater to drain into the excavation as the advancing tunnel intersects fractures and faults within bedrock or saturated alluvium in groundwater basins”; 7) “For all excavation methods, excessive groundwater pressures might generate some seepage into the tunnel during construction, but additional measures implemented during construction, such as pre-grouting, would help to reduce the flow to manageable values”; 8) “The tunnel lining system would also be important in controlling water flows both during and after construction and would consist of either a single-pass or two-pass lining system, depending on mining methods and groundwater pressure encountered”; 9) “The circumstances under which these approaches would be employed would be guided by site-specific geotechnical and hydrogeological characterizations that would be developed during the preconstruction phase of

<sup>6</sup> Each TBM requires 366 acre-feet of water per year [Page 3.6-78], and each portal site supports two TBMS; this means that each tunnel portal will require more than two acre-feet (or 653,487 gallons) of water per day.

Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4415-8722

the selected Preferred Alternative”. Coupling this confusing and arguably contradictory accumulation of declarative statements with the assertion offered on Page 3.8-41 that the analysis assumes “all tunnels are below the water table” in the area South of the Aqueduct and north of the ANF (which is where Acton and Agua Dulce are) reveals that CHSRA has no clear picture of where the water table is in Acton and Agua Dulce or where the tunnels are located in relation to the water table. Worse yet, the Draft fails to grasp that the salient issue is not where the tunnels are located in relation to the “water table”, rather it is where the tunnels are located in relation to the groundwater sources that residents pull from to extract their drinking water; the distinction is critical because many domestic wells in Acton and Agua Dulce actually extend well below the “water table” to ensure a reliable water supply despite drought conditions. For example, the domestic wells that serve the residents on Salty Dog Road and Hisey Ranch Road under which the SR14A tunnels run have depths ranging from 500 feet to 900 feet (which means that some wells extract water from zones above the tunnel and others extract water from zones below the tunnel). Inadequacies in the “analysis” of “Impact HWR#4” are substantially magnified by the fact that the Draft mistakenly presumes that there are very few wells in Acton and Agua Dulce<sup>7</sup> when, in reality, these communities have more than a thousand wells.

The Draft fails to provide a coherent analysis of “Impact HWR#4” and instead presents a muddled, incoherent, and uninformed mishmash of words which reveals that CHSRA knows nothing about local groundwater or perched water resources in Acton and Agua Dulce; it knows nothing about local well facilities in Acton and Agua Dulce or where they are or how they are configured; and it knows nothing about how tunneling will impact these water resources and well facilities. Yet, and despite these inadequacies, the Draft concludes on page 3.8-49 that impacts on groundwater outside the ANF will be “less than significant”. This conclusion is not supported by any evidence (let alone “substantial evidence”) and it constitutes the type of speculation that is prohibited by CEQA.

This deficiency must be addressed by revising the Draft to 1) clearly assert that there is insufficient evidence to conclude that the impacts of tunnel construction on groundwater resources in Acton and Agua Dulce will be less than significant; and 2) add a mitigate measure to address the impacts of tunnel construction on private water systems, residential wells, and groundwater resources in Acton and Agua Dulce which includes an “Adaptive Management and Monitoring Plan” (“AMMP”) that establishes protocols to determine baseline conditions of ground water levels at all wells in Acton and Agua Dulce that are located within ½ mile of any tunnel and detects changes in groundwater conditions at these locations which are related to tunnel construction to ensure timely implementation of remedial measures; these remedial measures must include supplying supplemental water to all affected well owners until baseline levels are restored or drilling a new well that complies with all applicable local and state requirements. The Draft already proposes a similar AMMP (identified in Mitigation Measure “HWR-MM#4”) for ANF lands [Pages 3.8-67 to 3.8-69], so incrementally extending this AMMP to protect the rural residents of Acton and Agua Dulce will not be burdensome. Moreover, CEQA requires that CHSRA mitigate all potentially significant impacts to the extent feasible. Given that this AMMP is clearly feasible (since it will be implemented in the ANF) and given that the Draft clearly affirms that tunnel construction will affect groundwater in Acton and Agua

<sup>7</sup> Table 3.8-3 identifies few wells in the area of the Project in Acton and Agua Dulce; additionally, the Draft appendices indicate that Acton has only 5 active wells and Agua Dulce has no active wells (as discussed in more detail below).

4415-8722

Dulce (i.e., “South of the California aqueduct and north of the ANF”) and given that CHSRA does not know how many wells it will affect or where they are located, CEQA requires that this AMMP be included in a mitigation measure developed for Acton and Agua Dulce.

4415-8723

**2.4 The Draft Fails to Address the Impacts on Water Resources That Will Result From Using Non Potable Water for Tunnel Construction.**

Section 3.8 of the Draft ostensibly pertains to water resource impacts that will result from Project construction and operation, yet it fails to address the potential contamination of groundwater resources that will result from the use of non-potable water to construct the tunnels on all 6 route alternatives. Specifically, and though the Draft asserts in Tables 3.6-11 and 3.6-21 that tunnel construction will be conducted using AVEK resources (which are potable), page 3.6-90 contradicts this assertion by stating that the Project will require the use of non-potable water for tunnel construction to the extent feasible. The Draft fails to identify the sources of non-potable water that will be used, but non-potable water is typically comprised of either partially treated sewage or untreated groundwater. And, given the substantial likelihood that the TBMs will pierce water channels and aquifers that either overlie, or serve as, public and private drinking water sources in Acton and Agua Dulce (as discussed above), tunnel construction with non-potable water will result in the direct injection of potentially unclean water into groundwaters that directly serve as drinking water sources.

As indicated above, CHSRA staff recently announced that only groundwater resources will be used for tunnel construction in Acton and Agua Dulce. This, coupled with the fact that local groundwater in Acton and Agua Dulce is often contaminated with nitrates and arsenic at levels exceeding federal drinking water standards<sup>8</sup>, necessarily implies that tunneling will result in the direct injection of these and other pollutants into all the aquifers, perched water, and other groundwater sources through which the tunnels pass. Yet, the potential contamination of groundwater that is posed by the use of non-potable water for tunnel construction is not addressed anywhere in the Draft. Instead, the Draft simply asserts that “the tunnels are below the water table” [Page 3.8-41] and thus will not contaminate groundwater in Acton and Agua Dulce (a.k.a. “the area south of the California Aqueduct and north of the ANF”). This assertion has no evidentiary support; in fact (as discussed above), CHSRA has insufficient information to draw any specific conclusions regarding where tunnels will be located in relation to either the “water table” or the groundwater sources that Acton and Agua Dulce residents rely on.

The lack of analysis of potential groundwater contamination resulting from the use of non-potable water in Acton and Agua Dulce and the attendant lack of mitigation measures to address this impact renders the Draft materially deficient. Accordingly, the Draft must be revised to address this deficiency and offer mitigation; the revisions must include a clear statement that the principal means to avoid these impacts is to preclude the use of groundwater resources for tunnel construction in Acton and Agua Dulce and instead require the use of AVEK resources.

<sup>8</sup> Nitrate concentrations in groundwater extracted from local municipal wells in Acton are reported in Attachment 3. Additionally, arsenic is found in the groundwater within Agua Dulce; in fact, “Agua Dulce” (or “sweet water” in Spanish) is an historic term for water contaminated with arsenic. A study conducted 10 years ago by the Los Angeles County Health Department indicates that many wells in Agua Dulce have detectable levels of arsenic and in some areas, arsenic exceeds the MCL of 10 ppb [<http://file.lacountv.gov/SDSInter/bcs/supdocs/65110.pdf>].

Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

**3.0 ADDITIONAL DEFICIENCIES NOTED IN THE DRAFT**

For simplicity and to facilitate review, additional deficiencies and factual errors noted in the Draft are presented sequentially by page number below.

4415-8724

Page 3.8-10 states “The Authority is a state agency and therefore is not required to comply with local land use and zoning regulations”; while it is true that CHSRA is not required to comply with local land use and zoning regulations, CEQA does require CHSRA to identify Project elements that conflict with local land use plans and policies; it also requires CHSRA to mitigate conflicts with any plan or policy or regulation adopted for the purpose of avoiding or mitigating an environmental effect if such conflicts will result in a significant environmental impact. So, while the Project is not required to conform with local land use and zoning policies, it must nevertheless mitigate the significant environmental impacts that arise from non-conformance with local land use and zoning policies.

4415-8725

Page 3.8-10 addresses the consistencies of the Project’s hydrology and water resource characteristics with applicable planning documents adopted by local agencies and it defers to an analysis presented in Appendix 2-H. It also states “Each of the six Build Alternatives are consistent with the majority of policies reviewed but are potentially inconsistent with 2 policies. These are Policy S 2.2 of the Los Angeles County General Plan, which discourages development from locating downslope from aqueducts, and Policy LU 3.3 of the Los Angeles County Ordinances, which limits the amount of development in Flood Zones designated by FEMA.” This consistency analysis does not comply with CEQA. Specifically, CEQA requires that CHSRA ascertain whether the Project is inconsistent with any policies that were adopted for the purpose of avoiding or mitigating an environmental effect and whether these inconsistencies will result in significant environmental impacts; if so, mitigation must be offered<sup>9</sup>. Unfortunately, the Draft does not meet this standard because it offers no mitigation measures to address the inconsistencies that are identified. Equally important, the consistency analysis presented in Appendix 2-H is incomplete and arguably erroneous. For example, Appendix H-2 states on page 2.0-H-27 that the Project is consistent with Los Angeles County General Plan Policy C/NR 5.6 (Minimize point and nonpoint-source water pollution) because CHSRA will prepare a stormwater management and treatment plan and a Stormwater Pollution Prevention Plan (SWPPP) to manage stormwater runoff for all six Build Alternatives; however, stormwater management plans and SWPPs configured to address stormwater runoff are not appropriate for addressing the wastewater generated at each portal location (as discussed above). Moreover, using stormwater facilities or SWPPP measures to treat wastewater will not “minimize water pollution” as required by Policy C/NR 5.6 because “stormwater” and “wastewater” are two very different streams that require different treatment methodologies (as discussed above); this is particularly true in Acton and Agua Dulce where stormwater runoff requires little (if any) treatment. The consistency analysis presented for Policy C/NR 5.6 in Appendix H-2 is inadequate and must be revised to recognize these facts. Another concern is that Appendix H-2 fails to address the water pollution that will result from CHSRA’s plan to use non-potable water to operate the TBMs (as discussed above). Furthermore, Appendix H-2 does not address Goal C/NR 6 to achieve “Protected and usable local groundwater resources”. Goal C/NR 6 was clearly adopted “for the purpose of avoiding or mitigating an environmental effect”; therefore, CEQA

<sup>9</sup> California Code of Regulation, Title 14, Chapter 3, Appendix G.

4415-8725

requires that the Final EIR 1) address the manner in which the Project substantially conflicts with this Goal by requiring groundwater resources to be used for tunnel construction in Acton and Agua Dulce; and 2) provide mitigation for the significant impacts to local groundwater levels that will arise from this conflict. The only feasible mitigation measure that will ensure the Project does not conflict with either Goal C/NR 6 or Policy C/NR 5.6 is to preclude the use of local groundwater for tunnel construction in Acton and Agua Dulce and mandate that only AVEK resources will be used. Finally, Appendix H-2 fails to identify the Antelope Valley Area Plan (AV Plan) or discuss its relevance to the Project. Policy COS 2.7 from the AV Plan pertains to protected and usable local groundwater resources and it is particularly relevant given that the Project may substantially impact local groundwater resources. Additionally, AV Plan Policy COS 3.5 pertaining to the protection of water supplies from pollution is also relevant given that CHSRA proposes to use non-potable water for TBM operation. In summary: Page 3.8-10 and Appendix H-2 must be revised to 1) address the Project’s conflicts with Goal C/NR 6, Policy C/NR 5.6, Policy COS 2.7 and Policy COS 3 (all of which were adopted “for the purpose of avoiding or mitigating an environmental effect”); 2) establish the significant environmental impacts resulting from these conflicts; and 3) and provide appropriate mitigation measures to reduce these environmental impacts. Recommended mitigation measures include the development of properly robust wastewater treatment facilities and a commitment to use only potable water supplied by the Antelope Valley-East Kern (AVEK”) Water Agency for constructing the tunnels in Acton and Agua Dulce.

4415-8726

Pages 3.8-21 through 3.8-22 pertain to surface water conditions and according to Table 3.8-3, these pages are supposed to address well issues, but they do not. Worse yet, Table 3.8-3 asserts (wrongly) that there are almost no active wells present throughout any of the route alternatives! Table 3.8-3 was ostensibly compiled based on data provided in Appendix 3.8-A, but Appendix 3.8-A fails to identify nearly every single well in Acton and Agua Dulce (for instance, page 3.8-A-21 reports that the entire Community of Acton only has 5 active wells and page 3.8-A-22 reports that there are no active wells in Agua Dulce). For the record, most Acton and Agua Dulce residents are not served by Waterworks District #37 so they rely on small domestic wells and local groundwater for their water supply; this means that there are at least a thousand active wells in Acton and Agua Dulce, yet none of them are reflected anywhere in Section 3.8 or in Appendix 3.8-A. For more than 10 years, the residents of Acton and Agua Dulce have expressed concerns that the Project would adversely impact their domestic residential wells; yet, and as discussed above, these concerns have not been properly addressed. Instead, the Draft reports (incorrectly) that there are virtually no active wells in any areas affected by the Project. These appalling material deficiencies must be rectified. CHSRA can easily identify the general area of residential wells in Acton by simply assuming that every house which is not served by Waterworks District 37 has a nearby well. Such an analysis must be conducted and incorporated in the Final EIR/EIS along with the AMMP discussed above to mitigate Project impacts on residential wells in Acton and Agua Dulce; an adverse impact to a single well should be established as the CEQA “threshold of significance” for this analysis.

4415-8727

Pages 3.8-25 through 3.8-26 address affected groundwater basins and Table 3.8-5 asserts that all route alternatives other than E1A and E2A are located within the “Acton Valley” groundwater basin. This is incorrect. In fact, according to Figures 3.8-A-21 and 3.8-A-22 of Appendix 3.8-A, the only Project element lying within the “Acton Valley” Basin is a utility line serving the SR14A route; no tracks or tunnels will be located in the “Acton Valley” water basin. It is a common

Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4415-8727

misconception that the “Acton Valley” groundwater basin is located in Acton; however, it is not<sup>10</sup>.

4415-8728

Page 3.8-27 States that Figure 3.8-A-21 through Figure 3.8-A-23 depict the groundwater wells within the groundwater “Resource Study Area”. This is incorrect. Figure 3.8-A-21 through Figure 3.8-A-23 fail to identify the thousand+ existing wells in Acton and Agua Dulce. Page 3.8-27 also states that there are only 30 active wells in the Refined SR14 and SR4A RSAs and only 24 or fewer active wells in the E1/E1A/E2/E2A RSAs; this statement is also incorrect. The route maps provided with the Draft indicate that the routes traverse many areas where there are hundreds of wells, including Peaceful Valley, Kentucky Springs, Aliso Canyon, Arrastre Canyon, Red Rover Mine, Escondido, Hisey Ranch, Hubbard, etc. These errors must be corrected by revising the Draft to include a complete and thorough survey of all the wells located in the vicinity of the preferred Alternative Route and provide mitigation measures to reduce impacts on these wells to a level that is less than significant.

4415-8729

Page 3.8-28 asserts that CHSRA mapped the “water wells within 1 mile” of all the route alignment alternatives, however it does not clarify where these maps are or how the public can view them to confirm whether they do indeed capture all “water wells within 1 mile” of the alignments. This is a substantial deficiency, particularly given that the residents of Acton and Agua Dulce have a right pursuant to CEQA to know whether CHSRA’s impact assessment has properly accounted for their residential well facilities. Moreover, given the mapping errors in Figure 3.8-A-21 through Figure 3.8-A-23 (described above), the public can be relatively confident that CHSRA *did not* map all the “water wells within 1 mile” of all the alignments, and thus the impact analysis presented in the Draft does not account for their well facilities. These errors are compounded by the fact that the Draft offers no measures to mitigate the Project’s significant impacts on private domestic wells (including, but not limited to, well destruction by TBM operation). The Draft must be substantially revised to properly identify the significant environmental impacts that the Project poses to domestic residential wells and provide appropriate mitigation measures which include well replacement services and municipal water line connection services.

4415-8730

Page 3.8-36 concludes that ancillary features such as power and utility lines will be “strung from utility poles that could be located outside of surface water features and utility lines would be collocated within existing roadway rights-of-way”. This conclusion is problematic for several reasons. First, CHSRA has committed to constructing utilities underground in Los Angeles County to the extent feasible<sup>11</sup>, and since the only locations where undergrounding utilities may be infeasible are either steep hillsides or across seismic faults, most of the Project’s electric

<sup>10</sup> In 2016, the Department of Water Resources (DWR) revised “Bulletin 118” to and improperly combine the groundwater basin that underlies Acton with the groundwater basin that underlies the Antelope Valley. Then, DWR compounded the confusion by renaming the groundwater basin that underlies Agua Dulce to “Acton Valley Basin” even though it is not in the Acton Valley. Under the 2016 version of “Bulletin 118”, the basin in Acton and the basin in Antelope Valley are considered to be a single basin called “Antelope Valley Basin”, and the basin in Agua Dulce is called the “Acton Valley” Basin. This is of course a mistake; the basin under Acton is in the Santa Clara River watershed and drains to the ocean, whereas the basin under Antelope Valley is in the Antelope Valley watershed portion of the “Great Basin” which does not drain to the ocean. The two basins are separated by the San Andreas fault which prevents communication and groundwater transfer between them.

<sup>11</sup> Appendix H-2 Page 12.

4415-8730

utilities in Los Angeles County will be underground and not strung on utility poles. Second, the Communities of Acton and Agua Dulce are located in Very High Fire Hazard Severity Zones (VHFHSZs) where above ground electrical utilities pose a very real and significant fire risk<sup>12</sup>; accordingly, electrical infrastructure in Acton and Agua Dulce must be installed underground for fire-safety reasons. Third, the electrical service provided by above-ground facilities is highly unreliable in Acton and Agua Dulce because such facilities are susceptible to frequent power shutoffs (referred to as “Public Safety Power Shutoffs”) that can last for days and which will cause extensive service interruptions during Project construction and operation. Fourth, according to the “Utility Relocation Plans” prepared for the Project, utility lines are not always “collocated within existing roadway rights of way”; in fact, CHSRA is proposing to construct an entirely new 230 kV transmission line in a completely new right of way corridor that is not within or near an existing road right of way. Taken together, these factors demonstrate that ancillary features such as power lines and utility infrastructure must be placed underground in Acton and Agua Dulce and not “strung from utility poles”; the Draft must be corrected to reflect that all utility installations (including the 230 kV line) will be underground in Acton and Agua Dulce.

4415-8731

Page 3.8-46 states “Each of the Build Alternative footprints in the Antelope Valley Groundwater Basin are within developed suburban land uses and infrastructure. Because these areas are developed, the net increase in impervious surfaces would be relatively low.” These statements are only valid for the portion of the Antelope Valley Groundwater basin that is located in Palmdale, they are not valid for the portion of the Antelope Valley Groundwater basin that is located in Acton. This is because Acton is a rural community with very little impervious surface area; it is not developed with suburban land uses and infrastructure. Accordingly, and contrary to what the Draft asserts, any net increase in impervious surfaces in Acton will be relatively high. Page 3.8-46 also states that, within the Antelope Valley Groundwater Basin, “Each of the build alternatives Stormwater retention and detention BMPs would be implemented to control stormwater runoff while also increasing groundwater recharge”; however (and as discussed above), the use of standard retention and detention BMPs to control stormwater runoff in Acton and Agua Dulce will result in significant erosion problems and therefore cannot be utilized.

4415-8732

Page 3.8-47 states “The E1/E2 Build Alternatives would require footprint in the Acton Valley Groundwater Basin”. This statement is incorrect. As explained above, the “Acton Valley Groundwater Basin” boundaries are located entirely in Agua Dulce and, as shown in Figures 3.8-A-21 and 3.8-A-22, no portion of any of the “F” route alternative comes close to it.

4415-8733

Page 3.8-83 through 3.8-85 present CEQA significance conclusions indicating that the Project will avoid all significant impacts on hydrology and water resources. These conclusions are insupportable because:

- The BMPs and SWPPP measures that the Draft relies upon to conclude that the Project will not impact drainage patterns or runoff characteristics cannot be implemented in rural areas like Acton because they will result in significant erosion and other significantly adverse hydrologic impacts.

<sup>12</sup> Most of the deadly and extensive wildfires that have been sparked since 2017 were caused by “above-ground” electrical lines in VHFHSZs

Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4415-8733

- The Draft fails to provide a proper analysis of the impacts of tunneling on groundwater resources and residential wells in Acton and Agua Dulce (which is referred to as the area “south of the Aqueduct and north of the ANF”) and instead presents a jumble of disjointed and arguably contradictory statements which reveal that CHSRA has no idea of where groundwater resources are in relation to tunnel locations or well infrastructure and that tunnel construction can indeed impact groundwater levels. Then, the Draft simply declares (without evidentiary support) that the Project will not impact groundwater resources or residential wells. All of this substantially violates CEQA and NEPA.
- The Draft conflates stormwater treatment with wastewater treatment and fails to properly articulate the measures that will be used to treat the hundred thousand+ gallons of contaminated wastewater that will be generated daily at each tunnel portal in Acton and Agua Dulce.
- The Draft fails to address or even mention the impacts of using local groundwater resources for tunnel construction rather than AVEK resources; these impacts include depletion of the already scant groundwater resources that Acton and Agua Dulce residents depend on as well as contamination of aquifer, groundwater, and perched water sources.
- The Draft does not comply with CEQA because it does not offer any strategies for minimizing the significant environmental impacts that will occur as a result of inconsistencies between the Project and local plans, policies, and ordinances that were adopted for the purpose of avoiding environmental effects (particularly those policies pertaining to the protection of groundwater resources and groundwater quality).

4415-8734

**3.0 CONCLUSION**

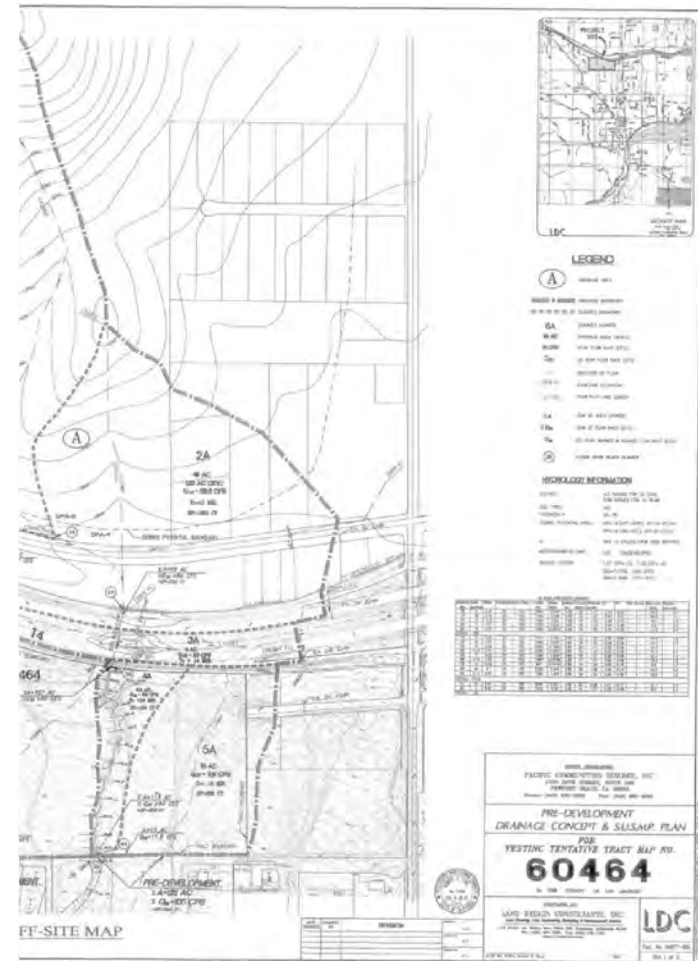

For the reasons set forth above, the Draft Environmental Impact Report prepared for the Palmdale to Burbank section is deficient and does not comply with CEQA or NEPA; these deficiencies must be corrected in the Final EIR which must specifically address the residential well impacts and groundwater impacts of the Project and include appropriate BMPs and SWPPPs for rural areas that guarantee there will be no change in any runoff characteristics (including, but not limited to, volume, location, sediment loading, discharge rate, etc.). Without these corrections, the Final EIR will not comply with CEQA or NEPA.

## Response to Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022)

### 4415-8719

The commenter introduces the content of their comments in Submission PB-4415. Specific comments are noted and addressed among responses to Submission PB-4415. Ultimately, among these comments, the Authority has found no errors or deficiencies. The commenter did not identify any new or significant environmental effect that requires further mitigation, and the Authority has concluded that, even in light of these comments, the EIR/EIS takes a hard look at the project's environmental impacts.

### 4415-8720

The commenter indicates that the BMP and SWPPP project features discussed in Draft EIR/EIS Section 3.8, Hydrology and Water Resources, were developed for urban areas and are not appropriate for rural areas. The commenter also indicates that the "stormwater runoff" that is "conveyed" by the Project has nowhere to go in Acton and Agua Dulce and that if it is dumped into the natural drainage courses in these communities, it will cause extensive erosion.

Section 3.8 does not identify the specific BMPs or SWPPP elements that will be implemented during the project. The construction-related storm water BMPs will be designed during development of the SWPPP, closer to the time of construction, and the permanent storm water BMPs will be developed during design of the facilities. It is premature to speculate or develop specific BMPs or SWPPP elements at this time. The SWPPP is a plan that is developed during the construction phase of the project and will be developed on a site-specific basis to take into consideration the erosion and sediment control requirements for the particular construction area. Practices to reduce erosion of exposed soil will be included in the plan, as indicated in HYD-IAMF#3, considering the particularities of Acton and Agua Dulce as rural areas. The BMPs and SWPPP must be developed in accordance with proper permitting and the project features (IAMFs) to minimize erosion, as described in the following paragraphs.

The commenter also indicates that construction in Acton and Agua Dulce will cause significant erosion. The Draft EIR/EIS discloses that construction could significantly impact erosion. To minimize this impact, the project would implement adequate BMPs and SWPPPs as previously described. The BMPs and SWPPPs would be developed to consider the lack of existing drainage infrastructure, as indicated by the commenter, in Acton and Agua Dulce. The commenter indicates that it is critical that drainage patterns remain preserved and unchanged to protect existing developments. The Authority agrees with this comment and notes that HYD-IAMF#1 and HYD-IAMF#2 were specifically developed to ensure that impacts on hydraulic capacity would be reduced by minimizing alterations to watercourses and maintaining existing stormwater patterns.

Under the Clean Water Act, discharge of stormwater from construction sites must comply with the conditions of a National Pollutant Discharge Elimination System (NPDES) permit. The State Water Resources Control Board is the permitting authority in

## Response to Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4415-8720

California and has adopted the statewide General Permit for Stormwater Discharges Associated with Construction Activity that applies to projects resulting in one or more acres of soil disturbance, in both urban and rural environments. For projects disturbing more than 1 acre of soil, a SWPPP is required that specifies site management activities to be implemented during site development. These activities include construction stormwater BMP, erosion and sedimentation controls, dewatering (nuisance water removal), runoff controls, and construction equipment maintenance. The following project features have been incorporated into the project: HYD-IAMF#1 and HYD-IAMF#2 will require that surface water crossings maintain preconstruction hydraulic capacity through the implementation of on-site stormwater management BMPs to provide runoff dispersion, infiltration, detention, and evaporation. The incorporation of these IAMFs into project design will ensure that impacts on hydraulic capacity would be reduced by minimizing alterations to watercourses, implementing erosion control BMPs, and maintaining existing stormwater patterns. HYD-IAMF#3, which involves the preparation and implementation of a SWPPP, would avoid or minimize changes to drainage, stormwater, and erosion patterns during construction. Hydromodification management procedures would include steps to maintain preconstruction hydrology by emphasizing on-site retention of stormwater runoff using measures such as flow dispersion, infiltration, and evaporation (supplemented by detention where required). In addition, BMPs would ensure that stormwater runoff was retained on-site per the stormwater management and treatment plan, as outlined in HYD-IAMF#1. The construction-period SWPPP (HYD-IAMF#3) will incorporate BMPs to reduce short-term increases in construction-site runoff, and the stormwater management and treatment plan (HYD-IAMF#1) will address stormwater runoff and system capacity. HYD-IAMF#2 will require water crossings to maintain preconstruction hydraulic capacity. With implementation of HYD-IAMF#1 and HYD-IAMF#3, construction of the Build Alternatives would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surface, in a manner that would: 1) Result in substantial erosion or siltation on- or off-site, 2) Substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site, and 3) Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems.

The commenter also indicates that the project's impacts cannot be avoided through

### 4415-8720

"designing appropriate drainage facilities" because no drainage facilities could actually adequately interact with the natural drainage. This statement is not accurate. Drainage facilities like culverts, CON/SPAN bridges and box culverts are commonly used structures in construction projects, and would be adequate to maintain drainage patterns and water courses at the Acton Intermediate Window site.

## Response to Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4415-8721

The commenter asserts that the Draft EIR/EIS conflates stormwater treatment with wastewater treatment and fails to address the impacts of wastewater pollutants on water resources.

Section 3.8, Hydrology and Water Resources, of the Draft EIR/EIS mentions wastewater only three times because the Authority addressed that issue directly in Section 3.6, Public Utilities and Energy. It addressed the effects of construction wastewater specifically in Impact PUE#4. There, the Draft EIR/EIS explains that the construction contractor will reduce water consumption for construction of the tunnels by recycling and reusing water on-site. The contractor will collect some of this wastewater in water retention ponds or, like the tunnel spoils, it will haul the water off-site. Water taken off-site for treatment would be hauled to a nearby treatment facility, most likely in the Palmdale or Lancaster area. However, the specific location for treatment of project wastewater from tunnel construction has not been identified. Regardless, the contractor will not directly pipe wastewater from tunneling activities back into local wastewater treatment facilities, collection systems, or treatment plants.

On Page 3.6-78, the Draft EIR/EIS explains a different process for managing stormwater. There, it explains, HYD-IAMF#1 requires the contractor to capture runoff from pollutant-generating surfaces by using on-site stormwater management facilities. It explains that the Authority will require the contractor to implement a construction SWPPP and to use other BMPs. Among the BMPs, the Authority may require the contractor to provide permeable surfaces and systems to retain or detain and treat stormwater from construction areas on-site. Despite these efforts, the Draft EIR/EIS recognizes that some wastewater may discharge to local stormwater management systems. Nonetheless, it expects that the SWPPP and BMPs would reduce the impacts on the capacity of existing stormwater management system facilities managed by local stormwater management authorities. Therefore, contrary to the comment's assertions, the Draft EIR/EIS treats wastewater different from stormwater, and it recognizes how the two types of water may impact local jurisdiction's stormwater treatment facilities.

### 4415-8722

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF, PB-Response-PUE-3: Water Demand and Usage.

The commenter states that the Draft EIR/EIS does not adequately address impacts to local water resources and well systems (particularly drinking water wells in Acton and Agua Dulce) due to tunnel construction; states that tunneling will destroy well facilities; and states that these impacts must be addressed and mitigation measures must be offered. The commenter also characterizes the Authority's analysis in Impact HWR#4 in the Draft EIR/EIS as contradictory and states that the Authority has no clear picture of the groundwater conditions (i.e., water table) in Acton and Agua Dulce. Additionally, the commenter states that Section 3.6, Public Utilities and Energy, of the Draft EIR/EIS identifies that non-potable water would be used for construction and fails to address the impacts from extracting groundwater. The commenter also indicates that at a public meeting on November 4, 2022, the Authority announced that they rely entirely on local groundwater resources in Acton and Agua Dulce; however, the Authority cannot verify the commenter's claim about the remarks made on November 4, 2022.

The resource study area (RSA) for tunnel construction is the area within 1 mile of the centerline of each of the six Build Alternatives. Pursuant to the Authority's 2019 Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest and 2019 Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest (referenced in Section 3.8, Hydrology and Water Resources, of the EIR/EIS), based on observed impacts on groundwater from past tunnel projects, no impacts to wells are expected to occur outside the tunnel construction RSA (more than 1 mile from the centerline of each Build Alternative). Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail the options that the Authority would

## Response to Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4415-8722

consider to address impacts to private water supply wells outside the ANF, including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells.

For wells within the ANF that are determined through modeling and monitoring to be adversely affected by groundwater reductions caused by the HSR, the Adaptive Management and Monitoring Plan (AMMP) included in Mitigation Measure HWR-MM#4 requires modifications to the affected wells or by providing supplemental water. Supplemental water would only be provided if monitoring indicates that the HSR construction caused groundwater impacts. However, the Authority has identified several IAMFs to avoid and minimize the potential for impacts to water supply wells and the need for supplemental water. These include state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, including through the use of TBMs equipped with specific features designed to reduce or prevent inflows and grouting and tunneling-lining approaches that have been effective at controlling water seepage (as required by HYD-IAMF#5 [Tunnel Boring Machine Design and Features], HYD-IAMF#6 [Tunnel Lining Systems], and HYD-IAMF#7 [Grouting]). Regarding the commenter's statement which characterizes the Authority's analysis in Impact HWR#4 in the Draft EIR/EIS as contradictory and states that the Authority has no clear picture of the groundwater conditions (i.e., water table) in Acton and Agua Dulce, the Authority respectfully disagrees and has provided substantial evidence in its Draft EIR/EIS. On page 3.8-48 of the Draft EIR/EIS, the Authority identified that "The primary issues associated with tunneling outside the ANF is the tunnel depth relative to the groundwater table and tunneling through alluvial soils. When tunnel depths are above the known groundwater table, effects on groundwater and groundwater dependent resources would be minimal to none." The Authority has reviewed the conditions in Acton and Agua Dulce and has found the following: the primary issues affecting groundwater from tunneling are groundwater level and pressures, geologic and hydrogeologic conditions (includes aquifer characteristics), and tunneling construction methods. In Acton and Agua Dulce, tunnels are above the groundwater level, there are no groundwater pressures, the alluvial soils differ from fractured rock (e.g., within ANF) that convey surface water through joints/fractures to the tunnel location, and the proposed tunneling methods will not affect the groundwater levels, which are deeper than the tunnel inverts.

Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage,

### 4415-8722

which provides an overview of the water sources that would be used by the project. As explained in that Standard Response, the Authority would not drill wells to extract groundwater for construction.

## Response to Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4415-8723

The commenter asserts that the Draft EIR/EIS fails to address impacts on water resources from the use of non-potable water during tunnel construction.

As described in Impact HWR#2: Construction Activities Required for the Build Alternatives, in Section 3.8, Hydrology and Water Quality of the Draft EIR/EIS, during tunnel construction, disposal of water flow into the tunnel could release water contaminated with drilling muds, sediments, and lubricants used during the tunneling activities would introduce new sources of pollutants that could contaminate groundwater within the groundwater basins which they overlay. Implementation of HWR-MM#1 will require the Authority to treat potential groundwater contamination pursuant to RWQCB permit requirements. Through treatment of groundwater and installation of groundwater barriers (where necessary), application of this mitigation measure would prevent degradation of groundwater quality. Treatment methods for groundwater would include constructed wetland systems, biofiltration and bioretention systems, wet ponds, organic mulch layers, planting soil beds, and vegetated systems (biofilters), such as vegetated swales and grass filter strips.

Draft EIR/EIS Section 3.6, Public Utilities and Energy, does indicate that non-potable water would be used to the extent feasible. PUE-MM#1 will require the Authority to utilize non-potable water from regional water utility service providers for construction activities where feasible. Non-potable water will meet the standards included in the Water Recycling Criteria, Title 22, Division 4, Chapter 3 of the California Code of Regulations, which specifies requirements for water used for various purposes. For example, water classified in this Code as Disinfected Secondary-23 can generally be used for soil compaction, mixing concrete, dust control, street cleaning and other industrial and construction activities where water will not come into contact with workers; whereas water classified as Disinfected Tertiary water according to this Code may be used in processes where water may come into contact with workers. The ASTM C1602 Standard Specification for Mixing Water Used in the Production of Hydraulic Cement Concrete would be considered for the use of non-potable water in the production of dowels, shotcrete, and other concrete structural elements like retaining walls, foundations, bridge decks and piers. These water quality standards for the use of non-potable water have been clarified in Section 3.6 of the Final EIR/EIS and will prevent the pollution of aquifers, perched water zones, or other groundwater sources.

### 4415-8723

The commenter also indicates that at a public meeting on November 4, 2022, the Authority announced that they rely entirely on local groundwater resources in Acton and Agua Dulce. The Authority cannot verify the commenter's claim about the remarks made on November 4, 2022. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides an overview of the water sources that would be used by the project. As explained in that Standard Response, the Authority would not drill wells to extract groundwater for construction.

### 4415-8724

The commenter stated that while the Project is not required to conform with local land use and zoning policies, it must nevertheless mitigate the significant environmental impacts that arise from non-conformance with local land use and zoning policies. As indicated in Section 3.1.4.3, Consistency with Plans and Laws, the California Environmental Quality Act (CEQA) and the Council on Environmental Quality (CEQ) regulations require a discussion of inconsistencies or conflicts between a proposed undertaking and federal, state, regional, or local plans and laws to provide planning context. Further, as described in the CEQA methodology discussion within Section 3.13, whether the project would conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect is discussed in each resource section of Chapter 3 of the Draft EIR/EIS. The Authority, as the lead state and federal agency proposing to construct and operate the California HSR System, is required to comply with all federal and state laws and regulations and to secure all applicable federal and state permits prior to initiating construction on the selected Build Alternative. Therefore, there would be no inconsistencies between the six Build Alternatives and these federal and state laws and regulations. The Authority is a state agency and therefore is not required to comply with local land use and zoning regulations; however, it has endeavored to design and construct the California HSR System so that it is consistent with land use and zoning regulations.

## Response to Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4415-8725

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter expresses concern that the project does not comply with local and state policies regarding water pollution, protection of water supplies from pollution, and use of groundwater for water supply. A response to each specific policy identified by the commenter is addressed below.

Appendix 2.0-H describes that Policy S 2.2 of the Los Angeles County General Plan (2015) and LU 3.3 of the Los Angeles County Code of Ordinances (2016) would be inconsistent for all Build Alternatives. Regarding Policy 2.2, all six Build Alternatives would cross the Governor Edmund G Brown East Branch California Aqueduct, like other transportation routes between Palmdale and Burbank. With implementation of PUE-IAMF#2 and PUE-IAMF#3, temporary utility conflicts and relocations associated with the Refined SR14, the E1 and E2 Build Alternatives' crossing of the East Branch of the California Aqueduct will be minimized and temporary service interruptions will be limited to short durations during construction. Also, construction of the SR14A, E1A, and E2A Build Alternatives would not result in temporary stoppage of water delivery through the aqueduct because those Build Alternatives cross over the Sierra Highway via an elevated viaduct and would not require realignment of the aqueduct.

Regarding LU 3.3, the Build Alternatives would result in development in Flood Hazard Areas. However, the Flood Protection Plan (see HYD-IAMF#2) would minimize increases in 100-year and 200-year flood elevations and establish design standards to allow for the Build Alternatives to remain operational during flood events. Regarding Policy C/NR 5.6, HYD-IAMF#3 would require the contractor to comply with the State Water Resources Control Board Construction General Permit to avoid or minimize temporary hydraulic impacts associated with construction activities at all construction sites and in adjacent areas during construction. These project features would reduce impacts from stormwater during construction activities through the preparation and implementation of the construction Stormwater Pollution Prevention Plan (SWPPP), including the use of best management practices (BMP) to provide hydromodification controls to maintain pre- Palmdale to Burbank Project Section hydrology and to manage the amount of stormwater runoff coming from the construction sites.

### 4415-8725

In addition, Section 3.6 of Final EIR/EIS indicates that any water generated from the tunnel construction would be treated and reused or hauled off-site. This would include non-potable water which can be used for tunneling purposes. Management of any water generated from construction activities would be in accordance with federal and state regulations and would prevent any discharge from impacting water quality standards. The construction contractor would recycle and reuse water on-site to reduce water consumption for construction of the tunnels. Some of this wastewater would also be collected in water retention ponds or treated in the same capacity, and like the tunnel spoils, would be hauled off-site. None of the water discharged from the tunneling activities would be directly piped back into local wastewater treatment facilities, collection systems, or treatment plants. For these reasons, the Build Alternatives would be consistent with Policy C/NR 5.6 (Minimize point and nonpoint-source water pollution).

Goal C/NR 6, Protected and usable local groundwater resources, is addressed in Appendix 2.0-H by its supporting policies, specifically Policy C/NR 6.2, Protect natural groundwater recharge areas and regional spreading grounds. Appendix 2.0-H describes that the project would be consistent with this policy, as the Authority would create new detention facilities to maintain existing levels of groundwater recharge. Furthermore, PUE-MM#1 (described in Section 3.6.7) will require the Authority to prepare an updated water supply analysis for the selected Build Alternative that details and describes the minimum adequate water supply for the RSA during normal, dry, and multiple dry years based on a more detailed project design. Additionally, PUE-MM#1 will require the Authority to utilize non-potable water from regional water utility service providers for construction activities where feasible, as well as recycling/reusing water used for tunnel construction, further minimizing demand for water supplies. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, for further information regarding the supply of water for construction. This standard response also describes that the project would not directly use groundwater and that any indirect use of groundwater (from local water supply purveyors which include groundwater as one of their sources) would not affect sustainable groundwater management or the ability of residents that receive water from these suppliers to receive water that includes groundwater.

The commenter also indicates that Appendix 2.0-H fails to identify the Antelope Valley

## Response to Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4415-8725

Area Plan (AV Plan) or discuss its relevance to the Project. The Draft EIR/EIS did include an assessment of the project's consistency with the Los Angeles County Antelope Valley Area Plan 2035 (2015) (see page 2.0-H-17 in Appendix 2-H of the Draft EIR/EIS). As described above, the use of local groundwater as a source of for construction is not anticipated, so there would not be a need to limit use of groundwater sources or establish controls per Policies COS 2.7 and COS 3.5.

As indicated in these responses, the Authority has identified both IAMFs and mitigation measures to address any potential impacts on water resources, including any impacts arising from conflicts with local plans. As such, the mitigation measures recommended in this comment to include the development of wastewater treatment facilities and a commitment to use only potable water are not necessary. For clarity purposes, Table 2.0-H-1, Regional and Local Policy Consistency Analysis, in Appendix 2-H of the Final EIR/EIS has been revised to include the consistency analysis for Policy COS 2.7 and Goal COS 3.

### 4415-8726

Refer to Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF.

The commenter expressed concern regarding the impact tunneling in the Acton area will have on wells and whether the analysis in the Draft EIR/EIS sufficiently captures the number of wells that may be affected.

The resource study area (RSA) for tunnel construction is the area within 1 mile of the centerline of each of the six Build Alternatives. Pursuant to the Authority's 2019 Preliminary Geotechnical Data Report for Tunnel Feasibility, Angeles National Forest and 2019 Geotechnical Tunnel Feasibility Evaluation for High-Speed Rail Tunnels Beneath the Angeles National Forest (referenced in Section 3.8 of the EIR/EIS), based on observed impacts on groundwater from past tunnel projects, no impacts to wells are expected to occur outside the tunnel construction RSA (more than 1 mile from the centerline of each Build Alternative). Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail the options that the Authority would consider to address impacts to private water supply wells outside the ANF, including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. For wells within the ANF that are determined through modeling and monitoring to be adversely affected by groundwater reductions caused by the HSR, the Adaptive Management and Monitoring Plan (AMMP) included in Mitigation Measure HWR-MM#4 requires modifications to the affected wells or by providing supplemental water. Supplemental water would only be provided if monitoring indicates that the HSR construction caused groundwater impacts. However, the Authority has identified several IAMFs to avoid and minimize the potential for impacts to water supply wells and the need for supplemental water. HYD-IAMF#5, HYD-IAMF#6, and HYD-IAMF#7 require design features and construction methods to

## Response to Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4415-8726

address potential groundwater intrusion, including the installation of a tunnel liner(s) capable of effectively controlling inflows into the tunnels. As such, groundwater inflow during construction would likely be minimal and temporary. Please refer to both Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest and Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest for additional information regarding impacts to wells and correlating mitigation measures and IAMFs.

### 4415-8727

The comment suggests that the Authority misidentified the impacts on Acton Valley groundwater basin. The Authority correctly identified the impacts on Acton Valley. The commenter cites Department of Water Resources' Bulletin 118. As that bulletin recognizes, the Acton Valley and Antelope Valley Groundwater Basins are designated and mapped as separate basins. Therefore, for the Draft EIR/EIS evaluated these two groundwater basins separately. Although only a utility line appears within the Acton Valley Groundwater Basin, this would still cause the alignment to potentially impact the basin, and therefore is described in the Draft EIR/EIS.

### 4415-8728

Refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF.

The commenter asserts that Draft EIR/EIS Section 3.8, Hydrology and Water Resources, text and figures identifying groundwater wells within the RSA fail to include all existing wells in Acton and Agua Dulce. Numerous active wells in the Acton and Agua Dulce area are located within 1 mile of the alignment centerline of each of the six Build Alternatives (see Figure 3.8-A-21 and Figure 3.8-A-22 in Appendix 3.8-A, Hydrology and Water Resources Figures Part 1, in Volume 2 of this Final EIR/EIS). The wells identified in this analysis and depicted on the figures are from publicly available databases, such as those provided by the Palmdale Water District, Antelope Valley-East Kern Water Agency, Los Angeles County Department of Public Works, and California Department of Water Resources. Information and locations regarding private residential wells are not generally publicly available. Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail the options that the Authority would consider to address impacts to private water supply wells outside the ANF, including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. Please refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest for additional information regarding impacts to wells and correlating mitigation measures and IAMFs.

The Authority understands that there are risks affecting groundwater and its recharge with the tunnel construction and analyzed these risks under Impact HWR#4 in Section 3.8. The project tunnel alignments would be constructed in compliance with CAHSRA Technical memoranda requirements (TM 2.4.2 Basic High-Speed Train Tunnel Configuration, TM 2.4.5 High-Speed Train Tunnel Structures, and TM 2.4.6 High-Speed Train Tunnel Portal Facilities) for application of engineering design features to address

## Response to Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4415-8728

and minimize these risks. The Authority would adopt engineering and design approaches described in HYD-IAMF#5 through HYD-IMAF#7 requiring the use of state-of-the-art tunneling techniques to avoid and minimize tunneling impacts on groundwater, utilizing a tunnel liner system appropriate to the groundwater conditions/pressures, and using grout injected into the subsurface material to minimize seepage and groundwater flows into the tunnel. In the event that groundwater and/or water wells are adversely impacted, the Authority will implement an Adaptive Management and Monitoring Plan (AMMP) (see HWR-MM#4). The AMMP includes provisions for augmenting water supplies for wells and actions to restore affected resources, if necessary. With implementation of HWR-MM#4, the analysis concludes that the impacts to nearby groundwater and groundwater wells would be less than significant.

### 4415-8729

Refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the ANF.

The commenter reiterates concern that the Draft EIR/EIS fails to include all existing wells in Acton and Agua Dulce. The commenter also raises concerns about the potential for physical destruction of private domestic wells due to tunnel construction and requests that appropriate mitigation measures be included to address well replacement services and municipal water line connection services.

Section 3.8, Hydrology and Water Resources, of Final EIR/EIS has been revised to expressly clarify concerns related to private water supply wells. As stated in the Final EIR/EIS, because only limited information is available regarding the location of private wells, there is the potential that tunnel construction could result in the destruction of private water supply wells, including wells that have not been identified, if any wells are located directly in the path of the tunnels. HYD-IAMF#8: Private Well Monitoring and Minimizing Access Disruptions for Private Water Supply Wells Outside of the ANF has been added to the Final EIR/EIS to describe in detail the options that the Authority would consider to address impacts to private water supply wells outside the ANF, including relocating the wells and ensuring similar pumping capacity and water quality in replacement wells. Please refer to Standard Response PB-Response-HYD-3: Impacts of Tunnels on Wells Outside the Angeles National Forest for additional information regarding impacts to wells and correlating mitigation measures and IAMFs. Please also refer to response to comment #8728.

## Response to Submission 4415 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4415-8730

The commenter expresses concern about above ground electrical facilities to be constructed in the communities of Acton and Agua Dulce, and Los Angeles County generally, and references Page 3.8-36 of the Draft EIR/EIS and suggests these lines should be underground.

Please note that the section referenced in the comment (Section 3.8 of the Draft EIR/EIS) relates to construction impacts on surface waterbodies. Construction activities may temporarily impact surface water hydrology, requiring some temporary power lines during construction to be strung from utility poles and located outside of surface water features. Draft EIR/EIS Appendix 2-H Regional and Local Policy Consistency Analysis Page 2.0-H-12 clarifies that for Policy PS/F 6.6, the Authority would relocate utilities in unincorporated Los Angeles County underground where *feasible*, but it is not necessarily feasible, or reasonable, to underground utility lines for construction purposes. Construction work related to electrical power lines will be conducted in coordination with the provider and in accordance with the utility provider's and regulatory agency's permits and approval processes. The proposed 230kV line on the SR14A Alignment, which would run from SCE-Vincent substation to Portal 1A north of Pear Blossom Interchange along the infrastructure corridor of SR14 Freeway, Sierra Highway and Angeles Forest Highway, will be overhead. This new power line will be designed in accordance with California Code of Regulations (CCR) Title 14, Section 1250, "Fire Prevention Standards for Electric Utilities," which specifies utility-related measures for fire prevention, including firebreak clearance standards. According to the CPUC Regulations (Rule 20 Undergrounding Programs Current Proceedings, Electric Tariff Rule 15 for SCE), undergrounding for power lines is not required. Additionally, the CCR does not include any requirements to underground power lines. As such, undergrounding is not required.

For more detail on this issue, and a response to the comment on fire safety associated with above-ground lines, please refer to response to comment # 8408, which responds to another similar comment from Acton Town Council. Please also note that the reliability of above-ground electrical power lines is not an environmental impact and, therefore, is outside the scope of this document.

### 4415-8731

The preferred alignment (SR14A) is exclusively underground through the Acton Area (see Section 8.1.1, Figure 8-1), and therefore, would not create impermeable surfaces. The other alternative alignments that pass near the Acton area will have limited aboveground portions (see Section 8.4.1, Figure 8-2). For the limited aboveground portions of the alternative alignments, permeable materials or impervious surfaces with designed drainage infrastructure to redirect stormwater for local discharge would be implemented. Please also refer to Response to Comment #8720 (of Submission PB-4415) for additional detail on the IAMFs and mitigation, as applicable, proposed to address stormwater impacts associated with the project.

### 4415-8732

The comment asserts that the E1/E2 Build Alternatives would not require footprint in the Acton Valley Groundwater Basin. Earlier, in comment 8727, the commenter recognized that the project would require a utility line in the Acton Valley Groundwater Basin for the E1/E2 Build Alternatives. Because the project footprint includes any direct impacts, even the presence of that utility line means that the E1/E2 Build Alternatives' project footprints would impact the Acton Valley Groundwater Basin.

### 4415-8733

The commenter summarizes their prior comments on the subject of hydrology. Detailed responses have been provided to all comments included in Submission PB-4415.

### 4415-8734

The commenter summarizes their concerns and perceived deficiencies with the Palmdale to Burbank Draft EIR/EIS. Comments are noted and addressed among responses to Submission PB-4415. As detailed in responses to Submission PB-4415, the Draft EIR/EIS is compliant with CEQA and NEPA. Contrary to the comment's assertion, nothing in CEQA or NEPA requires any "guarantee there will be no change in any runoff characteristics . . . ." The IAMFs and mitigation measures identified in the EIR/EIS, including those that implement BMPs and SWPPPs, were determined to be effective in reducing impacts.

**Stakeholder Comments/Issues :**

- 4418-8137 I am writing on behalf of the local environmental justice non-profit Pacoima Beautiful to express deep concern for the potential impacts that the SR14A route would have on Pacoima, Sun Valley, and surrounding communities. I strongly urge the authority to choose an alternate route from Palmdale to Burbank that will not bisect the working class communities of color in Sun Valley and Pacoima. These communities have long been redlined and segregated due to transportation projects that do not take into consideration the health and quality of life of local residents, and this project is no different. The SR14A as a preferred router is a clear environmental injustice, as there are no current plans to bisect more white and affluent communities, while this route specifically runs over low income communities of color. This project will negatively impact residents during construction and operation. The highspeed rail will displace and destroy homes and businesses. This project will significantly increase noise pollution for surrounding communities, and there are not adequate buffers zones to protect local residents from dangerous decibel levels. Moreover, this route does not include a planned stop any where in Pacoima or Sun Valley after it resurfaces, meaning local community members will not be able to have access to use the train. There is no clear benefit for Pacoima and Sun Valley residents if this route were established, only further inequities and disruption for the local community.
- 4418-8138

Attn: Palmdale to Burbank Project Section Draft EIR/EIS Comment December 2, 2022  
 Southern California Regional Office  
 355 S. Grand Avenue, Suite 2050  
 Los Angeles, CA 90071

**Re: Comments to Palmdale to Burbank High Speed Rail Draft Environmental Impact Report/Environmental Impact Statement**

California's High-Speed Rail Authority ("Authority") seeks to build a high-speed rail system ("HSR") connecting Sacramento to San Diego. In 2005, a "Statewide Program Environmental Impact Report/Environmental Impact Statement" was adopted. The Authority released the "Palmdale to Burbank Project Section California High-Speed Rail: Draft Environmental Impact Report/Environmental Impact Statement" on September 2, 2022 ("DEIR/EIS"), for public review and comment under the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). "The Authority proposes to construct, operate, and maintain an electric powered [High Speed Rail] HSR system in California. ...The Palmdale to Burbank Project Section would serve to connect the Bakersfield to Palmdale Project Section to the north and the Burbank to Los Angeles Project Section to the south." (DEIR/EIS, p. i).

The Arroyos & Foothills Conservancy (AFC) is a non-profit organization dedicated to preserving undeveloped areas of the western San Gabriel Valley, and Crescenta Valley, and eastern San Fernando Valley to support long-term wildlife population connectivity. AFC recognizes the need for modern mass transportation in a rapidly changing world. However, the Palmdale to Burbank Draft EIR/EIS document does not adequately document current biological resources within their proposed alternatives impact and buffer footprint, nor does it clearly address impacts to sensitive resources within the alternatives E2 and E2A. Our review of the Draft EIR/EIS identified the following:

- Failure to have consistency in acknowledging Big Tujunga Wash as a wildlife corridor (DEIR/EIS p. 3.7-90; DEIR/EIS, p. 3.7-92).
- Dismissal of wildlife impacts for the San Fernando Valley section of the rail (DEIR/EIS, p. 3.7-92).
- Failure to provide mitigation measures for potential impacts on the Santa Ana Sucker and its designated critical habitat within the Los Angeles River Watershed Recovery Unit (LARW-RU).
- Failure to distinguish the unique impacts of habitat fragmentation on already impacted developed areas (DEIR/EIS p. 3.7-92)

4448-9877

- Inconsistent data on sensitive plant communities found in Big Tujunga Wash that would be impacted by routes E2 and E2A (3.7-47; p. 3.7-90).
- Failure to include the 210 freeway as a wildlife crossing barrier despite its identification in the Wildlife Corridor Assessment Report (WCAR, p. 7-11; DEIR/EIS, p. 3.7-93).
- Insufficient analysis of sound effects on wildlife (DEIR/EIS, p. 3.4-34)
- Failure to provide sufficient information and analysis based on project duration for temporary impacts such as light and noise.

4448-9879

movement and connectivity, citing that due to limited wildlife movement in the area, it would have “few impacts on the already limited wildlife movement localized to urban center” (DEIR/EIS, p. 3.7-92). As we outline below, alternative routes E2 and E2A will disrupt functional connectivity to an important remnant open space critical providing habitat and water resources to wildlife.

4448-9878

AFC recommends removing alternative routes E2 and E2A as options for the Palmdale to Burbank Project Section of the California HSR. The DEIR reflects insufficient data has been collected regarding wildlife and biodiversity within the 1000-foot buffer zone (area of impact) designated in the San Fernando Valley for these routes. Effects on wildlife connectivity in Big Tujunga Wash would significantly worsen the already fragmented connectivity that is critical to facilitate gene flow between populations of native animals and plants. Suitably safe corridors provide wildlife with a means to adapt in the face of climate change.

Qualifications of contributing advisors and AFC staff are outlined below. All contributing advisors and staff have experience in the ecology and natural history of Southern California.

The following comments are based on facts established in part by the DEIR/EIS, supplemental documents released by the Authority, published peer-reviewed scientific literature, and government agency reports.

4448-9880

The expansion of the Santa Monica Mountains National Recreation Area, also entitled the Rim of the Valley Corridor, is a network of parks, trails, and open spaces connecting the mountains surrounding the San Fernando, La Crescenta, Santa Clarita, Simi, and Conejo Valleys (National Park Service, 2016). The inclusion of Tujunga Valley/Hansen Dam, among other sites, in the Santa Monica Mountains National Recreation Area by virtue of the recommended boundary adjustment currently pending before Congress, emphasizes the importance of protecting regional wildlife corridors (National Park Service, 2016). The Authority acknowledges in the DEIR/EIS that the Tujunga Valley/Hansen Dam Spreading Grounds is a Significant Ecological Area (SEA).

The Tujunga Valley/Hansen Dam SEA is an important wildlife corridor used by migratory birds (DEIR/EIS, p. 3.7-184) and designated critical habitat for the southwestern willow flycatcher (*Empidonax traillii extimus*) (DEIR/EIS, p. 3.7-86). In the Biological Resources and Aquatic Technical Report for the Palmdale to Burbank Section, provided to the public as a supplementary document to the DEIR/EIS, the least Bell’s vireo (*Vireo bellii pusillus*) is also noted as having a high potential to occur in the area where E2 crosses Big Tujunga Wash (BARTR, p. 6-42). The Authority describes that there could be indirect effects to riparian habitat providing nesting and foraging habitat for special special-status birds in the E2 Alternative due to potential changes in hydrology patterns (BARTR Technical Report, p. 7-7). Bobcats, a species sensitive to habitat fragmentation and urbanization (Crooks, 2002; Possel et al., 2014) have also been observed to occupy Hansen Dam (Figure 2). The DEIR/EIS and accompanying Wildlife Corridor Assessment do not complete a sufficient assessment of Big Tujunga Wash and its significance as an area for wildlife passage. Build alternatives E2 and E2A would have significant negative impacts on the quality of habitat and the functionality of Big Tujunga Wash as a wildlife corridor. Despite the Authority’s acknowledgement of these significant impacts in the DEIR/EIS (p.3.7-134), build alternatives E2 and E2A have not yet been eliminated.

4448-9879

**Alternative Routes E2 and E2A Extend Through Critical Wildlife Passage Area:** The alternative routes identified as E2 and E2A travel through an area critical to wildlife passage between the San Gabriel Mountains and the Verdugo Mountains as identified in (i) the Greater Los Angeles County Open Space for Habitat and Recreation Plan (2012), (ii) the Los Angeles County General Plan where it is identified as a Significant Ecological Area (2015), namely the Tujunga/Hansen Dam Significant Ecological Area, (iii) the eastern edge of the Rim of the Valley Corridor (2015), and (iv) the Climate Resilient Connectivity for the South Coast Ecoregion of California (2019)<sup>1</sup>.

Big Tujunga Wash is the last remaining intact low elevation riparian zone in Los Angeles County that continues to exhibit hydrological and biological processes typical of coastal southern California. The Authority does not acknowledge Big Tujunga Wash as a terrestrial wildlife movement corridor in the DEIR/EIS section describing wildlife

4448-9881

Big Tujunga Wash, connecting down from the San Gabriel Mountains to Hansen Dam, hosts critical riparian/wetland habitat. This area has been identified as critical habitat for the Santa Ana Sucker, a species assigned threatened status by the United States Fish and Wildlife Service (USFWS, 2000). The areas of Big Tujunga Wash where Santa Ana Suckers are still found make up a full 25% of the Santa Ana Sucker’s remaining occupied native range (USFWS, 2000). Additionally, Hansen Reach – the area of Big Tujunga Creek between Big Tujunga Dam and Hansen Dam, including connecting

4448-9881 | tributaries - is part of the Los Angeles River Watershed Recovery Unit (LARW-RU) in the most recent recovery plan (USFWS, 2017). Effects on special-status fish, identified by the Authority, include altered water quality from contaminants, sedimentation, oxygen depletion, and even death from vibrations caused by construction (DEIR/EIS p. 3.7-137). The Authority does not identify a mitigation measure specific to the Santa Ana Sucker or its RU, despite its federally threatened status. Additionally, proposed mitigation of the significant negative impacts the HSR would have on the Santa Ana Sucker's habitat by land acquisition or wetland restoration elsewhere would not be sufficient because "to have sufficient levels of resiliency, redundancy, and representation for recovery, the Santa Ana sucker must comprise healthy, viable populations within each of the three RUs" (USFWS, 2017). In the last five-year review of the species, USFWS stated that "threats have not been abated and have continued to increase, thereby making the Santa Ana sucker more vulnerable to extinction" (USFWS, 2011).

4448-9882 | The Authority includes a note that the final bridge designs were not available at the time of the analysis included in the DEIR/EIS (p. 3.7-137). The construction plans for the bridge crossing over Big Tujunga Wash will be an extremely important factor in assessing the true impact construction will have on the habitat and its associated species. In the absence of drafted bridge designs, Impact BIO#13: Project Effects on Wildlife Movement Corridors, identifies that for elevated (viaduct) sections, temporary laydown areas and roads would be constructed for access and hauling material to the viaduct area (DEIR/EIS p. 3.7-188). The DEIR/EIS does not identify impacts to hydrology, water quality, habitat, and wildlife that could be caused by temporary and/or permanent infrastructure, such as laydown yards and maintenance facilities, in Big Tujunga Wash.

4448-9883 | **Inconsistency Regarding Tujunga Valley/Hansen Dam SEA Makeup:** Inconsistencies in the identification of habitat types in the DEIR/EIS are unacceptable, particularly regarding rare plant communities. The Tujunga Valley/Hansen Dam SEA contains alluvial sage scrub/scale broom scrub, which is a rare and Sensitive Natural Community (CDFW, 2022). The Authority notes this in their description of the Tujunga Valley/Hansen Dam SEA (p. 3.7-90) but does not identify this plant community in the maps or tables demonstrating the vegetation types identified along the footprint of the proposed HSR routes (DEIR/EIS, p. 3.7-33-38; p. 3.7-47).

4448-9884 | **Severe Noise Impacts:** In the DEIR/EIS, the Authority identifies build alternative E2 as having the highest number of severe sound impacts of all the build alternatives (DEIR/EIS, p. 3.4-146). It is well established that anthropogenic sound has effects on many different types of wildlife. Exposure to elevated environmental noise can have critical negative biological effects on wildlife, including negative impacts to gene expression, cell structure and signaling, physiological systems, and behavioral and

4448-9884 | community ecology (Knight and Swaddle 2011). The Authority also states that "increased noise levels and human presence may influence local shifts in populations, and noise and vibration associated with construction activities could disrupt individuals and may impair normal life cycle behaviors" (DEIR/EIS, p. 3.7-11). For species such as big brown bats (*Eptesicus fuscus*) and barn owls (*Tyto alba*) who use sound to identify, stalk and capture prey, anthropogenic noise could disrupt their ability to hunt (Barber and Crooks 2010). Construction and potentially operation of build alternatives E2 and E2A will increase anthropogenic noise in an area of critical habitat already significantly impacted by anthropogenic noise from the I-210 freeway.

4448-9885 | The Authority acknowledges that "One of the most apparent [impacts from noise] is the potential for communication masking. Wild animals depend on calls and song for species identification, mate attraction, and territorial defense" (DEIR/EIS, p. 3.4-34). The Authority includes studies recognizing that continuous noise levels above 60 dBA  $L_{eq}$  can affect habitat suitability for bird species (DEIR/EIS p. 3.4-34). The threshold for significance is identified as an impact that would "generate temporary increase in ambient noise levels in the vicinity of the project in excess of the FRA/FTA and FHWA standards for severe noise impacts" and "generate temporary or permanent increase in ground-borne vibration or ground-borne noise levels exceeding FRA/FTA standards" (DEIR/EIS p. 3.4-36) during construction. A 100 dB sound exposure level ("SEL") is established "for all domestic and wild birds and mammals as an effective criterion for determining impacts of a train pass-by" (DEIR/EIS, p. 3.4-34). However, "the 100 dBA SEL impact threshold has no basis in science and will radically underestimate the noise, vibration, and startle impacts from the proposed project" (Land Protection Partners, 2014). Additionally, the Authority appears to assume that all birds and mammals experience equal sensitivity to noise and vibration, which may result in inaccurate measurement of impact on these groups.

4448-9886 | As pointed out in section 3.4, the "Implementation of Mitigation Measure N&V-MM#3 could reduce noise, [though] it is unlikely it would fully mitigate impacts. This represents a significant and unavoidable impact for the Refined SR14, SR14A, E1, E1A, E2, and E2A Build Alternatives" (DEIR/EIS, p. 3.4-70). As discussed above, unmitigated noise has been shown to have chronic effects on wildlife beyond startle effects (Forman & Deblinger 2000; Peris & Pescador 2004; Reijnen & Foppen 1994; Reijnen et al. 1996; Reijnen et al. 1997). This is a critical wildlife passage area where development impediments have created a funnel, severely limiting the ability of wildlife to go back and forth between the San Gabriel mountains and the Verdugo mountains. A negative impact in this area would be amplified by the development pressures already existent.

4448-9887 | The Authority proposes to mitigate the expected noise impacts by installing noise barriers for certain sections of the HSR. However, such barriers are not effective for

4448-9887 | the greater area of impact (Mital and Ramakrishnan, 1997). This is not sufficient for the amount of noise this project will generate. As previously established, environmental noise and vibrations are critical to the development and behaviors of many species (Hill 2001). Though sound walls may reduce levels by a maximum of 11 dBA, this reduction may be of little significance to the net noise generated by the project during both construction and operation. This is acknowledged by the Authority throughout the Noise and Vibration section of the DEIR/EIS as non-mitigatable. Additionally, use of sound barriers may result in an additional loss of connectivity, adding an extra barrier for wildlife to move around and thereby having adverse effects.

4448-9888 | In build alternative E2, the train will run through Hansen Dam Recreation Area. Species may lose the functional connectivity provided by Big Tujunga Wash due to being driven away by the increased anthropogenic noise or startle effects from the elevated train. Despite build alternative E2 being a proposed aerial route, ground-borne vibration may still result. The Authority identifies that the “E2 and E2A Build Alternatives [have] the most noise impacts on sensitive receivers (141/168 moderate and 164/102 severe, respectively)” (DEIR/EIS, p. 3.4-148). Because the Authority will not be able to fully mitigate noise and vibration impacts of the HSR and moderate to severe noise impacts are expected to occur on either side of the HSR section crossing over Big Tujunga Wash (DEIR/EIS, p. 3.4-103), we believe that build alternatives E2 and E2A would have a severe negative effect on the species utilizing the Big Tujunga Wash area. It is imperative that the Authority not move forward with a build option that puts numerous already-threatened species at undue risk and further reduce the connectivity of urban habitat fragments.

4448-9889 | **Artificial Light Impacts:** Another significant anthropogenic factor affecting wildlife is artificial light at night (ALAN). ALAN has adverse impacts on wildlife (Longcore and Rich, 2006), disrupting the natural cycles influenced by day and night and has been shown to have effects ranging from disruption of gene regulation (Touzot et al., 2021) to impacts on predator-prey interactions (Gomes, 2020; Ditmer et. al., 2020). ALAN can also decrease functional connectivity for certain species, such as bats (Laforge et. al. 2019), impeding wildlife movement (Beier, 1995; Beier, 2006).

The Palmdale to Burbank Wildlife Corridor Assessment Report, provided to the public as a supplementary document to the DEIR/EIS, identifies that wildlife are avoidant of artificially lit areas and that artificially lit areas can impact species behaviors (WCAR, p. 7.1). Mitigation measures proposed in the DEIR/EIS for light impacts during construction include avoiding nightwork, shielding and directing lighting, minimizing vehicle headlights, and using remote sensing to ensure construction site security during construction (DEIR/EIS, p.3.7-24). Despite construction being temporary, the duration of construction, and therefore the lighting used during construction, is not

4448-9889 | included in the assessment for impacts of ALAN on wildlife. Mitigation measures proposed in the Draft EIR/EIS for ALAN during operation of the HSR include shielding or other methods to direct light downward and use of remote monitoring systems to ensure site security when the site is not in use (p. 3.7-25). These measures are not sufficient, as the presence of light itself has been shown to have adverse effects on wildlife (Beier 1995; Beier 2006). Regarding proposed routes E2 and E2A, introducing a significant construction project that results in temporary and potentially permanent ALAN impacts will significantly hinder the usefulness of the critical wildlife corridor to wildlife traveling along that route.

4448-9890 | **Wildlife Crossings:** An important aspect of the Authority’s identified mitigation measures is the establishment of wildlife crossings. However, wildlife crossings are specified to be installed specifically in places where fenced infrastructure would impede wildlife movement (DEIR/EIS, p. 3.7-22). As such, when determining where to locate wildlife crossings, we urge the Authority to take into consideration locations beyond those where wildlife movement is impeded by the HSR project, toward a more proactive improvement in wildlife mobility, as well as addressing the other above-mentioned factors impacting connectivity and reducing wildlife movement (i.e., noise and ALAN impacts).

4448-9891 | BIO-MM #37 (Minimize Effects on Wildlife Movement Corridors During Construction) notes that during construction the Authority will avoid fencing, ground disturbing activities (particularly at night), and shield night lighting from illuminating wildlife corridors. The specification that night lighting be shielded to avoid light “spilling” onto wildlife corridors is insufficient to mitigate impacts on wildlife usage (Land Protection Partners, 2014). Multiple research studies have shown that the existence of lighting itself influences wildlife movement (Beier 1995; Beier 2006).

4448-9892 | Should the Authority proceed with build alternative E2 or E2A, a wildlife corridor analysis of Big Tujunga Wash should be completed. While the HSR crossing over Big Tujunga Wash is planned as an elevated section, the impacts on habitat from construction, increased noise levels, ALAN, and possible other effects such as vibration, will result in a loss of the functionality of the Big Tujunga Wash as a wildlife corridor.

4448-9893 | **CDFW Eastern Rim of the Valley Conceptual Area Protection Plan:** CDFW adopted its Eastern Rim of the Valley Conceptual Area Protection Plan (EROV CAPP) in 2017. The EROV CAPP identified a wildlife corridor running from Hahamongna Watershed Park in Pasadena, down the Arroyo Seco, into and across the San Rafael Hills, and cross developed land through the Verdugo Mountains to Hansen Dam and Big Tujunga Wash. CDFW uses the EROV CAPP in assessing conservation opportunities, particularly land acquisition that facilitates wildlife movement, within that area, namely a 20-mile

4448-9893

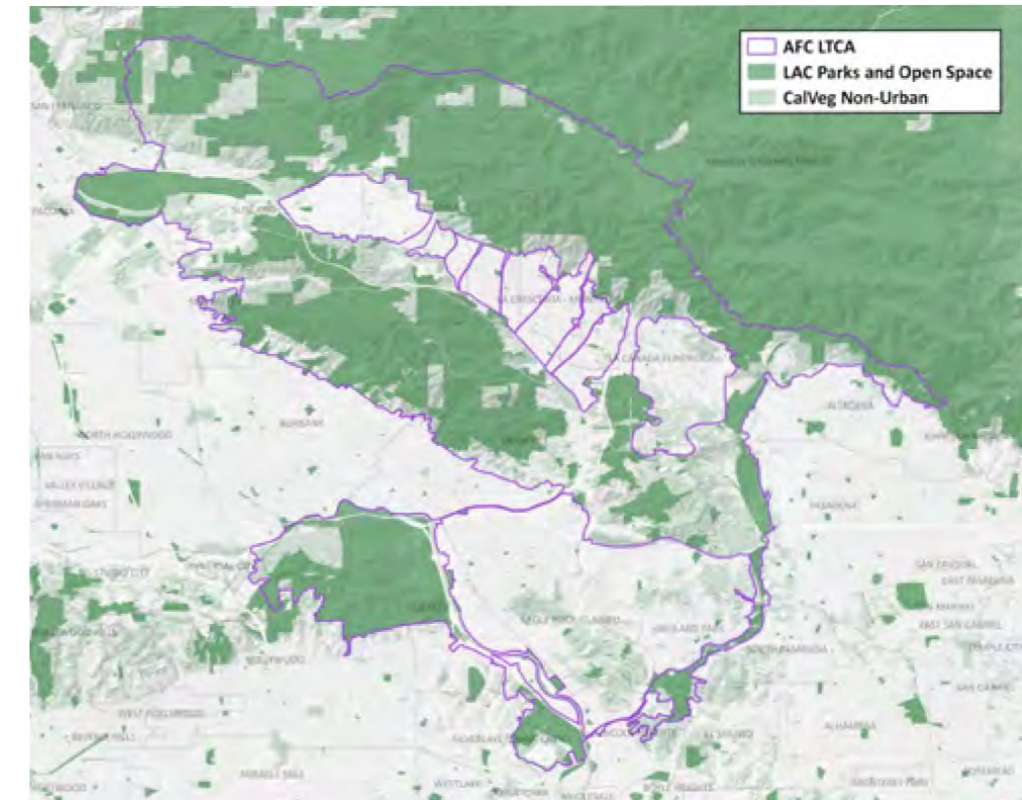

wildlife corridor that includes the above-ground portion of Alternatives E2 and E2A in the San Fernando Valley.

4448-9893

**Figure 1.** Map of the Eastern Rim of the Valley Conceptual Area Protection Plan (EROV CAPP) (maroon outline). Existing Conservation Investments (green). Rim of the Valley Corridor (light blue outline). Designated critical habitat (dark blue outline). Significant Ecological Areas (yellow striped). Choke points (dark blue arrows). Local bridges (black dots) and state bridges (yellow dots).

**AFC Data:** The Arroyos & Foothills Conservancy's (AFC) regional area of interest (its Long-Term Conservation Area (LTCA) is outlined in Figure 2 (Zellmer and Goto, 2022). AFC designated, within the LTCA, areas that are critical for wildlife passage between preserved open spaces (Critical Wildlife Passage Areas, or CWPAs; Figure 2). They are high priority areas for urban wildlife conservation. AFC identified the CWPAs based on remotely sensed camera data, expert opinion, on-the-ground investigation, an GIS mapping (Zellmer and Goto, 2022). CWPAs, including the Shadow Hills CWPA described below, were identified without regard to the HSR.

**Figure 2.** Map of the Arroyos & Foothills Conservancy's Long-Term Conservation Area (AFC LTCA) (outlined in purple) in the greater Los Angeles area. Existing public parks and open space (LA County) are dark green. Privately owned open space is (light green (CalVeg).

The Shadow Hills CWPA (Figure 3) includes areas of Big Tujunga Wash and Hansen Dam. Routes E2 and E2A and the Shadow Hills CWPA overlap. The Shadow Hills CWPA stretches from the section of Big Tujunga Wash over which Routes E2 and E2A would cross to the last remaining open space of land on the south side of Wentworth St. Development, and an HSR line with exclusionary fencing, would create a barrier for this important area passage for wildlife moving between the San Gabriel and Verdugo Mountains.

4448-9893

**Figure 3.** Map of the Arroyos & Foothills Conservancy's Critical Wildlife Passage Areas (CWPA, orange) within its designated Long Term Conservation Area (LTCA, purple).

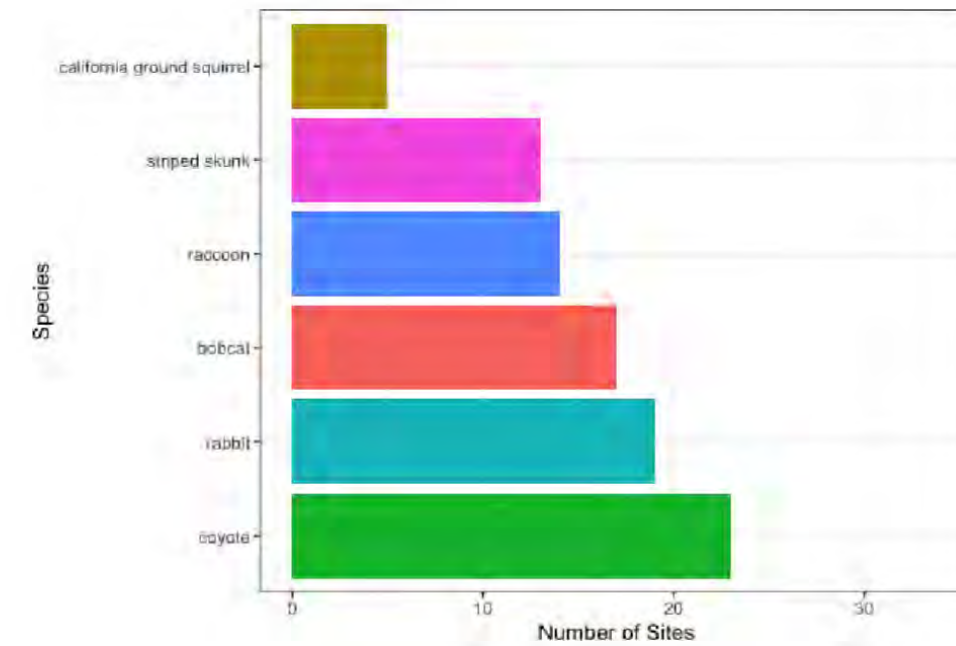

AFC conducted a baseline biological survey at Hansen Dam, in partnership with the U.S. Geologic Survey, to collect data on terrestrial mammal diversity. We found a healthy diversity of native mammals (Figure 4) that provide important data regarding wildlife usage in this area. Species sensitive to habitat fragmentation, such as bobcats (Crooks, 2002; Possel et al., 2014), were found throughout the area, demonstrating the good quality of habitat available to wildlife. Wildlife data for mammal species were not included in the DEIR/EIS for the Tujunga Valley/Hansen Dam SEA even though construction and operations for routes E2 and E2A would have direct impact on this area.

Community science data from eBird also demonstrates the importance of the Big Tujunga Wash/Hansen Dam area as a bird hotspot. This data source identifies 287 different species. This data is available for use at <https://ebird.org/hotspot/L732299?yr=all&m=&rank=mrec>.

4448-9893

**Figure 4.** Number of camera sites at which each detected species was identified at Hansen Dam during the deployment of wildlife cameras between December 2020 and March 2021.

**Conclusion:** AFC concludes that build alternatives E2 and E2A pose a significant threat to the connectivity of urban habitat areas already impacted by fragmentation and development. The functionality of Big Tujunga Wash is ignored as an area of critical wildlife passage and should be incorporated into the DEIR/EIS. Additionally, while the Mitigation Measures and Biological Impact Avoidance and Minimization Features proposed in the DEIR/EIS attempt to address mitigation of these negative impacts, they are insufficient. Further survey efforts must be employed to gather sufficient data on the area of impact for the San Fernando Valley, which must not be dismissed as simply an urban area where wildlife will not be impacted by further development projects.

Build alternatives E2 and E2A must be viewed contextually. Development over the years has deprived wildlife of passage, including between the Verdugo Mountains and the San Gabriel Mountains. Much work is required to secure and enhance habitat to reestablish wildlife passage. That is the point of recreating and securing wildlife corridors. The Verdugo Mountains are a biological island. Connections to the San Gabriel Mountains must be both created and enhanced. The best opportunity for wildlife is Big Tujunga Wash, with ample opportunity to move under the 210 Freeway. This project creates multiple obstacles on top of those already faced to reestablish safe, secure, and inviting passage for all manner of wildlife and plants. Accordingly, E2 and E2A are highly inadvisable, biologically and ecologically.

## Qualifications

Contributions to these comments were made by Mickey Long, Thomas Juhasz, and Auxenia Grace Privett-Mendoza.

Mickey Long and Thomas Juhasz are biological resource advisors for the Arroyos & Foothills Conservancy. Mickey Long retired in 2010 from his position as natural areas administrator for the Los Angeles County Department of Parks and Recreation, having spent 39 years working in the county's Natural Areas Division. As administrator, Long operated the Eaton Canyon Nature Center in Altadena, along with 18 other natural areas. He graduated from CSULA with a B.A. in Zoology. Long has taught environmental biology and human ecology courses at Art Center College of Design, and currently teaches bird identification, botany and ecology classes for LA county's nature centers. Long served fourteen years on L.A. County's Significant Ecological Areas Tech. Advisory Committee, many years on the Conservation & Rare Plant Committees for the San Gabriel Mountains Chapter of the California Native Plant Society, was past president of the Pasadena Audubon Society, and is currently a Biological Advisor for the Arroyos & Foothills Conservancy. He has published articles in peer-reviewed journals on the topics of herpetology, ornithology and botany.

Thomas Juhasz is an aquatic veterinarian who has worked as an endangered species biologist in the western US, the Pacific, and Caribbean. During his time as an endangered species biologist, he worked for AECOM International and Intercontinental Applied Ecology. Juhasz graduated from USC with a BLARC in Landscape Architecture, holds an M.S. in Environmental Science from the University of Manchester, and a D.V.M. from the University of Veterinary Medicine, Budapest. He has co-authored scientific papers in reputable peer-reviewed journals such as *Journal of Fish Biology* as well as those published at scientific conferences such as the Optical Fiber Communication Conference. Auxenia Grace Privett-Mendoza is the Field Administrator for the Arroyos & Foothills Conservancy. She graduated from Smith College with a B.A. in Biological Science. She oversees AFC's urban wildlife research partnership with Occidental College's Computational Biology Lab. She has co-authored a paper published in top peer-reviewed journal PLOS One (Smith et. al., 2021).

John Howell is the Executive Director and General Counsel for the Arroyos & Foothills Conservancy. Prior to this he practiced real estate law for 33 years.

## Response to Submission 4448 (Auxenia Privett-Mendoza, Arroyos & Foothills Conservancy, December 1, 2022)

### 4448-9877

The commenter expresses concerns that the Draft EIR/EIS does not adequately document the current biological resources and does not address the impact on sensitive resources within alternatives E2 and E2A. The commenter expresses concern that wildlife impacts in the San Fernando Valley are dismissed, and Big Tujunga Wash is not consistently acknowledged as a wildlife corridor. The Tujunga Valley/Hansen Dam Significant Ecological Area is identified as a wildlife corridor on pg. 3.7-90, shown in Figure 3.7-36, and reiterates the importance of the SEAs and other conservation lands. The WCA identifies the Big Tujunga Wash as a designated TNC Priority Area and LA County SEA, Critical Habitats for Santa Ana River sucker and southwest willow flycatcher, with natural qualities for wildlife movement. Alternatives E2 and E2A include a 0.82-mile-long elevated viaduct that spans the Big Tujunga Wash and Hansen Dam open space area. There are substantial existing constraints to wildlife connectivity in the San Fernando Valley where the Palmdale to Burbank Project Section would result in marginal effects on the already limited wildlife movement corridors. For this reason, the EIR/EIS analysis focuses on the non-urban areas between Palmdale and the San Fernando Valley because of existing constraints, such as the 210 freeway. As such, the 210 freeway is not explicitly called out as a barrier to wildlife movement in the Draft EIR/EIS. However, the WCA identifies the I-210 freeway as a barrier to wildlife. The EIR/EIS in Impact BIO #11 evaluates the project's effects on significant ecological areas and specifically identifies the impacts of the E2 and E2A alternatives on the Big Tujunga Wash area as being significant requiring mitigation which is also included (BIO-MM#6, BIO-MM#47, BIO-MM#50 and BIO-MM#53). The EIR/EIS also evaluates project impacts on Santa Ana Sucker under Impact BIO#4 and finds the impact would be significant requiring mitigation which is also included (BIO-MM#6, BIO-MM#32-#34, BIO-MM#46 and #47, BIO-MM#50, #53 and #55), which would reduce the impact to less-than-significant. These analyses take into consideration the length of construction, which would not be 7 years in the area of Big Tujunga Wash. As noted in Table 2-35 the duration for construction of aerial structures such as the viaduct across Big Tujunga Wash that would be associated with either the E2 or E2A alternative would take a maximum of 43 months (less than 4 years). This duration and the effects of noise and light were considered and contributed to the Authority's analysis and conclusion that the impact of the E2/E2A alternatives would be significant on the Big Tujunga Wash ecological area as well as species present such as the Santa Ana Sucker, and why extensive mitigation measures were included to mitigate these impacts. Some of the

### 4448-9877

issues identified by the commenter such as the impacts of the E2/E2A alternatives on Big Tujunga Wash contributed to the Authority's decision to select the SR14A alternatives as its preferred alternative.

### 4448-9878

The commenter requests the E2 and E2A alternative be removed. The Authority's preferred alternative is the SR14A alternative, which would avoid crossing Big Tujunga Wash. Notwithstanding this, the Alternatives E2 and E2A would span over the Big Tujunga Wash on a viaduct, allowing wildlife able to traverse underneath the project alignment. The project would not significantly affect wildlife connectivity in Big Tujunga Wash.

### 4448-9879

The commenter provides information as to wildlife movement and biological sensitivity of areas along the E2 and E2A alternative alignment between the Angeles National Forest and the Verdugo Mountain (Big Tujunga Wash). The Authority's preferred alternative is the SR14A alternative, which would avoid crossing Big Tujunga Wash and the areas of concern noted in the comment. Notwithstanding this, the Alternatives E2 and E2A would span over the Big Tujunga Wash on a viaduct, allowing wildlife to traverse underneath the project alignment. The project would not significantly affect wildlife movement between the San Gabriel Mountains and the Verdugo Mountains.

## Response to Submission 4448 (Auxenia Privett-Mendoza, Arroyos & Foothills Conservancy, December 1, 2022) - Continued

### 4448-9880

The commenter notes the importance of the Tujunga Valley/Hansen Dam SEA as a migratory corridor. The commenter states that the WCA and Draft EIR/EIS do not sufficiently assess the Big Tujunga Wash as an area for wildlife passage due to the impacts from the E2 and E2A Build Alternative. The Authority disagrees with the commenter and describes the importance of Tujunga Valley/Hansen Dam SEA to migrating birds on the Pacific Flyway and rare alluvial habitat within the region (Draft EIR/EIS Section 3.7.5, page 3.7-89). In this same section the Authority describes Big Tujunga Wash as habitat for least Bell's vireo and Swainson's hawk (page 3.7-59). In Table 3.7-9, the Authority describes Big Tujunga Wash as critical habitat for southwestern willow flycatcher and Santa Ana sucker. Impact BIO#3 includes acreage of direct effects to species from E2 and E2A (Table 3.7-15) and a discussion of direct and indirect effects from this alternative. This analysis includes the description of indirect effects during the construction period, which includes permanent or temporary displacement of bird species to avoid disturbance (e.g., noise, vibration, visual stimuli); such displacement would also result from fragmentation of the landscape caused by construction of project components (e.g., security fences, elevated structures, railbeds, and associated facilities). Indirect effects include interference with the daily movement, foraging, and dispersal of resident and migratory bird species. The Authority also describes in this section (page 3.7-128) that the implementation of BIO-IAMF#1, BIO-IAMF#2, BIO-IAMF#3, and BIO-IAMF#5 through BIO-IAMF#11 would reduce potential impacts to species within Big Tujunga Wash. The WCA identifies the Big Tujunga Wash as a designated TNC Priority Area and LA County SEA, Critical Habitats for Santa Ana River sucker and southwest willow flycatcher, with natural qualities for wildlife movement. Alternatives E2 and E2A include a 0.82-mile long elevated viaduct that spans the Big Tujunga Wash and Hansen Dam area. The WCA identifies the I-210 freeway as a barrier to wildlife. Potential impacts to biological resources in the San Fernando Valley are discussed and evaluated in the EIR/EIS including impacts to Santa Ana Sucker and biological resources in the Big Tujunga wash area. The EIR/EIS identifies several mitigation measures to reduce impacts to this species (BIO-MM#6, BIO-MM#47, BIO-MM#50, and BIO-MM#53). Alternatives E2 and E2A were not identified by the Authority as the Preferred Alternative.

### 4448-9881

The commenter expressed concern that there was not a mitigation measure specific to Santa Ana Sucker or its Recovery Unit. However, the commenter also stated that proposed mitigation for impacts to Santa Ana Sucker habitat is insufficient given recovery plan objectives. Information on designated critical habitat and conservation areas within the Palmdale to Burbank Project Section was compiled using Geographic information system layers from the USFWS Ventura and Carlsbad field offices (Authority, 2019a). The E2 Build Alternative alignment would traverse 0.26 mile of designated Santa Ana sucker critical habitat on viaduct within Big Tujunga Wash. Construction of the viaduct would require the permanent removal of 8.4 acres of designated critical habitat for the Santa Ana sucker. Areas where the in-stream aquatic habitat is covered by riparian vegetation make up the physical and biological features essential to the biotic viability of designated habitat for the Santa Ana sucker because these areas can provide thermal refuge and in-stream habitat structure. Construction of the E2 Build Alternative has the potential to result in the removal of riparian vegetation that make up the physical and biological features essential to Santa Ana sucker. Implementation of Bio-MM#6, BIO-MM#47, Bio-MM#50, and BIO-MM#53 would provide avoidance, minimization, and compensatory mitigation for the impact such that it would no longer be a substantial adverse effect on designated critical habitat. Further, additional avoidance, minimization, and mitigation measures for Santa Ana Sucker and critical habitat would be further refined and developed in coordination with the USFWS as part of the formal Section 7 consultation process. It should also be noted that the Authority's Preferred Alternative, SR14A, would avoid impacts to Santa Ana Sucker at Big Tujunga Wash.

## Response to Submission 4448 (Auxenia Privett-Mendoza, Arroyos & Foothills Conservancy, December 1, 2022) - Continued

### **4448-9882**

The commenter is concerned about potential impacts to the hydrology, water quality, habitat, and wildlife in Big Tujunga wash from temporary or permanent infrastructure associated with the E2 and E2A Build Alternatives, such as laydown yards and maintenance facilities that are not identified in the Draft EIR/EIS. There are no proposed placements of laydown yards or maintenance facilities within Big Tujunga Wash. The methods for identifying impacts are discussed in Sections 3.1.4.4 and 3.7.4.3, as well as in the discussion of each impact in Section 3.7.6.3, including but not limited to Impact BIO#2 (Project Construction Effects on Special-Status Amphibian Habitat), Impact BIO#3 (Project Construction Effects on Special-Status Bird Habitat), and Impact BIO#4 (Project Construction Effects on Special-Status Fish Habitat). The hydrological impacts of the Build Alternatives are evaluated in Section 3.8 (Hydrology and Water Resources). BIO-IAMF#5 requires that all sensitive areas be identified on the construction plans and other measures address avoidance of impacts to sensitive biological resources. BIO-IAMF#8 requires that staging areas and traffic routes be delineated prior to any ground disturbance to minimize effects to sensitive biological resources. Additionally, the mitigation measures included in Section 3.7.7 provide further avoidance, minimization, and compensatory mitigation requirements for all project work, including any work in or around Big Tujunga Wash.

As described in Chapter 8, Preferred Alternative, of this Final EIR/EIS, the Authority has identified the SR14A Build Alternative as the Preferred Alternative for the Palmdale to Burbank Project Section, which would avoid effects on wildlife movement corridors in Big Tujunga Wash.

### **4448-9883**

The commenter expressed concern about "alluvial sage scrub/scalebroom scrub" being present in Tujunga Valley/Hansen Dam SEA and a sensitive natural community, but not being specifically identified on maps or in tables. Coastal Scrub and Desert Wash are defined in the Tujunga Valley/Hansen Dam SEA area on Figure 3.7-13. Coastal Scrub is an alternative name for "alluvial sage scrub" and Desert Wash is alternative name for "scalebroom scrub" which are described in Table 3.7-4 on p 3.7-35 to include the Big Tujunga Wash crossing. The name "alluvial sage scrub/scalebroom scrub" is not a vegetation community defined by A Manual of California Vegetation (Sawyer et al. 2009) or California Wildlife Habitat Relationship (CWHR) system which were used as sources for defining the vegetation communities and landcover types. Scalebroom scrub is an associated CWHR vegetation community with Desert Wash, and is defined as a special-status plant community in Table 3.7-6 and 3.7-10 and potential impacts are discussed under Impact BIO#1.

### **4448-9884**

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter expresses concern over the effects of noise on wildlife. The EIR/EIS utilizes noise impact thresholds established by the Federal Railroad Administration for effects on animals. To further address potential noise effects, the EIR/EIS cites NV-IAMF#1, which provides guidelines for minimizing construction noise and vibration. Also, please refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which discusses this topic further.

## Response to Submission 4448 (Auxenia Privett-Mendoza, Arroyos & Foothills Conservancy, December 1, 2022) - Continued

### 4448-9885

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter asserts, based on citations from Section 3.4 of the Draft EIR/EIS, that the Authority appears to assume that all birds and mammals experience equal sensitivity to noise and vibration, which may result in inaccurate measurement of impact on these groups.

As discussed under Impact BIO#14 in the Draft EIR/EIS, wildlife responses to noise are species dependent and would depend on the timing, intensity, and frequency of the sound, as well as the species' tolerance to noise. Each animal's response to noise and thresholds are unique enough that noise standards cannot be established. When these species are in proximity of the 100 dBA sound exposure level contour identified in Section 3.4, Noise and Vibration, their ability to communicate may be affected by noise and vibration generated by the at-grade portions of the Build Alternatives.

Impact BIO#14 of the Draft EIR/EIS further acknowledges that the noise exposure limit of sound exposure level of 100 dBA for wildlife would be limited to locations within 40 to 50 feet of the aboveground alignment centerline, which is typically within the fenced right-of-way. Such fencing would preclude wildlife from approaching the alignment at a proximity of 40 to 50 feet. However, as discussed under Impact BIO#14, a train would take approximately 2 seconds to pass any given point, and it is expected that such short periods of time would not affect animal species' communications with the exception of special-status birds as discussed further below.

The effect of operational noise on birds depends on the interaction of existing noise conditions relative to the published thresholds for noise impacts. At the noise levels that would be generated outside the fence line, masking is the primary impact on birds. Masking occurs when new noise sources make bird calls inaudible due to the greater volume of the new sound. Dooling and Popper identify the conservative threshold of 60 A-weighted decibels for masking effects (Dooling and Popper 2007). This threshold must be considered relative to existing conditions, such as existing ambient noise sources. For example, on the Burbank to Los Angeles Project Section, the USFWS noted that for least Bell's vireo that are habituated to existing conditions of 63-73 A-

### 4448-9885

weighted decibels of ambient noise, an increase due to train operations, of 67-77 A-weighted decibels is not likely to adversely affect the species (USFWS 2021a). Because the area of operational impact has some ambient noise but is generally not subject to high levels of ambient noise, the conservative threshold of 65 A-weighted decibels is used for this analysis.

The Authority modeled habitat for FESA-listed special-status bird species that would be subject to noise in excess of 65 dBA (this excludes areas within the fenced right-of-way that would already be replaced with facilities and areas where noise levels generated by existing transportation facilities already exceed 65 dBA). As shown in Table 3.7-31 of the Draft EIR/EIS, three special-status bird species were identified as having suitable habitat within the noise exposure limit of sound exposure level of 100 A-weighted decibels: Coastal California gnatcatcher, Least Bell's vireo, and Southwestern willow flycatcher. Where noise levels would exceed 65 dBA outside of the fenced HSR right-of-way and outside of areas where noise levels currently exceed 65 dBA, the Authority will implement BIO-MM#101, which involves the development of sound barriers to minimize or avoid noise impacts in locations with special-status bird habitat.

Related to vibration impacts, Impact BIO#14 concludes that vibration from train passage has a low potential to affect wildlife movement because the duration of vibration would be brief (up to 3 seconds) for each train passing or because train passages would occur primarily during the day, while most activity by vulnerable wildlife receptors is nocturnal.

## Response to Submission 4448 (Auxenia Privett-Mendoza, Arroyos & Foothills Conservancy, December 1, 2022) - Continued

### 4448-9886

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter raises concerns about unmitigated noise impacts on wildlife movement between the San Gabriel Mountains and the Verdugo Mountains. The commenter references text from Impact N&V#4: Operational Traffic Noise Impacts on Sensitive Receivers and incorrectly ties N&V-MM#3: Implement California High-Speed Rail Project Noise Mitigation Guidelines to impacts to wildlife. As discussed under Impact N&V#4, N&V-MM#3 would mitigate impacts to sensitive receivers, which include residences, schools, hotels/motels, and medical facilities. N&V-MM#3 does not apply to Impact N&V#7: Noise and Vibration Impacts on Domestic Animals, which evaluates operational noise and vibration impacts on domestic animals. Rather N&V-MM#8 would mitigate Impact N&V#7 by requiring active and passive warning signs to be posted along the Pacific Crest Trail and in Vasquez Rocks Natural Area Park, the Hansen Dam Recreation Area, and Stonehurst Park and Recreation Center under the Refined SR14, SR14A, E2, and E2A Build Alternative alignments.

The commenter states that unmitigated noise impacts to wildlife would reduce the ability of wildlife to go back and forth between the San Gabriel mountains and the Verdugo mountains. None of the proposed build alternative alignments are located between the San Gabriel Mountains and the Verdugo Mountains, and would therefore not create a barrier to wildlife movement nor would they result in noise impact between these two habitats.

Impact BIO#14 in the Draft EIR/EIS evaluates wildlife responses to noise due to project operation. As discussed in the impact evaluation, the noise exposure limit of sound exposure level of 100 dBA for wildlife would be limited to locations within 40 to 50 feet of the aboveground alignment centerline, which is typically within the fenced HSR right-of-way. Such fencing would preclude wildlife from approaching the alignment at a proximity of 40 to 50 feet. Additionally, where the Build Alternative alignments would occur within urban areas or adjacent to highways, noise exposure would be masked by other noisy features of the landscape. Operation of the Build Alternatives would be masked in urban areas in Antelope Valley and Lancaster Valley and major highways (SR 14), as these features produce noise of a magnitude comparable to that of the HSR line, and they

### 4448-9886

produce that noise more continuously. Impact BIO#14 concludes that implementation of BIO-IAMF#4 (Conduct Operation and Maintenance Period WEAP Training), HYD-IAMF#1 (Storm and Groundwater Management), HMW-IAMF#9 (Environmental Management System), HMW-IAMF#10 (Hazardous Materials Plans), and BIO-IAMF#12 (Design the Project to be Bird Safe) have been incorporated into the Palmdale to Burbank Project Section design to reduce impacts on special-status species and associated habitat during operation. However, operation of each of the six Build Alternatives could have a substantial adverse effect on special-status species by threatening to eliminate or result in measurable degradation of habitat. Therefore, BIO-MM#36 (Install Aprons or Barriers within Security Fencing) and BIO-MM#101 (Minimize Permanent, Intermittent Noise Impacts on Special-Status Bird Habitat) would be implemented to reduce effects related to operational noise impacts to wildlife. BIO-MM#36 would require exclusion barriers and fencing to prevent wildlife from accessing the HSR right-of-way, and BIO-MM#101 would require the construction of sound barriers to address the permanent, intermittent impact of noise on suitable special-status bird habitat. With implementation of the identified IAMFs and mitigation measures, the Build Alternatives would result in a less than significant impact on special-status species during operation.

Please refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, which discusses this topic further.

## Response to Submission 4448 (Auxenia Privett-Mendoza, Arroyos & Foothills Conservancy, December 1, 2022) - Continued

### 4448-9887

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter expresses concern over the effects of sound on wildlife and states that sound barriers do not provide sufficient reduction in noise and may result in restricting wildlife connectivity. The commenter further states that the Draft EIR/EIS acknowledged that noise effects on wildlife were unmitigable. The Authority disagrees with commenter's assertion. Although the Draft EIR/EIS disclosed that construction noise impacts on structures such as residences was significant and unavoidable, the conclusion for wildlife is that construction and operational noise effects on wildlife would be less than significant after mitigation (see Table 3.7-37).

The commenter questions the effectiveness of the sound barriers proposed to mitigate significant noise impacts. As discussed in Response to Comment #9886, sound barriers have been used by other transportation agencies (e.g., Caltrans, FRA) to effectively reduce noise effects resulting from operation of projects.

The commenter also suggests that the placement of sound barriers would restrict wildlife movement. Sound barriers would not present a barrier to wildlife movement because they would be installed where the at-grade segment is already a barrier.

### 4448-9888

The commenter opines that because the E2/E2A project alignment runs through the Hansen Dam Recreation Area, this would result in a loss of functional connectivity for wildlife that is currently provided within the Big Tujunga Wash due to an increase in project-related anthropogenic noise, startle effects and ground-borne vibration from the elevated train. The commenter notes concerns with E2 and E2A Build Alternative alignments having the most noise impacts on sensitive receivers compared to the other build alternative alignments. The commenter also notes the Authority will not be able to fully mitigate noise and vibration impacts of the HSR and moderate to severe noise impacts are expected to occur on either side of the HSR section crossing over Big Tujunga Wash (Draft EIR/EIS, p. 3.4-103). The commenter notes that build alternatives E2 and E2A would have a severe negative effect on the species utilizing the Big Tujunga Wash area and puts numerous already-threatened species at undue risk and further reduce the connectivity between other urban habitat fragments. Lastly the commenter also notes their opposition to moving forward with the E2/E2A alternative alignment for this reason. As described in p. 3.7-184, the E2 and E2A Build Alternatives would require construction through the Tujunga Valley/Hansen Dam SEA as it traverses the Big Tujunga Wash south of the Lake View Terrace neighborhood of Los Angeles. The Tujunga Valley/Hansen Dam SEA is a valuable wildlife corridor. Although build alternatives SR14, SR14A, E1, and E1A would fill the southernmost perimeter of the Hansen Dam Spreading Grounds, this area represents a fraction of the total spreading ground area and would not impact connectivity between other portions of the SEA. E2 and E2A cross the Tujunga Wash north of Hansen Dam and the spreading grounds. The Authority also conducted extensive wildlife movement analysis for this project which is published in their Wildlife Corridor Assessment Report (available upon request through the Public Records Act portal), a technical report prepared by the Authority that identifies the Big Tujunga Wash as a designated TNC Priority Area and LA County SEA, Critical Habitats for Santa Ana River sucker and southwest willow flycatcher, with natural qualities for wildlife movement. Build Alternatives E2 and E2A include a 0.82-mile-long elevated viaduct that spans the Big Tujunga Wash and Hansen Dam area. The technical analysis identified the I-210 freeway as a barrier to wildlife. The implementation of several IAMF (BIO-IAMF#1, BIO-IAMF#2, BIO-IAMF#3, and BIO-IAMF#5 through BIO-IAMF#12) will reduce impacts on wildlife corridors (3.7-18 through 3.7-20) for all the build alternatives including E2 and E2A across the Tujunga Valley/Hansen Dam SEA as it traverses the Big Tujunga Wash via viaduct. The Authority's preferred alternative is

## Response to Submission 4448 (Auxenia Privett-Mendoza, Arroyos & Foothills Conservancy, December 1, 2022) - Continued

### 4448-9888

SR14A which crosses the Tujung Channel south of Hansen Dam via viaduct.

### 4448-9889

The commenter expresses concern that the mitigation measures proposed in the Draft EIR/EIS are not sufficient to avoid adverse effects of nighttime lighting on wildlife movement during construction and operation, and raised specific concern regarding the potential for permanent artificial light at night (ALAN) impacts that could significantly hinder the usefulness of critical wildlife corridors. The Authority has incorporated BIO-IAMF#12 into the project design to avoid and minimize impacts from operational lighting sources by several methods, including using appropriate shielding to reduce horizontal or skyward illumination and avoiding the use of high-intensity lights (e.g., sodium vapor, quartz, and halogen). Additionally, BIO-IAMF#12 specifies that no lighting be installed under viaduct and bridge structures in riparian habitat areas. BIO-MM#37 (Minimize Effects on Wildlife Movement Corridors During Construction) includes avoiding ground disturbing activities within wildlife movement corridors and when that is not feasible, shielding and directing the nighttime lighting towards the work area. BIO-MM#64 (Establish Wildlife Crossings) includes design considerations for establishing/continuing wildlife crossings across the Build Alternatives. Among many design considerations is the "avoidance of artificial light at approaches to wildlife crossings." BIO-MM#100 (Implement Lighting Minimization Measures for Operations) would minimize the intensity and duration of operational lighting of permanent facilities as well as intermittent train lighting in order to avoid potential effects associated with ALAN. Implementation of these measures would generally limit light to active work areas, and effectively manage spillover such that non-work areas would be close to background levels, and are therefore anticipated to be effective in minimizing effects to wildlife movement corridors associated with artificial light at night. As described in Chapter 8, Preferred Alternative, of this Final EIR/EIS, the Authority has identified the SR14A Build Alternative as the Preferred Alternative for the Palmdale to Burbank Project Section, which would avoid ALAN effects from the E2 and E2A Build Alternative alignment.

### 4448-9890

Refer to Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife.

The commenter expresses concerns related to wildlife connectivity and crossing opportunities and urges the Authority to take into consideration implementation of wildlife crossings at locations beyond those where wildlife movement is impeded by the HSR project.

Wildlife crossings in locations where wildlife movement is not impeded by the Build Alternatives are not required as mitigation for the project. As explained in Impact BIO#13: Project Effects on Wildlife Movement Corridors in Section 3.7, Biological and Aquatic Resources, of the Draft EIR/EIS, the underground tunnel sections and elevated viaduct sections allow wildlife to cross the HSR alignment unimpeded. The remaining impermeable at-grade segments were reviewed for opportunities to add a crossing where wildlife movement would likely be least constrained by adjacent infrastructure. Table 6-6 in the WCA and Table 2-13 in the supplemental WCA list the at-grade segments in relationship to adjacent permeable segments by mile. Physical constraints of the HSR grade, height clearance, and position in the landscape narrowed the locations where a wildlife crossing could be located. The number and lengths of crossing opportunities over underground tunnels and underneath elevated viaducts allow for a diversity of crossing opportunities throughout the project alignment. BIO-MM#64 (Establish Wildlife Crossings) includes design considerations for establishing/continuing wildlife crossings across the HSR Build Alternatives. Among many design considerations is the "Avoidance of artificial light at approaches to wildlife crossings." BIO-MM#100 (Implement Lighting Minimization Measures for Operations) would minimize the intensity and duration of operational lighting of permanent facilities, as well as intermittent train lighting in order to avoid potential effects associated with artificial light at night. Implementation of these measures, among others, are anticipated to be effective in minimizing effects to wildlife movement corridors associated with artificial light at night. With respect to noise effects on wildlife, the Draft EIR/EIS screened for potential effects by applying a noise criterion for HSR pass-by events that considered potential for wildlife relocation, running, physiological effects such as changes in hormones or blood composition, and startle. The Draft EIR/EIS concluded that impacts from wildlife exposure to operational noise impacts would be less than significant under

## Response to Submission 4448 (Auxenia Privett-Mendoza, Arroyos & Foothills Conservancy, December 1, 2022) - Continued

### **4448-9890**

CEQA with the implementation of mitigation measures identified in Chapter 3.7.

### **4448-9891**

The commenter expresses shielding the light from spilling onto wildlife corridors is insufficient to mitigate impacts on wildlife usage during construction. BIO-MM #37 (Minimize Effects on Wildlife Movement Corridors During Construction), described in Section 3.7.7 of the Draft EIR/EIS, describes how contractors would minimize nighttime construction and keep night lighting (e.g., for security) from spilling into potential wildlife movement areas. If night work is required, lighting will avoid illuminating natural lands through directional lighting and shielding. Lighting for construction will only be temporary in nature. BIO-MM#64 (Establish Wildlife Crossings) includes design considerations for establishing/continuing wildlife crossings across the Build Alternatives. Among many design considerations is the "Avoidance of artificial light at approaches to wildlife crossings". BIO-MM#100 (Implement Lighting Minimization Measures for Operations) would minimize the intensity and duration of operational lighting of permanent facilities as well as intermittent train lighting in order to avoid potential effects associated with ALAN.

### **4448-9892**

The commenter suggests that a wildlife corridor analysis be completed if the Authority proceeds with the E2 and E2A Build Alternative alignment between the Angeles National Forest and the Verdugo Mountain (Big Tujunga Wash). The Authority's preferred alternative is the SR14A Build Alternative, which would avoid crossing Big Tujunga wash and the areas of concern noted in the comment. Notwithstanding this, the E2 and E2A Build Alternatives would span over the Big Tujunga Wash on a viaduct, allowing wildlife to traverse underneath the project alignment.

### **4448-9893**

The commenter highlighted the importance of the CDFW adopted Eastern Rim of the Valley Conceptual Area Protection Plan (EROV CAPP) and the Arroyos & Foothills Conservancy's (AFC) regional area of interest (its Long-Term Conservation Area and their Critical Wildlife Passage Areas). The commenter is concerned that the E2 and E2A Build Alternatives cross the last remaining open space of land on the south side of Wentworth Street at the Shadow Hills CWPA, which would create a barrier for an important area passage for wildlife moving between the San Gabriel and Verdugo Mountains. The commenter also indicates that wildlife data for mammal species was not included in the Draft EIR/EIS for the Tujunga Valley/Hansen Dam SEA.

The Tujunga Valley/Hansen Dam Significant Ecological Area is identified as a wildlife corridor on page 3.7-90 (shown in Figure 3.7-36), and reiterates the importance of the SEAs and other conservation lands. The WCA identifies the Big Tujunga Wash as a designated TNC Priority Area and LA County SEA, Critical Habitats for Santa Ana River sucker and southwest willow flycatcher, with natural qualities for wildlife movement.

The E2 and E2A Build Alternatives include a 0.82-mile-long elevated viaduct that spans the Big Tujunga Wash and Hansen Dam area. This viaduct would be permeable to wildlife movement. Impacts to special-status mammal species are discussed in Impact Bio#6; Table 3.7-20 quantifies the acreage of special-status mammal habitat within the Build Alternative construction footprints, including within the Tujunga Valley/Hansen Dam SEA. Impacts to the Tujunga Valley/Hansen Dam SEA are discussed in Impact BIO#11, which indicates that construction of the E2 and E2A Build Alternatives has the potential to degrade the biotic viability of the Tujunga Valley/Hansen Dam SEA such that its functionality for species would be compromised. However, with implementation of BIO-MM#6, BIO-MM#47, BIO-MM#50, and BIO-MM#53, this impact would be minimized or avoided such that it would not result in a substantial adverse impact on SEAs.

As described in Chapter 8, Preferred Alternative, of the Draft EIR/EIS, the Authority has identified the SR14A Build Alternative as the Preferred Alternative for the Palmdale to Burbank Project Section, which would largely avoid effects to Tujunga Valley/Hansen Dam SEA.

The E2 and E2A Build Alternatives are the only Build Alternative alignments that cross

## Response to Submission 4448 (Auxenia Privett-Mendoza, Arroyos & Foothills Conservancy, December 1, 2022) - Continued

### **4448-9893**

the Verdugo Mountains and they are not the preferred alternative. Alternatives E2 and E2A traverse the approximate 1.77-mile distance across the Verdugo Mountains either underground in tunnel or elevated on viaduct, allowing wildlife to cross the HSR alignment. There is a 0.038 mile (200 foot) at-grade section that would be fenced and impermeable; however, it is assumed that a highly mobile mammal such as mountain lion would be able to traverse around this small segment.

### **4448-9894**

The commenter provides a summary of prior comments about the effects of the E2 and E2A Build Alternatives on biological resources and wildlife connectivity in the Big Tujunga wash and surrounding areas.

Responses to the individual comments are provided separately in Response to Comments #9877 through #9893. Please refer to those Response to comments. The Authority's Preferred Alternative is the SR14A Build Alternative, which would avoid crossing Big Tujunga wash. The comment also provides the qualifications of the commenters and the references. The Authority notes the qualifications and references.

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

**ANALYSIS OF THE “TRANSPORTATION” SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT.**

**1.0 INTRODUCTION**

4451-9055

The “Transportation” impact assessment presented in Chapter 3.2 of the Draft Environmental Impact Report/Environmental Impact Statement (hereafter referred to as “the Draft”) that was prepared by the California High Speed Rail Authority (“CHSRA”) for the Palmdale-Burbank Segment of the High Speed Rail Project (“Project”) has been evaluated and numerous factual errors and material deficiencies have been identified. These errors and deficiencies are set forth in the comments presented below; they demonstrate that the Draft does not comply with the California Environmental Quality Act (“CEQA”). Please note: These comments were prepared by a competent engineer with more than 35 years of environmental engineering experience and they present expert opinion supported by facts pertaining to the significant environmental effects that will be caused by the Project and which must be mitigated. Accordingly, the comments provided herein constitute “substantial evidence” as that term is defined by the CEQA Statute [California Public Resources Code §21080(e)(1)] and Guidelines [California Code of Regulations Section 15064(f)(5)]. These comments also demonstrate that CHSRA/FRA have failed to conduct a substantive ‘hard look’ review of the Project’s environmental impacts as required by NEPA.

**2.0 MAJOR DEFICIENCIES NOTED IN THE DRAFT.**

4451-9056

**2.1 The Draft Fails to Properly Report Traffic Impacts at Unsignalized Intersections.**

It is appreciated that the Draft assesses traffic impacts at unsignalized intersections in a manner that is consistent with Chapters 19 and 20 of the “Highway Capacity Manual 2010” by using the “vehicle delay” methodology to assess “Level of Service” (“LOS”) impacts rather than the “Volume to Capacity” or “v/c” methodology. However, the Draft fails to report the vehicle delay results properly. Specifically, at unsignalized intersections, vehicle delay values are supposed to be reported for all approaches to the intersection. For example, consider the intersection of Antelope Woods Road and Crown Valley Road in Acton; this intersection has 4 approaches (one each from the north, south, east, and west), thus Table 3.2-23 should report a separate LOS value for each of these four approaches. However, Table 3.2-23 reports only one; thus, it provides an incomplete and actually incorrect “picture” of the LOS at this location. Ironically, this omission will work to CHSRA’s detriment because (as discussed below), the actual LOS that currently exists at the intersection of Antelope Woods Road and Crown Valley Road is “F” for westbound traffic and “E” for eastbound traffic, which means that that CHSRA’s trucks exiting the “Acton Window” construction site will experience significant delays while trying to turn left to access the freeway and will become heavily “backed up” during peak morning hours. This problem that CHSRA trucks will experience is completely masked and arguably suppressed by the Draft because Table 3.2-23 only reports one value for the LOS at this intersection rather than 4 values representing the northbound, southbound, eastbound, and westbound approaches.

4451-9056

The incomplete and incorrect LOS values reported for unsignalized intersections throughout the Project area render the results reported for both “existing” traffic conditions and “existing + Project” traffic conditions completely erroneous. This is of particular concern to the rural communities of Acton and Agua Dulce (where virtually all intersections are unsignalized) because it means that stakeholders have been provided incomplete and incorrect information regarding actual traffic impacts that will occur in our communities; this prevents us from providing meaningful comments on the Draft’s traffic impact analysis.

To address this problem, the Draft must be revised to properly report LOS values at unsignalized intersections under both “existing” and “existing + project” conditions, and it should be recirculated for public comment and review to ensure that the robust public process guaranteed by CEQA and NEPA is achieved.

4451-9057

**2.2 Traffic Impacts at the Intersection of Crown Valley Road and Antelope Woods Road will be much more Significant than What is Reported in the Draft.**

It has been repeatedly pointed out in meetings with CHSRA engineers and staff that the intersection of Antelope Woods Road and Antelope Valley Road is the most sensitive traffic area in the Community of Acton and that the excessive truck traffic that will result at this intersection if the SR14A alternative is selected will be significantly adverse. This intersection already experiences significant traffic loads that pose safety risks to our residents because it is 1) adjacent to the High Desert Middle School where children from Acton and Agua Dulce congregate after school while they walk to the Park or the Library; 2) it is immediately adjacent to 14 Freeway intersection that are heavily used by freeway commuters in the morning and afternoon to access the freeway-serving fast food and service station businesses located at freeway intersections; and 3) it is where traffic congestion is already significantly adverse, particularly in the morning during school drop-off events. Yet, the Draft indicated that there are no traffic problems at the intersection of Antelope Woods Road and Crown Valley; in fact, it assigns a current “Level of Service” (“LOS”) condition of “B” to this intersection [Table 3.2-23]. It is not known where this result came from or whether the traffic study that resulted in these LOS values was conducted at a time that accurately represents typical traffic conditions in the area; however, it is suspected that any traffic analysis that was conducted at this intersection occurred during the COVID pandemic because that is when the SR14A route alternative was developed. Accordingly, it is certain that the existing traffic conditions at the intersection of Antelope Woods Road and Crown Valley under normal conditions are very congested and that the intersection does not operate at an LOS of “B”. This is not conjecture; it is fact. A pre-pandemic traffic study conducted at this intersection in 2017 clearly shows that, during morning peak hours, the LOS at this intersection is “F”<sup>1</sup>. It is certain that current conditions are even worse now because the middle school has even more children than it did in 2017.

The Draft also fails to address the significant safety risks to school children and other pedestrians that will result from the increased construction traffic at this intersection if the SR14A route is selected. All of this renders the Draft deficient. The Draft must be revised to: 1) accurately report current traffic conditions at this intersection during Peak AM hours;

<sup>1</sup> See page 8 of the traffic study excerpt provided in Attachment 1; only an excerpt is provided because the traffic study itself is very lengthy; a complete copy of the traffic study can be provided upon request.

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9057

2) disclose the actual traffic impacts that will result when construction traffic caused by the SR14A alternative is added to the existing traffic situation at this intersection (especially during peak AM hours); and 3) disclose the child safety and pedestrian risks that already exist at this intersection and the extent to which these risks will be magnified by the construction traffic that will be added by the Project.

Most importantly, the Draft must recommend mitigation measures to reduce the safety risks and terrible traffic impacts that will result at the intersection of Antelope Woods Road and Crown Valley if the SR14A route is selected. The best mitigation measure would be to construct a temporary, dedicated onramp and offramp to the northbound lanes of the 14 freeway from the “Acton Window” construction location; this would deconflict the normal traffic on Crown Valley Road and mitigate safety issues associated with the proximity of potential construction traffic to the High Desert Middle School. A far less appropriate mitigation measure would be to delay all construction traffic during the morning and afternoon time intervals when school children are being picked up and dropped off.

4451-9058

**2.3 The Draft Reports Incorrect Peak Hour Traffic Levels on all Roadway Segments that are Analyzed and Also Omits Critical Data.**

According to Table 3.2-20, the “northbound” traffic volumes, v/c values, and LOS levels are identical to the “southbound” traffic volumes, v/c values, and LOS levels for every single roadway segment that is evaluated. This is a mathematical impossibility because (for instance) southbound traffic on Sierra Highway near Red Rover Mine Road during peak morning hours is much heavier than southbound traffic because Sierra Highway is a commuter corridor that connects the Antelope Valley to the Los Angeles basin; therefore, southbound lanes are much more heavily used in the morning than northbound lanes. Similar discrepancies are noted in Tables 3.2-21 and 3.2-22 (particularly for the segment of Sierra Highway west of Pearblossom). Another deficiency noted in Table 3.2-20 is that it only reports AM traffic conditions and traffic impact results for Sierra Highway west of Red Rover Mine Road in Acton; it omits PM traffic conditions and traffic impacts for Sierra Highway at this location entirely. This is a substantial deficiency; Northbound traffic on Sierra Highway west of Red Rover Mine Road is significant because Sierra Highway is a critical commuter corridor (as discussed above). Accordingly, the Draft must be revised to consider impacts on this roadway segment at all hours and not just during the morning. The fact is, it appears that none of the results presented in Tables 3.2-20, 3.2-21, and 3.2-23 are accurate or reliable; these are substantial deficiencies which prevent the public from providing meaningful comments on the Draft’s traffic impact analysis. The entire traffic analysis section of the Draft should be revised and recirculated for public comment and review to ensure that the robust public process guaranteed by CEQA and NEPA is achieved.

4451-9059

**2.4 The Traffic Mitigation Measures Offered by the Draft are Not Appropriate in Rural Communities of Los Angeles County and are in Fact Precluded by Adopted Planning Policies.**

Page 3.2-116 of the Draft identifies various traffic mitigation measures, and it specifically identifies the installation of traffic signals under mitigation measure TR-MM#4. This is entirely unacceptable to the residents of Acton because traffic signals are not appropriate in our rural community. The County of Los Angeles has adopted numerous policies in the County General Plan and the Antelope Valley Area Plan that make it explicitly clear that traffic signals and other

4451-9059

urban infrastructure have no place in rural communities like Acton<sup>2</sup>. Thus, implementation of TR-MM#4 in the Community of Acton is contrary to every aspect of Acton’s community profile and it utterly controverts many adopted plan policies and goals. It is understood that CHSRA’s position is that it does not have to comply with local plans and policies [Page 3.2-12]; however, CEQA *does* compel CHSRA to ascertain whether the Project (or the Project’s mitigation measure) is inconsistent with any general plan policies that were adopted for the purpose of avoiding or mitigating an environmental effect; if these inconsistencies result in significant environmental impacts, mitigation must be provided<sup>3</sup>. In other words, while the Project is not required to conform with local land use and zoning policies, CEQA nevertheless requires the Project to mitigate the significant environmental impacts that arise from non-conformance. There is no question that the installation of a traffic signal in Acton would be utterly inconsistent with environmental protection policies adopted by the County General Plan and AV Area Plan for the purpose of preserving Acton’s rural profile by preventing the incursion of urban infrastructure; there is also no question that the installation of a traffic signal in Acton will result in unmitigable significant adverse impacts in the Community by advancing urbanization in a manner that is entirely contrary to our rural profile. Therefore, mitigation TR-MM#4 cannot be implemented in Acton and another solution must be found. For the SR14A route alternative in particular, it is recommended that CHSRA construct temporary onramps and offramps connecting to the 14 freeway directly from the “Acton Window” construction to avoid all construction traffic concerns in our community.

4451-9060

**2.5 CHSRA May Not Be Required to Develop Mitigation Measures to Reduce LOS Transportation Impacts of Project Construction, but CHSRA is Required to Identify and Mitigate Transportation Safety Impacts.**

The Draft points out several times that, because LOS is not an impact under CEQA, no mitigation measures are required to reduce LOS impacts. While LOS impacts may be “off the table”, the traffic, pedestrian, bicycle, and equestrian safety concerns that arise from these LOS impacts are not “off the table”, and CHSRA is mandated to address them. Yet, the Draft spends virtually no time discussing safety concerns; in fact, it does not even identify any particular safety concerns at any of the intersections and roadway segments that it analyzes! Worse yet, the Draft offers no mitigation measures for these (unidentified) safety concerns and instead offers vaguely described “Impact Avoidance and Minimization Features” (“IAMFs”). These IAMFs merely commit to the development of construction management plans; they incorporate no performance standards for mitigation and include no discussion on what level of mitigation will be achieved or whether the mitigation will fully address the significant safety impacts that the project will create. As discussed in more detail below, all of this violates CEQA’s prohibition on deferring mitigation measures.

<sup>2</sup> Among other things, the AV Area Plan establishes “rural” as an area where traffic signals and other urban infrastructure is absent. See excerpts from the Antelope Valley Area Plan provided in Attachment 2. Also, Page 74 of the County General Plan defines “Rural” as “a way of life characterized by living in a non-urban or agricultural environment at low densities without typical urban services” and it explicitly identifies urban infrastructure as “curbs, gutters and sidewalks; street lighting, landscaping and traffic signalization; public solid waste disposal, integrated water and sewerage system; mass transit; and commercial facilities dependent upon large consumer volumes”.

<sup>3</sup> California Code of Regulation, Title 14, Chapter 3, Appendix G.

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

**3.0 ADDITIONAL DEFICIENCIES NOTED IN THE DRAFT.**

For simplicity and to facilitate review, the deficiencies and factual errors noted in the Draft are presented sequentially by page number below,

4451-9061

Page 3.2-15 states in part *disposal of spoils at the Vulcan Mine site would require an agreement with the mine owner and coordination with the USFS*. This would imply that, unlike the other planned disposal sites (Boulevard Mine and CalMat Mine), an agreement is not currently in place to dispose of spoils at this location. This means that the Vulcan Mine site may not be where the spoils are disposed of and a different site will be used that will have different impacts. If the Vulcan Mine site is not where Project spoils will ultimately be deposited and another location is selected, CHSRA will be required to prepare a supplemental EIR/EIS and circulate it for public comment to ensure compliance with both CEQA and NEPA.

4451-9062

Page 3.2-31. Table 3.2-7 defines a segment of Agua Dulce Canyon Road between Burke Road and Briggs Edison Road; however, Burke Road does not intersect Agua Dulce Canyon Road. Therefore, it is unclear what the actual endpoints are for this segment and if it was consistently used throughout the analysis of all impacts presented in the Draft. The Draft must be revised to correct this error not only in the “Transportation” section but also in all other sections of the Draft that rely on this incorrect information.

4451-9063

Page 3.2-63 states “Refined SR14 and SR14A Build Alternative spoils hauling would degrade LOS to unacceptable levels at the roadway segments listed in Table 3.2-20 for up to 6.4 years, depending on location and Build Alternative.” Based on the discrepancy noted above, it is not clear how this conclusion was reached; it is also not clear whether, after Table 3.2-20 is corrected, the impact will be more severe or less severe.

4451-9064

Page 3.2-64 states “The E1 and E1A Build Alternatives spoils hauling would degrade LOS and V/C ratios to unacceptable levels at the roadway segments listed in Table 3.2-21. Roadway segments in the spoils hauling RSA are displayed on Figure 3.2-4 though Figure 3.2-6. The E2 and E2A Build Alternatives spoils hauling would degrade LOS and V/C ratios to unacceptable levels at the roadway segments listed in Table 3.2-22.” Based on the discrepancy noted above, it is not clear how this conclusion was reached; it is also not clear whether, after Table 3.2-21 is corrected, the impact will be more severe or less severe.

4451-9065

Page 3.2-71 states “Refined SR14 and SR14A Build Alternative spoils hauling would degrade LOS to unacceptable levels at the intersections listed in Table 3.2-23 for up to 6.4 years depending on location and Build Alternative”. In particular, the Crown Valley intersection to the SR14 FB and WB ramps will be severely impacted due to the proximity to the window that will be used to support tunnel boring operations. In order to mitigate these impacts, TR-MM#12 requires development of a transportation Congestion Management Plan to address circulation and connections for modes of travel during the construction duration. This “mitigation measure” is completely unacceptable and it impermissibly defers consideration of appropriate mitigation measures in a manner that utterly violates CEQA. Section 15126.4(a)(1)(B) of the CEQA Guidelines makes it clear that “Formulation of mitigation measures shall not be deferred until some future time. The specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project’s environmental review provided that the agency (1) commits itself to the mitigation, (2) adopts

4451-9065

specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be considered, analyzed, and potentially incorporated in the mitigation measure.” Mitigation measure TR-MM#12 does not meet this standard<sup>4</sup>: it does not include performance standards and it does not demonstrate that any of the measures it identifies can feasibly achieve anything. Therefore, CHSRA has absolutely no basis to conclude on page 3.2-71 that TR-MM#12 will be effective in reducing impacts associated with haul route traffic.

4451-9066

Page 3.2-80 indicates that a method for reducing traffic impacts will be to restrict construction/spoils hauling hours. While this seems a reasonable thing to do, it seems unlikely that such an approach will actually be implemented because it will interfere with the project schedule and interrupt the “work tempo” needed to achieve the project schedule. The Draft must be revised to explain how restricting construction hours were factored into the project timeline and completion schedule and thereby clearly demonstrate that this mitigation measure can be feasibly implemented.

4451-9067

**4.0 CONCLUSION**

Because so much of the data that is presented in the Traffic Analysis section of the Draft is unreliable and simply incorrect, and because so many of the measures proposed in the Draft are deficient and violate CEQA because they defer mitigation determinations, the public has been prevented from providing appropriately responsive comments on the Draft. Therefore, the Traffic Impact section should be completely revised and recirculated again for public comment.

<sup>4</sup> Mitigation Measure TR-#12 states “Prepare a Transportation Construction Management Plan—Prior to construction, the Authority will require the construction contractor to develop a plan to manage circulation and connections for modes of travel during the construction duration. Implementation of the transportation CMP will maintain the flow of traffic, bicyclists, pedestrians, and buses in and around the construction zones. Typical measures associated with a CMP include the following ...”

**RE: TRAFFIC IMPACT STUDY -ACTON RETAIL CENTER PROJECT -  
 ACTON, CALIFORNIA, LOS ANGELES COUNTY**

Dear Mr. Friedman:

Hall & Foreman, a Division of David Evans and Associates, Inc. is pleased to submit this Traffic Impact Study (TIS) for the proposed Acton Retail Center Project located in the unincorporated community of Acton, California, Los Angeles County. The project is comprised of a 8,000 square-foot retail building with a 1,600 square foot storage facility and a 3,300 square-foot restaurant, on an approximate 85,250 square foot parcel. The proposed project is located near the intersection of Sierra Highway and Crown Valley Road in the unincorporated community of Acton, California, Los Angeles County.

The report examines the traffic impacts specifically for the project and presents recommended traffic improvements. The report also addresses the impacts of overall growth within the area to assure that cumulative traffic mitigations can be addressed.

We are pleased to have been of assistance to you in processing and obtaining approval for the project. If you have any questions or comments, please feel free to contact me at 760-524-9115.

Respectfully submitted,

Hall & Foreman, a Division of David Evans and Associates, Inc.

Robert A. Kilpatrick, P.E., T.E.  
 Senior Associate

## I. PURPOSE AND VALUES

### Purpose

The purpose of the Antelope Valley Area Plan (Area Plan) is to achieve the communities' shared vision of the future through the development of specific goals, policies, land use and zoning maps, and other planning instruments. This shared vision is articulated in the Town and Country Vision Statement, which was developed by the Antelope Valley communities in various workshops in 2008. It goes:

The Antelope Valley region is a wonderful place to live, work, play, and raise a family. The Valley is a mosaic of unique small towns in which rural lifestyles are cherished. These diverse towns are unified by an extraordinary environmental setting that includes agricultural lands, natural open spaces, expansive mountain views, diverse ecological habitats, and dark night skies. The Valley's network of trails, roads, and transit link these dispersed towns to each other and to a wide offering of local-serving businesses and quality social, educational, cultural, and recreational services and facilities.

Residents, business owners, and property owners collaborate with a responsive local government to ensure that life in the Antelope Valley region will continue to be exciting, enjoyable, and rewarding. The growing population's need for additional housing and employment opportunities is balanced against the need to respect historical heritage and preserve the natural environment. Public improvements and private developments are sustainable, conserving available resources and relying on alternative energy sources, and complement the small scale of existing rural towns. A wide array of activities and opportunities for youth ensure that the Valley's high quality of life will be sustained for future generations.

The Area Plan is a blueprint for future development and conservation in the Antelope Valley that informs decision-making at all levels to help ensure that individual activities are consistent with, and supportive of, the communities' vision. It is a tool for residents, elected officials, planners, service providers, and developers. Each group will use the Area Plan in different ways, but all are guided by its vision, goals, and policies. Residents will use the Area Plan as a benchmark in attaining their aspirations for the development and preservation of their communities. Elected officials and planners will refer to the Area Plan when allocating resources to address residents' most important issues and priorities. Service providers will use the Area Plan as a guide for deciding which infrastructure and improvement projects should be undertaken and which programs should be established or improved. Developers will look to the Area Plan's goals and policies in deciding what to build, including location, character, and appearance.

As a component of the Los Angeles County General Plan, the Antelope Valley Area Plan refines the countywide goals and policies in the General Plan by addressing specific issues relevant to the Antelope Valley, such as community maintenance and appearance, and provides more specific guidance on

Antelope Valley Area Plan

I-2

June 2015

4451-9069

elements already found in the General Plan. The General Plan provides guidance on all issues not covered in the Area Plan.

The Area Plan also helps further the countywide objective of reducing greenhouse gases in order to meet the goals of the California Global Warming Solutions Act of 2006 (Assembly Bill 32) and California's Sustainable Communities and Climate Protection Act (Senate Bill 375), which aim to achieve reductions of greenhouse gases. Los Angeles County has undertaken countywide measures to address these mandates, including adoption of the Green Building, Drought Tolerant Landscaping, and Low Impact Development Ordinances in 2008. The Area Plan strengthens these efforts by including goals and policies to support local development practices and initiatives to reduce greenhouse gas emissions. Implementation of the Land Use, Mobility, and Conservation and Open Space Elements contained in this Area Plan cumulatively affect the future reduction of greenhouse gases both locally and regionally.

### Values

All aspects of the Area Plan are informed by a set of core values that ground and guide the Area Plan. In order to best serve the common interests represented in this Area Plan, planning values outline the shared responsibilities of the many partners who will work together to transform goals and policies into a realized vision. The core values of the Antelope Valley Area Plan are:

- 1. Collaboration:** The issues and actions identified in the Area Plan are multi-dimensional and complex. As such, it takes a collaborative effort to accomplish the Area Plan's goals. Working in partnership with individuals from public agencies, private organizations and throughout the community, participants in planning and implementation of the Area Plan can come together to achieve the community's vision.
- 2. Participation:** The dedicated commitment and ongoing participation of community members, service providers and elected officials will ensure that the Area Plan's implementation over time remains in line with the communities' vision. Community participation also demonstrates to elected leaders and service providers that constituents support the implementation of the Area Plan and expect results.
- 3. Accountability:** By adopting this Area Plan, elected leaders have expressed their commitment to achieving the communities' vision by adhering to the Area Plan's goals and policies and by using the implementation actions to guide their work. Land use decisions will be made to benefit the needs of the community as a whole and not individual interests. Accountability means that all stakeholders take responsibility for their respective components of the Area Plan.
- 4. Stewardship:** In order for the Area Plan to be effective in achieving the community's goals, people who live, learn, work, and play in the Antelope Valley will have to take an active role in ensuring the Area Plan's timely and thorough implementation. Community members and service providers can and should provide feedback on the insights into the Area Plan's effectiveness.

Antelope Valley Area Plan

I-3

June 2015

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

- 5. **Balance:** As the diverse and sometimes conflicting needs of current and future stakeholders evolve, the tools within the Area Plan create a framework which allows for balanced decisions to be made. For residents of the Antelope Valley, achieving a balance will unfold gradually. This shall be achieved by encouraging growth and development in appropriate areas of the Antelope Valley and ensuring that these enhance the quality of life of the communities without compromising their rural character.

II. **BACKGROUND**

**Setting**

The Antelope Valley planning area is bounded by the Kern County border to the north, the Ventura County border to the west, the Angeles National Forest (inclusive) to the south, and the San Bernardino County border to the east. It excludes the Cities of Lancaster and Palmdale. This area covers approximately 1,800 square miles and includes over two dozen communities.

For a map of the Antelope Valley and the immediate vicinity, please see Map 1.1: Planning Area Boundary.

**History**

The historic development of the Antelope Valley started in 1876 with the completion of the Southern Pacific Railroad line from San Francisco to Los Angeles via the Antelope Valley. Many communities began to develop, including Lancaster, Palmdale, Rio del Llano and Littlerock, all dependent upon stock raising, dry farming and fruit orchards.

The World War II years brought the development of Edwards Air Force Base and a doubling of the Antelope Valley population. Military defense work expanded in the 1950s, and Palmdale Airport emerged as a national center for jet testing. The latter part of the decade saw the start of an economic downturn throughout the country that slowed military investments in Antelope Valley projects.

The final decades of the 20th century saw the Antelope Valley emerge with major new housing opportunities as vast acreages were subdivided for affordable tract homes. Lancaster and Palmdale incorporated as independent cities, and rural communities continued to grow. Farming regained its status as a productive employer, but the area continued to develop without balancing the growth in housing with a corresponding growth in jobs and investment in infrastructure. Today, many who live in the Antelope Valley commute to jobs in other parts of the Los Angeles Basin. New local commercial centers are expanding the shopping, entertainment and employment opportunities of Antelope Valley residents. For additional information on the setting and history of the Antelope Valley, please see Background Report.

Antelope Valley Area Plan I-4 June 2015

4451-9069

**Past and Current Planning Efforts**

The previous Antelope Valley Areawide General Plan was adopted by the Los Angeles County Board of Supervisors on December 4, 1986. It contained Valleywide goals and policies pertaining to land use, housing, community revitalization, community design, human resources, circulation, public services and facilities, governmental services, environmental resource management, noise abatement, seismic safety, public safety, and energy conservation. This Area Plan replaces the previous Antelope Valley Areawide General Plan in its entirety.

This Area Plan covers issues that were important in 1986 and are still important to the communities; for example, managing growth, minimizing disruption of ecological resources, placing development away from natural hazards, and ensuring a variety of housing types and costs. This Area Plan also addresses new issues that have emerged in recent years; for example, maintaining agricultural uses, improving mobility, developing renewable energy resources, and curbing greenhouse gas emissions.

**Community Participation**

The Area Plan is the result of a highly inclusive and extensive community participation program launched in the fall of 2007. Through a series of 23 community meetings, residents and other stakeholders worked alongside planners to develop a shared vision of the future, identify community issues, draft proposals for the future, and prioritize their recommendations, forming the foundation of the Area Plan.

Building on the foundation laid by the communities, planners partnered with other County departments to explore the recommendations, refine the proposed goals and policies, plan for program implementation, and gather support to ensure success. Plan development is an iterative process, and in this case, the communities were included in the earliest steps of development and subsequent rounds of review. The Area Plan began with, and will be realized by, the dedicated residents and stakeholders who have committed, and will continue to commit their time, energy and interests to the Antelope Valley.

III. **VISION AND STRATEGY**

**Vision Statement**

At the heart of the County's approach to community planning is the idea that the Area Plan is an adopted version of the communities' aspirations for the future. Collectively, those aspirations amount to a community vision, based on shared values and common goals. The communities reached consensus on the following vision statement:

The Antelope Valley region is a wonderful place to live, work, play, and raise a family. The Valley is a mosaic of unique small towns in which rural lifestyles are cherished. These diverse towns are unified by an extraordinary environmental setting that includes agricultural lands, natural open spaces, expansive mountain views, diverse ecological

Antelope Valley Area Plan I-5 June 2015

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

habitats, and dark night skies. The Valley’s network of trails, roads, and transit link these dispersed towns to each other and to a wide offering of local-serving businesses and quality social, educational, cultural, and recreational services and facilities.

Residents, business owners, and property owners collaborate with a responsive local government to ensure that life in the Antelope Valley region will continue to be exciting, enjoyable, and rewarding. The growing population’s need for additional housing and employment opportunities is balanced against the need to respect historical heritage and preserve the natural environment. Public improvements and private developments are sustainable, conserving available resources and relying on alternative energy sources, and complement the small scale of existing rural towns. A wide array of activities and opportunities for youth ensure that the Valley’s high quality of life will be sustained for future generations.

This vision of the Antelope Valley’s future serves as a touchstone through the planning process, and it is reflected in the land use map, goals, and policies that comprise the Area Plan.

**Issues**

Through the planning and visioning process, the County identified issues of Valleywide significance that, it determined, were best addressed in a comprehensive and coordinated manner. In anticipation of future growth, the planning effort focused on ways to manage this growth and addressed the need for balance on the following issues:

1. Preservation and enhancement of each unique town’s rural character, allowing for continued growth and development without compromising the rural lifestyle;
2. Preservation of open space around existing towns, in order to preserve hillside areas and significant ridgelines, conserve biological resources, provide opportunities for recreation, and make more efficient use of existing infrastructure in the core areas;
3. Planning for integrated circulation systems, including bikeways, walkways, and multi-purpose trails;
4. Conservation of significant resources, including agricultural lands, mineral resources, water supply, and scenic areas;
5. Preservation of public health, safety, and welfare, through identification of natural and environmental hazards, including noise, seismic, fire, and airborne emissions, and designation of land uses in an appropriate manner to mitigate these impacts; and
6. Coordination on enhancing public and community services such as law enforcement, fire protection, and parks.

**Rural Preservation Strategy**

The Area Plan’s Rural Preservation Strategy addresses issues of Valleywide significance in a manner that builds upon the communities’ vision statement. While each community in the Antelope Valley possesses its own identity, they are all unified in the pursuit of preserving the rural lifestyle and the rural

4451-9069

character of the region. This rural character is what makes the Antelope Valley so unique and valuable to the rest of Southern California.

The term “rural” is defined by the following characteristics:

- Living in a low density environment without high intensity land uses, such as regional commercial centers;
- A natural, peaceful, quiet setting, with the ability to find a sense of solitude;
- Views of adjacent natural areas by day, such as hillsides and ridgelines, and views of starry skies by night;
- Agricultural and equestrian uses that are sensitive to the land; and
- An absence of infrastructure generally found in urban and suburban areas, including but not limited to curbs, gutters, sidewalks, street lighting, and traffic signals.

The Rural Preservation Strategy is based on four types of environments – rural town center areas, rural town areas, rural preserve areas, economic opportunity areas – that serve different purposes. Collectively, these environments preserve the rural character of the region, conserve environmental resources, and protect residents from potential hazards while allowing for additional growth and development. For more information on these environments, please see Chapter 2: Land Use Element.

Rural town center areas are the focal points of rural communities, serving the daily needs of residents and providing local employment opportunities. The majority of new locally-oriented public facilities and new locally-oriented commercial uses should be directed to these areas. These areas will provide pleasant pedestrian environments and will be accessible by a range of transportation options to reduce vehicle trips. Some of these areas will allow for a mix of commercial and residential uses.

Rural town areas provide a transition between rural town center areas and rural preserve areas, as they are occupied by a mix of residential and light agricultural uses. Residents living in these areas are willing to forego urban infrastructure and services in order to live in a rural environment. The majority of new residential development should be directed to these areas, provided that such development is consistent with the existing community character and allows for light agricultural, equestrian, and animal-keeping uses where appropriate. These areas will provide transportation linkages to rural town center areas and other nearby destination points.

Rural preserve areas are areas outside of the Town Areas, which are largely undeveloped and generally not served by existing or planned infrastructure and public facilities. Many of these areas contain environmental resources, such as Significant Ecological Areas, Scenic Resource Areas, and Agricultural Resource Areas. In addition, many of these areas contain safety hazards, such as Seismic Zones, Very High Fire Hazard Severity Zones, and Flood Zones. The primary benefit of these areas is that they provide habitat for regionally significant biological species while simultaneously providing scenic value to residents. A secondary benefit of these areas is that they contain natural resources which provide economic opportunities. Development in these areas should be limited to single family homes at very low densities, light and heavy agricultural uses, including equestrian and animal-keeping uses, and other uses where appropriate.

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

Economic opportunity areas are defined clusters of land along the routes of two new proposed major infrastructure projects in the Antelope Valley, namely the High Desert Corridor and the Northwest 138 Corridor Improvement Project. These areas were identified as having tremendous potential for economic growth and development. Thus, any development induced by these two infrastructure projects should be guided to these areas so that the areas around them can be preserved and maintained at low density, or agricultural uses. This is intended to balance the growth and development which the two projects will undoubtedly bring, with the general intent of this Area Plan to preserve the ecological value and rural character of the Antelope Valley.

The Rural Preservation Strategy necessitates a “trade-off” between preserving rural character and developing additional infrastructure, as infrastructure improvements are typically funded by increased property tax revenues and developer fees. In rural town center areas and rural town areas, the amount of potential development allowed by this Area Plan will be equal to, or greater than, the amount of potential development allowed by the previous Area Plan. Therefore, those areas are likely to benefit from increased property tax revenues and developer fees, which can help fund additional infrastructure. In rural preserve areas, the amount of potential development allowed by this Area Plan will be far less than the amount of potential development allowed by the previous Area Plan. Therefore, rural preserve areas are unlikely to benefit from increased property tax revenues and developer fees, which may make it difficult to fund additional infrastructure. The Area Plan acknowledges this “trade-off” by directing additional infrastructure to rural town center areas and rural town areas, where the placement of additional infrastructure may be more cost-effective and environmentally sensitive, and not to rural preserve areas, where the placement of additional infrastructure may not be necessary. Residents of rural preserve areas should be prepared to forego additional infrastructure in order to live in a very remote rural environment and enjoy the benefits offered by such an environment. On the other hand, the economic opportunity areas provide an opportunity for the Area Plan to maximize the investment that state and regional agencies are bringing into the area, while still achieving the general goal of rural preservation in the Antelope Valley.

**IV. HOW TO USE THE ANTELOPE VALLEY AREA PLAN**

**Definitions**

The following definition shall apply only as it specifically appears in this Area Plan and shall not be used in any other context outside of this Area Plan.

“Legal lot” means any lot created in compliance with the provisions of the Subdivision Map Act, or would qualify for a conditional certificate of compliance as provided in the Subdivision Map Act. Where a conditional certificate of compliance is reviewed by the County, the conditions imposed therein will be based on those required at the time the lot was created, including land use density and required area under the zoning code.

Antelope Valley Area Plan

I-8

June 2015

4451-9069

**Area Plan Format and Content**

The Area Plan is organized into eight chapters. Chapter 1 (Introduction) presents the Area Plan’s purpose and values, the geographic area, and the communities’ vision statement. Chapter 2 (Land Use Element) discusses how the communities’ vision translates into a development pattern through the concept of land use. Chapter 3 (Mobility Element) describes the multi-modal approach to moving around the Antelope Valley. Chapter 4 (Conservation and Open Space Element) describes conservation efforts to address potential threats to natural resources. Chapter 5 (Public Safety, Services and Facilities Element) provides measures to ensure services are in place to maintain the safety and welfare of residents. Chapter 6 (Economic Development Element) provides the blueprint for the planning area to build a healthy and sustainable economic base that will drive development and private-sector led conservation and preservation of open space in the area. Chapters 2 through 6 contain goals and policies specific to each chapter’s respective topic but all work jointly to comprehensively implement the overall vision. Chapter 7 (Community-Specific Land Use Concepts) highlights each established town and describes its land use form in more detail. Finally, Chapter 8 (Plan Implementation) describes future planning activities that will be undertaken to further implement the goals and policies of this Area Plan. Appendix A includes descriptions of the Significant Ecological Areas within the Antelope Valley Area Plan.

**Applicability**

The following provisions shall apply to complete applications filed prior to the effective date of this Antelope Valley Area Plan.

The applicant can choose whether the application will be reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan or this Antelope Valley Area Plan. In either case, approval of the application is not guaranteed.

If an application is reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan, the applicant may modify the application prior to consideration by the Regional Planning Commission, Hearing Officer, or Director. The modification will be reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan if it does not change the housing type (e.g., from single family to two family or multifamily) nor increase:

- The residential density;
- The floor area or lot coverage of non-residential space;
- The amount of grading; or
- The area of ground disturbance.

A modification may necessitate the submittal of revised, updated, or additional materials and reports, such as site plans, elevations, and oak tree reports. In addition, a modification may necessitate

Antelope Valley Area Plan

I-9

June 2015

## Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

additional environmental review pursuant to the California Environmental Quality Act and the County’s environmental review procedures.

Modification to an application that is already approved but not used, can be reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan if it is found to be in substantial conformance with such application as determined by the Director. Otherwise a modification shall be considered a new application and shall be reviewed for consistency with this Antelope Valley Area Plan.

If an approval is used and has a grant term, the approved use may be maintained until the end of the grant term. At the end of the grant term, the use shall be subject to the Antelope Valley Area Plan policies in effect at that time. During the grant term, a modification to the approved use will be reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan if the modification is found to be in substantial conformance with such application as determined by the Director. Otherwise, a modification to the approved use shall be subject to the Antelope Valley Area Plan policies in effect at that time.

If an approval is used and does not have a grant term, the approved use may be maintained in perpetuity unless a time limit is specified in the Zoning Code. In addition, all applicable non-conforming use provisions of the Zoning Code shall apply to the approved use. A modification to the approved use will be reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan if the modification is found to be in substantial conformance with the use originally approved as determined by the Director. Otherwise, a modification to the approved use shall be subject to the Antelope Valley Area Plan policies in effect at that time.

**Guidance**

The Antelope Valley Area Plan is a component of the Los Angeles County General Plan. All of its maps, goals, policies, and implementing actions must be consistent with the elements of the Countywide General Plan. Users should be guided by the following:

- **General Plan Applicability:** Should any areas of conflicting interpretation arise, unless specifically noted, the provisions of the Countywide General Plan shall prevail.
- **Comprehensive Area Plan:** The Land Use Policy Map is never to be interpreted as a stand-alone document, but must be interpreted in light of applicable written policies in the Area Plan.
- **Equally Weighted Policies:** No policy, whether in written or diagram form, shall be given greater weight than any other policy in evaluating the policy intent of this Antelope Valley Area Plan.
- **Vision and Rural Preservation Strategy:** The interpretation of policy should be governed by the Vision and Rural Preservation Strategy of the Antelope Valley Area Plan.

Antelope Valley Area Plan I-10 June 2015

4451-9069

- **Established Town Descriptions:** Descriptions of established towns in Chapter 7 are intended to provide more detailed descriptions of existing land use patterns, local character, and desired local development patterns, and should be referred to in addition to the remainder of the Area Plan in planning for local projects.
- **Non-Conforming Uses:** All legally established uses in existence at the time of adoption of this Antelope Valley Area Plan are deemed to be consistent with this Area Plan, although Zoning Ordinance provisions regarding Non-Conforming Uses may apply.
- **Undersized Parcels:** Existing legal lots may be developed (following current development requirements) regardless of lot size. For example, a 10 acre parcel designated Rural Land 20 (1du/20ac) may still develop one home.
- **Pending Projects:** Completed applications filed prior to the effective date of this Area Plan shall be allowed to be reviewed for consistency with the previously adopted Area Plan. Projects may be maintained as originally approved provided the approval is still valid and has not expired. Any subsequent changes of use or intensity shall be subject to the policies of this Area Plan.
- **Community Standards Districts:** Community-specific zoning regulations shall be consistent with the goals and policies of this Area Plan. Such regulations shall be instituted only when a unique or detrimental condition exists within a community that prevents implementation of this Area Plan.
- **Regulatory Codes:** Title 21 (Subdivision) and 22 (Zoning) of the Los Angeles County Code provide detailed development guidelines that work to implement this Area Plan. Project applications shall refer to these codes, including Community Standards Districts, to ensure that development and land use activities are compatible with the zoning and to not threaten the health, safety, and welfare of the communities.
- **Staff Consultation:** While the Antelope Valley Area Plan is meant to be a guide for the public in determining allowable uses of private property, the public is encouraged to consult with members of the County’s planning staff prior to investing in the preparation of development plans that might later prove to be inconsistent with the Antelope Valley Area Plan.

In addition to the direction provided by this Area Plan, new development and land use activities are regulated by many agencies other than the Department of Regional Planning. Obtaining approval for certain types of actions may require proof of the availability for public services, fair-share provisions for public facilities, and other permitting. The applicant for any such application is advised to consult with all applicable departments and agencies.

Antelope Valley Area Plan

COMM-1

June 2015

### I. Background

#### Purpose

The previous Chapters of this Area Plan set forth general goals and policies that may be applied throughout the unincorporated Antelope Valley. However, each community varies in its nature, form, and character. The Community-Specific Land Use Concepts contained in this Chapter describe in greater detail how this Area Plan, particularly the Land Use Element, is to be implemented in each community within the unincorporated Antelope Valley.

The Land Use Concepts (Concepts) attempt to provide expectations for how each rural community may change and grow throughout the life of this Area Plan. The Concepts specify the desired land uses for each area and identify potentially incompatible land uses that would not be desirable. Residents, stakeholders, and decision-makers should refer to the Concepts to familiarize themselves with the setting and character of each community and should use this information when considering the appropriateness of land use development projects, infrastructure improvements, and consideration efforts.

The following communities are addressed in this Chapter:

- Acton
- Antelope Acres
- Crystalaire
- El Dorado and White Fence Farms
- Elizabeth Lake and Lake Hughes (The Lakes)
- Fairmont
- Gorman
- Green Valley
- Juniper Hills
- Lake Los Angeles
- Lakeview
- Leona Valley
- Littlerock and Sun Village (Southeast Antelope Valley)
- Llano
- Neenach
- Pearblossom
- Quartz Hill
- Roosevelt
- Three Points

#### Vision and Strategy

The Area Plan's Vision Statement acknowledges that the unincorporated Antelope Valley "is a mosaic of unique small towns" and the Community-Specific Land Use Concepts are intended to reflect each community's unique nature, form, and character, as well as each community's unique vision of the future. The Area Plan's Rural Preservation Strategy seeks to achieve the Area Plan's Vision Statement

Antelope Valley Area Plan

COMM-2

June 2015

# Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

through a framework of rural town centers, rural town areas, rural preserve areas, and economic opportunity areas. The Community-Specific Land Use Concepts describe how this framework has been applied to each community and refines the framework in a manner that addresses each community's individual needs. Overall, this Chapter ensures that the Area Plan will serve as a living document that will shape future implementation efforts in a manner that is both complementary of the overall Vision Statement and Rural Preservation Strategy and relevant to, and appropriate for, each community within the unincorporated Antelope Valley.

**Community Standards Districts**

Some of the communities described in this Chapter are within Community Standards Districts (CSD's). CSD's are overlays in the Zoning Code that provide specific development standards with unique land use issues that are not adequately addressed by the County's Subdivision and Zoning Codes. CSD's, as well as other applicable County Code requirements, should be consulted when projects are being considered in a community.

**II. Land Use Concepts**

**Acton**

The community of Acton is located in the southwestern portion of the Antelope Valley, south of the City of Palmdale along State Route 14. The community is adjacent to the National Forest, and natural hillsides and significant ridgelines separate the community from the City of Palmdale and the remainder of the Antelope Valley. Community residents are concerned about urbanization of the area and wish to remain an unincorporated rural community with a unique identity. Some portions of the community are partially developed with a variety of agricultural uses and single-family homes on large lots. Other portions are largely undeveloped, are generally not served by existing infrastructure, contain environmental resources, such as Significant Ecological Areas and Hillside Management Areas, and are subject to safety constraints, such as Very High Hazard Severity Zones.

The community has a rural town center area along Crown Valley Road between Gillespie Avenue and Soledad Canyon Road. The rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of residents and provide local employment opportunities. New buildings in the rural town center area shall be limited to two stories in height and shall include Old West design elements with earth tone colors at a pedestrian-oriented scale, with primary building entries facing Crown Valley Road or adjacent local streets. New development in the rural town center that would require the installation of urban infrastructure, such as concrete curbs and gutters, street lights, and traffic signals, shall be strongly discouraged as this does not fit with the community's unique rural character and identity.

The rural town centers shall continue to be the focal point of the community and shall be linked to the surrounding rural town area through trails and pedestrian routes. Pedestrian routes shall have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as plazas and community bulletin boards, are encouraged in this area.

Some areas outside the rural town center area have also been designated as Rural Commercial (CR) to acknowledge existing uses and to provide additional commercial services and local employment opportunities. The intent of these designations is to allow low-intensity local commercial uses that

4451-9069

serve community residents and to prohibit high-intensity regional commercial uses that serve travelers along State Route 14. Moving west to east through the community, areas with this designation include:

- Two parcels along Sierra Highway, generally between Sand Creek Drive and Wanstead Drive, north of State Route 14;
- A parcel along Sierra Highway, east of Red Rover Mine Road and north of State Route 14;
- Several parcels surrounding the intersection of Crown Valley Road and Sierra Highway and of Crown Valley Road and Antelope Woods Road, both of which are adjacent to State Route 14;
- A parcel at the northeast corner of Soledad Canyon Road and Santiago Road;
- Several parcels at the northwest and northeast corners of the intersection of Sierra Highway and Santiago Road, north of State Route 14;
- Several parcels along the south side of Sierra Highway between San Gabriel Avenue and State Route 14; and
- Several parcels along the north side of Sierra Highway, west of State Route 14.

New buildings in these CR designations shall also be limited to two stories in height, shall include Old West design elements with earth tone colors at a pedestrian-oriented scale, and shall be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes shall have permeable paving, consistent with rural community character, instead of concrete sidewalks. Development in these CR designations that would require the installation of urban infrastructure, such as concrete curbs and gutters, street lights and traffic signals, shall be discouraged as this does not fit with the community's unique rural character and identity. New commercial uses outside of these CR designations, or outside the CR designation within a rural town center area, are also strongly discouraged, as they are not compatible with the community character.

Some areas within the community have been designated as Light Industrial (IL) to acknowledge existing uses and to provide additional local employment opportunities. Moving west to east through the community, areas with this designation include:

- Several parcels at the northeast and southeast corners of Sierra Highway and Red Rover Mine Road;
- Several parcels along Soledad Canyon Road, south of the Crown Valley Road intersection and the rural town center area;
- Several parcels along Soledad Canyon Road, northeast of the Crown Valley Road intersection, and also along Syracuse Avenue and Gillespie Avenue, all east of the rural town center area;
- Several parcels along the south side of Soledad Canyon Road between Santiago Road and Malinta Avenue; and

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

- Several parcels along Sierra Highway, west and north of the Vincent Grade/Acton Metrolink Station.

New buildings in these IL designations shall be limited to two stories in height, shall include Old West design elements with earth tone colors at a pedestrian-oriented scale, and shall be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes shall have permeable paving, consistent with rural community character, instead of concrete sidewalks. Development in these IL designations that would require the installation of urban infrastructure, such as concrete curbs and gutters, street lights and traffic signals shall be strongly discouraged as this does not fit with the community's unique rural character and identity. New industrial uses outside of these IL designations are also strongly discouraged, as they are not compatible with the community character.

All advertising signs shall be limited to no more than 35 feet. More restrictions on the allowed Floor Area Ratio (FAR), drive-through services and other such regulations may be adopted by the community through their Community Standards District. Please see Chapter 8 (Plan Implementation) of this Area Plan for more details.

Most of the community is considered to be a rural town area. The rural town area has been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land, Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land, and Rural Land 1 (RL1), with a maximum density of 1 residential unit for each 1 gross acre of land. Small portions of the rural town area have other designations, as follows:

- The area generally bounded by Syracuse Avenue to the north, Bartlett Street and 1st Street to the west, Cory Avenue and 9th Street to the south, and 3rd Street to the east has been designated as Residential 5 (H5), with a maximum density of 5 residential units for each 1 net acre of land. In addition, a few parcels between Syracuse Avenue and Gillespie Avenue, east of Crown Valley Road, have been designated as H5; and
- The area surrounding the H5 designation, generally bounded by Sacramento Avenue to the north, 41st Street West and 40th Street West to the west, 9th Street and Spring Avenue to the south, and Crown Valley Road to the east, has been designated as Residential 2 (H2), with a maximum density of 2 residential units for each 1 net acre of land.
- The RL5, RL2, RL1, H2, and H5 designations are intended to reflect the existing densities within various parts of the rural town area, which are developed or partially developed as the result of previous land divisions. The RL5, RL2, RL1, H2, and H5 designations are not intended to promote further land divisions. New land divisions in the rural town area shall maintain a large minimum lot size to ensure consistency with the desired community character.

The majority of new residential development in Acton shall be directed to the rural town area instead of the surrounding rural preserve area, provided that such development is consistent with existing community character. New land divisions shall maintain a large minimum lot size. Various types of agriculture, equestrian, and animal-keeping uses should be allowed through the rural town area, provided that lots meet Zoning Code requirements for those uses. Home-based occupations may also be permitted throughout the rural town area, provided that they meet Zoning Code requirements.

Antelope Valley Area Plan

COMM-5

June 2015

4451-9069

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit per 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit per 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area shall be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

**Antelope Acres**

The community of Antelope Acres is located in the northwestern portion of Antelope Valley, west of the City of Lancaster. Community residents are concerned about urbanization of the area and wish to remain an unincorporated rural community with a unique identity. Some portions of the community are partially developed with light agricultural uses and single-family homes on large lots, while other portions are largely undeveloped and contain environmental resources, such as Significant Ecological Areas and Agricultural Resource Areas.

The community has a rural town center area located along 90th Street West between Avenue E-4 and Avenue E-12. The rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of residents and provide local employment opportunities. New buildings in the rural town center area should be limited to one story in height and should include Old West design elements at a pedestrian-oriented scale, with primary building entries facing 90th Street West. No other portions of the community have been designated for commercial or industrial use, and new commercial and industrial uses outside the rural town center area are strongly discouraged, as they are incompatible with the community character.

Over time, the rural town center areas should become the focal point of the Antelope Acres community and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as plazas and community bulletin boards, are encouraged in this area.

The community includes rural town areas that surround the rural town center area and are generally bounded by Avenue E and Avenue C to the north, 80th Street West to the east, Avenue F and Avenue F-8 to the south, and 95th Street West and 90th Street West to the west. These areas have been designated as Rural Land 2 (RL2), with a maximum density of 1 residential unit per 2 gross acres of land. This designation is intended to reflect the existing density of the rural town areas and is not intended to promote further land divisions. New land divisions in the rural town areas shall maintain a large minimum lot size to ensure consistency with the existing community character.

The majority of new residential development in Antelope Acres should be directed to the rural town areas instead of the surrounding rural preserve areas, provided that such development is consistent with the existing community character and allows for light agriculture, equestrian, and animal-keeping uses should be allowed through the rural town area, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be discouraged in the rural town areas because of potential impacts on existing residents. Home-based occupations are also appropriate in the rural town areas, provided that they meet Zoning Code requirements.

Antelope Valley Area Plan

COMM-6

June 2015

# Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints and environmental resources. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Crystalaire

The community of Crystalaire is located in the southeastern portion of the Antelope Valley, south of Llano, and includes a golf course and a small airport which are described in more detail below. Some portions of the community are developed with single-family homes on large lots. Other portions are largely undeveloped and contain environmental resources, such as Significant Ecological Areas, and are subject to safety hazards, such as Flood Zones, particularly along Big Rock Creek and Big Rock Wash..

The community currently does not have a rural town center area but a stretch of 165th Street East between East Avenue W-12 and East Avenue X, in front of Crystalaire Airport has been designated Mixed Use – Rural (MU-R) in anticipation of a future town center to develop in this area. New commercial uses outside of this MU-R designation are strongly discouraged, as they are not compatible with the community character.

The community includes a rural town area that includes the existing subdivision near the Crystalaire Country Club and adjacent lands that are generally bounded by 165th Street East to the east and Avenue Y-4 to the south. This area has been designated as Residential 2 (H2), with a maximum density of 2 residential units for each 1 net acre of land. This designation is intended to reflect the existing density of the rural town area. New land divisions in this area shall have large lot sizes that are consistent with the existing subdivision near the Crystalaire Country Club.

The majority of new residential development in Crystalaire should be directed to the rural town area instead of the surrounding rural preserve areas, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited because of potential impacts on existing residents. Home-based occupations may also be permitted in this area, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Crystalaire Airport

The Crystalaire Airport is a privately owned and operated aviation facility that occupies several parcels. These parcels have been designated as Public and Semi-Public (P) to acknowledge the existing airport use and to allow for its continued operation. However, the Area Plan acknowledges that these parcels

Antelope Valley Area Plan

COMM-7

June 2015

4451-9069

also contain commercial and industrial uses and are an appropriate location for such uses given its proximity to the communities of Crystalaire and Llano. Accordingly, at the time of this Area Plan's adoption, the parcels were zoned Rural Commercial – Mixed Use (MXD-RU) and Light Industrial (M-1). This Area Plan allows commercial mixed-use and industrial uses on these parcels without a Plan Amendment, provided that these are compatible with airport operations and that these do not restrict or prohibit the operations of the airport.

### Crystalaire Golf Course

The Crystalaire Golf Course is a privately owned golf facility that occupies several parcels. These parcels have been designated as Open Space – Parks (OS-PR) and zoned Commercial – Recreation (C-R) to acknowledge the existing residential recreational use and its open space character on the property, and to allow for its continued operation. The Area Plan also acknowledges that some limited residential uses may be appropriate as accessory to the primary use as a golf course. Thus the Area Plan allows some limited residential uses on these parcels without a Plan Amendment, provided that the golf course is in continued operation and that the residential uses occupy not more than 10 percent of the total area. All requirements of the base zone shall apply, including but not limited to, an approved conditional use permit.

### El Dorado and White Fence Farms

The communities of El Dorado and White Fence Farms are located in the central portion of the Antelope Valley and are surrounded by the cities of Lancaster and Palmdale. Although these communities are adjacent to urbanized areas, such as the Rancho Vista community and the Antelope Valley Mall, they have a distinctly rural character. The communities are partially developed with light agricultural uses and single-family homes on large lots.

These communities do not have a rural town center area, but they are served by the rural town center area in Quartz Hill and by commercial centers in the adjacent cities. Two parcels on 10th Street West and one parcel on Avenue N have been designated as Rural Commercial (CR) in recognition of existing commercial uses. No other portions of the communities have been designated for commercial or industrial use, and new commercial uses outside of these CR designations and new industrial uses are strongly discouraged, as they are not compatible with the communities' character.

The communities are considered to be a rural town area and have been designated as Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land. This designation is intended to reflect the communities' existing density and is not intended to promote further land divisions. New land divisions shall maintain a large minimum lot size to ensure consistency with the existing character of the communities.

Light agriculture, equestrian, and animal-keeping uses are appropriate in these communities, but heavy agriculture uses should be discouraged because of potential impacts on existing residents. Home-based businesses are also appropriate in these communities, provided that they meet Zoning Code requirements.

Antelope Valley Area Plan

COMM-8

June 2015

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

**Elizabeth Lake and Lake Hughes (The Lakes)**

The communities of Elizabeth Lake and Lake Hughes are located in the southwestern portion of the Antelope Valley, northwest of Leona Valley, and are partially within the National Forest. Some portions of the community are developed or partially developed with single-family homes, light agricultural uses, and a limited amount of commercial and industrial uses. Other portions are largely undeveloped, are generally not served by existing infrastructure, contain environmental resources, such as Significant Ecological Areas and Hillside Management Areas, and are subject to safety constraints, such as the San Andreas Fault and Very High Fire Hazard Severity Zones.

The communities share one rural town center area in Lake Hughes, located along Elizabeth Lake Road between Trail I and Mountain View Road, west of the Lake Hughes Community Center. The rural town center area has been designated as Rural Commercial (CR) and Light Industrial (IL) to serve the daily needs of residents and provide local employment opportunities. New buildings in the rural town center area should be limited to two stories in height and should be designed at a pedestrian-oriented scale, with primary building entries facing Elizabeth Lake Road or adjacent local streets.

The rural town center area should continue to be the focal point of the communities and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as plazas and community bulletin boards, are encouraged in this area.

Some areas outside the rural town center area have been designated as Rural Commercial (CR) to acknowledge existing uses and to provide additional commercial services and local employment opportunities. Moving west to east through the communities, areas with this designation include:

- Several parcels along Lake Hughes Road between Elizabeth Lake Road and Desswood Road (Lake Hughes); and
- Two parcels at the southwest corner of Elizabeth Lake Road and Johnson Road (Elizabeth Lake).

New buildings in these CR designations should also be limited to two stories in height, should be designed at a pedestrian-oriented scale, and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. New commercial uses outside of these CR designations, or outside the CR designations within the rural town center area, are strongly discouraged, as they are not compatible with the communities' character.

Several parcels at the southwest corner of Elizabeth Lake Road and Lake Hughes Road have been designated as Light Industrial (IL) to acknowledge an existing use. New industrial uses outside of this IL designation, or outside the IL designation within the rural town center area, are strongly discouraged, as they are not compatible with the communities' character.

The community of Elizabeth Lake includes rural town areas. The primary rural town area surrounds the Elizabeth Lake water body. North of Elizabeth Lake Road, the primary rural town area is generally bounded by Hawk Drive, Gist Drive, and hillsides to the north, Munz Ranch Road to the west, and Pekaboo Road and hillsides to the east. South of Elizabeth Lake Road, the primary rural town area is generally bounded by Sandrock Drive, Ranch Club Road, and Elizabeth Lake Road to the north, the

Antelope Valley Area Plan                      COMM-9                      June 2015

4451-9069

National Forest boundary to the west, the National Forest boundary, Ranch Club Road, and Kiptree Drive to the south, and Elizabeth Lake Road to the east. The primary rural town area has been designated as Residential 5 (H5), with a maximum density of 5 residential units for each 1 net acre of land. A few parcels north of Elizabeth Lake Road have been designated as Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land. The H5 and RL2 designations are intended to reflect the existing densities within the primary rural town area, which resulted from previous land division activities. The H5 and RL2 designations are not intended to promote further land divisions. The privately owned portion of Elizabeth Lake water body is considered to be one of the communities' rural preserve areas, which are discussed below.

A secondary rural town area in Elizabeth Lake is located north of Johnson Road between Leadhill Drive and Limeridge Drive and is partially developed as the result of previous land division activities. The secondary rural town area has been designated as Residential 9 (H9), with a maximum density of 9 residential units for each 1 net acre of land. The H9 designation is intended to reflect the existing density of this area and is not intended to promote further land divisions.

The community of Lake Hughes also includes a rural town area. The rural town area extends west from the rural town center area and is generally bounded by Elizabeth Lake Road, Elderberry Street, High Trail, Lone Pine Trail, and hillsides to the north, Muir Drive and a line approximately 1,500 feet west of Lake Hughes Road to the west, Desswood Road, New View Drive, and South Shore Drive to the south, and Mountain View Road to the east. The rural town area has been designated as Residential 5 (H5), with a maximum density of 5 residential units for each 1 net acre of land. A few parcels west of Lake Hughes Road have been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. The H5 and RL5 designations are intended to reflect the existing densities within the rural town area, which resulted from previous land division activities. The H5 and RL5 designations are not intended to promote further land divisions.

The majority of new residential development in Elizabeth Lake and Lake Hughes (collectively known as The Lakes) should be directed to the rural town areas instead of the surrounding rural preserve areas, provided that such development is consistent with existing community character. New land divisions in the rural town area shall maintain a large minimum lot size to ensure consistency with the desired community character. Light agriculture, equestrian, and animal-keeping uses should be allowed throughout the rural town area, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited throughout the rural town areas because of potential impacts on existing residents. Home-based businesses may be permitted throughout the rural town areas, provided that they meet Zoning Code requirements.

The remaining lands in the communities are considered to be rural preserve areas and have been designated as Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety constraints. Development in rural preserve areas should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate. The privately owned portion of the Elizabeth Lake water body has been designated as RL20 and the Area Plan supports efforts to acquire this area and preserve it as open space (see Conservation and Open Space Element, Policy COS 18.1).

Antelope Valley Area Plan                      COMM-10                      June 2015

# Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

**Fairmont**

The community of Fairmont is located in the northwestern portion of the Antelope Valley, west of Antelope Acres and near the Antelope Valley California Poppy Reserve. The community is largely undeveloped and is generally not served by existing infrastructure and public facilities, but it does contain some single-family homes on large lots and some agricultural uses. The community includes environmental resources, such as Significant Ecological Areas, and is subject to safety hazards, such as fault zones.

The community does not have a rural town center area. No portion of the community has been designated for commercial or industrial use, except for a parcel along Avenue D to reflect an existing use. New commercial or industrial uses are strongly discouraged, as they are not compatible with the community character.

The entire community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

**Gorman**

The community of Gorman is located in the far northwestern portion of Antelope Valley along the Golden State Freeway (Interstate 5). A portion of the community is partially developed with commercial uses that primarily serve travelers along the Freeway, along with some single-family homes and light agricultural uses. The remainder of the community is largely undeveloped, is generally not served by existing infrastructure, and contains environmental resources such as Hillside Management Areas and Significant Ecological Areas.

The community has a rural town center area surrounding the Golden State Freeway interchanges at Gorman School Road. The rural town center area has been designated as Major Commercial (CM) to serve the daily needs of residents and interstate travelers.

Some areas outside the rural town center area have also been designated Rural Commercial (CR) in recognition of existing commercial uses and future opportunities to serve interstate travelers. The existing Flying J Travel Plaza on Frazier Park Road and two parcels east of it also have been designated as Rural Commercial (CR). Several parcels surrounding Smokey Bear Road have been designated as Rural Commercial. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside these CR and CM designations and new industrial uses are strongly discouraged, as they are incompatible with the community character.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints and environmental resources. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

Antelope Valley Area Plan

COMM-11

June 2015

4451-9069

**Green Valley**

The community of Green Valley is located in the southwestern portion of the Antelope Valley, south of Elizabeth Lake, and is completely within the National Forest. A large portion of the community is developed with single-family homes and commercial uses, while the remaining portion is largely undeveloped and contains scenic hillsides that are located in a Very High Fire Hazard Severity Zone.

The community does not have a rural town center area but is served by the rural town center areas in Lake Hughes Road and Leona Valley. Two areas, generally located at the intersections of Spunky Canyon Road and San Francisquito Canyon Road and of Spunky Canyon Road and Calle Olivera, have been designated as Rural Commercial (CR), recognizing existing uses that serve the daily needs of residents and provide local employment opportunities. New buildings in these areas should be limited to one story in height and should be designed at a pedestrian-oriented scale. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside these CR designations and new industrial uses are strongly discouraged, as they are incompatible with the community character.

The community includes rural town areas which are developed or partially developed as the result of previous land division activities. These areas generally extend southeast from San Francisquito Canyon Road and generally extend both north and south from Spunky Canyon Road, and are bounded by hillsides. These areas have been designated as Residential 9 (H9), with a maximum density of 9 residential units for each 1 net acre of land. The H9 designation is intended to reflect these areas' existing densities and development pattern, and is not intended to promote further land divisions.

The majority of new residential development in Green Valley should be directed to the rural town areas instead of the surrounding rural preserve area, provided that such development is consistent with existing community character. Light agriculture, equestrian and animal-keeping uses should be allowed in these areas, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited in these areas because of potential impacts on existing residents. Home-based occupations may also be permitted in these areas, provided that they meet Zoning Code requirements.

The remainder of the privately-owned land in the community is considered to be a rural preserve area and has been designated as Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

**Juniper Hills**

The community of Juniper Hills is located in the southern portion of the Antelope Valley, south of Littlerock and Pearblossom. The community is largely developed and is generally not served by existing infrastructure and public facilities, but it does contain many single-family homes on large lots and some agricultural uses. The community is adjacent to the National Forest, includes scenic hillside areas, and is subject to several safety hazards, including the San Andreas Fault and Very High Fire Hazard Severity Zones.

Antelope Valley Area Plan

COMM-12

June 2015

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

The community does not have a rural town center area but is served by the rural town center areas in Littlerock and Pearblossom. The Juniper Hills Community Center on 106th Street East serves as a community meeting place, in lieu of a rural town center area, and residents have expressed a desire for a Post Office. No portion of the community has been designated for commercial or industrial use, and new commercial or industrial uses are strongly discouraged, as they are not compatible with the community character.

The entire community is considered to be a rural town area and has been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural town area should be limited to single-family homes on large lots, light agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

**Lake Los Angeles**

The community of Lake Los Angeles is in the eastern portion of the Antelope Valley. As of the 2000 Census, it had the largest population of any unincorporated community in the Valley. Many portions of the community are developed or partially developed with a wide range of uses and a distinctly rural character. The remaining portions are largely undeveloped and generally not served by existing infrastructure, include environmental resources, such as buttes and Significant Ecological Areas, and are subject to safety hazards, such as Flood Zones.

The community has a rural center area along Avenue O between 167th Street East and 172nd Street East, and along 170th Street East between Avenue O and Glenfall Avenue. The rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of residents and provide local employment opportunities. New buildings in the rural town center area should be limited to two stories in height and include Old West or Southwestern design elements at a pedestrian-scale, with primary building entries facing Avenue O or 170th Street East. New development in the rural town center area should not require the installation of urban infrastructure, such as concrete curbs and gutters and traffic signals.

The rural town center area should continue to be the focal point of the community and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Streetscape improvements are recommended for Avenue O and 170th Street East, including native landscaping, "Old West" style street lights that meet dark sky objectives (only where necessary for public safety), and coordinated street furniture, such as benches, bus shelters, and bicycle racks. Other public amenities, such as plazas and community bulletin boards, are also encouraged in this area.

Some areas outside of the rural town center area have also been designated as Rural Commercial (CR) to provide additional commercial services, such as feed and tack stores. These areas include the intersection of Avenue P and 170th Street East and the northwest and northeast corners of the intersection of Avenue ) and 175th Street East. New buildings in these areas should also be limited to two stories in height and include Old West or Southwestern design elements at a pedestrian-oriented scale with transportation links to surrounding rural town areas. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside these CR

Antelope Valley Area Plan

COMM-13

June 2015

4451-9069

designations and new industrial uses are strongly discouraged, as they are incompatible with the community character.

The community includes several rural town areas. One area is generally bounded by Avenue Q to the north, 150th Street East to the west, Palmdale Boulevard to the south, and 160th Street East to the east. This area has been designated as Rural Land 1 (RL1), with a maximum density of 1 residential unit per 1 gross acre of land. This designation is intended to reflect the area's existing density and is not intended to promote further land divisions. Another similar area is generally bounded by Avenue M-8, Penfield Avenue, and Avenue N to the north, 155th Street East, 150th Street East, and 152nd Street East to the west, Avenue N and Avenue O to the south, and 160th Street East and 165th Street East to the east. This area has also been designated as RL1, and this designation is also intended to reflect the area's existing density and is not intended to promote further land divisions.

Another rural town area is generally bounded by Avenue M, Avenue M-4, and Avenue M-12 to the north, 160th Street East to the west, Avenue N to the south, and 170th Street East, 175th Street East, and 180th Street East to the east. This area has been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit per 5 gross acres of land. This designation is intended to reflect the area's existing density and is not intended to promote further land divisions. The final rural town area is generally bounded by Avenue O and Avenue N to the north, 165th Street East and 160th Street East to the west, Avenue Q, Avenue P-12, Rawhide Avenue, and Avenue P to the south, and 165th Street East, 170th Street East, 175th Street East, and 180th Street East to the east. This area has been designated as Residential 2 (H2), with a maximum density of 2 residential units per 1 net acre of land. This designation is intended to reflect the area's existing density and is not intended to promote further land divisions. However, the buttes east of 170th Street East have been designated as RL5, acknowledging the need to limit development in scenic resource areas. The buttes west of 170th Street East, which are in a Significant Ecological Area, are considered to be in the rural preserve area, which is discussed below.

The majority of new residential development in Lake Los Angeles should be directed to the rural town areas instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited because of potential impacts on existing residents. Home-based businesses may also be permitted in the rural town areas, provided that they meet Zoning Code requirements. New land divisions in the rural town areas shall maintain a large minimum lot size to ensure consistency with the existing community character.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

**Lakeview**

The community of Lakeview is located in the southern central portion of the Antelope Valley, adjoining the City of Palmdale to the north and east, and includes Lake Palmdale. Although this community is adjacent to urbanized areas, it has a distinctly rural character. Some portions of the community are

Antelope Valley Area Plan

COMM-14

June 2015

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

partially developed with light agricultural uses and single-family homes on large lots. Other portions are largely undeveloped and generally not served by existing infrastructure, include environmental resources such as Hillside Management Areas, and are subject to safety hazards, such as Very High Fire Hazard Severity Zones.

The community does not have a rural town center area but is served by commercial centers in the adjacent City of Palmdale. A few parcels at the intersection of the State Route 14 and Avenue S, and two parcels along Sierra Highway between Pearblossom Highway and Barrel Springs Road, have been designated as Rural Commercial (CR). In addition, several parcels at the intersection of Pearblossom Highway and Sierra Highway, and a parcel on Avenue S west of State Route 14 have been designated as Light Industrial (IL). These designations recognize existing uses and opportunities for additional local services and employments. No other portions of the community have been designated for commercial or industrial use, and new commercial or industrial uses outside of these CR and IL designations are strongly discouraged, as they are not compatible with the community character.

The community includes a rural town area that is generally bounded by the City of Palmdale boundary to the north, the City of Palmdale boundary, Farnborough Avenue and Tovey Avenue to the west, a line approximately 1,300 feet south of Lakeview Drive and Barrel Springs Road to the south, and the City of Palmdale boundary to the east. North of Avenue S, this area has been designated as Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land. South of Avenue S, this area has been designated as Rural Land 1 (RL1), with a maximum density of 1 residential unit for each 1 gross acre of land, with the following exceptions:

- West of Tovey Avenue – RL2; and
- South of Lakeview Drive and west of El Camino Drive – RL2.

The RL1 and RL2 designations are intended to reflect this area’s existing densities. New land divisions in this area shall maintain large lot sizes that are compatible with the community character.

The majority of new residential development in Lakeview should be directed to the rural town area instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited because of potential impacts on existing residents. Home-based businesses may also be permitted in this area, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety hazards. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

**Leona Valley**

The community of Leona Valley is located in the southwestern portion of the Antelope Valley, adjacent to the National Forest, and is bounded by the City of Palmdale to the north and east. Community residents are concerned about urbanization of the area and wish to remain in an unincorporated rural

Antelope Valley Area Plan

COMM-15

June 2015

4451-9069

community with a unique identity. Some portions of the community are partially developed with light agricultural uses and single-family homes on large lots. Other portions are largely undeveloped, are generally not served by existing infrastructure, contain environmental resources, such as Significant Ecological Areas and Hillside Management Areas, and are subject to safety constraints, such as the San Andreas Fault and Very High Fire Hazard Severity Zones.

The community has a rural town center located at the intersection of Elizabeth Lake Road and 90th Street West. The rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of residents and provide local employment opportunities. New buildings in the rural town center area should be limited to one story in height and should be designed at a pedestrian-oriented scale, with primary building entries facing Elizabeth Lake Road or 90th Street West. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside of this CR designation and new industrial uses are strongly discouraged, as they are incompatible with community character.

The rural town center area should continue to be the focal point of the community and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as community bulletin boards, are encouraged in this area.

The community includes a rural town area that surrounds the rural town center. North of Elizabeth Lake Road, the rural town area is generally bounded by North Side Drive, Babia Street, and Penhaven Lane to the north, 100th Street West to the west, Elizabeth Lake Road to the south, and 86th Street West to the east. South of Elizabeth Lake Road, the rural town area is generally bounded by Leona Avenue and Elizabeth Lake Road to the north, 107th Street West, 98th Street West, and 92nd Street West to the west, hillsides and Odd Road to the south, and 86th Street West to the east. The rural town area has been designated as Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land. This designation is intended to reflect the existing density of the rural town area and is not intended to promote further land divisions.

The majority of new residential development in Leona Valley should be directed to the rural town area instead of the surrounding rural preserve area, provided that such development is consistent with existing community character. New land divisions shall maintain a large minimum lot size to ensure compatibility with the community character. Each new home should have a unique architectural design. Light agriculture, equestrian, and animal-keeping uses should be allowed throughout the rural town area, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture should be prohibited throughout the rural town area because of potential impacts on existing residents. Home-based businesses may also be permitted throughout the rural town area, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots (2.5 net acres or greater), light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

Antelope Valley Area Plan

COMM-16

June 2015

4451-9069

## Littlerock and Sun Village (Southeast Antelope Valley)

The communities of Littlerock and Sun Village are located in the southeastern portion of the Antelope Valley, east of the City of Palmdale. Residents of the communities are concerned about urbanization of the area and wish to remain as unincorporated rural communities with unique identities. Many portions of the communities are developed or partially developed with a wide range of uses and a distinctly rural character. The remaining portions are largely undeveloped and generally not served by existing infrastructure, include environmental resources such as Significant Ecological Areas, and are subject to safety hazards, such as Flood Zones.

Each community has a rural town center area. The Littlerock rural town center area is located along Pearblossom Highway between Little Rock Wash and 90th Street East. This rural town center area has been designated as Rural Commercial (CR), and Light Industrial (IL) to serve the daily needs of residents and provide local employment opportunities. This rural town center area also serves travelers along Pearblossom Highway. A possible expansion of the town center has also been identified further to the east where additional parcels have been designated Rural Commercial (CR) and Light Industrial (IL). New buildings in this rural town center area should be limited to two stories in height and include Old West or Southwestern design elements with earth tone colors at a pedestrian-oriented scale, with primary building entries facing Pearblossom Highway. The industrial designations in this rural town center have been expanded to accommodate light industrial uses appropriate for rural areas, such as truck storage facilities.

The Sun Village rural town center area is located along Palmdale Boulevard between Little Rock Wash and 95th Street East, and along 90th Street East between Palmdale Boulevard and Avenue Q-14. This rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of residents and provide local employment opportunities. New buildings in this rural town center area should be limited to three stories in height and include Southwestern, Spanish Mission, or Mediterranean design elements with earth tone colors at a pedestrian-oriented scale, with primary building entries facing Palmdale Boulevard or 90th Street East.

The two rural town center areas should continue to be the focal point of their respective communities and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Streetscape improvements are recommended for Palmdale Boulevard and 90th Street East in the Sun Village rural town center area, including native landscaping, "Southwestern" style street lights that meet dark sky objectives (only where necessary for public safety), and coordinated street furniture, such as benches, bus shelters, and bicycle racks. If Pearblossom Highway is relinquished by the State of California (Caltrans), similar streetscape improvements are recommended in the Littlerock rural town center area. Other public amenities, such as plazas and community bulletin boards, are encouraged in both rural town center areas.

Some areas outside the two town center areas have also been designated as Rural Commercial (CR) to provide additional commercial services and local employment. These areas include the intersection of Avenue T and 87th Street East and the northeast corner of Avenue S and 90th Street East. New buildings in these areas should also be limited to two stories in height and include Old West or Southwestern design elements with a pedestrian-oriented scale and transportation links to surrounding rural town areas. New commercial uses outside of these CR designations, are strongly discouraged, as they are not compatible with the communities' character.

Antelope Valley Area Plan

COMM-17

June 2015

4451-9069

Several parcels near the intersection of Avenue R-8 and 90th Street East and a parcel at the northwest corner of Avenue T-8 and 80th Street East have been designated as Heavy Industrial (IH), recognizing existing uses appropriate for rural areas, such as truck storage facilities. New industrial uses outside of these IH designations, or outside the IL designations within the Littlerock rural town center area, are strongly discouraged, as they are not compatible with the communities' character.

The community includes several rural town areas. The first rural town area surrounds the Littlerock rural town center area and is generally bounded by Avenue U to the north, the Little Rock Wash to the west, the California Aqueduct and Avenue U-4 to the south, and 89th Street East and 94th Street East to the east. This area has been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land, with the following exceptions:

- The area generally bounded by Avenue U to the north, the Littlerock Wash to the west, Pearblossom Highway to the south, and 75th Street East to the east, has been designated as Residential 5 (H5), with a maximum density of 5 residential units for each 1 net acre of land.

A second rural town area surrounds the Sun Village rural town center area and is generally bounded by Avenue Q to the north, the Little Rock Wash to the west, Avenue R to the south, and 115th Street East to the east. This rural town area has been designated as Rural Land 1 (RL1), with a maximum density of 1 residential unit for each 1 gross acre of land; and Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land.

A third rural town area is generally bounded by Avenue R to the north, the Little Rock Wash and 87th Street East to the west, Avenue U to the south, and 106th Street East, 116th Street East and 120th Street East to the east. This rural town area has been designated as RL1-and RL2.

The RL1, RL2, RL5 and H5 designations are intended to reflect the rural town area's existing densities and are not intended to promote further land divisions. All future land divisions must comply with any minimum lot sizes as set forth in the Southeast Antelope Valley Community Standards District.

The majority of new residential development in Littlerock and Sun Village (collectively known as Southeast Antelope Valley) should be directed to rural town areas instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited in the rural town areas because of potential impacts on existing residents. Home-based businesses may also be permitted in the rural town areas, provided that they meet Zoning Code requirements. New land divisions in the rural town areas shall maintain a large minimum lot size to ensure consistency with the desired community character.

The remainder of the communities is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

Antelope Valley Area Plan

COMM-18

June 2015

## Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

### Llano

The community of Llano is located in the southeastern portion of the Antelope Valley, along Pearblossom Highway (State Route 138). Some portions of the community are partially developed with light agricultural uses and single-family homes on large lots, while other portions are largely undeveloped, generally not served by existing infrastructure, and contain environmental resources, such as Significant Ecological Areas.

The community does not have a rural town center area but is served by the rural town center area in Pearblossom. A few parcels along Pearblossom Highway have been designated as Rural Commercial (CR) or Light Industrial (IL), recognizing existing uses and opportunities for additional local services and employment. No other portions of the community have been designated for commercial or industrial use, and new commercial or industrial uses outside these CR and IL designations are strongly discouraged, as they are not compatible with the community character.

The community includes a rural town area that is generally bounded by Pearblossom Highway to the north, 170th Street East and 172nd Street East to the west, Avenue W-14 to the south, and 175th Street East on the east. This area has been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. This designation is intended to reflect the existing density of the rural town area and is not intended to promote further land divisions.

The majority of new residential development in Llano should be directed to the rural town area instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses. Heavy agriculture uses should be prohibited in this area because of potential impacts on existing residents. Home-based businesses may also be permitted in this area, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints and environmental resources. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Neenach

The community of Neenach is located in the far western portion of the Antelope Valley, along Avenue D (State Route 138). Some portions of the community are partially developed with light agricultural uses and single-family homes on large lots, while other portions are largely undeveloped and contain environmental resources, such as Significant Ecological Areas and Agricultural Resource Areas.

The community does not have a rural town center area but is served by the rural town center areas in Antelope Acres and Lake Hughes. A few parcels on Avenue D have been designated as Rural Commercial (CR) or Light Industrial (IL) in recognition of existing and/or planned commercial and industrial uses. No other portions of the community have been designated for commercial or industrial use, and new

Antelope Valley Area Plan

COMM-19

June 2015

4451-9069

commercial and industrial uses outside of these CR and IL designations are strongly discouraged, as they may not be compatible with the community character.

The community includes rural town areas that are generally bounded by Avenue B to the north, 270th Street West and 260th Street West to the west, Avenue D to the south, and 250th Street West on the east. These areas have been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. This designation is intended to reflect the existing density of the rural town areas and is not intended to promote further land divisions.

The majority of new residential development in Neenach should be directed to the rural town areas instead of the surrounding rural preserve areas, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses. Heavy agriculture uses should be prohibited in rural town areas because of potential impacts on existing residents. Home-based businesses are also appropriate in the rural town areas, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints and environmental resources. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Pearblossom

The community of Pearblossom is located in the southeastern portion of the Antelope Valley, along Pearblossom Highway between Littlerock and Llano. Some portions of the community are developed with a wide range of uses and a distinctly rural character, while other portions are largely undeveloped, generally not served by existing infrastructure, and subject to safety hazards, such as Seismic Zones and Flood Zones.

The community has a rural town center area along Pearblossom Highway between 121st Street East and 133rd Street East. The rural town center area has been designated as Rural Commercial (CR) or Light Industrial (IL) to serve the daily needs of the residents and provide local employment opportunities. New buildings in the rural town center area should be limited to two stories in height and include Old West or Southwestern design elements at a pedestrian-oriented scale, with primary building entries facing Pearblossom Highway. No other portions of the community have been designated for commercial or industrial use, and new commercial and industrial uses outside of the rural town center area are strongly discouraged, as they are incompatible with the community character.

The rural town center area should continue to be the focal point of the communities and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as plazas and community bulletin boards, are encouraged in this area.

The community includes rural town areas that are generally bounded by Pearblossom Highway to the north, 121st Street East to the west, Avenue W, the California Aqueduct, and Avenue W-11 to the south, and 135th Street East on the east. North of Avenue W, these areas have been designated as Residential

Antelope Valley Area Plan

COMM-20

June 2015

Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

2 (H2), with a maximum density of 2 residential units for each 1 net acre of land or Residential 18 (H18), with a maximum density of 18 residential units for each 1 net acres of land. South of Avenue W and west of 128th Street East, these areas have been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. South of Avenue WE and east of 128th Street East, these areas have been designated as Rural Land 1 (RL1), with a maximum density of 1 residential unit for each 1 gross acre of land. These designations are intended to reflect existing densities of the area and are not intended to promote further land divisions.

The majority of new residential development in Pearblossom should be directed to the rural town areas instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses. Heavy agriculture uses should be prohibited in these areas because of potential impacts on existing residents. Home-based businesses may also be permitted in these areas, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure and safety resources. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

**Quartz Hill**

The community of Quartz Hill is located in the central portion of the Antelope Valley and is surrounded by the cities of Lancaster and Palmdale. The community is adjacent to urbanized areas and is largely developed with a wide range of uses, but it retains a semi-rural character and residents wish to keep it an unincorporated community with a unique identity.

The community has a rural town center area along 50th Street West between Avenue L-6 and Avenue M-2. The town center area has been designated as Mixed Use – Rural (MU-R) and Light Industrial (IL) to serve the daily needs of residents and provide local employment opportunities. No other portions of the community have been designated for industrial use, and new industrial uses outside of the rural town center area are strongly discouraged, as they are incompatible with the community character. New buildings in the rural town center area should be limited to two stories in height, include Old West or Southwestern design elements with earth tone colors, and should be designed at a pedestrian-oriented scale, with primary building entries facing 50th Street West. In the MU-R designation, a vertical mix of commercial and residential uses is encouraged – for example, a building with commercial uses on the first floor and residential or office uses on the second floor. A horizontal mix of commercial and residential uses may also be appropriate – for example, a commercial building facing 50th Street West, with a residential building located towards the rear of the same lot.

The rural town center area should continue to be the focal point of the community and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Streetscape improvements are recommended for 50th Street West, including native landscaping, “Western” street lights that meet dark sky objectives, and coordinated street furniture, such as benches,

4451-9069

bus shelters, and bicycle racks. Other public amenities, such as plazas and community bulletin boards, are also encouraged in this area.

Some areas outside the rural town center area have also been designated as MU-R to provide additional commercial services and housing opportunities. These areas include the northwest corner of Avenue N and 50th Street West and the Avenue L corridor between 42nd Street West and 50th Street West. New buildings in these areas should also be limited to two stories in height, include Old West or Southwestern design elements with earth tone colors, and should be designed at a pedestrian-oriented scale with transportation links to surrounding rural town areas. A vertical or horizontal mix of commercial and residential uses may be appropriate in these areas. No other portions of the community have been designated for commercial use, and new commercial uses outside these MU-R designations, or outside the MU-R within the rural town center area, are strongly discouraged, as they are incompatible with the community character.

As the Avenue L corridor between 42nd Street West and 50th Street West develops over time, it will become a secondary rural town center area and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Streetscape improvements are recommended for the Avenue L corridor between 42nd Street West and 50th Street West, including native landscaping, “Western” street lights that meet dark sky, and coordinated street furniture, such as benches, bus shelters, and bicycle racks. Other public amenities, such as plazas and community bulletin boards, are also encouraged in this corridor.

The remainder of the community is considered to be a rural town area. Two properties along Avenue M have been designated as Residential 30 (H30), with a maximum density of 30 residential units for each 1 net acre of land, in recognition of existing multi-family uses. Several parcels adjoining the rural town center area between Avenue L-8 and Columbia Way have been designated as Residential 18 (H18), with a maximum density of 18 residential units for each 1 net acre of land, recognizing existing multi-family units and providing additional housing opportunities. In addition, a property at the northwest corner of Avenue M and 70th Street West, and several parcels on the south side of Avenue L near 40th Street West, has been designated as H18. New multi-family buildings in the H18 designation should be limited to two stories in height and should be designed in a manner that is compatible with nearby single-family homes.

South of Avenue L, the remaining rural town area has been designated as Residential 5 (H5), with a maximum density of 5 residential units for each 1 net acre of land, or Residential 2 (H2), with a maximum density of 2 residential units for each 1 net acre of land. These designations are intended to reflect the area’s existing density and are not intended to promote further land divisions, although properties along Columbia Way between 40th Street West and 45th Street West present some land division opportunities. Light agriculture, equestrian, and animal-keeping uses may be permitted in these areas, provided that lots meet Zoning Code requirements for those uses. Home-based businesses may also be permitted in these areas, provided that they meet Zoning Code requirements.

North of Avenue L, the remaining rural town area has been designated as Rural Land 1 (RL1), with a maximum density of 1 residential unit for each 1 gross acre of land. This designation is intended to reflect the area’s existing density and is not intended to promote further land divisions. Light agriculture, equestrian, and animal-keeping uses are appropriate in this area, but heavy agriculture uses

# Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

4451-9069

should be prohibited because of potential impacts to existing residents. Home-based businesses are also appropriate in this area, provided that they meet Zoning Code requirements.

### Roosevelt

The community of Roosevelt is located in the northeastern portion of the Antelope Valley, north of the City of Lancaster. Community residents are concerned about the urbanization of the area and wish to remain an unincorporated rural community with a unique agricultural identity. Some portions of the community are partially developed with light agricultural uses and single-family homes on large lots, while some portions are in Agricultural Resource Areas and are partially undeveloped with farms and heavy agricultural uses. The remaining portions are largely undeveloped and contain environmental resources, such as Significant Ecological Areas.

The community has a rural town center area located at the intersection of Avenue J and 90th Street East. The rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of the residents and provide local employment opportunities. New buildings in the rural town center area should be limited to one story in height and should be designed at a pedestrian-oriented scale, with primary building entries facing Avenue J or 90th Street East.

The rural town center area should continue to be the focal point of the communities and should be linked to the surrounding rural town area through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as community bulletin boards, are encouraged in this area.

Two parcels on 90th Street East have been designated as CR and Light Industrial (IL) in recognition of existing commercial and industrial uses. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside of this IL designation are strongly discouraged, as they are not compatible with the community character.

The community includes rural town areas that are generally bounded by Lancaster Boulevard to the north, 85th Street East to the west, Avenue J-12 and Avenue J to the south, and 90th Street East on the east. These areas have been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. This designation is intended to reflect the existing density of the rural town areas and is not intended to promote further land divisions. New land divisions in the rural town areas shall maintain a large minimum lot size to ensure consistency with the existing community character.

The majority of new residential development in Roosevelt should be directed to the rural town areas instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses. Heavy agriculture uses should be prohibited in these areas because of potential impacts on existing residents. Home-based businesses may also be permitted in these areas, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, and Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints and environmental resources.

Antelope Valley Area Plan

COMM-23

June 2015

4451-9069

Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate. Agricultural uses in Agricultural Resource Areas will be protected and promoted, as directed in the policies of the Conservation and Open Space Element.

### Three Points

The community of Three Points is located in the far western portion of the Antelope Valley, south of Neenach and northwest of Lake Hughes. The community is largely undeveloped and is generally not served by existing infrastructure and public facilities, but it does contain some single-family homes on large lots and some agricultural uses. The community is adjacent to the National Forest, includes environmental resources, such as scenic hillsides and Significant Ecological Areas, and is subject to several safety hazards, including the San Andreas Fault and Very High Fire Hazard Severity Zones.

The community does not have a rural town center area but is served by the rural town center area in Lake Hughes. A parcel at the southwest corner of Three Points Road and Pine Canyon Road has been designated as Rural Commercial (CR) in recognition of an existing commercial use. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside of this CR designation and new industrial uses are strongly discouraged, as they are not compatible with the community character.

The entire community is considered to be a rural preserve area and has been designated as Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

Antelope Valley Area Plan

COMM-24

## Response to Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022)

### 4451-9055

This is an overview of the commenter's subsequent comments, to which the Authority responds in detail, below. In general, the Authority has concluded that its technical analysis is correct, comprehensive, and compliant with the requirements of both CEQA and NEPA. No further response is needed.

### 4451-9056

The commenter disputes the accuracy and methodology of the traffic analysis. The operations analysis of intersections, however, was conducted consistent with the Authority's approved methodology, which was based on the industry-standard Highway Capacity Manual (HCM) methodology (this is also the standard methodology for LA County Public Works Department). The comment seeks the LOS for every approach to every intersection. Consistent with the HCM, however, the Authority used a different, more conservative approach. For unsignalized intersections, the Draft EIR/EIS reports the level of service (LOS) differently for all-way and two-way stop-controlled intersections. At an all-way stop-controlled intersection, the Draft EIR/EIS reports the LOS on the intersection level, based on the weighted average control delay, considering all movements. At a two-way stop-controlled intersection, the uncontrolled approaches (i.e., those that do not have a stop sign) typically have minimal delays because they do not have to stop. Therefore, the Draft EIR/EIS reports the LOS for the intersection as the worst stop-controlled movement because that movement provides a conservative evaluation of entire intersection performance. In other words, for a two-way stop-controlled intersection, the Draft EIR/EIS reports the LOS as the worst LOS of the two approaches that have stop signs. In the case of the intersection of Antelope Woods Road and Crown Valley Road, the worst approach is presented in the Draft EIR/EIS. As shown in Table 3.2-23 of the Draft EIR/EIS, under the Existing plus Spoils Hauling Conditions SR14A, the results indicate LOS F (51.2 second/vehicle of delay), which is the result of the worst approach (eastbound). Conversely, the west approach would operate at LOS B and the north/south uncontrolled approaches would operate at LOS A. Therefore, the Draft EIR/EIS reports accurate LOS results that do not "mask" or "suppress" the construction trucks' impacts on intersection levels of service. The commenter suggests that the rural communities of Acton and Agua Dulce have "virtually all" unsignalized intersections, and the Draft EIR/EIS provides incorrect information on those intersections. As shown above, the traffic analysis followed the HCM and reported the results accurately. To be clear, the traffic method requires LOS analysis of potential construction-truck related impacts only for intersections that would have 17 or more construction trucks trips per day. The Authority completed that analysis consistent with the HCM. As discussed in Appendix 2-E and Section 3.2.4.2 of the Draft EIR/EIS, IAMFs and Mitigation Measures were identified to reduce the effect of construction vehicles on traffic circulation. In addition, the Authority would add traffic signals to affected unsignalized intersections to improve LOS and intersection operations. Other types of

## Response to Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4451-9056

measures that could be applied to address school-related activities include restricted hours for construction activities to avoid drop-off and pick-up times of schools, stationing flaggers at intersections, upgrades to drop-off and pick-up locations and procedures, temporary fencing, and outreach and education. These measures would reduce congestion during peak hours so that large back-ups would not occur. For reference, automobile delay is not considered a significant environmental impact under CEQA; as such, mitigation is not required. No further analysis is required.

### 4451-9057

Refer to Standard Response PB-Response-SOCIO-3: Health and Safety of Children.

The commenter is concerned about significant traffic impacts from construction of the SR14A Build Alternative at the intersection of Antelope Woods Road and Crown Valley, potential impacts to High Desert Middle School, and the results of the Draft EIR/EIS traffic analysis.

As documented in Section 3.2.6.3 of the Draft EIR/EIS, weekday AM and PM peak hour existing (no project) conditions were determined for year 2015 for all analysis locations, including the intersection of Crown Valley Road and Antelope Woods Road. These existing conditions were based on 2015 intersection and roadway counts, which reflected conditions before the COVID-19 pandemic. More information regarding the development of existing conditions is included in the Palmdale to Burbank Project Section: Transportation Technical Report. Electronic versions of the Technical Reports are available by submitting a request on the Authority's portal (available at: <https://hsr-ca.nextrequest.com/>). For more information about how to obtain a copy of this report, see Standard Response PB-Response-GEN-7: Access to Technical Reports.

As an important matter of clarification, the traffic study referenced in the comment (and in footnote 1) had incorrect geometry at the westbound approach: the intersection allows for two lanes (right and through-left), but the referenced study included only one lane. This would make the results of the study's operations analysis worse than actually occurs. The transportation analysis conducted for the project, and documented in the Transportation Technical Report, used the correct geometry at this location and, as a result, presents the most accurate results.

In response to the commenter's concerns regarding construction traffic near High Desert Middle School, based on the preliminary spoils generation site and haul routes, it is anticipated that construction spoils trucks would not pass directly in front of High Desert Middle School; instead, trucks would use the west leg of the intersection to access the spoils generation site. As such, they would be assigned to the southbound right-turn and eastbound left-turn movements, thus not using Antelope Woods Road east of the intersection with Crown Valley Road which is where High Desert Middle school is located. Thus, the SR14A Build Alternative would limit impacts associated with

## Response to Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4451-9057

construction and no changes to the EIR/EIS are required. For additional information related to schools and safety, please refer to Standard Response PB-Response-SOCIO-3: Health and Safety of Children.

The commenter also identifies what they refer to as a “far less appropriate mitigation measure” to “delay all construction traffic during morning and afternoon time intervals when school children are being picked up and dropped off.” As discussed in Section 3.2.4.2 of the Draft EIR/EIS, the Build Alternatives include several IAMFs that require the construction contractors to minimize traffic impacts during construction. These include TR-IAMF#2, which requires the development of a Construction Transportation Plan (CTP) that will, at a minimum, as it pertains to schools and school-aged children, include: “[p]rovisions for safe pedestrian and bicycle passage or convenient detour”; temporary bus stops away from construction and “[a]dequate measures...to separate students and parents walking to and from the temporary bus stop from the construction zone”; “[a]dvance notification to the local school district of construction activities and rigorously maintained traffic control at all school bus loading zones, to provide for the safety of schoolchildren” as well as a review of “existing or planned Safe Routes to Schools with school districts...to incorporate roadway modifications that maintain existing traffic patterns and fulfill response route and access needs during project construction and HSR operations”; the “[i]dentification and assessment of the potential safety risks of project construction to children, especially in areas where the project is located near...schools”; and the “[p]romotion of child safety within and near the project area. For example, crossing guards could be provided in areas where construction activities are located near schools...”. TR-IAMF#6 is also included, which restricts construction and truck delivery hours to avoid peak traffic periods, and TR-IAMF#7 which limits trucks to the appropriate routes and away from schools wherever possible.

The types of measures that could be applied at key intersections along Crown Valley Road to address school-related activities as part of these IAMFs include, but are not limited to, the following:• Filling and queuing trucks during truck limitation periods, which leave en masse after drop-off/pick-up times.• Aligning schedules so that routes located near schools overlap as much as possible with summer breaks.• Pause construction for the afternoon pick-up period, but then extend a few hours later.• Restrict construction activities on a case-by-case basis (by location) to minimize conflicts with

### 4451-9057

peak commute congestion, this typically occurs between 7:00-9:00 AM and 4:00-6:00 PM, or longer depending on which portion of the alignment. • Modify truck routes to avoid the most sensitive land uses, when they are active. As described above, the Authority has identified IAMFs that will, in effect, implement the commenter’s suggestions of limiting construction traffic when school children are being picked up and dropped off.

Lastly, as to the commenter’s concerns with traffic mitigation, as discussed in Draft EIR/EIS Appendix 2-E and Section 3.2.4.2 of the Draft EIR/EIS, IAMFs and Mitigation Measures were identified to reduce the effect of construction vehicles on traffic circulation. In particular, TR-MM#12 would reduce impacts associated with haul route traffic, including the scheduling of a majority of travel during off-peak hours, stationing traffic control officers, developing alternative routes to reduce trucks on sensitive facilities, and developing and implementing an outreach program. These elements would help address the effects of construction trucks on uses near the Antelope Woods Road and Crown Valley Road intersection. In addition, the contractor would be required to prepare and implement specific CMPs (congestion management practices) to ensure safe transit, pedestrian, and bicycle access during construction (TR-IAMF#4, TR-IAMF#5, TR-IAMF#11, and TR-IAMF#12).

The commenter suggested constructing temporary on- and/or off-ramps to and from SR 14 to accommodate construction spoils hauling trucks. This suggested measure would not be feasible because, for one reason, the Authority lacks the jurisdiction to execute this measure. Primarily, access to and from freeways is regulated by Caltrans, which has standards for interchange spacing, ramp grades, horizontal and vertical curves, sight distances, and other design and engineering factors. To provide access to these ramps, new roadways would need to be constructed. All these facilities would be located on property not owned by the Authority. In addition, these new facilities would need to be environmentally cleared and may result in significant impacts to the built and natural environment that would require supplemental mitigation.

## Response to Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4451-9058

The commenter provides comments about the accuracy of the spoils analysis and the traffic assumptions. The spoils hauling analysis presents two scenarios: one with all of the spoils deposited in locations to the north of the study area (called Northbound Routing) and one with all of the spoils deposited in locations to the south of the study area (called Southbound Routing). Contrary to the assumptions of the comment, the different routing directions do not always result in the spoils haul-trucks traveling only in those directions. A Southbound Routing spoils haul-truck may initially travel north to reach a roadway that would allow it to travel faster and to reach its destination in less time.

As shown in Table 3.2-20 of the Draft EIR/EIS, the Existing (2015) conditions would sometimes be the same for both the Northbound Routing and Southbound Routing options. That results because, whether going north or going south, the spoils haul-trucks would often use the same freeway and the same path to the freeway from the construction site. In other words, for study locations that are located outside of the influence of the freeway ramps, traffic volumes would be the same for both the Refined SR14 and SR14A Build Alternatives. As an example, the volumes on Sierra Highway west of Pear Blossom Highway (Map ID B) would be the same for the Northbound Routing and Southbound Routing because trucks would use this section of Pear Blossom Highway from the spoils generation site to the freeway interchange with SR 14; at the interchange, trucks would either access the northbound ramp or the southbound ramp—depending on the routing. Table 3.2-23 shows the traffic effects at the interchanges that result from the different routing. It shows different intersection level of service results for the Northbound Routing and Southbound Routing.

As noted in the text, Table 3.2-20 only presents roadway segments where the Refined SR14 and SR14A Build Alternatives would result in unacceptable operating conditions. Other locations and time periods were also assessed; however, the project would not result in unacceptable conditions at these locations. As such, this information was not included in the Draft EIR/EIS but can be found in the background Transportation Technical Report. No changes to the analysis is required to address this comment.

### 4451-9059

The commenter raises concerns about the applicability of some traffic mitigation measures in the study area and asserts that they are inconsistent with the local plans. The Antelope Valley Area Plan, in particular, states, "[the term 'rural' is defined by the following characteristics: . . . An absence of infrastructure generally found in urban and suburban areas, including but not limited to . . . street lighting, and traffic signals." Moreover, it states, "[n]ew development in the rural town center that would require the installation of urban infrastructure, such as . . . street lights, and traffic signals, shall be strongly discouraged as this does not fit with the community's unique rural character and identity." In other words, it is a non-mandatory policy because it only discourages installing street lights and traffic signals, but does not preclude them, and is silent as to their temporary use. Details on the IAMFs and Mitigation Measures can be found at in Appendix 2-E, Section 3.2.4.2 and Section 3.2.7 of the Draft EIR/EIS. TR-MM#4 is one of many mitigation measures that were developed to reduce the effect of spoils hauling on local intersections. TR-MM#4 states that temporary traffic signals may be provided during construction to improve traffic flows at unsignalized intersections. The Authority will not temporarily install signals at intersections if they do not meet signal warrants. Any new traffic signal would need to occur within existing pavement or disturbed graded right-of-way and would involve minor physical disturbance that could cause secondary environmental effects. In areas like Acton where use of temporary signals may not be appropriate from a land use/rural character perspective, other measures that could be considered include employing flaggers, temporary intersection/roadway restriping, modifications to haul routes, and the development of detour routes. It is the Authority's intention to remove temporary traffic signals installed to address construction traffic generated by spoils haul-trucks after the construction period is over. However, regardless, because the Antelope Valley Area Plan only discourages installing street lights and traffic signals, but does not preclude them and is silent on the use of temporary ones, the project's use of temporary construction signals is not inconsistent with the Plan. A project cannot be inconsistent with a non-mandatory policy.

As suggested by the commenter, the construction of temporary on- and/or off-ramps to and from SR 14 would not be feasible to accommodate construction spoils haul-trucks. Primarily, access to and from freeways is regulated by Caltrans, which has standards for interchange spacing, ramp grades, horizontal and vertical curves, sight distances, and other design and engineering factors. To provide access to these ramps, new roadways

## Response to Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4451-9059

would need to be constructed. All of these facilities would be located on property not owned by the Authority. In addition, these extensive new facilities would need to be environmentally cleared, and may result in significant impacts to the built and natural environment that would require supplemental mitigation.

### 4451-9060

The commenter addresses the Authority's required mitigation and also suggests that details of the mitigation measures are missing. Details on the IAMFs and Mitigation Measures can be found at in Appendix 2-E, Section 3.2.4.2 and Section 3.2.7 of the Draft EIR/EIS. IAMFs and Mitigation Measures were developed to address transit, pedestrian, and bicycle access during construction (TR-IAMF#4, TR-IAMF#5, TR-IAMF#11, and TR-IAMF#12). In particular, TR-IAMF#12 identifies the Authority's commitment to ensuring pedestrian and bicycle safety throughout construction. In addition, mitigation measures TR-MM#1 through TR-MM#8 identify improvements to intersections and roads, including modification of intersection configurations, addition of lanes, and the provision of temporary traffic signals. The analysis of safety hazards resulting from construction of the section is presented in Section 3.11.6.2.

The environmental analysis considers these IAMFs to be part of the project design. As such, the IAMFs are not deferred mitigation measures. The IAMFs reflect standard requirements for design and construction and standard procedures to be followed during construction. These will be incorporated into the project delivery specification and will result in a tangible avoidance or minimization of environmental impacts as described in the impact analysis sections. Additional information can be found under Impact TRA#7 in Section 3.2.6.3.

Section 3.2.6.3 presents the construction impacts and the spoils hauling effects on roadway segments, intersections, and on-ramps, including locations in the Town of Acton.

In Impact TRA#6, the Authority analyzed potential means to improve transit, bicycle, and pedestrian conditions during construction. Those may include modifications to haul routes, temporary relocation of bus stops and/or rerouting of bus routes, striping of improved bicycle facilities, temporary construction protection barriers, lighting enhancements, flaggers, intersection control modifications, and reduced speed limits. The Authority expects that mitigation measures like these will prevent hazardous conditions that would substantially interfere with pedestrian or bicycle movements or access during spoils hauling. That expectation provides the metric by which the Authority will measure the effectiveness of the mitigation measures.

## Response to Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### **4451-9061**

The commenter notes that some project spoils would be disposed of at the Vulcan Mine site but there are no specific agreements in place at this time for use of the Vulcan mine site. The Vulcan Mine site would be used for the deposition of spoils for both the Refined SR14 and the SR14A Build Alternatives. The Vulcan Mine site is located on ANF property within the boundaries of the SGMNM. The USFS, which manages the ANF and SGMNM, is a cooperating agency in the preparation of this EIR/EIS. The Authority and the USFS have discussed use of the Vulcan Mine for this purpose for many years and believe that use of the site, which would result in restoring much of it to a more natural topography, would be a beneficial use. As such, the Authority reasonably expects the necessary agreements will be obtained once the Preferred Alternative is selected and approved, and there is no evidence that necessary agreements cannot or will not be obtained. In the unexpected event that the Vulcan Mine cannot be used, the Authority would evaluate whether supplemental environmental review under CEQA and NEPA would be required.

### **4451-9062**

The commenter raises a question about the location and presence of roadways in the Agua Dulce area. Burke Road is a private roadway that intersects with Agua Dulce Canyon Road about 600 feet to the south of the SR 14 eastbound on- and off-ramp intersection with Agua Dulce Canyon Road. Burke Road connects with Agua Dulce Canyon Road at the east side of Agua Dulce Canyon Road. Draft EIR/EIS Table 3.2-7 refers to the segment of Agua Dulce Canyon Road between that private road and Briggs Edison Road.

No changes are required to the technical analysis documented in the Draft EIR/EIS.

### **4451-9063**

The commenter reiterates a statement from the Draft EIR/EIS that the Refined SR14 and SR14A Build Alternatives would degrade LOS to unacceptable levels for up to 6.4 years. The commenter also notes discrepancies that they provided in Comment #9061 (related to disposal at the Vulcan Mine Site) and Comment #9062 (related to the accuracy of the assumptions used about Burke Road). The commenter asks whether impacts would be more or less severe when the discrepancies noted in Comment #9061 and Comment #9062 are corrected. Please refer to Response to Comment #9061 and #9062, which describes why the assumptions used by the Authority are correct and why no revisions are needed to the Draft EIR/EIS in response to those comments. As such, there are no discrepancies that need to be addressed as part of Table 3.2-20 or in the relevant technical analysis. Since no changes are needed to the analysis, the impacts as identified will not be more or less severe and thus do not need to be modified in the EIR/EIS.

### **4451-9064**

The commenter reiterates a statement from the Draft EIR/EIS that the E1 and E1A Build Alternatives spoils hauling would degrade LOS and V/C ratios to unacceptable levels. The commenter also notes discrepancies that they provided in Comment #9061 (related to disposal at the Vulcan Mine Site) and Comment #9062 (related to the accuracy of the assumptions used about Burke Road). The commenter asks whether impacts would be more or less severe when the discrepancies noted in Comment #9061 and Comment #9062 are corrected. Please refer to Response to Comment #9061 and #9062, which describes why the assumptions used by the Authority are correct and why no revisions are needed to the Draft EIR/EIS in response to those comments. As such, there are no discrepancies that needs to be addressed as part of Table 3.2-21 or Table 3-22, or in the relevant technical analysis. Since no changes are needed to the analysis, the impacts as identified will not be more or less severe and thus do not need to be modified in the EIR/EIS.

## Response to Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4451-9065

The commenter states a concern regarding whether mitigation is deferred.

Mitigation Measures were identified to reduce the effect of construction vehicles on traffic circulation, pedestrians, bicyclists, and transit, as documented in Section 3.2.7 Mitigation Measures and Appendix 3.1-C: Standardized Mitigation Measures.

All mitigation measures would require documentation of implementation, monitoring and reporting, and subject to the Mitigation Monitoring and Enforcement Plan (MMEP). CEQA Guidelines Section 15126.4 (B) states: "formulation of mitigation measures shall not be deferred until some future time. The specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project's environmental review provided that the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be considered, analyzed, and potentially incorporated in the mitigation measure."

The Authority would commit to its mitigation through adoption of an MMEP. TR-MM#12 includes specific performance standards (i.e., maintaining the flow of traffic in and around the construction zone) as described in the Draft EIR/EIS. The Authority identifies the actions that can be achieved to meet performance standards (TR-MM#12 includes 9 bullet points of typical measures). In particular, TR-MM#12 intends to relocate spoils collection areas and to relocate access to minimize delays during peak hours. For these reasons, TR-MM#12 is not deferred.

### 4451-9066

The commenter questions whether restricting spoils truck-hauling hours to non-peak hours would disrupt the project timeline and schedule. As discussed in Section 3.2.4.2 of the Draft EIR/EIS, the Build Alternatives include several IAMFs that require the construction contractors to minimize traffic impacts during construction. These include TR-IAMF#2, which requires the development of a Construction Transportation Plan (CTP), TR-IAMF#6, which restricts construction and truck delivery hours to avoid peak traffic periods, and TR-IAMF#7, which limits trucks to the appropriate routes. In addition, other IAMFs address bicycle, pedestrian, transit, and rail access, off-street parking, and special events. In general, implementation of the IAMFs would reduce the potential for spoils hauling impacts by limiting the amount of trucks and construction workers during times when the use of the streets would be highest. Please note that the commenter states that "this seems a reasonable thing to do." If necessary, the contractor can apply the following measures at key intersections to address spoils hauling restrictions during peak periods: •Filling and queueing trucks during truck limitation periods, and leave *en masse* after peak periods. •Aligning schedules so that routes located near schools overlap as much as possible with summer breaks from school. •Pause construction for the afternoon peak period, but then extend a few hours later. •Restrict construction activities on a case-by-case basis (by location) to minimize conflicts with peak commute congestion, this typically occurs between 7:00-9:00 AM and 4:00-6:00 PM, or longer depending on which portion of the alignment. •Modify truck routes to avoid the most sensitive land uses, when they are active. Given the many options for avoidance and the different spoils hauling locations (i.e., some locations are not near school facilities and will not have restrictions and others are near school facilities), site-specific ways of managing trucks to stay out of the periods of importance to the local community would not affect the overall construction schedule.

## Response to Submission 4451 (Jacqueline Ayer, Acton Town Council, December 1, 2022) - Continued

### 4451-9067

This comment summarizes and recapitulates the commenter's prior assertions that data presented in the Traffic Analysis of the Draft EIR/EIS is unreliable and incorrect, and that there are other deficiencies and CEQA violations. Commenter requests the Traffic Impact section be revised and recirculated for public comment. This comment represents an overview of prior specific comments, to which the Authority has responded to with specificity as part of other comments on the Draft EIR/EIS. The Authority has concluded that its transportation analysis is comprehensive and accurately depicts the potential impacts from the construction and operation of the Build Alternatives and is in compliance with the requirements of CEQA and NEPA. The commenter has identified no new, significant impact that requires a supplemental environmental impact statement or recirculation.

### 4451-9068

The commenter is concerned about significant impacts with construction of either the Refined SR14 or SR14A Build Alternatives, in particular at the intersection of Antelope Woods Road and Crown Valley Road. Details of the assessment were included in response to Comment 9057.

In summary, the Authority analyzed weekday AM and PM peak hour existing (no project) conditions for year 2015 for all analysis locations, including the intersection of Crown Valley Road and Antelope Woods Road. More information regarding the development of existing conditions is included in the Transportation Technical Report. The Authority reviewed the Hall & Foreman traffic study submitted by the commenter as Attachment A. The Authority found that that study used incorrect geometry at the westbound approach to the intersection of Crown Valley Road and Antelope Woods Road: the intersection allows for two lanes (right and through-left), but the study included only one lane. This inaccuracy led the operations analysis to report worse LOS conditions than actually occur. The Authority's transportation evaluation conducted for the Draft EIR/EIS used the correct geometry at this location. No further response is needed.

### 4451-9069

The Authority has reviewed the attached excerpts of the Antelope Valley Area Plan. The Authority has also evaluated the Antelope Valley Area Plan in the Draft EIR/EIS, including in Section 3.13, and Appendix 2-H. It understands that the commenter provided these excerpts in support of Comment 9059. In responding to that comment, the Authority has referenced this plan, in particular.

## ANALYSIS OF THE "TRANSPORTATION" SECTION PRESENTED IN THE PALMDALE-BURBANK DRAFT ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT.

### 1.0 INTRODUCTION

The "Transportation" impact assessment presented in Chapter 3.2 of the Draft Environmental Impact Report/Environmental Impact Statement (hereafter referred to as "the Draft") that was prepared by the California High Speed Rail Authority ("CHSRA") for the Palmdale-Burbank Segment of the High Speed Rail Project ("Project") has been evaluated and numerous factual errors and material deficiencies have been identified. These errors and deficiencies are set forth in the comments presented below; they demonstrate that the Draft does not comply with the California Environmental Quality Act ("CEQA"). Please note: These comments were prepared by a competent engineer with more than 35 years of environmental engineering experience and they present expert opinion supported by facts pertaining to the significant environmental effects that will be caused by the Project and which must be mitigated. Accordingly, the comments provided herein constitute "substantial evidence" as that term is defined by the CEQA Statute [California Public Resources Code §21080(e)(1)] and Guidelines [California Code of Regulations Section 15064(f)(5)]. These comments also demonstrate that CHSRA/FRA have failed to conduct a substantive 'hard look' review of the Project's environmental impacts as required by NEPA.

### 2.0 MAJOR DEFICIENCIES NOTED IN THE DRAFT.

#### 2.1 The Draft Fails to Properly Report Traffic Impacts at Unsignalized Intersections.

It is appreciated that the Draft assesses traffic impacts at unsignalized intersections in a manner that is consistent with Chapters 19 and 20 of the "Highway Capacity Manual 2010" by using the "vehicle delay" methodology to assess "Level of Service" ("LOS") impacts rather than the "Volume to Capacity" or "v/c" methodology. However, the Draft fails to report the vehicle delay results properly. Specifically, at unsignalized intersections, vehicle delay values are supposed to be reported for all approaches to the intersection. For example, consider the intersection of Antelope Woods Road and Crown Valley Road in Acton; this intersection has 4 approaches (one each from the north, south, east, and west), thus Table 3.2-23 should report a separate LOS value for each of these four approaches. However, Table 3.2-23 reports only one; thus, it provides an incomplete and actually incorrect "picture" of the LOS at this location. Ironically, this omission will work to CHSRA's detriment because (as discussed below), the actual LOS that currently exists at the intersection of Antelope Woods Road and Crown Valley Road is "F" for westbound traffic and "E" for eastbound traffic, which means that that CHSRA's trucks exiting the "Acton Window" construction site will experience significant delays while trying to turn left to access the freeway and will become heavily "backed up" during peak morning hours. This problem that CHSRA trucks will experience is completely masked and arguably suppressed by the Draft because Table 3.2-23 only reports one value for the LOS at this intersection rather than 4 values representing the northbound, southbound, eastbound, and westbound approaches.

Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

4452-10243

The incomplete and incorrect LOS values reported for unsignalized intersections throughout the Project area render the results reported for both “existing” traffic conditions and “existing + Project” traffic conditions completely erroneous. This is of particular concern to the rural communities of Acton and Agua Dulce (where virtually all intersections are unsignalized) because it means that stakeholders have been provided incomplete and incorrect information regarding actual traffic impacts that will occur in our communities; this prevents us from providing meaningful comments on the Draft’s traffic impact analysis.

To address this problem, the Draft must be revised to properly report LOS values at unsignalized intersections under both “existing” and “existing + project” conditions, and it should be recirculated for public comment and review to ensure that the robust public process guaranteed by CEQA and NEPA is achieved.

**2.2 Traffic Impacts at the Intersection of Crown Valley Road and Antelope Woods Road will be much more Significant than What is Reported in the Draft.**

It has been repeatedly pointed out in meetings with CHSRA engineers and staff that the intersection of Antelope Woods Road and Antelope Valley Road is the most sensitive traffic area in the Community of Acton and that the excessive truck traffic that will result at this intersection if the SR14A alternative is selected will be significantly adverse. This intersection already experiences significant traffic loads that pose safety risks to our residents because it is 1) adjacent to the High Desert Middle School where children from Acton and Agua Dulce congregate after school while they walk to the Park or the Library; 2) it is immediately adjacent to 14 Freeway intersection that are heavily used by freeway commuters in the morning and afternoon to access the freeway-serving fast food and service station businesses located at freeway intersections; and 3) it is where traffic congestion is already significantly adverse, particularly in the morning during school drop-off events. Yet, the Draft indicated that there are no traffic problems at the intersection of Antelope Woods Road and Crown Valley; in fact, it assigns a current “Level of Service” (“LOS”) condition of “B” to this intersection [Table 3.2-23]. It is not known where this result came from or whether the traffic study that resulted in these LOS values was conducted at a time that accurately represents typical traffic conditions in the area; however, it is suspected that any traffic analysis that was conducted at this intersection occurred during the COVID pandemic because that is when the SR14A route alternative was developed. Accordingly, it is certain that the existing traffic conditions at the intersection of Antelope Woods Road and Crown Valley under normal conditions are very congested and that the intersection does not operate at an LOS of “B”. This is not conjecture; it is fact. A pre-pandemic traffic study conducted at this intersection in 2017 clearly shows that, during morning peak hours, the LOS at this intersection is “F”<sup>1</sup>. It is certain that current conditions are even worse now because the middle school has even more children than it did in 2017.

The Draft also fails to address the significant safety risks to school children and other pedestrians that will result from the increased construction traffic at this intersection if the SR14A route is selected. All of this renders the Draft deficient. The Draft must be revised to: 1) accurately report current traffic conditions at this intersection during Peak AM hours;

<sup>1</sup> See page 8 of the traffic study excerpt provided in Attachment 1; only an excerpt is provided because the traffic study itself is very lengthy; a complete copy of the traffic study can be provided upon request.

4452-10243

2) disclose the actual traffic impacts that will result when construction traffic caused by the SR14A alternative is added to the existing traffic situation at this intersection (especially during peak AM hours); and 3) disclose the child safety and pedestrian risks that already exist at this intersection and the extent to which these risks will be magnified by the construction traffic that will be added by the Project.

Most importantly, the Draft must recommend mitigation measures to reduce the safety risks and terrible traffic impacts that will result at the intersection of Antelope Woods Road and Crown Valley if the SR14A route is selected. The best mitigation measure would be to construct a temporary, dedicated onramp and offramp to the northbound lanes of the 14 freeway from the “Acton Window” construction location; this would deconflict the normal traffic on Crown Valley Road and mitigate safety issues associated with the proximity of potential construction traffic to the High Desert Middle School. A far less appropriate mitigation measure would be to delay all construction traffic during the morning and afternoon time intervals when school children are being picked up and dropped off.

**2.3 The Draft Reports Incorrect Peak Hour Traffic Levels on all Roadway Segments that are Analyzed and Also Omits Critical Data.**

According to Table 3.2-20, the “northbound” traffic volumes, v/c values, and LOS levels are identical to the “southbound” traffic volumes, v/c values, and LOS levels for every single roadway segment that is evaluated. This is a mathematical impossibility because (for instance) southbound traffic on Sierra Highway near Red Rover Mine Road during peak morning hours is much heavier than southbound traffic because Sierra Highway is a commuter corridor that connects the Antelope Valley to the Los Angeles basin; therefore, southbound lanes are much more heavily used in the morning than northbound lanes. Similar discrepancies are noted in Tables 3.2-21 and 3.2-22 (particularly for the segment of Sierra Highway west of Pearblossom). Another deficiency noted in Table 3.2-20 is that it only reports AM traffic conditions and traffic impact results for Sierra Highway west of Red Rover Mine Road in Acton; it omits PM traffic conditions and traffic impacts for Sierra Highway at this location entirely. This is a substantial deficiency; Northbound traffic on Sierra Highway west of Red Rover Mine Road is significant because Sierra Highway is a critical commuter corridor (as discussed above). Accordingly, the Draft must be revised to consider impacts on this roadway segment at all hours and not just during the morning. The fact is, it appears that none of the results presented in Tables 3.2-20, 3.2-21, and 3.2-23 are accurate or reliable; these are substantial deficiencies which prevent the public from providing meaningful comments on the Draft’s traffic impact analysis. The entire traffic analysis section of the Draft should be revised and recirculated for public comment and review to ensure that the robust public process guaranteed by CEQA and NEPA is achieved.

**2.4 The Traffic Mitigation Measures Offered by the Draft are Not Appropriate in Rural Communities of Los Angeles County and are in Fact Precluded by Adopted Planning Policies.**

Page 3.2-116 of the Draft identifies various traffic mitigation measures, and it specifically identifies the installation of traffic signals under mitigation measure TR-MM#4. This is entirely unacceptable to the residents of Acton because traffic signals are not appropriate in our rural community. The County of Los Angeles has adopted numerous policies in the County General Plan and the Antelope Valley Area Plan that make it explicitly clear that traffic signals and other

Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

4452-10243

urban infrastructure have no place in rural communities like Acton<sup>2</sup>. Thus, implementation of TR-MM#4 in the Community of Acton is contrary to every aspect of Acton's community profile and it utterly controverts many adopted plan policies and goals. It is understood that CHSRA's position is that it does not have to comply with local plans and policies [Page 3.2-12]; however, CEQA *does* compel CHSRA to ascertain whether the Project (or the Project's mitigation measure) is inconsistent with any general plan policies that were adopted for the purpose of avoiding or mitigating an environmental effect; if these inconsistencies result in significant environmental impacts, mitigation must be provided<sup>3</sup>. In other words, while the Project is not required to conform with local land use and zoning policies, CEQA nevertheless requires the Project to mitigate the significant environmental impacts that arise from non-conformance. There is no question that the installation of a traffic signal in Acton would be utterly inconsistent with environmental protection policies adopted by the County General Plan and AV Area Plan for the purpose of preserving Acton's rural profile by preventing the incursion of urban infrastructure; there is also no question that the installation of a traffic signal in Acton will result in unmitigable significant adverse impacts in the Community by advancing urbanization in a manner that is entirely contrary to our rural profile. Therefore, mitigation TR-MM#4 cannot be implemented in Acton and another solution must be found. For the SR14A route alternative in particular, it is recommended that CHSRA construct temporary onramps and offramps connecting to the 14 freeway directly from the "Acton Window" construction to avoid all construction traffic concerns in our community.

**2.5 CHSRA May Not Be Required to Develop Mitigation Measures to Reduce LOS Transportation Impacts of Project Construction, but CHSRA is Required to Identify and Mitigate Transportation Safety Impacts.**

The Draft points out several times that, because LOS is not an impact under CEQA, no mitigation measures are required to reduce LOS impacts. While LOS impacts may be "off the table", the traffic, pedestrian, bicycle, and equestrian safety concerns that arise from these LOS impacts are not "off the table", and CHSRA is mandated to address them. Yet, the Draft spends virtually no time discussing safety concerns; in fact, it does not even identify any particular safety concerns at any of the intersections and roadway segments that it analyzes! Worse yet, the Draft offers no mitigation measures for these (unidentified) safety concerns and instead offers vaguely described "Impact Avoidance and Minimization Features" ("IAMFs"). These IAMFs merely commit to the development of construction management plans; they incorporate no performance standards for mitigation and include no discussion on what level of mitigation will be achieved or whether the mitigation will fully address the significant safety impacts that the project will create. As discussed in more detail below, all of this violates CEQA's prohibition on deferring mitigation measures.

<sup>2</sup> Among other things, the AV Area Plan establishes "rural" as an area where traffic signals and other urban infrastructure is absent. See excerpts from the Antelope Valley Area Plan provided in Attachment 2. Also, Page 74 of the County General Plan defines "Rural" as "a way of life characterized by living in a non-urban or agricultural environment at low densities without typical urban services" and it explicitly identifies urban infrastructure as "curbs, gutters and sidewalks; street lighting, landscaping and traffic signalization; public solid waste disposal, integrated water and sewerage system; mass transit; and commercial facilities dependent upon large consumer volumes".

<sup>3</sup> California Code of Regulation, Title 14, Chapter 3, Appendix G.

4452-10243

**3.0 ADDITIONAL DEFICIENCIES NOTED IN THE DRAFT.**

For simplicity and to facilitate review, the deficiencies and factual errors noted in the Draft are presented sequentially by page number below,

Page 3.2-15 states in part *disposal of spoils at the Vulcan Mine site would require an agreement with the mine owner and coordination with the USPS*. This would imply that, unlike the other planned disposal sites (Boulevard Mine and CalMat Mine), an agreement is not currently in place to dispose of spoils at this location. This means that the Vulcan Mine site may not be where the spoils are disposed of and a different site will be used that will have different impacts. If the Vulcan Mine site is not where Project spoils will ultimately be deposited and another location is selected, CHSRA will be required to prepare a supplemental EIR/EIS and circulate it for public comment to ensure compliance with both CEQA and NEPA.

Page 3.2-31. Table 3.2-7 defines a segment of Agua Dulce Canyon Road between Burke Road and Briggs Edison Road; however, Burke Road does not intersect Agua Dulce Canyon Road. Therefore, it is unclear what the actual endpoints are for this segment and if it was consistently used throughout the analysis of all impacts presented in the Draft. The Draft must be revised to correct this error not only in the "Transportation" section but also in all other sections of the Draft that rely on this incorrect information.

Page 3.2-63 states "Refined SR14 and SR14A Build Alternative spoils hauling would degrade LOS to unacceptable levels at the roadway segments listed in Table 3.2-20 for up to 6.4 years, depending on location and Build Alternative." Based on the discrepancy noted above, it is not clear how this conclusion was reached; it is also not clear whether, after Table 3.2-20 is corrected, the impact will be more severe or less severe.

Page 3.2-64 states "The E1 and E1A Build Alternatives spoils hauling would degrade LOS and V/C ratios to unacceptable levels at the roadway segments listed in Table 3.2-21. Roadway segments in the spoils hauling RSA are displayed on Figure 3.2-4 though Figure 3.2-6. The E2 and E2A Build Alternatives spoils hauling would degrade LOS and V/C ratios to unacceptable levels at the roadway segments listed in Table 3.2-22." Based on the discrepancy noted above, it is not clear how this conclusion was reached; it is also not clear whether, after Table 3.2-21 is corrected, the impact will be more severe or less severe.

Page 3.2-71 states "Refined SR14 and SR14A Build Alternative spoils hauling would degrade LOS to unacceptable levels at the intersections listed in Table 3.2-23 for up to 6.4 years depending on location and Build Alternative". In particular, the Crown Valley intersection to the SR14 EB and WB ramps will be severely impacted due to the proximity to the window that will be used to support tunnel boring operations. In order to mitigate these impacts, TR-MM#12 requires development of a transportation Congestion Management Plan to address circulation and connections for modes of travel during the construction duration. This "mitigation measure" is completely unacceptable and it impermissibly defers consideration of appropriate mitigation measures in a manner that utterly violates CEQA. Section 15126.4(a)(1)(B) of the CEQA Guidelines makes it clear that "Formulation of mitigation measures shall not be deferred until some future time. The specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project's environmental review provided that the agency (1) commits itself to the mitigation, (2) adopts

# Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

4452-10243

specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be considered, analyzed, and potentially incorporated in the mitigation measure.” Mitigation measure TR-MM#12 does not meet this standard<sup>4</sup>: it does not include performance standards and it does not demonstrate that any of the measures it identifies can feasibly achieve anything. Therefore, CHSRA has absolutely no basis to conclude on page 3.2-71 that TR-MM#12 will be effective in reducing impacts associated with haul route traffic.

Page 3.2-80 indicates that a method for reducing traffic impacts will be to restrict construction/spoils hauling hours. While this seems a reasonable thing to do, it seems unlikely that such an approach will actually be implemented because it will interfere with the project schedule and interrupt the “work tempo” needed to achieve the project schedule. The Draft must be revised to explain how restricting construction hours were factored into the project timeline and completion schedule and thereby clearly demonstrate that this mitigation measure can be feasibly implemented.

#### 4.0 CONCLUSION

Because so much of the data that is presented in the Traffic Analysis section of the Draft is unreliable and simply incorrect, and because so many of the measures proposed in the Draft are deficient and violate CEQA because they defer mitigation determinations, the public has been prevented from providing appropriately responsive comments on the Draft. Therefore, the Traffic Impact section should be completely revised and recirculated again for public comment.

<sup>4</sup> Mitigation Measure TR- #12 states “Prepare a Transportation Construction Management Plan—Prior to construction, the Authority will require the construction contractor to develop a plan to manage circulation and connections for modes of travel during the construction duration. Implementation of the transportation CMP will maintain the flow of traffic, bicyclists, pedestrians, and buses in and around the construction zones. Typical measures associated with a CMP include the following...”

**RE: TRAFFIC IMPACT STUDY –ACTON RETAIL CENTER PROJECT -  
ACTON, CALIFORNIA, LOS ANGELES COUNTY**

Dear Mr. Friedman:

Hall & Foreman, a Division of David Evans and Associates, Inc. is pleased to submit this Traffic Impact Study (TIS) for the proposed Acton Retail Center Project located in the unincorporated community of Acton, California, Los Angeles County. The project is comprised of a 6,000 square-foot retail building with a 1,600 square foot storage facility and a 3,300 square-foot restaurant, on an approximate 85,250 square foot parcel. The proposed project is located near the intersection of Sierra Highway and Crown Valley Road in the unincorporated community of Acton, California, Los Angeles County.

The report examines the traffic impacts specifically for the project and presents recommended traffic improvements. The report also addresses the impacts of overall growth within the area to assure that cumulative traffic mitigations can be addressed.

We are pleased to have been of assistance to you in processing and obtaining approval for the project. If you have any questions or comments, please feel free to contact me at 760-524-9115.

Respectfully submitted,

Hall & Foreman, a Division of David Evans and Associates, Inc.

Robert A. Kilpatrick, P.E., T.E.  
Senior Associate

I. PURPOSE AND VALUES

Purpose

The purpose of the Antelope Valley Area Plan (Area Plan) is to achieve the communities' shared vision of the future through the development of specific goals, policies, land use and zoning maps, and other planning instruments. This shared vision is articulated in the Town and Country Vision Statement, which was developed by the Antelope Valley communities in various workshops in 2008. It goes:

The Antelope Valley region is a wonderful place to live, work, play, and raise a family. The Valley is a mosaic of unique small towns in which rural lifestyles are cherished. These diverse towns are unified by an extraordinary environmental setting that includes agricultural lands, natural open spaces, expansive mountain views, diverse ecological habitats, and dark night skies. The Valley's network of trails, roads, and transit link these dispersed towns to each other and to a wide offering of local-serving businesses and quality social, educational, cultural, and recreational services and facilities.

Residents, business owners, and property owners collaborate with a responsive local government to ensure that life in the Antelope Valley region will continue to be exciting, enjoyable, and rewarding. The growing population's need for additional housing and employment opportunities is balanced against the need to respect historical heritage and preserve the natural environment. Public improvements and private developments are sustainable, conserving available resources and relying on alternative energy sources, and complement the small scale of existing rural towns. A wide array of activities and opportunities for youth ensure that the Valley's high quality of life will be sustained for future generations.

The Area Plan is a blueprint for future development and conservation in the Antelope Valley that informs decision-making at all levels to help ensure that individual activities are consistent with, and supportive of, the communities' vision. It is a tool for residents, elected officials, planners, service providers, and developers. Each group will use the Area Plan in different ways, but all are guided by its vision, goals, and policies. Residents will use the Area Plan as a benchmark in attaining their aspirations for the development and preservation of their communities. Elected officials and planners will refer to the Area Plan when allocating resources to address residents' most important issues and priorities. Service providers will use the Area Plan as a guide for deciding which infrastructure and improvement projects should be undertaken and which programs should be established or improved. Developers will look to the Area Plan's goals and policies in deciding what to build, including location, character, and appearance.

As a component of the Los Angeles County General Plan, the Antelope Valley Area Plan refines the countywide goals and policies in the General Plan by addressing specific issues relevant to the Antelope Valley, such as community maintenance and appearance, and provides more specific guidance on

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

elements already found in the General Plan. The General Plan provides guidance on all issues not covered in the Area Plan.

The Area Plan also helps further the countywide objective of reducing greenhouse gases in order to meet the goals of the California Global Warming Solutions Act of 2006 (Assembly Bill 32) and California's Sustainable Communities and Climate Protection Act (Senate Bill 375), which aim to achieve reductions of greenhouse gases. Los Angeles County has undertaken countywide measures to address these mandates, including adoption of the Green Building, Drought Tolerant Landscaping, and Low Impact Development Ordinances in 2008. The Area Plan strengthens these efforts by including goals and policies to support local development practices and initiatives to reduce greenhouse gas emissions. Implementation of the Land Use, Mobility, and Conservation and Open Space Elements contained in this Area Plan cumulatively affect the future reduction of greenhouse gases both locally and regionally.

### Values

All aspects of the Area Plan are informed by a set of core values that ground and guide the Area Plan. In order to best serve the common interests represented in this Area Plan, planning values outline the shared responsibilities of the many partners who will work together to transform goals and policies into a realized vision. The core values of the Antelope Valley Area Plan are:

1. **Collaboration:** The issues and actions identified in the Area Plan are multi-dimensional and complex. As such, it takes a collaborative effort to accomplish the Area Plan's goals. Working in partnership with individuals from public agencies, private organizations and throughout the community, participants in planning and implementation of the Area Plan can come together to achieve the community's vision.
2. **Participation:** The dedicated commitment and ongoing participation of community members, service providers and elected officials will ensure that the Area Plan's implementation over time remains in line with the communities' vision. Community participation also demonstrates to elected leaders and service providers that constituents support the implementation of the Area Plan and expect results.
3. **Accountability:** By adopting this Area Plan, elected leaders have expressed their commitment to achieving the communities' vision by adhering to the Area Plan's goals and policies and by using the implementation actions to guide their work. Land use decisions will be made to benefit the needs of the community as a whole and not individual interests. Accountability means that all stakeholders take responsibility for their respective components of the Area Plan.
4. **Stewardship:** In order for the Area Plan to be effective in achieving the community's goals, people who live, learn, work, and play in the Antelope Valley will have to take an active role in ensuring the Area Plan's timely and thorough implementation. Community members and service providers can and should provide feedback on the insights into the Area Plan's effectiveness.

5. **Balance:** As the diverse and sometimes conflicting needs of current and future stakeholders evolve, the tools within the Area Plan create a framework which allows for balanced decisions to be made. For residents of the Antelope Valley, achieving a balance will unfold gradually. This shall be achieved by encouraging growth and development in appropriate areas of the Antelope Valley and ensuring that these enhance the quality of life of the communities without compromising their rural character.

## II. BACKGROUND

### Setting

The Antelope Valley planning area is bounded by the Kern County border to the north, the Ventura County border to the west, the Angeles National Forest (inclusive) to the south, and the San Bernardino County border to the east. It excludes the Cities of Lancaster and Palmdale. This area covers approximately 1,800 square miles and includes over two dozen communities.

For a map of the Antelope Valley and the immediate vicinity, please see Map 1.1: Planning Area Boundary.

### History

The historic development of the Antelope Valley started in 1876 with the completion of the Southern Pacific Railroad line from San Francisco to Los Angeles via the Antelope Valley. Many communities began to develop, including Lancaster, Palmdale, Rio del Llano and Littlerock, all dependent upon stock raising, dry farming and fruit orchards.

The World War II years brought the development of Edwards Air Force Base and a doubling of the Antelope Valley population. Military defense work expanded in the 1950s, and Palmdale Airport emerged as a national center for jet testing. The latter part of the decade saw the start of an economic downturn throughout the country that slowed military investments in Antelope Valley projects.

The final decades of the 20th century saw the Antelope Valley emerge with major new housing opportunities as vast acreages were subdivided for affordable tract homes. Lancaster and Palmdale incorporated as independent cities, and rural communities continued to grow. Farming regained its status as a productive employer, but the area continued to develop without balancing the growth in housing with a corresponding growth in jobs and investment in infrastructure. Today, many who live in the Antelope Valley commute to jobs in other parts of the Los Angeles Basin. New local commercial centers are expanding the shopping, entertainment and employment opportunities of Antelope Valley residents. For additional information on the setting and history of the Antelope Valley, please see Background Report.

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

### Past and Current Planning Efforts

The previous Antelope Valley Areawide General Plan was adopted by the Los Angeles County Board of Supervisors on December 4, 1986. It contained Valleywide goals and policies pertaining to land use, housing, community revitalization, community design, human resources, circulation, public services and facilities, governmental services, environmental resource management, noise abatement, seismic safety, public safety, and energy conservation. This Area Plan replaces the previous Antelope Valley Areawide General Plan in its entirety.

This Area Plan covers issues that were important in 1986 and are still important to the communities; for example, managing growth, minimizing disruption of ecological resources, placing development away from natural hazards, and ensuring a variety of housing types and costs. This Area Plan also addresses new issues that have emerged in recent years; for example, maintaining agricultural uses, improving mobility, developing renewable energy resources, and curbing greenhouse gas emissions.

### Community Participation

The Area Plan is the result of a highly inclusive and extensive community participation program launched in the fall of 2007. Through a series of 23 community meetings, residents and other stakeholders worked alongside planners to develop a shared vision of the future, identify community issues, draft proposals for the future, and prioritize their recommendations, forming the foundation of the Area Plan.

Building on the foundation laid by the communities, planners partnered with other County departments to explore the recommendations, refine the proposed goals and policies, plan for program implementation, and gather support to ensure success. Plan development is an iterative process, and in this case, the communities were included in the earliest steps of development and subsequent rounds of review. The Area Plan began with, and will be realized by, the dedicated residents and stakeholders who have committed, and will continue to commit their time, energy and interests to the Antelope Valley.

### III. VISION AND STRATEGY

#### Vision Statement

At the heart of the County's approach to community planning is the idea that the Area Plan is an adopted version of the communities' aspirations for the future. Collectively, those aspirations amount to a community vision, based on shared values and common goals. The communities reached consensus on the following vision statement:

The Antelope Valley region is a wonderful place to live, work, play, and raise a family. The Valley is a mosaic of unique small towns in which rural lifestyles are cherished. These diverse towns are unified by an extraordinary environmental setting that includes agricultural lands, natural open spaces, expansive mountain views, diverse ecological

habitats, and dark night skies. The Valley's network of trails, roads, and transit link these dispersed towns to each other and to a wide offering of local-serving businesses and quality social, educational, cultural, and recreational services and facilities.

Residents, business owners, and property owners collaborate with a responsive local government to ensure that life in the Antelope Valley region will continue to be exciting, enjoyable, and rewarding. The growing population's need for additional housing and employment opportunities is balanced against the need to respect historical heritage and preserve the natural environment. Public improvements and private developments are sustainable, conserving available resources and relying on alternative energy sources, and complement the small scale of existing rural towns. A wide array of activities and opportunities for youth ensure that the Valley's high quality of life will be sustained for future generations.

This vision of the Antelope Valley's future serves as a touchstone through the planning process, and it is reflected in the land use map, goals, and policies that comprise the Area Plan.

#### Issues

Through the planning and visioning process, the County identified issues of Valleywide significance that, it determined, were best addressed in a comprehensive and coordinated manner. In anticipation of future growth, the planning effort focused on ways to manage this growth and addressed the need for balance on the following issues:

1. Preservation and enhancement of each unique town's rural character, allowing for continued growth and development without compromising the rural lifestyle;
2. Preservation of open space around existing towns, in order to preserve hillside areas and significant ridgelines, conserve biological resources, provide opportunities for recreation, and make more efficient use of existing infrastructure in the core areas;
3. Planning for integrated circulation systems, including bikeways, walkways, and multi-purpose trails;
4. Conservation of significant resources, including agricultural lands, mineral resources, water supply, and scenic areas;
5. Preservation of public health, safety, and welfare, through identification of natural and environmental hazards, including noise, seismic, fire, and airborne emissions, and designation of land uses in an appropriate manner to mitigate these impacts; and
6. Coordination on enhancing public and community services such as law enforcement, fire protection, and parks.

#### Rural Preservation Strategy

The Area Plan's Rural Preservation Strategy addresses issues of Valleywide significance in a manner that builds upon the communities' vision statement. While each community in the Antelope Valley possesses its own identity, they are all unified in the pursuit of preserving the rural lifestyle and the rural

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

character of the region. This rural character is what makes the Antelope Valley so unique and valuable to the rest of Southern California.

The term “rural” is defined by the following characteristics:

- Living in a low density environment without high intensity land uses, such as regional commercial centers;
- A natural, peaceful, quiet setting, with the ability to find a sense of solitude;
- Views of adjacent natural areas by day, such as hillsides and ridgelines, and views of starry skies by night;
- Agricultural and equestrian uses that are sensitive to the land; and
- An absence of infrastructure generally found in urban and suburban areas, including but not limited to curbs, gutters, sidewalks, street lighting, and traffic signals.

The Rural Preservation Strategy is based on four types of environments – rural town center areas, rural town areas, rural preserve areas, economic opportunity areas – that serve different purposes. Collectively, these environments preserve the rural character of the region, conserve environmental resources, and protect residents from potential hazards while allowing for additional growth and development. For more information on these environments, please see Chapter 2: Land Use Element.

Rural town center areas are the focal points of rural communities, serving the daily needs of residents and providing local employment opportunities. The majority of new locally-oriented public facilities and new locally-oriented commercial uses should be directed to these areas. These areas will provide pleasant pedestrian environments and will be accessible by a range of transportation options to reduce vehicle trips. Some of these areas will allow for a mix of commercial and residential uses.

Rural town areas provide a transition between rural town center areas and rural preserve areas, as they are occupied by a mix of residential and light agricultural uses. Residents living in these areas are willing to forego urban infrastructure and services in order to live in a rural environment. The majority of new residential development should be directed to these areas, provided that such development is consistent with the existing community character and allows for light agricultural, equestrian, and animal-keeping uses where appropriate. These areas will provide transportation linkages to rural town center areas and other nearby destination points.

Rural preserve areas are areas outside of the Town Areas, which are largely undeveloped and generally not served by existing or planned infrastructure and public facilities. Many of these areas contain environmental resources, such as Significant Ecological Areas, Scenic Resource Areas, and Agricultural Resource Areas. In addition, many of these areas contain safety hazards, such as Seismic Zones, Very High Fire Hazard Severity Zones, and Flood Zones. The primary benefit of these areas is that they provide habitat for regionally significant biological species while simultaneously providing scenic value to residents. A secondary benefit of these areas is that they contain natural resources which provide economic opportunities. Development in these areas should be limited to single family homes at very low densities, light and heavy agricultural uses, including equestrian and animal-keeping uses, and other uses where appropriate.

Economic opportunity areas are defined clusters of land along the routes of two new proposed major infrastructure projects in the Antelope Valley, namely the High Desert Corridor and the Northwest 138 Corridor Improvement Project. These areas were identified as having tremendous potential for economic growth and development. Thus, any development induced by these two infrastructure projects should be guided to these areas so that the areas around them can be preserved and maintained at low density, or agricultural uses. This is intended to balance the growth and development which the two projects will undoubtedly bring, with the general intent of this Area Plan to preserve the ecological value and rural character of the Antelope Valley.

The Rural Preservation Strategy necessitates a “trade-off” between preserving rural character and developing additional infrastructure, as infrastructure improvements are typically funded by increased property tax revenues and developer fees. In rural town center areas and rural town areas, the amount of potential development allowed by this Area Plan will be equal to, or greater than, the amount of potential development allowed by the previous Area Plan. Therefore, those areas are likely to benefit from increased property tax revenues and developer fees, which can help fund additional infrastructure. In rural preserve areas, the amount of potential development allowed by this Area Plan will be far less than the amount of potential development allowed by the previous Area Plan. Therefore, rural preserve areas are unlikely to benefit from increased property tax revenues and developer fees, which may make it difficult to fund additional infrastructure. The Area Plan acknowledges this “trade-off” by directing additional infrastructure to rural town center areas and rural town areas, where the placement of additional infrastructure may be more cost-effective and environmentally sensitive, and not to rural preserve areas, where the placement of additional infrastructure may not be necessary. Residents of rural preserve areas should be prepared to forego additional infrastructure in order to live in a very remote rural environment and enjoy the benefits offered by such an environment. On the other hand, the economic opportunity areas provide an opportunity for the Area Plan to maximize the investment that state and regional agencies are bringing into the area, while still achieving the general goal of rural preservation in the Antelope Valley.

#### IV. HOW TO USE THE ANTELOPE VALLEY AREA PLAN

##### Definitions

The following definition shall apply only as it specifically appears in this Area Plan and shall not be used in any other context outside of this Area Plan.

“Legal lot” means any lot created in compliance with the provisions of the Subdivision Map Act, or would qualify for a conditional certificate of compliance as provided in the Subdivision Map Act. Where a conditional certificate of compliance is reviewed by the County, the conditions imposed therein will be based on those required at the time the lot was created, including land use density and required area under the zoning code.

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

### Area Plan Format and Content

The Area Plan is organized into eight chapters. Chapter 1 (Introduction) presents the Area Plan's purpose and values, the geographic area, and the communities' vision statement. Chapter 2 (Land Use Element) discusses how the communities' vision translates into a development pattern through the concept of land use. Chapter 3 (Mobility Element) describes the multi-modal approach to moving around the Antelope Valley. Chapter 4 (Conservation and Open Space Element) describes conservation efforts to address potential threats to natural resources. Chapter 5 (Public Safety, Services and Facilities Element) provides measures to ensure services are in place to maintain the safety and welfare of residents. Chapter 6 (Economic Development Element) provides the blueprint for the planning area to build a healthy and sustainable economic base that will drive development and private-sector led conservation and preservation of open space in the area. Chapters 2 through 6 contain goals and policies specific to each chapter's respective topic but all work jointly to comprehensively implement the overall vision. Chapter 7 (Community-Specific Land Use Concepts) highlights each established town and describes its land use form in more detail. Finally, Chapter 8 (Plan Implementation) describes future planning activities that will be undertaken to further implement the goals and policies of this Area Plan. Appendix A includes descriptions of the Significant Ecological Areas within the Antelope Valley Area Plan.

### Applicability

The following provisions shall apply to complete applications filed prior to the effective date of this Antelope Valley Area Plan.

The applicant can choose whether the application will be reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan or this Antelope Valley Area Plan. In either case, approval of the application is not guaranteed.

If an application is reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan, the applicant may modify the application prior to consideration by the Regional Planning Commission, Hearing Officer, or Director. The modification will be reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan if it does not change the housing type (e.g., from single family to two family or multifamily) nor increase:

- The residential density;
- The floor area or lot coverage of non-residential space;
- The amount of grading; or
- The area of ground disturbance.

A modification may necessitate the submittal of revised, updated, or additional materials and reports, such as site plans, elevations, and oak tree reports. In addition, a modification may necessitate

additional environmental review pursuant to the California Environmental Quality Act and the County's environmental review procedures.

Modification to an application that is already approved but not used, can be reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan if it is found to be in substantial conformance with such application as determined by the Director. Otherwise a modification shall be considered a new application and shall be reviewed for consistency with this Antelope Valley Area Plan.

If an approval is used and has a grant term, the approved use may be maintained until the end of the grant term. At the end of the grant term, the use shall be subject to the Antelope Valley Area Plan policies in effect at that time. During the grant term, a modification to the approved use will be reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan if the modification is found to be in substantial conformance with such application as determined by the Director. Otherwise, a modification to the approved use shall be subject to the Antelope Valley Area Plan policies in effect at that time.

If an approval is used and does not have a grant term, the approved use may be maintained in perpetuity unless a time limit is specified in the Zoning Code. In addition, all applicable non-conforming use provisions of the Zoning Code shall apply to the approved use. A modification to the approved use will be reviewed for consistency with the previously adopted Antelope Valley Areawide General Plan if the modification is found to be in substantial conformance with the use originally approved as determined by the Director. Otherwise, a modification to the approved use shall be subject to the Antelope Valley Area Plan policies in effect at that time.

### Guidance

The Antelope Valley Area Plan is a component of the Los Angeles County General Plan. All of its maps, goals, policies, and implementing actions must be consistent with the elements of the Countywide General Plan. Users should be guided by the following:

- **General Plan Applicability:** Should any areas of conflicting interpretation arise, unless specifically noted, the provisions of the Countywide General Plan shall prevail.
- **Comprehensive Area Plan:** The Land Use Policy Map is never to be interpreted as a stand-alone document, but must be interpreted in light of applicable written policies in the Area Plan.
- **Equally Weighted Policies:** No policy, whether in written or diagram form, shall be given greater weight than any other policy in evaluating the policy intent of this Antelope Valley Area Plan.
- **Vision and Rural Preservation Strategy:** The interpretation of policy should be governed by the Vision and Rural Preservation Strategy of the Antelope Valley Area Plan.

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

- **Established Town Descriptions:** Descriptions of established towns in Chapter 7 are intended to provide more detailed descriptions of existing land use patterns, local character, and desired local development patterns, and should be referred to in addition to the remainder of the Area Plan in planning for local projects.
- **Non-Conforming Uses:** All legally established uses in existence at the time of adoption of this Antelope Valley Area Plan are deemed to be consistent with this Area Plan, although Zoning Ordinance provisions regarding Non-Conforming Uses may apply.
- **Undersized Parcels:** Existing legal lots may be developed (following current development requirements) regardless of lot size. For example, a 10 acre parcel designated Rural Land 20 (1du/20ac) may still develop one home.
- **Pending Projects:** Completed applications filed prior to the effective date of this Area Plan shall be allowed to be reviewed for consistency with the previously adopted Area Plan. Projects may be maintained as originally approved provided the approval is still valid and has not expired. Any subsequent changes of use or intensity shall be subject to the policies of this Area Plan.
- **Community Standards Districts:** Community-specific zoning regulations shall be consistent with the goals and policies of this Area Plan. Such regulations shall be instituted only when a unique or detrimental condition exists within a community that prevents implementation of this Area Plan.
- **Regulatory Codes:** Title 21 (Subdivision) and 22 (Zoning) of the Los Angeles County Code provide detailed development guidelines that work to implement this Area Plan. Project applications shall refer to these codes, including Community Standards Districts, to ensure that development and land use activities are compatible with the zoning and to not threaten the health, safety, and welfare of the communities.
- **Staff Consultation:** While the Antelope Valley Area Plan is meant to be a guide for the public in determining allowable uses of private property, the public is encouraged to consult with members of the County’s planning staff prior to investing in the preparation of development plans that might later prove to be inconsistent with the Antelope Valley Area Plan.

In addition to the direction provided by this Area Plan, new development and land use activities are regulated by many agencies other than the Department of Regional Planning. Obtaining approval for certain types of actions may require proof of the availability for public services, fair-share provisions for public facilities, and other permitting. The applicant for any such application is advised to consult with all applicable departments and agencies.

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

### I. Background

#### Purpose

The previous Chapters of this Area Plan set forth general goals and policies that may be applied throughout the unincorporated Antelope Valley. However, each community varies in its nature, form, and character. The Community-Specific Land Use Concepts contained in this Chapter describe in greater detail how this Area Plan, particularly the Land Use Element, is to be implemented in each community within the unincorporated Antelope Valley.

The Land Use Concepts (Concepts) attempt to provide expectations for how each rural community may change and grow throughout the life of this Area Plan. The Concepts specify the desired land uses for each area and identify potentially incompatible land uses that would not be desirable. Residents, stakeholders, and decision-makers should refer to the Concepts to familiarize themselves with the setting and character of each community and should use this information when considering the appropriateness of land use development projects, infrastructure improvements, and consideration efforts.

The following communities are addressed in this Chapter:

- Acton
- Antelope Acres
- Crystalaire
- El Dorado and White Fence Farms
- Elizabeth Lake and Lake Hughes (The Lakes)
- Fairmont
- Gorman
- Green Valley
- Juniper Hills
- Lake Los Angeles
- Lakeview
- Leona Valley
- Littlerock and Sun Village (Southeast Antelope Valley)
- Llano
- Neenach
- Pearblossom
- Quartz Hill
- Roosevelt
- Three Points

#### Vision and Strategy

The Area Plan's Vision Statement acknowledges that the unincorporated Antelope Valley "is a mosaic of unique small towns" and the Community-Specific Land Use Concepts are intended to reflect each community's unique nature, form, and character, as well as each community's unique vision of the future. The Area Plan's Rural Preservation Strategy seeks to achieve the Area Plan's Vision Statement

Antelope Valley Area Plan

COMM-2

June 2015

through a framework of rural town centers, rural town areas, rural preserve areas, and economic opportunity areas. The Community-Specific Land Use Concepts describe how this framework has been applied to each community and refines the framework in a manner that addresses each community's individual needs. Overall, this Chapter ensures that the Area Plan will serve as a living document that will shape future implementation efforts in a manner that is both complementary of the overall Vision Statement and Rural Preservation Strategy and relevant to, and appropriate for, each community within the unincorporated Antelope Valley.

#### Community Standards Districts

Some of the communities described in this Chapter are within Community Standards Districts (CSD's). CSD's are overlays in the Zoning Code that provide specific development standards with unique land use issues that are not adequately addressed by the County's Subdivision and Zoning Codes. CSD's, as well as other applicable County Code requirements, should be consulted when projects are being considered in a community.

### II. Land Use Concepts

#### Acton

The community of Acton is located in the southwestern portion of the Antelope Valley, south of the City of Palmdale along State Route 14. The community is adjacent to the National Forest, and natural hillsides and significant ridgelines separate the community from the City of Palmdale and the remainder of the Antelope Valley. Community residents are concerned about urbanization of the area and wish to remain an unincorporated rural community with a unique identity. Some portions of the community are partially developed with a variety of agricultural uses and single-family homes on large lots. Other portions are largely undeveloped, are generally not served by existing infrastructure, contain environmental resources, such as Significant Ecological Areas and Hillside Management Areas, and are subject to safety constraints, such as Very High Hazard Severity Zones.

The community has a rural town center area along Crown Valley Road between Gillespie Avenue and Soledad Canyon Road. The rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of residents and provide local employment opportunities. New buildings in the rural town center area shall be limited to two stories in height and shall include Old West design elements with earth tone colors at a pedestrian-oriented scale, with primary building entries facing Crown Valley Road or adjacent local streets. New development in the rural town center that would require the installation of urban infrastructure, such as concrete curbs and gutters, street lights, and traffic signals, shall be strongly discouraged as this does not fit with the community's unique rural character and identity.

The rural town centers shall continue to be the focal point of the community and shall be linked to the surrounding rural town area through trails and pedestrian routes. Pedestrian routes shall have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as plazas and community bulletin boards, are encouraged in this area.

Some areas outside the rural town center area have also been designated as Rural Commercial (CR) to acknowledge existing uses and to provide additional commercial services and local employment opportunities. The intent of these designations is to allow low-intensity local commercial uses that

Antelope Valley Area Plan

COMM-3

June 2015

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

serve community residents and to prohibit high-intensity regional commercial uses that serve travelers along State Route 14. Moving west to east through the community, areas with this designation include:

- Two parcels along Sierra Highway, generally between Sand Creek Drive and Wanstead Drive, north of State Route 14;
- A parcel along Sierra Highway, east of Red Rover Mine Road and north of State Route 14;
- Several parcels surrounding the intersection of Crown Valley Road and Sierra Highway and of Crown Valley Road and Antelope Woods Road, both of which are adjacent to State Route 14;
- A parcel at the northeast corner of Soledad Canyon Road and Santiago Road;
- Several parcels at the northwest and northeast corners of the intersection of Sierra Highway and Santiago Road, north of State Route 14;
- Several parcels along the south side of Sierra Highway between San Gabriel Avenue and State Route 14; and
- Several parcels along the north side of Sierra Highway, west of State Route 14.

New buildings in these CR designations shall also be limited to two stories in height, shall include Old West design elements with earth tone colors at a pedestrian-oriented scale, and shall be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes shall have permeable paving, consistent with rural community character, instead of concrete sidewalks. Development in these CR designations that would require the installation of urban infrastructure, such as concrete curbs and gutters, street lights and traffic signals, shall be discouraged as this does not fit with the community's unique rural character and identity. New commercial uses outside of these CR designations, or outside the CR designation within a rural town center area, are also strongly discouraged, as they are not compatible with the community character.

Some areas within the community have been designated as Light Industrial (IL) to acknowledge existing uses and to provide additional local employment opportunities. Moving west to east through the community, areas with this designation include:

- Several parcels at the northeast and southeast corners of Sierra Highway and Red Rover Mine Road;
- Several parcels along Soledad Canyon Road, south of the Crown Valley Road intersection and the rural town center area;
- Several parcels along Soledad Canyon Road, northeast of the Crown Valley Road intersection, and also along Syracuse Avenue and Gillespie Avenue, all east of the rural town center area;
- Several parcels along the south side of Soledad Canyon Road between Santiago Road and Malinta Avenue; and

- Several parcels along Sierra Highway, west and north of the Vincent Grade/Acton Metrolink Station.

New buildings in these IL designations shall be limited to two stories in height, shall include Old West design elements with earth tone colors at a pedestrian-oriented scale, and shall be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes shall have permeable paving, consistent with rural community character, instead of concrete sidewalks. Development in these IL designations that would require the installation of urban infrastructure, such as concrete curbs and gutters, street lights and traffic signals shall be strongly discouraged as this does not fit with the community's unique rural character and identity. New industrial uses outside of these IL designations are also strongly discouraged, as they are not compatible with the community character.

All advertising signs shall be limited to no more than 35 feet. More restrictions on the allowed Floor Area Ratio (FAR), drive-through services and other such regulations may be adopted by the community through their Community Standards District. Please see Chapter 8 (Plan Implementation) of this Area Plan for more details.

Most of the community is considered to be a rural town area. The rural town area has been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land, Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land, and Rural Land 1 (RL1), with a maximum density of 1 residential unit for each 1 gross acre of land. Small portions of the rural town area have other designations, as follows:

- The area generally bounded by Syracuse Avenue to the north, Bartlett Street and 1st Street to the west, Cory Avenue and 9th Street to the south, and 3rd Street to the east has been designated as Residential 5 (H5), with a maximum density of 5 residential units for each 1 net acre of land. In addition, a few parcels between Syracuse Avenue and Gillespie Avenue, east of Crown Valley Road, have been designated as H5; and
- The area surrounding the H5 designation, generally bounded by Sacramento Avenue to the north, 41st Street West and 40th Street West to the west, 9th Street and Spring Avenue to the south, and Crown Valley Road to the east, has been designated as Residential 2 (H2), with a maximum density of 2 residential units for each 1 net acre of land.
- The RL5, RL2, RL1, H2, and H5 designations are intended to reflect the existing densities within various parts of the rural town area, which are developed or partially developed as the result of previous land divisions. The RL5, RL2, RL1, H2, and H5 designations are not intended to promote further land divisions. New land divisions in the rural town area shall maintain a large minimum lot size to ensure consistency with the desired community character.

The majority of new residential development in Acton shall be directed to the rural town area instead of the surrounding rural preserve area, provided that such development is consistent with existing community character. New land divisions shall maintain a large minimum lot size. Various types of agriculture, equestrian, and animal-keeping uses should be allowed through the rural town area, provided that lots meet Zoning Code requirements for those uses. Home-based occupations may also be permitted throughout the rural town area, provided that they meet Zoning Code requirements.

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit per 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit per 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area shall be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Antelope Acres

The community of Antelope Acres is located in the northwestern portion of Antelope Valley, west of the City of Lancaster. Community residents are concerned about urbanization of the area and wish to remain an unincorporated rural community with a unique identity. Some portions of the community are partially developed with light agricultural uses and single-family homes on large lots, while other portions are largely undeveloped and contain environmental resources, such as Significant Ecological Areas and Agricultural Resource Areas.

The community has a rural town center area located along 90th Street West between Avenue E-4 and Avenue E-12. The rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of residents and provide local employment opportunities. New buildings in the rural town center area should be limited to one story in height and should include Old West design elements at a pedestrian-oriented scale, with primary building entries facing 90th Street West. No other portions of the community have been designated for commercial or industrial use, and new commercial and industrial uses outside the rural town center area are strongly discouraged, as they are incompatible with the community character.

Over time, the rural town center areas should become the focal point of the Antelope Acres community and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as plazas and community bulletin boards, are encouraged in this area.

The community includes rural town areas that surround the rural town center area and are generally bounded by Avenue E and Avenue C to the north, 80th Street West to the east, Avenue F and Avenue F-8 to the south, and 95th Street West and 90th Street West to the west. These areas have been designated as Rural Land 2 (RL2), with a maximum density of 1 residential unit per 2 gross acres of land. This designation is intended to reflect the existing density of the rural town areas and is not intended to promote further land divisions. New land divisions in the rural town areas shall maintain a large minimum lot size to ensure consistency with the existing community character.

The majority of new residential development in Antelope Acres should be directed to the rural town areas instead of the surrounding rural preserve areas, provided that such development is consistent with the existing community character and allows for light agriculture, equestrian, and animal-keeping uses should be allowed through the rural town area, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be discouraged in the rural town areas because of potential impacts on existing residents. Home-based occupations are also appropriate in the rural town areas, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints and environmental resources. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Crystalaire

The community of Crystalaire is located in the southeastern portion of the Antelope Valley, south of Llano, and includes a golf course and a small airport which are described in more detail below. Some portions of the community are developed with single-family homes on large lots. Other portions are largely undeveloped and contain environmental resources, such as Significant Ecological Areas, and are subject to safety hazards, such as Flood Zones, particularly along Big Rock Creek and Big Rock Wash.

The community currently does not have a rural town center area but a stretch of 165th Street East between East Avenue W-12 and East Avenue X, in front of Crystalaire Airport has been designated Mixed Use – Rural (MU-R) in anticipation of a future town center to develop in this area. New commercial uses outside of this MU-R designation are strongly discouraged, as they are not compatible with the community character.

The community includes a rural town area that includes the existing subdivision near the Crystalaire Country Club and adjacent lands that are generally bounded by 165th Street East to the east and Avenue Y-4 to the south. This area has been designated as Residential 2 (H2), with a maximum density of 2 residential units for each 1 net acre of land. This designation is intended to reflect the existing density of the rural town area. New land divisions in this area shall have large lot sizes that are consistent with the existing subdivision near the Crystalaire Country Club.

The majority of new residential development in Crystalaire should be directed to the rural town area instead of the surrounding rural preserve areas, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited because of potential impacts on existing residents. Home-based occupations may also be permitted in this area, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Crystalaire Airport

The Crystalaire Airport is a privately owned and operated aviation facility that occupies several parcels. These parcels have been designated as Public and Semi-Public (P) to acknowledge the existing airport use and to allow for its continued operation. However, the Area Plan acknowledges that these parcels

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

also contain commercial and industrial uses and are an appropriate location for such uses given its proximity to the communities of Crystallaire and Llano. Accordingly, at the time of this Area Plan's adoption, the parcels were zoned Rural Commercial – Mixed Use (MXD-RU) and Light Industrial (M-1). This Area Plan allows commercial mixed-use and industrial uses on these parcels without a Plan Amendment, provided that these are compatible with airport operations and that these do not restrict or prohibit the operations of the airport.

### *Crystallaire Golf Course*

The Crystallaire Golf Course is a privately owned golf facility that occupies several parcels. These parcels have been designated as Open Space – Parks (OS-PR) and zoned Commercial – Recreation (C-R) to acknowledge the existing residential recreational use and its open space character on the property, and to allow for its continued operation. The Area Plan also acknowledges that some limited residential uses may be appropriate as accessory to the primary use as a golf course. Thus the Area Plan allows some limited residential uses on these parcels without a Plan Amendment, provided that the golf course is in continued operation and that the residential uses occupy not more than 10 percent of the total area. All requirements of the base zone shall apply, including but not limited to, an approved conditional use permit.

### **El Dorado and White Fence Farms**

The communities of El Dorado and White Fence Farms are located in the central portion of the Antelope Valley and are surrounded by the cities of Lancaster and Palmdale. Although these communities are adjacent to urbanized areas, such as the Rancho Vista community and the Antelope Valley Mall, they have a distinctly rural character. The communities are partially developed with light agricultural uses and single-family homes on large lots.

These communities do not have a rural town center area, but they are served by the rural town center area in Quartz Hill and by commercial centers in the adjacent cities. Two parcels on 10th Street West and one parcel on Avenue N have been designated as Rural Commercial (CR) in recognition of existing commercial uses. No other portions of the communities have been designated for commercial or industrial use, and new commercial uses outside of these CR designations and new industrial uses are strongly discouraged, as they are not compatible with the communities' character.

The communities are considered to be a rural town area and have been designated as Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land. This designation is intended to reflect the communities' existing density and is not intended to promote further land divisions. New land divisions shall maintain a large minimum lot size to ensure consistency with the existing character of the communities.

Light agriculture, equestrian, and animal-keeping uses are appropriate in these communities, but heavy agriculture uses should be discouraged because of potential impacts on existing residents. Home-based businesses are also appropriate in these communities, provided that they meet Zoning Code requirements.

### **Elizabeth Lake and Lake Hughes (The Lakes)**

The communities of Elizabeth Lake and Lake Hughes are located in the southwestern portion of the Antelope Valley, northwest of Leona Valley, and are partially within the National Forest. Some portions of the community are developed or partially developed with single-family homes, light agricultural uses, and a limited amount of commercial and industrial uses. Other portions are largely undeveloped, are generally not served by existing infrastructure, contain environmental resources, such as Significant Ecological Areas and Hillside Management Areas, and are subject to safety constraints, such as the San Andreas Fault and Very High Fire Hazard Severity Zones.

The communities share one rural town center area in Lake Hughes, located along Elizabeth Lake Road between Trail I and Mountain View Road, west of the Lake Hughes Community Center. The rural town center area has been designated as Rural Commercial (CR) and Light Industrial (IL) to serve the daily needs of residents and provide local employment opportunities. New buildings in the rural town center area should be limited to two stories in height and should be designed at a pedestrian-oriented scale, with primary building entries facing Elizabeth Lake Road or adjacent local streets.

The rural town center area should continue to be the focal point of the communities and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as plazas and community bulletin boards, are encouraged in this area.

Some areas outside the rural town center area have been designated as Rural Commercial (CR) to acknowledge existing uses and to provide additional commercial services and local employment opportunities. Moving west to east through the communities, areas with this designation include:

- Several parcels along Lake Hughes Road between Elizabeth Lake Road and Desswood Road (Lake Hughes); and
- Two parcels at the southwest corner of Elizabeth Lake Road and Johnson Road (Elizabeth Lake).

New buildings in these CR designations should also be limited to two stories in height, should be designed at a pedestrian-oriented scale, and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. New commercial uses outside of these CR designations, or outside the CR designations within the rural town center area, are strongly discouraged, as they are not compatible with the communities' character.

Several parcels at the southwest corner of Elizabeth Lake Road and Lake Hughes Road have been designated as Light Industrial (IL) to acknowledge an existing use. New industrial uses outside of this IL designation, or outside the IL designation within the rural town center area, are strongly discouraged, as they are not compatible with the communities' character.

The community of Elizabeth Lake includes rural town areas. The primary rural town area surrounds the Elizabeth Lake water body. North of Elizabeth Lake Road, the primary rural town area is generally bounded by Hawk Drive, Gist Drive, and hillsides to the north, Munz Ranch Road to the west, and Pekaboo Road and hillsides to the east. South of Elizabeth Lake Road, the primary rural town area is generally bounded by Sandrock Drive, Ranch Club Road, and Elizabeth Lake Road to the north, the

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

National Forest boundary to the west, the National Forest boundary, Ranch Club Road, and Kiptree Drive to the south, and Elizabeth Lake Road to the east. The primary rural town area has been designated as Residential 5 (H5), with a maximum density of 5 residential units for each 1 net acre of land. A few parcels north of Elizabeth Lake Road have been designated as Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land. The H5 and RL2 designations are intended to reflect the existing densities within the primary rural town area, which resulted from previous land division activities. The H5 and RL2 designations are not intended to promote further land divisions. The privately owned portion of Elizabeth Lake water body is considered to be one of the communities' rural preserve areas, which are discussed below.

A secondary rural town area in Elizabeth Lake is located north of Johnson Road between Leadhill Drive and Limeridge Drive and is partially developed as the result of previous land division activities. The secondary rural town area has been designated as Residential 9 (H9), with a maximum density of 9 residential units for each 1 net acre of land. The H9 designation is intended to reflect the existing density of this area and is not intended to promote further land divisions.

The community of Lake Hughes also includes a rural town area. The rural town area extends west from the rural town center area and is generally bounded by Elizabeth Lake Road, Elderberry Street, High Trail, Lone Pine Trail, and hillsides to the north, Muir Drive and a line approximately 1,500 feet west of Lake Hughes Road to the west, Desswood Road, New View Drive, and South Shore Drive to the south, and Mountain View Road to the east. The rural town area has been designated as Residential 5 (H5), with a maximum density of 5 residential units for each 1 net acre of land. A few parcels west of Lake Hughes Road have been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. The H5 and RL5 designations are intended to reflect the existing densities within the rural town area, which resulted from previous land division activities. The H5 and RL5 designations are not intended to promote further land divisions.

The majority of new residential development in Elizabeth Lake and Lake Hughes (collectively known as The Lakes) should be directed to the rural town areas instead of the surrounding rural preserve areas, provided that such development is consistent with existing community character. New land divisions in the rural town area shall maintain a large minimum lot size to ensure consistency with the desired community character. Light agriculture, equestrian, and animal-keeping uses should be allowed throughout the rural town areas, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited throughout the rural town areas because of potential impacts on existing residents. Home-based businesses may be permitted throughout the rural town areas, provided that they meet Zoning Code requirements.

The remaining lands in the communities are considered to be rural preserve areas and have been designated as Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety constraints. Development in rural preserve areas should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate. The privately owned portion of the Elizabeth Lake water body has been designated as RL20 and the Area Plan supports efforts to acquire this area and preserve it as open space (see Conservation and Open Space Element, Policy COS 18.1).

### Fairmont

The community of Fairmont is located in the northwestern portion of the Antelope Valley, west of Antelope Acres and near the Antelope Valley California Poppy Reserve. The community is largely undeveloped and is generally not served by existing infrastructure and public facilities, but it does contain some single-family homes on large lots and some agricultural uses. The community includes environmental resources, such as Significant Ecological Areas, and is subject to safety hazards, such as fault zones.

The community does not have a rural town center area. No portion of the community has been designated for commercial or industrial use, except for a parcel along Avenue D to reflect an existing use. New commercial or industrial uses are strongly discouraged, as they are not compatible with the community character.

The entire community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Gorman

The community of Gorman is located in the far northwestern portion of Antelope Valley along the Golden State Freeway (Interstate 5). A portion of the community is partially developed with commercial uses that primarily serve travelers along the Freeway, along with some single-family homes and light agricultural uses. The remainder of the community is largely undeveloped, is generally not served by existing infrastructure, and contains environmental resources such as Hillside Management Areas and Significant Ecological Areas.

The community has a rural town center area surrounding the Golden State Freeway interchanges at Gorman School Road. The rural town center area has been designated as Major Commercial (CM) to serve the daily needs of residents and interstate travelers.

Some areas outside the rural town center area have also been designated Rural Commercial (CR) in recognition of existing commercial uses and future opportunities to serve interstate travelers. The existing Flying J Travel Plaza on Frazier Park Road and two parcels east of it also have been designated as Rural Commercial (CR). Several parcels surrounding Smokey Bear Road have been designated as Rural Commercial. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside these CR and CM designations and new industrial uses are strongly discouraged, as they are incompatible with the community character.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints and environmental resources. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

### Green Valley

The community of Green Valley is located in the southwestern portion of the Antelope Valley, south of Elizabeth Lake, and is completely within the National Forest. A large portion of the community is developed with single-family homes and commercial uses, while the remaining portion is largely undeveloped and contains scenic hillsides that are located in a Very High Fire Hazard Severity Zone.

The community does not have a rural town center area but is served by the rural town center areas in Lake Hughes Road and Leona Valley. Two areas, generally located at the intersections of Spunky Canyon Road and San Francisquito Canyon Road and of Spunky Canyon Road and Calle Olivera, have been designated as Rural Commercial (CR), recognizing existing uses that serve the daily needs of residents and provide local employment opportunities. New buildings in these areas should be limited to one story in height and should be designed at a pedestrian-oriented scale. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside these CR designations and new industrial uses are strongly discouraged, as they are incompatible with the community character.

The community includes rural town areas which are developed or partially developed as the result of previous land division activities. These areas generally extend southeast from San Francisquito Canyon Road and generally extend both north and south from Spunky Canyon Road, and are bounded by hillsides. These areas have been designated as Residential 9 (H9), with a maximum density of 9 residential units for each 1 net acre of land. The H9 designation is intended to reflect these areas' existing densities and development pattern, and is not intended to promote further land divisions.

The majority of new residential development in Green Valley should be directed to the rural town areas instead of the surrounding rural preserve area, provided that such development is consistent with existing community character. Light agriculture, equestrian and animal-keeping uses should be allowed in these areas, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited in these areas because of potential impacts on existing residents. Home-based occupations may also be permitted in these areas, provided that they meet Zoning Code requirements.

The remainder of the privately-owned land in the community is considered to be a rural preserve area and has been designated as Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Juniper Hills

The community of Juniper Hills is located in the southern portion of the Antelope Valley, south of Littlerock and Pearblossom. The community is largely developed and is generally not served by existing infrastructure and public facilities, but it does contain many single-family homes on large lots and some agricultural uses. The community is adjacent to the National Forest, includes scenic hillside areas, and is subject to several safety hazards, including the San Andreas Fault and Very High Fire Hazard Severity Zones.

The community does not have a rural town center area but is served by the rural town center areas in Littlerock and Pearblossom. The Juniper Hills Community Center on 106th Street East serves as a community meeting place, in lieu of a rural town center area, and residents have expressed a desire for a Post Office. No portion of the community has been designated for commercial or industrial use, and new commercial or industrial uses are strongly discouraged, as they are not compatible with the community character.

The entire community is considered to be a rural town area and has been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural town area should be limited to single-family homes on large lots, light agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Lake Los Angeles

The community of Lake Los Angeles is in the eastern portion of the Antelope Valley. As of the 2000 Census, it had the largest population of any unincorporated community in the Valley. Many portions of the community are developed or partially developed with a wide range of uses and a distinctly rural character. The remaining portions are largely undeveloped and generally not served by existing infrastructure, include environmental resources, such as buttes and Significant Ecological Areas, and are subject to safety hazards, such as Flood Zones.

The community has a rural center area along Avenue O between 167th Street East and 172nd Street East, and along 170th Street East between Avenue O and Glenfall Avenue. The rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of residents and provide local employment opportunities. New buildings in the rural town center area should be limited to two stories in height and include Old West or Southwestern design elements at a pedestrian-scale, with primary building entries facing Avenue O or 170th Street East. New development in the rural town center area should not require the installation of urban infrastructure, such as concrete curbs and gutters and traffic signals.

The rural town center area should continue to be the focal point of the community and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Streetscape improvements are recommended for Avenue O and 170th Street East, including native landscaping, "Old West" style street lights that meet dark sky objectives (only where necessary for public safety), and coordinated street furniture, such as benches, bus shelters, and bicycle racks. Other public amenities, such as plazas and community bulletin boards, are also encouraged in this area.

Some areas outside of the rural town center area have also been designated as Rural Commercial (CR) to provide additional commercial services, such as feed and tack stores. These areas include the intersection of Avenue P and 170th Street East and the northwest and northeast corners of the intersection of Avenue J and 175th Street East. New buildings in these areas should also be limited to two stories in height and include Old West or Southwestern design elements at a pedestrian-oriented scale with transportation links to surrounding rural town areas. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside these CR

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

designations and new industrial uses are strongly discouraged, as they are incompatible with the community character.

The community includes several rural town areas. One area is generally bounded by Avenue Q to the north, 150th Street East to the west, Palmdale Boulevard to the south, and 160th Street East to the east. This area has been designated as Rural Land 1 (RL1), with a maximum density of 1 residential unit per 1 gross acre of land. This designation is intended to reflect the area's existing density and is not intended to promote further land divisions. Another similar area is generally bounded by Avenue M-8, Penfield Avenue, and Avenue N to the north, 155th Street East, 150th Street East, and 152nd Street East to the west, Avenue N and Avenue O to the south, and 160th Street East and 165th Street East to the east. This area has also been designated as RL1, and this designation is also intended to reflect the area's existing density and is not intended to promote further land divisions.

Another rural town area is generally bounded by Avenue M, Avenue M-4, and Avenue M-12 to the north, 160th Street East to the west, Avenue N to the south, and 170th Street East, 175th Street East, and 180th Street East to the east. This area has been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit per 5 gross acres of land. This designation is intended to reflect the area's existing density and is not intended to promote further land divisions. The final rural town area is generally bounded by Avenue O and Avenue N to the north, 165th Street East and 160th Street East to the west, Avenue Q, Avenue P-12, Rawhide Avenue, and Avenue P to the south, and 165th Street East, 170th Street East, 175th Street East, and 180th Street East to the east. This area has been designated as Residential 2 (H2), with a maximum density of 2 residential units per 1 net acre of land. This designation is intended to reflect the area's existing density and is not intended to promote further land divisions. However, the buttes east of 170th Street East have been designated as RL5, acknowledging the need to limit development in scenic resource areas. The buttes west of 170th Street East, which are in a Significant Ecological Area, are considered to be in the rural preserve area, which is discussed below.

The majority of new residential development in Lake Los Angeles should be directed to the rural town areas instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited because of potential impacts on existing residents. Home-based businesses may also be permitted in the rural town areas, provided that they meet Zoning Code requirements. New land divisions in the rural town areas shall maintain a large minimum lot size to ensure consistency with the existing community character.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Lakeview

The community of Lakeview is located in the southern central portion of the Antelope Valley, adjoining the City of Palmdale to the north and east, and includes Lake Palmdale. Although this community is adjacent to urbanized areas, it has a distinctly rural character. Some portions of the community are

partially developed with light agricultural uses and single-family homes on large lots. Other portions are largely undeveloped and generally not served by existing infrastructure, include environmental resources such as Hillside Management Areas, and are subject to safety hazards, such as Very High Fire Hazard Severity Zones.

The community does not have a rural town center area but is served by commercial centers in the adjacent City of Palmdale. A few parcels at the intersection of the State Route 14 and Avenue S, and two parcels along Sierra Highway between Pearblossom Highway and Barrel Springs Road, have been designated as Rural Commercial (CR). In addition, several parcels at the intersection of Pearblossom Highway and Sierra Highway, and a parcel on Avenue S west of State Route 14 have been designated as Light Industrial (IL). These designations recognize existing uses and opportunities for additional local services and employments. No other portions of the community have been designated for commercial or industrial use, and new commercial or industrial uses outside of these CR and IL designations are strongly discouraged, as they are not compatible with the community character.

The community includes a rural town area that is generally bounded by the City of Palmdale boundary to the north, the City of Palmdale boundary, Farnborough Avenue and Tovey Avenue to the west, a line approximately 1,300 feet south of Lakeview Drive and Barrel Springs Road to the south, and the City of Palmdale boundary to the east. North of Avenue S, this area has been designated as Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land. South of Avenue S, this area has been designated as Rural Land 1 (RL1), with a maximum density of 1 residential unit for each 1 gross acre of land, with the following exceptions:

- West of Tovey Avenue – RL2; and
- South of Lakeview Drive and west of El Camino Drive – RL2.

The RL1 and RL2 designations are intended to reflect this area's existing densities. New land divisions in this area shall maintain large lot sizes that are compatible with the community character.

The majority of new residential development in Lakeview should be directed to the rural town area instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited because of potential impacts on existing residents. Home-based businesses may also be permitted in this area, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety hazards. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Leona Valley

The community of Leona Valley is located in the southwestern portion of the Antelope Valley, adjacent to the National Forest, and is bounded by the City of Palmdale to the north and east. Community residents are concerned about urbanization of the area and wish to remain in an unincorporated rural

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

community with a unique identity. Some portions of the community are partially developed with light agricultural uses and single-family homes on large lots. Other portions are largely undeveloped, are generally not served by existing infrastructure, contain environmental resources, such as Significant Ecological Areas and Hillside Management Areas, and are subject to safety constraints, such as the San Andreas Fault and Very High Fire Hazard Severity Zones.

The community has a rural town center located at the intersection of Elizabeth Lake Road and 90th Street West. The rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of residents and provide local employment opportunities. New buildings in the rural town center area should be limited to one story in height and should be designed at a pedestrian-oriented scale, with primary building entries facing Elizabeth Lake Road or 90th Street West. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside of this CR designation and new industrial uses are strongly discouraged, as they are incompatible with community character.

The rural town center area should continue to be the focal point of the community and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as community bulletin boards, are encouraged in this area.

The community includes a rural town area that surrounds the rural town center. North of Elizabeth Lake Road, the rural town area is generally bounded by North Side Drive, Babia Street, and Penhaven Lane to the north, 100th Street West to the west, Elizabeth Lake Road to the south, and 86th Street West to the east. South of Elizabeth Lake Road, the rural town area is generally bounded by Leona Avenue and Elizabeth Lake Road to the north, 107th Street West, 98th Street West, and 92nd Street West to the west, hillsides and Odd Road to the south, and 86th Street West to the east. The rural town area has been designated as Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land. This designation is intended to reflect the existing density of the rural town area and is not intended to promote further land divisions.

The majority of new residential development in Leona Valley should be directed to the rural town area instead of the surrounding rural preserve area, provided that such development is consistent with existing community character. New land divisions shall maintain a large minimum lot size to ensure compatibility with the community character. Each new home should have a unique architectural design. Light agriculture, equestrian, and animal-keeping uses should be allowed throughout the rural town area, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture should be prohibited throughout the rural town area because of potential impacts on existing residents. Home-based businesses may also be permitted throughout the rural town area, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots (2.5 net acres or greater), light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

**Littlerock and Sun Village (Southeast Antelope Valley)**

The communities of Littlerock and Sun Village are located in the southeastern portion of the Antelope Valley, east of the City of Palmdale. Residents of the communities are concerned about urbanization of the area and wish to remain as unincorporated rural communities with unique identities. Many portions of the communities are developed or partially developed with a wide range of uses and a distinctly rural character. The remaining portions are largely undeveloped and generally not served by existing infrastructure, include environmental resources such as Significant Ecological Areas, and are subject to safety hazards, such as Flood Zones.

Each community has a rural town center area. The Littlerock rural town center area is located along Pearblossom Highway between Little Rock Wash and 90th Street East. This rural town center area has been designated as Rural Commercial (CR), and Light Industrial (IL) to serve the daily needs of residents and provide local employment opportunities. This rural town center area also serves travelers along Pearblossom Highway. A possible expansion of the town center has also been identified further to the east where additional parcels have been designated Rural Commercial (CR) and Light Industrial (IL). New buildings in this rural town center area should be limited to two stories in height and include Old West or Southwestern design elements with earth tone colors at a pedestrian-oriented scale, with primary building entries facing Pearblossom Highway. The industrial designations in this rural town center have been expanded to accommodate light industrial uses appropriate for rural areas, such as truck storage facilities.

The Sun Village rural town center area is located along Palmdale Boulevard between Little Rock Wash and 95th Street East, and along 90th Street East between Palmdale Boulevard and Avenue Q-14. This rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of residents and provide local employment opportunities. New buildings in this rural town center area should be limited to three stories in height and include Southwestern, Spanish Mission, or Mediterranean design elements with earth tone colors at a pedestrian-oriented scale, with primary building entries facing Palmdale Boulevard or 90th Street East.

The two rural town center areas should continue to be the focal point of their respective communities and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Streetscape improvements are recommended for Palmdale Boulevard and 90th Street East in the Sun Village rural town center area, including native landscaping, "Southwestern" style street lights that meet dark sky objectives (only where necessary for public safety), and coordinated street furniture, such as benches, bus shelters, and bicycle racks. If Pearblossom Highway is relinquished by the State of California (Caltrans), similar streetscape improvements are recommended in the Littlerock rural town center area. Other public amenities, such as plazas and community bulletin boards, are encouraged in both rural town center areas.

Some areas outside the two town center areas have also been designated as Rural Commercial (CR) to provide additional commercial services and local employment. These areas include the intersection of Avenue T and 87th Street East and the northeast corner of Avenue S and 90th Street East. New buildings in these areas should also be limited to two stories in height and include Old West or Southwestern design elements with a pedestrian-oriented scale and transportation links to surrounding rural town areas. New commercial uses outside of these CR designations, are strongly discouraged, as they are not compatible with the communities' character.

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

Several parcels near the intersection of Avenue R-8 and 90th Street East and a parcel at the northwest corner of Avenue T-8 and 80th Street East have been designated as Heavy Industrial (IH), recognizing existing uses appropriate for rural areas, such as truck storage facilities. New industrial uses outside of these IH designations, or outside the IL designations within the Littlerock rural town center area, are strongly discouraged, as they are not compatible with the communities' character.

The community includes several rural town areas. The first rural town area surrounds the Littlerock rural town center area and is generally bounded by Avenue U to the north, the Little Rock Wash to the west, the California Aqueduct and Avenue U-4 to the south, and 89th Street East and 94th Street East to the east. This area has been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land, with the following exceptions:

- The area generally bounded by Avenue U to the north, the Littlerock Wash to the west, Pearblossom Highway to the south, and 75th Street East to the east, has been designated as Residential 5 (H5), with a maximum density of 5 residential units for each 1 net acre of land.

A second rural town area surrounds the Sun Village rural town center area and is generally bounded by Avenue Q to the north, the Little Rock Wash to the west, Avenue R to the south, and 115th Street East to the east. This rural town area has been designated as Rural Land 1 (RL1), with a maximum density of 1 residential unit for each 1 gross acre of land; and Rural Land 2 (RL2), with a maximum density of 1 residential unit for each 2 gross acres of land.

A third rural town area is generally bounded by Avenue R to the north, the Little Rock Wash and 87th Street East to the west, Avenue U to the south, and 106th Street East, 116th Street East and 120th Street East to the east. This rural town area has been designated as RL1-and RL2.

The RL1, RL2, RL5 and H5 designations are intended to reflect the rural town area's existing densities and are not intended to promote further land divisions. All future land divisions must comply with any minimum lot sizes as set forth in the Southeast Antelope Valley Community Standards District.

The majority of new residential development in Littlerock and Sun Village (collectively known as Southeast Antelope Valley) should be directed to rural town areas instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses, provided that lots meet Zoning Code requirements for those uses. Heavy agriculture uses should be prohibited in the rural town areas because of potential impacts on existing residents. Home-based businesses may also be permitted in the rural town areas, provided that they meet Zoning Code requirements. New land divisions in the rural town areas shall maintain a large minimum lot size to ensure consistency with the desired community character.

The remainder of the communities is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Llano

The community of Llano is located in the southeastern portion of the Antelope Valley, along Pearblossom Highway (State Route 138). Some portions of the community are partially developed with light agricultural uses and single-family homes on large lots, while other portions are largely undeveloped, generally not served by existing infrastructure, and contain environmental resources, such as Significant Ecological Areas.

The community does not have a rural town center area but is served by the rural town center area in Pearblossom. A few parcels along Pearblossom Highway have been designated as Rural Commercial (CR) or Light Industrial (IL), recognizing existing uses and opportunities for additional local services and employment. No other portions of the community have been designated for commercial or industrial use, and new commercial or industrial uses outside these CR and IL designations are strongly discouraged, as they are not compatible with the community character.

The community includes a rural town area that is generally bounded by Pearblossom Highway to the north, 170th Street East and 172nd Street East to the west, Avenue W-14 to the south, and 175th Street East on the east. This area has been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. This designation is intended to reflect the existing density of the rural town area and is not intended to promote further land divisions.

The majority of new residential development in Llano should be directed to the rural town area instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses. Heavy agriculture uses should be prohibited in this area because of potential impacts on existing residents. Home-based businesses may also be permitted in this area, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints and environmental resources. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Neenach

The community of Neenach is located in the far western portion of the Antelope Valley, along Avenue D (State Route 138). Some portions of the community are partially developed with light agricultural uses and single-family homes on large lots, while other portions are largely undeveloped and contain environmental resources, such as Significant Ecological Areas and Agricultural Resource Areas.

The community does not have a rural town center area but is served by the rural town center areas in Antelope Acres and Lake Hughes. A few parcels on Avenue D have been designated as Rural Commercial (CR) or Light Industrial (IL) in recognition of existing and/or planned commercial and industrial uses. No other portions of the community have been designated for commercial or industrial use, and new

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

commercial and industrial uses outside of these CR and IL designations are strongly discouraged, as they may not be compatible with the community character.

The community includes rural town areas that are generally bounded by Avenue B to the north, 270th Street West and 260th Street West to the west, Avenue D to the south, and 250th Street West on the east. These areas have been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. This designation is intended to reflect the existing density of the rural town areas and is not intended to promote further land divisions.

The majority of new residential development in Neenach should be directed to the rural town areas instead of the surrounding rural preserve areas, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses. Heavy agriculture uses should be prohibited in rural town areas because of potential impacts on existing residents. Home-based businesses are also appropriate in the rural town areas, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints and environmental resources. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Pearblossom

The community of Pearblossom is located in the southeastern portion of the Antelope Valley, along Pearblossom Highway between Littlerock and Llano. Some portions of the community are developed with a wide range of uses and a distinctly rural character, while other portions are largely undeveloped, generally not served by existing infrastructure, and subject to safety hazards, such as Seismic Zones and Flood Zones.

The community has a rural town center area along Pearblossom Highway between 121st Street East and 133rd Street East. The rural town center area has been designated as Rural Commercial (CR) or Light Industrial (IL) to serve the daily needs of the residents and provide local employment opportunities. New buildings in the rural town center area should be limited to two stories in height and include Old West or Southwestern design elements at a pedestrian-oriented scale, with primary building entries facing Pearblossom Highway. No other portions of the community have been designated for commercial or industrial use, and new commercial and industrial uses outside of the rural town center area are strongly discouraged, as they are incompatible with the community character.

The rural town center area should continue to be the focal point of the communities and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as plazas and community bulletin boards, are encouraged in this area.

The community includes rural town areas that are generally bounded by Pearblossom Highway to the north, 121st Street East to the west, Avenue W, the California Aqueduct, and Avenue W-11 to the south, and 135th Street East on the east. North of Avenue W, these areas have been designated as Residential

2 (H2), with a maximum density of 2 residential units for each 1 net acre of land or Residential 18 (H18), with a maximum density of 18 residential units for each 1 net acres of land. South of Avenue W and west of 128th Street East, these areas have been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. South of Avenue WE and east of 128th Street East, these areas have been designated as Rural Land 1 (RL1), with a maximum density of 1 residential unit for each 1 gross acre of land. These designations are intended to reflect existing densities of the area and are not intended to promote further land divisions.

The majority of new residential development in Pearblossom should be directed to the rural town areas instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses. Heavy agriculture uses should be prohibited in these areas because of potential impacts on existing residents. Home-based businesses may also be permitted in these areas, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, or Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure and safety resources. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

### Quartz Hill

The community of Quartz Hill is located in the central portion of the Antelope Valley and is surrounded by the cities of Lancaster and Palmdale. The community is adjacent to urbanized areas and is largely developed with a wide range of uses, but it retains a semi-rural character and residents wish to keep it an unincorporated community with a unique identity.

The community has a rural town center area along 50th Street West between Avenue L-6 and Avenue M-2. The town center area has been designated as Mixed Use – Rural (MU-R) and Light Industrial (IL) to serve the daily needs of residents and provide local employment opportunities. No other portions of the community have been designated for industrial use, and new industrial uses outside of the rural town center area are strongly discouraged, as they are incompatible with the community character. New buildings in the rural town center area should be limited to two stories in height, include Old West or Southwestern design elements with earth tone colors, and should be designed at a pedestrian-oriented scale, with primary building entries facing 50th Street West. In the MU-R designation, a vertical mix of commercial and residential uses is encouraged – for example, a building with commercial uses on the first floor and residential or office uses on the second floor. A horizontal mix of commercial and residential uses may also be appropriate – for example, a commercial building facing 50th Street West, with a residential building located towards the rear of the same lot.

The rural town center area should continue to be the focal point of the community and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Streetscape improvements are recommended for 50th Street West, including native landscaping, “Western” street lights that meet dark sky objectives, and coordinated street furniture, such as benches,

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

bus shelters, and bicycle racks. Other public amenities, such as plazas and community bulletin boards, are also encouraged in this area.

Some areas outside the rural town center area have also been designated as MU-R to provide additional commercial services and housing opportunities. These areas include the northwest corner of Avenue N and 50th Street West and the Avenue L corridor between 42nd Street West and 50th Street West. New buildings in these areas should also be limited to two stories in height, include Old West or Southwestern design elements with earth tone colors, and should be designed at a pedestrian-oriented scale with transportation links to surrounding rural town areas. A vertical or horizontal mix of commercial and residential uses may be appropriate in these areas. No other portions of the community have been designated for commercial use, and new commercial uses outside these MU-R designations, or outside the MU-R within the rural town center area, are strongly discouraged, as they are incompatible with the community character.

As the Avenue L corridor between 42nd Street West and 50th Street West develops over time, it will become a secondary rural town center area and should be linked to surrounding rural town areas through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Streetscape improvements are recommended for the Avenue L corridor between 42nd Street West and 50th Street West, including native landscaping, "Western" street lights that meet dark sky, and coordinated street furniture, such as benches, bus shelters, and bicycle racks. Other public amenities, such as plazas and community bulletin boards, are also encouraged in this corridor.

The remainder of the community is considered to be a rural town area. Two properties along Avenue M have been designated as Residential 30 (H30), with a maximum density of 30 residential units for each 1 net acre of land, in recognition of existing multi-family uses. Several parcels adjoining the rural town center area between Avenue L-8 and Columbia Way have been designated as Residential 18 (H18), with a maximum density of 18 residential units for each 1 net acre of land, recognizing existing multi-family units and providing additional housing opportunities. In addition, a property at the northwest corner of Avenue M and 70th Street West, and several parcels on the south side of Avenue L near 40th Street West, has been designated as H18. New multi-family buildings in the H18 designation should be limited to two stories in height and should be designed in a manner that is compatible with nearby single-family homes.

South of Avenue L, the remaining rural town area has been designated as Residential 5 (H5), with a maximum density of 5 residential units for each 1 net acre of land, or Residential 2 (H2), with a maximum density of 2 residential units for each 1 net acre of land. These designations are intended to reflect the area's existing density and are not intended to promote further land divisions, although properties along Columbia Way between 40th Street West and 45th Street West present some land division opportunities. Light agriculture, equestrian, and animal-keeping uses may be permitted in these areas, provided that lots meet Zoning Code requirements for those uses. Home-based businesses may also be permitted in these areas, provided that they meet Zoning Code requirements.

North of Avenue L, the remaining rural town area has been designated as Rural Land 1 (RL1), with a maximum density of 1 residential unit for each 1 gross acre of land. This designation is intended to reflect the area's existing density and is not intended to promote further land divisions. Light agriculture, equestrian, and animal-keeping uses are appropriate in this area, but heavy agriculture uses

should be prohibited because of potential impacts to existing residents. Home-based businesses are also appropriate in this area, provided that they meet Zoning Code requirements.

### Roosevelt

The community of Roosevelt is located in the northeastern portion of the Antelope Valley, north of the City of Lancaster. Community residents are concerned about the urbanization of the area and wish to remain an unincorporated rural community with a unique agricultural identity. Some portions of the community are partially developed with light agricultural uses and single-family homes on large lots, while some portions are in Agricultural Resource Areas and are partially undeveloped with farms and heavy agricultural uses. The remaining portions are largely undeveloped and contain environmental resources, such as Significant Ecological Areas.

The community has a rural town center area located at the intersection of Avenue J and 90th Street East. The rural town center area has been designated as Rural Commercial (CR) to serve the daily needs of the residents and provide local employment opportunities. New buildings in the rural town center area should be limited to one story in height and should be designed at a pedestrian-oriented scale, with primary building entries facing Avenue J or 90th Street East.

The rural town center area should continue to be the focal point of the communities and should be linked to the surrounding rural town area through trails and pedestrian routes. Pedestrian routes should have permeable paving, consistent with rural community character, instead of concrete sidewalks. Public amenities, such as community bulletin boards, are encouraged in this area.

Two parcels on 90th Street East have been designated as CR and Light Industrial (IL) in recognition of existing commercial and industrial uses. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside of this IL designation are strongly discouraged, as they are not compatible with the community character.

The community includes rural town areas that are generally bounded by Lancaster Boulevard to the north, 85th Street East to the west, Avenue J-12 and Avenue J to the south, and 90th Street East on the east. These areas have been designated as Rural Land 5 (RL5), with a maximum density of 1 residential unit for each 5 gross acres of land. This designation is intended to reflect the existing density of the rural town areas and is not intended to promote further land divisions. New land divisions in the rural town areas shall maintain a large minimum lot size to ensure consistency with the existing community character.

The majority of new residential development in Roosevelt should be directed to the rural town areas instead of the surrounding rural preserve area, provided that such development is consistent with existing community character and allows for light agriculture, equestrian, and animal-keeping uses. Heavy agriculture uses should be prohibited in these areas because of potential impacts on existing residents. Home-based businesses may also be permitted in these areas, provided that they meet Zoning Code requirements.

The remainder of the community is considered to be a rural preserve area and has been designated as Rural Land 10 (RL10), with a maximum density of 1 residential unit for each 10 gross acres of land, and Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. These very low densities reflect the underlying infrastructure constraints and environmental resources.

## Submission 4452 (Jacqueline Ayer, Acton Town Council, December 2, 2022) - Continued

Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate. Agricultural uses in Agricultural Resource Areas will be protected and promoted, as directed in the policies of the Conservation and Open Space Element.

### Three Points

The community of Three Points is located in the far western portion of the Antelope Valley, south of Neenach and northwest of Lake Hughes. The community is largely undeveloped and is generally not served by existing infrastructure and public facilities, but it does contain some single-family homes on large lots and some agricultural uses. The community is adjacent to the National Forest, includes environmental resources, such as scenic hillsides and Significant Ecological Areas, and is subject to several safety hazards, including the San Andreas Fault and Very High Fire Hazard Severity Zones.

The community does not have a rural town center area but is served by the rural town center area in Lake Hughes. A parcel at the southwest corner of Three Points Road and Pine Canyon Road has been designated as Rural Commercial (CR) in recognition of an existing commercial use. No other portions of the community have been designated for commercial or industrial use, and new commercial uses outside of this CR designation and new industrial uses are strongly discouraged, as they are not compatible with the community character.

The entire community is considered to be a rural preserve area and has been designated as Rural Land 20 (RL20), with a maximum density of 1 residential unit for each 20 gross acres of land. This very low density reflects the underlying infrastructure constraints, environmental resources, and safety constraints. Development in the rural preserve area should be limited to single-family homes on very large lots, light and heavy agriculture, equestrian and animal-keeping uses, and other uses where appropriate.

**1.0 INTRODUCTION**

4453-10518

The “Cultural Resources” impact assessment presented in Chapter 3.17 of the Draft Environmental Impact Report/Environmental Impact Statement (hereafter referred to as “the Draft”) that was prepared by the California High Speed Rail Authority (“CHSRA”) for the Palmdale-Burbank Segment of the High Speed Rail Project (“Project”) has been evaluated and numerous concerns and irregularities have been identified. As set forth in the comments below, these irregularities suggest that the Draft’s analysis of Cultural Resources do not comply with the California Environmental Quality Act (“CEQA”). These comments were prepared by Acton Residents who have resided in the Community for more than 30 years and know it well; this expertise lends significant credibility to, and provides a substantial foundation for, the comments submitted herein.

**2.0 DEFICIENCIES AND CONCERNS NOTED IN THE DRAFT’S CULTURAL RESOURCES ANALYSIS**

The Draft’s analysis of cultural resources raises the concerns set forth below.

4453-10519

**2.1 The Draft Fails to Mention the Aliso Arrastre Special Interest Area**

All of the proposed “E” Routes proceed above ground and transition underground in an area designated by the U.S. Forest Service (“USFS”) as the “Aliso-Arrastre Special Interest Area”<sup>1</sup> (“SIA”) within the San Gabriel Mountains National Monument portion of the Angeles National Forest; this designation was applied because, among other things, it contains extensive and irreplaceable heritage resources. The U.S. Department of Agriculture (“USDA”) Land Management Plan (“LMP”) adopted for the Angeles Forest requires that sites like the Aliso Arrastre SIA be protected to the same extent as properties deemed eligible for the National Register of Historic Places. Yet, the Draft makes no mention of the Aliso Arrastre Special Interest Area at all and it certainly does not clarify how the project will ensure the area is protected to the same extent as if it were eligible for the National Register of Historic Places. This constitutes a significant deficiency that can only be corrected by expanding the Draft to specifically address matters pertaining to the Aliso Arrastre SIA or, in the alternative, selecting the SR14A route rather than any of the “E” Routes.

4453-10520

**2.2 The Draft Appears to Defer the Development of Mitigation Measures in a Manner that Does not Comply with CEQA.**

The Draft asserts on Page 3.17-79 and Page 3.17-83 and elsewhere that “Due to limited access for archaeological surveying during environmental phase, the identification of archaeological sites will be conducted in phases as access to parcels is gained during design-build activities.

<sup>1</sup> [https://www.fs.usda.gov/detailfull/r5/forest-grasslandhealth/?cid=fsbdev3\\_047946&width=full](https://www.fs.usda.gov/detailfull/r5/forest-grasslandhealth/?cid=fsbdev3_047946&width=full)

4453-10520

Therefore, specific impacts on known and as-of-yet unknown archeological sites will be determined during phased investigation.” This indicates that CHSRA will assess the cultural resource impacts of the Project and develop mitigation measures for the Project *after* the Final EIR/EIS is certified. These “post EIR/EIS certification” environmental assessments and mitigation plans will be developed without public review and comment, and will remain as internal documents accessible only by CHSRA and CHSRA’s agents, contractors and representatives. CEQA does not permit a Lead Agencies to certify an EIR first and then assess project impacts second; yet, according to the Draft, that is precisely what CHSRA plans to do. This whole approach effectively turns CEQA on its head and is therefore completely unacceptable.

It is further noted that the Draft clearly asserts on page 3.17-87 “though implementation of CUL-IAMF#3 would avoid or minimize impacts on unknown or previously undiscovered archeological resources, various resource sites would remain susceptible to construction impacts, with the potential to cause a substantial change in the significance of an archaeological resource pursuant to Section 15064.5 of the CEQA Guidelines.” In other words, not only does the Draft indicate that CHSRA intends to assess cultural resource impacts and develop mitigation measures after the Final EIR/EIS is certified; it further indicates that, whatever mitigation methods are developed, they may not work! All of this is completely unacceptable; the Draft must be revised to properly identify the cultural resources that may be significantly affected by the Project and identify mitigation measures which actually *address* these impacts. Fortunately, these concerns can be largely eliminated if CHSRA selects the SR14A Route rather than any of the other routes.

4453-10521

**2.3 Historic Blum Ranch Will be Significantly Impacted if CHSRA Selects Any of the “E” Route Alternatives.**

Page 3.17-80 of the Draft states “As with other sections, the Palmdale to Burbank Project section would have the greatest significant impacts on historic architectural properties in the urbanized areas, and the greatest significant impacts on undisturbed prehistoric archaeological sites in rural/undeveloped areas.” This is inaccurate; the Project *will* result in significant impacts on historical architectural properties in Acton if any of the “E” route alternatives are selected. Specifically, Blum Ranch is a living Historic Resource that is also a working ranch which is visited every year by thousands of people, and all of the “E” route alternatives will cause significant adverse aesthetic and noise impacts on this historic property. Most areas of the farm and ranch house will have a direct line of site to the elevated tracks as they cross over Aliso Canyon Road; thus, Blum Ranch will experience significantly adverse aesthetic and noise impacts if any of the “E” Routes are approved. For instance, each time the train goes by, the noise level at the ranch will exceed 87 dBA; this will occur more than 460 times per day, and will require employees working at the Ranch to wear hearing protection<sup>2</sup>. In other words, the significant noise and visual impacts resulting from Project operation will make historic Blum Ranch unvisitable.

<sup>2</sup> As indicated in comments that the Acton Town Council submitted on December 1, 2022 in response to Section 3.4 of the Draft, the Sound Exposure Level 2,000 feet from the tracks will exceed 85 dBA; thus, hearing protection is required per Federal OSHA regulations.

## Submission 4453 (Jacqueline Ayers, Acton Town Council, December 1, 2022) - Continued

4453-10521

Blum Ranch is an Historic Homestead built in 1891 by the Blum Family. Their orchards started off with pears and apples along with beehives for local-made honey. They later added lilacs and then peaches. The ranch and store were continuously operated by the decedents of the original homesteaders until it the property was recently sold. The new owners continue to maintain the property as a family-owned ranch and store; they changed the name to Bloom Ranch as an “homage” to the original homesteading family name. They now have peaches and lilacs and run the store with other items that are locally grown or made. Thousands of people visit Bloom Ranch every year, but the noise and aesthetic impacts of the Project will greatly diminish visitorship to the property; this in turn will cause the new owners to experience significant economic hardships that may even force them to close the ranch down. If that happens, the historic Blum Ranch will fall into decay and ruin. Yet, the Draft fails to account for any of these impacts; in fact, the Draft dismisses these concerns because it declares on page 3.17-91 that “a quiet setting is not a character-defining feature of the resource”. Nothing could be further from the truth; the noise impacts of train operation will drive Bloom Ranch customers away and this will threaten the very financial foundation of the ranch. Once the customers leave, support for the Ranch will disappear and it will fall to ruin. The Draft must be revised to properly address the extent to which the very existence of historic Blum Ranch is threatened by the Project. Or, in the alternative, CHSRA can simply approve the SR14A route alternative.

4453-10522

**2.4 The Draft Concludes Cultural Resource Impacts Will be Mitigated Based on Insubstantial and Groundless Assumptions.**

Page 3.17-95 asserts that, to mitigate impacts, CHSRA will consult with MOA signatories and tribal consulting parties, but what is not clear is how mitigation will be achieved if the MOA signatories and tribal consulting parties conclude that a resource cannot be moved; such circumstances would render the cultural resource impact to be very significant, yet no solution is offered. In other words, the Draft appears to adopt a groundless assumption that any solution it develops will be acceptable to MOA signatories and tribal consulting parties when in fact, this may not be the case.

4453-10523

**2.5 The Lack of Data Regarding Many Resources Makes It Difficult for the Public to Provide Substantive Comments.**

All alternative routes for the proposed project will involve significant effects on the Cultural Resources found along the route; these comments pertain to those resources located in Acton. According to Table 3.17-6, there are ten resources that have USFS numbers and nine of these are in the vicinity of all the “E” routes; one is in the vicinity of the refined SR14 route. The other 26 resources have no USFS number which suggests that these resources are on private property and may be in the path of one of the HSR route alternatives (which, it is understood, are firmly fixed). The mitigation measures proposed by the Draft are vague and nonspecific, thus it is not clear whether these 26 “non-USFS” resources will indeed be adequately protected especially if they are in the path of the railway tracks. The best path towards protecting and securing these resources is to forego all route alternatives other than the SR14A.

**3.0 CONCLUSION**

4453-10524

For the reasons set forth below, CHSRA is urged to forego all route alternatives except the SR14A.

## Response to Submission 4453 (Jacqueline Ayers, Acton Town Council, December 1, 2022)

### 4453-10518

The commenter notes that their submission letter contains comments from Acton residents on the cultural resources analysis in Section 3.17, Cultural Resources, of the Draft EIR/EIS and asserts that the Draft EIR/EIS is not in compliance with CEQA. These comments are acknowledged. Refer to the subsequent comment responses to this submission letter (comment responses 4453-10519, 4453-10520, and 4453-10521) which address the commenter's more detailed concerns regarding the Aliso-Arrastre Special Interest Area; the identification of known and unknown archaeological resources and associated identification procedures, impact avoidance and minimization features, and mitigation measures; and noise and visual impacts to Blum Ranch.

### 4453-10519

The commenter notes that the Draft EIR/EIS fails to mention the Aliso Arrastre Special Interest Area (SIA) within the San Gabriel Mountains National Monument (SGMNM) of the Angeles National Forest (ANF), which intersects with the E1/E1A and E2/E2A Build Alternatives. The commenter asserts that the U.S. Department of Agriculture (USDA) Land Management Plan (LMP) adopted for the ANF requires that sites like the SIA be protected to the same extent as properties deemed eligible for the National Register of Historic Places (NRHP). The discussion of the SIA on page 85 of the USFS LMP Part 2 ANF Strategy ([www.fs.usda.gov/Internet/FSE\\_DOCUMENTS/stelprdb5166877.pdf](http://www.fs.usda.gov/Internet/FSE_DOCUMENTS/stelprdb5166877.pdf)) does not assert that USFS policy is to treat the SIA as NRHP-eligible. Although the LMP indicates that the SIA contains important archaeological sites, it does not state that the entire area is NRHP-eligible nor that it should be treated as such. Moreover, the SIA discussion in the LMP does not suggest that the important archaeological sites within the SIA are thematically linked consistent with the presence of a historic district. Additionally, a "special interest area" is not a historic property type typically used for NRHP nominations or determinations of eligibility. Nevertheless, Section 3.17.11.2, United States Forest Service Resource Analysis in Section 3.17, Cultural Resources has been updated in the Final EIR/EIS by providing a description of the SIA. In addition, Table 3.17-20 (Archaeological Resources within the ANF, including the SGMNM) in Section 3.17, Cultural Resources has been updated in the Final EIR/EIS to provide clarity on the resources located within the SIA by identifying the 9 archaeological resources that are located within the SIA. As with all unevaluated cultural resources in the Project area, cultural resources in this SIA would be assumed eligible until (a) phased identification and evaluation could be completed and (b) determinations of eligibility/treatment measures for adversely affected resources could be developed in consultation with the ANF, Native American Tribes, and other consulting parties. This update does not affect the CEQA and NEPA conclusions presented in the Draft EIR/EIS because the resources were already analyzed for potential impacts in Section 3.17.7.5, Environmental Consequences. The new information added to Section 3.17 of the Final EIR/EIS does not add any new significant impacts or increase the severity of previously disclosed impacts to cultural resources located within the SIA. The USFS is a Section 106 consulting party; consultation with the USFS and other Section 106 consulting parties has remained ongoing throughout the environmental document preparation process, as described in Section 3.17.4.2, Agency, Native American, Interested Parties, and Public Outreach Efforts. The Authority will continue consultation with the USFS and

## Response to Submission 4453 (Jacqueline Ayers, Acton Town Council, December 1, 2022) - Continued

### 4453-10519

other consulting parties through the construction phase of the Palmdale to Burbank Project Section during implementation of the MOA and treatment plans.

### 4453-10520

The commenter states the opinion that the Draft EIR/EIS defers mitigation measures for archaeological resources, in conflict with CEQA, and that the mitigation is insufficient to reduce identified impacts. The commenter also expresses concern that mitigation plans will be accessible only to the Authority and its agents, contractors, and representatives.

The analysis of impacts to archaeological resources is provided in Section 3.17.7 of the Draft EIR/EIS, specifically Impact CUL#1 (Effects on Known Archaeological Resources Caused by Construction Activities) and Impact CUL#2 (Effects on Unknown Archaeological Resources Caused by Construction Activities). Although implementation of CUL-IAMF#1, CUL-IAMF#2, and CUL-IAMF#5 will avoid and minimize impacts on known archaeological resources, various resource sites would remain susceptible to construction impacts, with the potential to cause a substantial change in the significance of an archaeological resource, pursuant to Section 15064.5 of the CEQA Guidelines. Therefore, mitigation measures are required. This includes CUL-MM#1, which requires mitigation of adverse effects to archaeological resources identified during phased identification, including through preservation in place, or data recovery if necessary. CUL-MM#2 further requires that, in the event of an unanticipated archaeological discovery, the contractor will cease work in the immediate vicinity of the find. The contractor's qualified archaeologist will assess the potential significance of the find and make recommendations for further evaluation and treatment as necessary, which must be followed. Finally, CUL-MM#3 addresses impacts on as-of-yet-unidentified significant archaeological resources, and requires that protocols for identification, evaluation, treatment, and data recover mitigation of these resources be addressed in the Memorandum of Agreement (MOA) and Archaeological Treatment Plan (ATP). Contrary to the commenter's assertion, cultural resource impacts are addressed in the Draft EIR/EIS and mitigation measures have been developed.

All mitigation measures would require documentation of implementation, monitoring and reporting, and subject to the Mitigation Monitoring and Enforcement Plan (MMEP). CEQA Guidelines Section 15126.4 (B) states: "formulation of mitigation measures shall not be deferred until some future time. The specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project's environmental review provided that the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the

## Response to Submission 4453 (Jacqueline Ayers, Acton Town Council, December 1, 2022) - Continued

### 4453-10520

mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be considered, analyzed, and potentially incorporated in the mitigation measure.”

The Programmatic Agreement Among the FRA, the ACHP, the SHPO, and the Authority Regarding Compliance with Section 106 of the NHPA, as it Pertains to the California High-Speed Train Project executed in 2011 (FRA et al. 2011) and amended in 2021 (Authority et al. 2021) (PA) sets forth the Authority’s systemwide cultural resources approach. The Archaeological Treatment Plan (ATP), Built Environment Treatment Plan (BETP), Memorandum of Agreement (MOA) to provide specific details regarding the Palmdale to Burbank Project Section. The ATP, BETP, and MOA provide additional detail regarding the implementation of CUL-MM#1. The PA, ATP, BETP, and MOA were developed in consultation with federal agencies, the State Historic Preservation Officer, tribes, local government officials, the Advisory Council on Historic Preservation, other interested parties, and the general public. The PA and MOA set forth provisions for consultation with these parties at each step of the phased identification process, ensuring public input and access. The mitigation plans will therefore be more accessible than suggested by the commenter.

The Authority would commit to its mitigation through adoption of an MMEP. CUL-MM#1 through CUL-MM#3 include specific performance standards [i.e., complying with the PA, MOA, and ATP; the Secretary of the Interior’s Standards and Guidelines for Archaeology and Historic Preservation (48 FR 44716-42); and Guidelines for the Implementation of CEQA, as amended (Title 14 CCR Chapter 3, Article 9, Sections 15120-15132), among others], as described in the Draft EIR/EIS. The Authority identifies the actions that can be achieved to meet performance standards [e.g., preparation of a data recovery plan as required under CEQA Guidelines §15126.4(b)(3)(C), the MOA, and ATP]. For these reasons, CR-MM#1 through CR-MM#3 are not deferred.

### 4453-10521

The commenter asserts that selection of the E1, E1A, E2, and E2A Build Alternatives would significantly alter the Blum Ranch.

This was also the conclusion of the Section 106 Finding of Effects (FOE), which SHPO concurred with on September 3, 2021. The FOE identified the potential for adverse visual effects during construction and operation of the E1, E1A, E2, and E2A Build Alternatives of the HSR Palmdale to Burbank Section. For the E1, E1A, E2, and E2A Build Alternatives, the project would be above ground outside of the historic property boundary of both the Blum Ranch Historic District and the Blum Ranch Farmhouse and the HSR structure would be highly noticeable intermittently. Blum Ranch Historic District is a rural historic landscape and would be highly sensitive to such large-scale visual changes within its viewshed. This is discussed in Section 3.17, Cultural Resources of the Draft EIR/EIS (see Impact CUL#4).

Furthermore, the effects analysis included review and incorporation of findings from other technical studies. These studies included assessments of visual, noise, and vibration impacts, as reported in the Noise and Vibration Technical Report, the Aesthetics and Visual Quality Technical Report, the Right-of-Way Analysis, and the Draft Preliminary Engineering/Project Definition. (Authority 2018 and 2017) (Authority and FRA 2017a, 2017b). The adverse effects analysis for historic properties also considered the FRA guidance manual regarding assessment of high-speed train noise and vibration effects (FRA 2012). Historically significant sites are considered noise-sensitive, for example, depending on their land use activities, with some being more sensitive to changes in noise levels than others. (FRA 2012: 3-8). Although the effects analysis acknowledged that the Farmhouse was noise-sensitive, it concluded that historically, the Blum Ranch Historic District as a whole was not.

In addition to the existing ambient sound levels, the effects analysis took into account the nature of the setting of the historic rural cultural landscape and historic farmhouse from multiple locations and times of day on the property, including the existing noise levels associated with farming, the road and nearby commercial industrial properties, as well as noise and disruption associated with visitors and deliveries to the farm store. The effects analysis compared these existing noise levels to the expected intermittent noise and vibration from the construction of the train alignment and the operation of the HSR

## Response to Submission 4453 (Jacqueline Ayers, Acton Town Council, December 1, 2022) - Continued

### 4453-10521

Palmdale to Burbank Section. Noise measurements were conducted in the immediate area of the adit where the train would emerge south of the historic properties. Within 250 feet of Noise Measurement Location 9, the dBA would not be more than 57 dBA. The southern border of the Blum Ranch Historic District (excluding the irrigation pipeline) is the "flatlands," located approximately 1,000 feet to the north of the proposed adit. The Blum Ranch Farmhouse is approximately 1,900 feet to the north of the proposed adit. As such, neither the Blum Ranch Historic District nor the Blum Ranch Farmhouse would experience noise levels that exceed 87 dBA, as suggested by the commenter. The irrigation pipeline, which is mostly below the surface, extends the historic district boundary south along its alignment towards the proposed adit. It is unknown how much of the original 1908-1912 water line is in situ, how much of the original water line is still in use, and what has been abandoned or relocated. The irrigation pipeline has not been identified as a noise-sensitive receptor and is unlikely to be adversely affected by a change or increase in noise as a result of the Build Alternatives.

As a matter of clarification, the commenter's statement that there would be 460 daily trains is not accurate. As explained in the "Operating Conditions" subheading in Section 3.4, Noise and Vibration of the Final EIR/EIS: "For the Palmdale to Burbank Project Section, it is assumed that there would be a total of 189 trains in both directions combined during the daytime hours (7:00 a.m. to 10:00 p.m.), and a total of 28 trains in both directions during the nighttime hours (10:00 p.m. to 7:00 a.m.), for a total of 217 trains per day in both directions combined. There would be a total of 14 trains per hour in both directions combined during the peak hours, and these 14 trains per hour during the peak hours are a subset of the number of daytime trains, and not an additional set of trains to be added to the total." The Blum Ranch Farmhouse would be subject to moderate, but not severe, residential noise impacts as analyzed in the Palmdale to Burbank Project Section Noise and Vibration Technical Report. Intermittent noise from the train could be audible at the Blum Ranch Farmhouse. The FOE determined that the integrity of the Blum Ranch Farmhouse under Criterion C (architecture) would be adversely affected by the moderate noise impacts.

Significant attention in both the 2019 Historic Architectural Survey Report (HASR) and the FOE to both the historic residence and historic farmstead property was made to establish the historic context, the period of significance, the NRHP criteria under which

### 4453-10521

they were found NRHP-eligible, the historic boundary and the character-defining features of the Blum Ranch rural cultural landscape and the historic farmhouse. SHPO concurred with the Authority's determination of eligibility for both on August 30, 2019.

The FOE determined that no adverse effects to the Blum Ranch Historic District or Blum Ranch Farmhouse would occur as a result of the SR14 Build Alternative or the Refined SR14 Build Alternative. The Authority has identified the SR14A Build Alternative as the preferred alternative, which avoids Blum Ranch Historic District and the Blum Ranch Farmhouse and therefore avoids adverse effects to both historic properties. The Draft EIR/EIS draws from both the identification and evaluation of properties in the HASR and potential for project effects on NRHP-listed/eligible historic properties in the FOE. An adverse effect on historic properties is found when an undertaking such as the HSR Palmdale to Burbank Section may alter, directly or indirectly, any of the characteristics that qualify that property for inclusion in the National Register of Historic Places (NRHP) (36 CFR.800.5[1]).

In summary, in its Draft EIR/EIS the Authority has disclosed the significant and unavoidable impacts and the adverse effects on the Blum Ranch Historic District and the Blum Ranch Farmhouse due to the E1, E1A, E2, and E2A Build Alternatives. The Refined SR14 Build Alternative would result in no adverse effect to the Blum Ranch Historic District or the Blum Ranch Farmhouse. In addition, the Authority has identified that its preferred alternative, the SR14A Build Alternative would not result in an adverse effect on the Blum Ranch Historic District and the Blum Ranch Farmhouse.

## Response to Submission 4453 (Jacqueline Ayers, Acton Town Council, December 1, 2022) - Continued

### **4453-10522**

The comment states that the conclusion that cultural resources will be mitigated is based on insubstantial and groundless assumptions, and states that it is not clear how mitigation will be achieved if a conclusion is reached that a cultural resource cannot be moved or of the solutions developed in the future are not acceptable to the signatories of the Memoranda of Agreement (MOA). Section 106 and CEQA mandate that identification and effects assessment of historic properties/historical resources occurs and treatment of adverse effects on significant cultural resources that cannot be avoided. Mitigation measures CUL-MM#1 through CUL-MM#6 described in Section 3.17.8 of the Draft EIR/EIS are considered the most effective and feasible mitigations to resolve adverse effects to Section 106 (NEPA) eligible properties or to mitigate impacts to less than significant levels to California Register of Historic Resources or CEQA eligible historical resources. However, while individual circumstances may not allow for the reduction of significance to less than significant level (for example, if a resource cannot be moved or protected in place), implementation of the mitigation will reduce or compensate for the loss of a property or resource. Under CEQA, the destruction of a historical resource cannot be mitigated to a less than significant level. In accordance with the PA, a Built Environment Treatment Plan and an Archaeological Treatment Plan are being prepared and will be implemented, subject to approval of the State Historic Preservation Officer, to resolve any potential adverse effects to NRHP-listed or -eligible historic and archaeological properties or potential impacts to CEQA historical resources (including archaeological resources). These treatment plans describe detailed requirements for the treatment of resources affected by the project, site monitoring during construction, handling of unanticipated discoveries, data recovery, and curation of artifacts, among other things. In accordance with the PA, the mitigation of impacts to historic properties (and the development of Memoranda of Agreement) and historical resources is being developed with input from consulting parties, which include local city and county jurisdictions, as well as local Native American representatives. Combined, these mitigation measures would mitigate for impacts to both known and unknown archaeological resources as well as historic built resources affected by the project.

### **4453-10523**

The commenter states that the mitigation measures in the Draft EIR/EIS are vague and non-specific and states that it is not clear whether 26 resources without USFS numbers will be adequately protected. The identification of known archaeological resources reflected in the Archaeological Survey Report (ASR) and EIR/EIS represents the most accurate data available at the time of the NOP, which established the existing conditions baseline for the Draft EIR/EIS. The 26 resources referred to in the comment consist of five historic period sites (1 landfill, 2 foundations, 2 refuse deposits) and 21 precontact sites (15 lithic scatters, 1 lithic quarry, 2 habitation sites, 2 rock shelters, and the Vasquez Rocks Archaeological District). Two of these resources (P-19-000360 and the Vasquez Rocks Archaeological District) are listed on the National Register of Historic Places (NRHP). All archaeological resources that were not previously evaluated for NRHP eligibility were assumed to be eligible for the NRHP in the EIR/EIS (Table 3.17-6). Not all resources, including the 26 resources in question, were accessible at the time of the ASR and EIR/EIS, and both documents propose phased identification once the project design is finalized. As stated in Section 3.17.7.3, page 3.17-81 of the EIR/EIS, three of these resources (3 precontact lithic scatters) would not be affected by the project. The remaining 23 resource may be affected by project construction, as shown in Tables 3.17-9, 3.17-12, and 3.17-15 of the EIR/EIS. Section 106 and CEQA do not require protection of historic properties. They mandate that identification and effects assessment of historic properties/historical resources occurs and that the agency consult on adverse effects on significant cultural resources that cannot be avoided. Mitigation measures CUL-MM#1 through CUL-MM#4 described in Section 3.17.18 of the EIR/EIS apply to all historic properties, including the 26 resources referred to in the comment, regardless of their location on public or private lands. CUL-MM#1 calls for the treatment of archaeological resources in accordance with the stipulations provided in the Section 106 Programmatic Agreement (PA) and Memorandum of Agreement (MOA). The PA stipulates the development of an Archaeological Treatment Plan (ATP) for the investigation and treatment of both known (including the 23 sites on private land that may be affected by project construction) and unknown archaeological resources. CUL-MM#2 calls for adherence to the MOA, PA, and ATP in the event of a new archaeological discovery. CUL-MM#3 provides for the mitigation for effects to precontact archaeological resources, which would apply to 20 of the 26 sites mentioned by the commentor (18 of the 21 precontact sites), and any other precontact site identified during implementation of the PA and MOA. the development of meaningful mitigation

## Response to Submission 4453 (Jacqueline Ayers, Acton Town Council, December 1, 2022) - Continued

### **4453-10523**

measures for effects on as-of-yet-unidentified Native American archaeological resources that cannot be avoided would be negotiated with the tribal consulting parties. CUL-MM#4 provides for protection-in-place through implementation of BMPs for standard practice maintenance and utility connections to reduce ground disturbance activities, which would apply to all 26 sites mentioned in the comment. These processes will be carried out in consultation with Section 106 consulting parties. Combined, these mitigation measures would mitigate for impacts to both known and unknown archaeological resources on federal and private lands.

### **4453-10524**

The commenter expresses a preference for the SR14A Build Alternative over any other HSR Build Alternatives. The Authority has identified the SR14A Build Alternative as the preferred Build Alternative for the Project. See Chapter 8: Preferred Alternative and Station Site(s), for more information regarding the preferred alternative. For a response to comments on how the Preferred Alternative was selected, refer to PB-Response-GEN-1.

California High Speed Rail Authority

Via email: [Palmdale\\_Burbank@hsr.ca.gov](mailto:Palmdale_Burbank@hsr.ca.gov)

**Subject: Palmdale to Burbank Project Section Draft EIR/EIS Comment**

4456-9070

The Sierra Club endorsed Proposition 1A in 2008 for California High Speed Rail, as an alternative to fossil fuel use, criteria pollutants, and greenhouse gas emissions from long car drives and intra-state plane flights, and to reduce highway and airport expansion.

Construction is now well underway between Bakersfield and Merced, and electrification for initial operations there is funded.

Palmdale to Burbank is the final section's Draft EIR/EIS for the San Francisco to Los Angeles main line, and this section is obviously required to complete the route. Due to necessary mountain crossings, it will be mostly tunneled.

We commend CHSRA's extensive environmental study from 2010 to 2022 of a comprehensive set of route alternatives between Palmdale and Burbank, and agree with CHSRA's selection of SR14A as the preferred Build Alternative to minimize environmental impacts.

4456-9071

We are also submitting these specific comments on the Draft EIR/EIS:

**Wildlife corridors and riparian habitats**

We note the discussion of SR14A's at-grade impermeability of the wildlife corridor near Bee Canyon, beginning on page 3.7-190, but seek more mitigation for this vital wildlife corridor north of the Angeles National Forest than only citing the adjacent SR14 freeway as a barrier. We appreciate the discussion of riparian habitat, but remain concerned about their degradation.

4456-9072

**Geology / seismic**

We note discussion of seismic risks on pages 3.9-101, 3.9-109, 3.9-112, and GEO-IAMF#6, GEO-IAMF#7, and GEO-IAMF#8, but remain concerned about tunnel integrity both from slow geologic uplift and during earthquakes, and safely evacuating passengers from a train stopped during a seismic event.

It is necessary for the planners to consult the formal peer-reviewed research papers that discuss the geologic hazards of the area. A distinguished geologist, who has spent his life mapping the proposed rail line area, has spoken at numerous High Speed Rail meetings only to have his research and maps ignored. The DEIR lists no independent research sources, and provides only topographic maps – many of which are not up-to-date by the standards of local geologists who have published papers on the geology of this area.

4456-9073

**Water supply**

We note that water demand for construction would exceed supply in dry years (page 3.6-76), with no clear solution.

Thank you,

Darrell Clarke  
Sierra Club Angeles Chapter Transportation Chair

## Response to Submission 4456 (Darrell Clarke, Sierra Club, December 1, 2022)

### 4456-9070

The commenter provided background of the commenter's (Sierra Club) support for Proposition 1A, as well as the extensive environmental study conducted by the Authority between 2010 and 2022. The Sierra Club agrees with the Authority's selection of the Preferred Alternative SR14A identified in the Draft EIR/EIS.

The Authority has not made any changes to the document in response to this comment.

### 4456-9071

Refer to Standard Response PB-Response-BIO-3: Wildlife Movement Corridors.

The commenter expresses concerns related to wildlife connectivity and wildlife crossing opportunities. Please refer to PB-Response-BIO-3: Wildlife Movement Corridors. Further, the commenter is specifically concerned about the impermeability of wildlife movement north of the Angeles National Forest adjacent to the SR 14 freeway and also adjacent to Bee Canyon described beginning on page 3.7-190 in the EIR/EIS.

The primary barrier to wildlife access along Bee Canyon is the SR 14 freeway. As described in the Wildlife Corridor Assessment (WCA) Report, movement opportunities across the SR 14 freeway are generally limited to several bridge undercrossings. Potential crossing opportunities across the SR 14 freeway are listed below with photographs provided in Appendix C in the WCA. Potential crossings include:

- California Aqueduct undercrossing of the SR 14 freeway
- SR 14 undercrossing south of California Aqueduct
- Sierra Highway-SR 14 undercrossing
- Mountain Springs Road-SR 14 overcrossing
- Sierra Highway-SR 14 overcrossing
- Santiago Road-SR 14 undercrossing
- Crown Valley Road-SR 14 undercrossing
- Red Rover Mine Road-SR 14 undercrossing
- Culvert under SR 14 near Red Rover Mine Road
- Ward Road-SR 14 undercrossing
- Culvert under SR 14 near Ward Road
- Puritan Mine Road-SR 14 undercrossing
- Escondido Canyon Road-SR 14 overcrossing
- Pacific Crest Trail SR 14 undercrossing
- Culvert under SR 14 near Vasquez Rocks
- Agua Dulce Canyon Road-SR 14 undercrossing
- Culvert under SR 14 near Agua Dulce Canyon Road
- Stone Crest Road-SR 14 undercrossing
- Soledad Canyon Road-SR 14 undercrossing

Response to Submission 4456 (Darrell Clarke, Sierra Club, December 1, 2022) - Continued

**4456-9071**

The primary crossing opportunities under the SR 14 freeway in the vicinity of Bee Canyon include Agua Dulce Canyon Road to the northeast and Stone Crest Road to the southwest. Furthermore, Figure 4-5 in the WCA shows the spatial relationship between these wildlife crossing opportunities at the existing bridges on the SR 14 freeway and the tunnel and viaduct segments of the alignment and how the existing wildlife movement opportunities are maintained as a result. Attached Figures 1 and 2 below further illustrate how existing wildlife movement opportunities across the SR 14 freeway line up with the adjacent permeable tunnel and viaduct segments for the SR14A Build Alternative to maintain wildlife movement and gene flow.

Figure 1 –Aerial photograph showing wildlife movement opportunities, looking north from

**4456-9071**

Agua Dulce Canyon Road, through the Linkage Design, across the SR 14 freeway corridor with UC Davis Wildlife-Vehicle Conflict Hotspots identified.

Figure 2 –Aerial photograph showing wildlife movement opportunities, looking north from Stonecrest Road, through the Linkage Design, across the SR 14 freeway corridor with UC Davis Wildlife-Vehicle Conflict Hotspots identified.

Subsequent to the development of the WCA, the University of California Davis, Road Ecology Center, created the Real-time Deer Incidents & Wildlife-Vehicle Conflict (WVC) Hotspot maps. The mapping includes California Highway Incident Processing System (CHIPS) data collected by the California Highway Patrol (CHP) combined with carcass

## Response to Submission 4456 (Darrell Clarke, Sierra Club, December 1, 2022) - Continued

### 4456-9071

data from the California Roadkill Observation System (CROS) (2023). The data was used to illustrate high use wildlife movement areas on the map ranging in color from blue, yellow, orange, red, and dark red based on the number of vehicle collisions per mile per year (Attached Figure 3). The hotspot map Areas identified as high wildlife use areas align with permeable sections of the Refined SR14 and SR14A Alternatives (illustrated in Figures 1 and 2). The steep roadcuts and adjacent ridgelines along the stretch of the SR 14 freeway adjacent to Bee Canyon may also deter wildlife use (Attached Figures 4 and 5). Those areas that are not permeable were reviewed for crossing opportunities where wildlife could move across the existing landscape. Please refer to Graphs 6-1 through 6-15 of the WCA that illustrate the relative comparison of existing and project permeability for each of the focal species. The WCA determined the effect on wildlife movement was less than significant because of the extensive network of permeable tunnels and viaducts that align with the existing SR 14 freeway bridge undercrossings and wildlife roadkill hotspots, maintaining wildlife movement.

The Draft EIR/EIS identified several mitigation measures to reduce impacts to wildlife movement, such as BIO-MM#64 (Establish Wildlife Crossings), which would require installation of one wildlife crossing south of the California Aqueduct (Soledad Siphon) and one wildlife crossing east of Una Lake to improve the permeability of SR14A and Refined SR14. Other mitigation measures were also developed to further reduce impacts, including: preparation and implementation of a restoration and revegetation plan (BIO-MM#6 (Prepare and Implement a Restoration and Revegetation Plan)); installation of aprons or barriers within security fencing (BIO-MM#36 (Install Aprons or Barriers within Security Fencing)); minimize effects on wildlife movement corridors during construction (BIO-MM#37 (Minimize Effects on Wildlife Movement Corridors During Construction)); establish environmentally sensitive areas (BIO-MM#58 (Establish Environmentally Sensitive Areas and Nondisturbance Zones)); limit vehicle traffic and construction site speeds (BIO-MM#60 (Limit Vehicle Traffic and Construction Site Speeds)); implement wildlife height requirements for enhanced security fencing (BIO-MM#77 (Implement Wildlife Height Requirements for Enhanced Security Fencing)); install wildlife jump-outs (BIO-MM#78 (Install Wildlife Jump-outs)); and implementation of measures intended to reduce, avoid and minimize effects on wildlife movement (BIO-MM#83 (Measures Intended to Reduce, Avoid, and Minimize Effects on Animal Movement)).

### 4456-9071

Response to Submission 4456 (Darrell Clarke, Sierra Club, December 1, 2022) - Continued

4456-9071

Figure 4. Looking northwest at the steep cut slopes along the SR 14 freeway adjacent to Bee Canyon.

4456-9071

Figure 5. Looking northwest at the steep natural terrain and steep road cuts along the SR 14 freeway adjacent to Bee Canyon.

The commenter also appreciated the discussion of riparian habitat, but remains concerned about habitat degradation. Implementation of BIO-MM#32 (Restore Temporary Riparian Habitat Impacts) would involve restoration and revegetation of riparian habitat in temporary impact areas, while implementation of BIO-MM#6 (Prepare and Implement a Restoration and Revegetation Plan) would ensure that vegetation surrounding wildlife movement corridors is restored in order to provide appropriate cover for wildlife species. BIO-MM#46 (Provide Compensatory Mitigation for Permanent Impacts on Riparian Habitat) would also offset permanent impacts to permanently

## Response to Submission 4456 (Darrell Clarke, Sierra Club, December 1, 2022) - Continued

### 4456-9071

disturbed riparian habitat, including areas with wildlife movement. As a result, impacts on wildlife movement corridors would be reduced.

### 4456-9072

The commenter is concerned with construction and operational impacts associated with earthquakes, seismicity and the effectiveness of the Early Earthquake Detection System (EEDS) affecting all of the alignments. It suggests the Authority did not review formal, peer-reviewed papers on the area's geologic hazards. It states that the Authority ignored a geologist who spoke at several HSR meetings. The Authority understands that there are risks associated with undergoing construction in a seismically active area such as southern California. All of the alignment alternatives would be constructed in compliance with building code requirements for application of engineering design features to address and minimize these risks. These risks and impacts are analyzed in detail in Section 3.9, Geology, Soils, Seismicity and Paleontological Resources, specifically in Impact GSSP#7 (Fault Rupture and Seismic Ground Shaking Could Endanger People or Structures During Construction) and Impact GSSP#16 (Effects of Geologic Hazards During Operations). These risks and impacts are addressed by GEO-IAMF#7 that requires an evaluation of fault rupture potential and GEO-IAMF#10 that will implement engineering and safety protocols to limit fault rupture and ground shaking hazards during construction and operation. The HSR system project design also includes several components that minimize the effects from seismic events and the potential safety risks from seismic events (GEO-IAMF#6). These include a train control system with earthquake early warning detection systems; operational responses to notification of a seismic event including stopping or slowing of trains and inspection of infrastructure. GEO-IAMF#6 recognizes that damage to infrastructure from fault creep can be mitigated with routine maintenance including minor realignment. These measures would help identify situations where fault rupture has the potential to damage facilities and enable control of trains in a manner that would reduce the potential for accidents. The project's design will require the preparation of a Construction Management Plan (IAMF#1) that requires a topographic survey and an assessment of geotechnical conditions prior to construction. Other features set specific standards that the project must comply with to promote safety during construction and operations, such as an Early Earthquake Detection System (EEDS). EEDS lead times will depend on the location of the epicenter of the seismic event with respect to the train. The project design includes emergency exits and notification systems, consistent with the requirements of the NFPA Safety Code and Standard for Fixed Guideway Transit and Passenger Rail Systems, the California Building Standards Code, and the International Building Code. The Authority has developed an emergency access plan for operation of the California HSR System

## Response to Submission 4456 (Darrell Clarke, Sierra Club, December 1, 2022) - Continued

### **4456-9072**

pursuant to NFPA Standard 130: Standard for Fixed Guideway Transit and Passenger Rail Systems, the principal guidance document. The plan includes emergency access provisions with regard to fire and safety for stations, tunnels, ventilation systems, procedures, control systems, communication, and vehicles. That standard also includes requirements for egress and evacuation. Because of the effectiveness of these design features, there would be no significant impacts on geology, soils, seismicity, or paleontological resources under CEQA under any of the project alternatives. Formal, peer-reviewed research papers on the geology, hydrogeology, seismicity and geologic hazards of the area were reviewed, cited, and referenced in the "Palmdale to Burbank Project Section Geology, Soils, and Seismicity Technical Report." The Technical Report is cited in and supports the Draft EIR/EIS and is available from the Authority upon request by calling the Authority office, as described in the Draft EIR/EIS Notice of Availability. Finally, the Authority did not ignore any public commenter. It considered all substantive comments during this process. In response to the commenter's statement that the Authority ignored a particular geologist, the Authority notes that the commenter did not identify that geologist, or it would have provided more responsive information here.

### **4456-9073**

Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage.

The commenter notes that project water demand for construction would exceed water supply in dry years with no clear solution. Please refer to Standard Response PB-Response-PUE-3: Water Demand and Usage, which provides additional information about water supplies for the project, including in the scenario of dry and multiple dry years.

California High-Speed Rail Authority  
 ATTN: Palmdale to Burbank Draft EIR/EIS Comment  
 355 South Grand Avenue, Suite 2050  
 Los Angeles, CA 90071

4459-9074

The Crescenta Valley Community Association (CVCA) is a cross-jurisdictional, volunteer organization that represents the valley with one voice in matters of preserving our historical structures, monitoring and encouraging thoughtful building design, and promoting open space to maintain and enhance our suburban quality of life. Our main objectives as an association are to protect our limited resources and infrastructures through responsible growth policies; to encourage development that is compatible, preserves our historic structures and our rural community; and to ensure open space is protected and valued as a necessity for the quality of life in the Crescenta Valley area. The CVCA welcomes participation from all stakeholders in Sunland-Tujunga, Glendale, La Crescenta, Montrose and La Canada Flintridge.

Thank you for the opportunity to comment on the draft EIR/EIS for the Palmdale to Burbank section of the California High-Speed Rail. The CVCA has great concern about CAHSR and the project's inherent risk to the Angeles National Forest landscape and wildlife, the foothill communities, and the severe impact to the Greater Los Angeles area. The proposal has so little benefit weighed against huge cost, burden on the electric grid, neighborhood disruption, traffic woes, and safety issues. After reviewing the comprehensive environment document, the CVCA recommends the No Project alternative in order to continue our main objectives.

4459-9075

Project Cost Estimates were Misrepresented in Proposition 1A

The "Safe, Reliable High-Speed Passenger Train Bond Act" was promoted to voters in 2008 as a 2-1/2-hour train ride from San Francisco to Los Angeles for only \$50. The proposed bond measure for \$9.95 billion was blatantly deceptive as the full cost estimate for the bullet train at the time was approximately \$30-45 billion. Now known as California High-Speed Rail, the project has grown exponentially from its original cost projections. In February 2022, the estimate rose to \$105 billion for Phase I, San Francisco to Los Angeles with more money to be added for the extension to Anaheim and Phase 2 to San Diego and Oakland. Based on the history of megaprojects in the U.S. and other countries, the full and final cost will continue to grow at a tremendous rate and taxpayers will likely be subsidizing future operations and ridership. If the price tag was the only factor determining whether the CAHSR should get built or not, the voters would certainly not support it today.

# Submission 4459 (Susan Bolan, Crescenta Valley Community Association, December 1, 2022) - Continued

4459-9076 CAHSR will Require Significant Upgrade to Power Systems in Multiple Jurisdictions  
High-Speed Rail uses a substantial level of electrical power along routes in order to move the trains forward to their destinations and to balance the power load. The proposed system will need traction power substations at 30-mile intervals; switching stations every 15 miles; and paralleling stations every 5 miles; as well as a considerable amount of additional new equipment and upgrades to the existing infrastructure. Not only will the new electric buildings, equipment and transmission lines look ugly across the beautiful landscape and in our communities, the new complex system would compete with other power needs such home appliances and electric vehicles during peak demand or when power is less available. Governor Gavin Newsom, who was recently criticized for asking Californians to avoid charging electric cars during a heat wave while approving legislation for electric vehicle mandates, may have inadvertently disclosed that our current sources of power cannot handle any additional strain.

4459-9077 Tunnels in the San Gabriel Mountains and Angeles National Forest will have Inherent Risk  
All Build Alternatives in the study area from Palmdale to Burbank will utilize a series of twin tunnels to traverse the areas of the Angeles National Forest and the suburban corridors. This presents a whole host of issues beside environmental concerns. The tunnels will be bored/mined underground as little as 100 feet below the surface to a depth as much as 2,670 feet or more due to the varying terrain of the San Gabriel mountains. The route would be exposed to a number of fault lines, both known and unknown, some with the capability for substantial earth movement like the San Andreas fault.

4459-9078 While modern tunnels are designed to flex and bend during earthquakes, trains and people are not. A large and sustained earthquake has the potential to trap passengers deep underground to await rescue services. During a scoping meeting for the project and later during an online informational meeting a question was asked, "What is the plan for evacuation during an emergency such as earthquake or fire?" The answer was shocking. The CAHSRA consultant stated that if a tunnel was damaged, the train would stop. Passengers would then disembark, find a cross passage to the other parallel tunnel, and await rescue by emergency equipment and personnel.

A review of the draft EIR/EIS report confirms that passenger walkways and crossings with fire doors are indeed built into the Safety plan with emergency staging space outside at the portals. However, there is no mention that the planned tunnels will be as long as 16.6 miles and that highly specialized equipment and training would be needed for firefighting or rescue operations in areas that are difficult to access with non-able-bodied victims. The CVCA is not confident that the tunnel proposals and emergency procedures have been thoroughly vetted. The environmental report fell short in considering evacuation protocols due to fire, earthquake, collision, or other emergency. The Safety and Security portion of the environmental document definitely needs further study.

4459-9079 The Towns of Lake View Terrace and Shadow Hills will be destroyed by the E2/E2A Alternative  
Within the City of Los Angeles are two rural towns – Lake View Terrace and Shadow Hills. They are established communities built during the 1950s that have maintained a recreational and equestrian lifestyle. The homes in these communities will be divided by the E2/E2A route

4459-9079 with tracks planned to be built in place of and next to houses and through the middle of equestrian trails. In reviewing the environmental report, the draft EIR/EIS summary states, "Although the E2 and E2A Build Alternatives would largely be built underground, project infrastructure would contrast with the natural harmony of some views near the portals such as near Lake View Terrace and Big Tujunga Wash." This is an understatement by any definition. The E2/E2A route should be removed from consideration before the CEQA process is finalized.

4459-9080 Thank you for considering these comments of the Crescenta Valley Community Association as part of the draft environmental review for the California High-Speed Rail, Palmdale to Burbank section. Please include them in the final document and provide response to our concerns.

Sincerely,

Susan Bolan, Steering Committee Member  
Crescenta Valley Community Association  
crescentavalleycommunityassn@gmail.com

## Response to Submission 4459 (Susan Bolan, Crescenta Valley Community Association, December 1, 2022)

### 4459-9074

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-GEN-2: Project Costs and Funding, PB-Response-GEN-4: General Opinions, Opposition or Support, PB-Response-PUE-1: Energy Use and Consumption, PB-Response-S&S-3: Effects on Local and Regional Evacuation Plans, PB-Response-SOCIO-1: Parcel Acquisitions and Relocations, PB-Response-TRA-1: Temporary Traffic Associated with Construction.

The commenter provides a description of their organization and their goals and membership. They express concern about potential impacts to the ANF, communities, and the greater Los Angeles area. Lastly, they state the opinion that project costs outweigh its potential benefits and express support for the No Project Alternative. Regarding opposition to the proposed project, refer to Standard Response PB-Response-GEN-4: General Opinions, Opposition or Support. Regarding comments about environmental impacts, refer to Standard Response PB-Response-GEN-2: Project Costs and Funding, PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-PUE-1: Energy Use and Consumption, PB-Response-S&S-3: Effects on Local and Regional Evacuation Plans, PB-Response-SOCIO-1: Parcel Acquisitions and Relocations, PB-Response-TRA-1: Temporary Traffic Associated with Construction, and PB-Response-S&S-3: Effects on Local and Regional Evacuation Plans, which address these issues. Note that there would be many offsetting benefits within all communities within the HSR Palmdale to Burbank Project Section footprint. These include regional and statewide improvements in LOS and VMT metrics, improvements in regional air quality and health risks, reductions in vehicular, cycling and pedestrian accidents, economic revitalization of both communities in Burbank and Sun Valley, and the generation of 80,000 to 85,000 construction jobs and 5,400 permanent jobs.

### 4459-9075

Refer to Standard Response PB-Response-GEN-2: Project Costs and Funding.

The commenter expressed concern with the funding of the project. Please refer to Standard Response PB-Response-GEN-2: Project Cost and Funding which provides information relating to the project's funding and costs. This information can also be found in Chapter 6, Project Costs and Operations, of the Final EIR/EIS. The comment does not address technical analysis in the Draft EIR/EIS or suggest edits to the document.

## Response to Submission 4459 (Susan Bolan, Crescenta Valley Community Association, December 1, 2022) - Continued

### 4459-9076

The comment notes that substantial electrical power infrastructure would be required to power the project.

The project's need for electrical power infrastructure is included in both the project design as well as the EIR/EIS analysis. Please refer to Appendix 2-D Design Baseline Report (Section 2.2.2.4) in the Draft EIR/EIS, which describes Traction Power Distribution. As clarified in this Appendix, the Authority has coordinated with Pacific Gas and Electric Company and SCE and determined that network upgrades would be required to meet the projected power demands of the 345-mile portion of the California HSR System within the two utilities' respective service territories. Detailed engineering of electrical interconnections and network upgrade components has not been undertaken, and will not be completed until closer to the time of construction. Network upgrades could include modifications to existing infrastructure such as expansion of existing substations and reconductoring of existing electrical lines (i.e., replacement of power structures [poles and lattice steel towers] and electrical conductors with taller structures and more efficient electrical wires or new electrical lines). Anticipated network upgrades are included in the Build Alternative footprint and would be implemented pursuant to California Public Utilities Commission General Order 131-D.

Please refer to PUE-IAMF#1 of Section 3.6, Public Utilities, which requires the Authority's commitment to energy-efficient and green design. As described in Impact PUE#11: Permanent Operations Energy Demand, the Palmdale to Burbank Project Section would not place a substantial demand on regional energy supply, require significant additional capacity, or significantly increase peak- and base-period electricity demand, nor would it conflict with or obstruct a state or local plan for renewable energy or energy efficiency. In addition, the project would overall result in net energy savings.

Regarding the comment that "the new electric buildings, equipment and transmission lines" would "look ugly", please refer to Impact AVQ#4 in the Draft EIR/EIS, which discusses the potential impacts on aesthetics from the project, including electrical infrastructure.

### 4459-9077

Refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events.

The commenter expresses concern related to seismicity due to the HSR Palmdale to Burbank Section crossing fault lines. Please refer to Standard Response PB-Response-GSSP-1: Risk and Impacts Associated with Seismic Events, which addresses concerns related to seismicity.

## Response to Submission 4459 (Susan Bolan, Crescenta Valley Community Association, December 1, 2022) - Continued

### 4459-9078

The commenter expressed concern on emergency and evacuation plans for the project in the case of emergencies (such as fire, seismic events, and train collisions/derailment).

As described under Impact S&S#3, each of the Build Alternatives will include provisions for emergency service access to the access-controlled right-of-way, including passenger walkways to allow emergency access and evacuation routes for tracks in trenches and tunnels. Passenger walkways would be located along the trench/tunnel walls on the same side as the access/egress points and would be illuminated to provide safe passage in the event of an emergency. Tunnel design would also include a central, fire-rated dividing wall that would separate the two tracks of each single tunnel into two independently ventilated railways to allow access in the event of an emergency, where the two tracks would be in a single tunnel such as in the Burbank area; safety egress would be achieved via fire-rated doorways through the tunnel dividing wall. Emergency egress for long, twin-bore tunnels is expected to be done by the passengers and crew from one tunnel to the other, through the cross passages, which will be located every 800 feet. These cross passages will serve as safe zones too, as they will be equipped with self-closing fire protected doors (rated for 1.5 hours), ventilation, communications, and other facilities. The typical procedure will be to wait inside these cross passages until a rescue train is able to reach the incident section, or at least until the traffic on the other tunnel has been confirmed to have stopped and to perform a self-rescue walking along the tunnel to the nearest portal as defined in TM 2.8.1: Safety and Security Design Requirements for Infrastructure Elements, Section 3.2 Access/Egress (available at: [https://hsr.ca.gov/wp-content/uploads/docs/programs/eir\\_memos/TM%202.8.1%20Safety%20and%20Security%20Design%20Requirements%20R0%20120312no%20sigs.pdf](https://hsr.ca.gov/wp-content/uploads/docs/programs/eir_memos/TM%202.8.1%20Safety%20and%20Security%20Design%20Requirements%20R0%20120312no%20sigs.pdf)). These procedures will be detailed in the Emergency Response Plan in later stages of the project. Additionally, regarding specialized equipment and training, note that SS-IAMF#2: Safety and Security Management Plan states that, "Rail systems must comply with FRA requirements for tracks, equipment, railroad operating rules and practices, passenger safety, emergency response, and passenger equipment safety standards found in 49 CFR Parts 200-299." To elaborate, 49 CFR section 239.1(a) specifically states, "The purpose of this part is to reduce the magnitude and severity of casualties in railroad operations by ensuring that railroads involved in passenger train operations can effectively and efficiently manage passenger train emergencies." Furthermore, 49 CFR

### 4459-9078

section 239.101(a)(4)(i) states that, "When applicable, the railroad's emergency preparedness plan shall reflect readiness procedures designed to ensure passenger safety in an emergency situation occurring in a tunnel of 1,000 feet or more in length. The railroad's emergency preparedness plan shall address, as a minimum, availability of emergency lighting, access to emergency evacuation exits, benchwall readiness, ladders for detrainment, effective radio or other communication between on-board crewmembers and the control center, and options for assistance from other trains."

As an example of evacuation from long tunnels, there is a 22-mile tunnel on the E1 Build Alternative between Portal P3 and P4. This tunnel has two intermediate windows and one adit that can serve as emergency egress. The longest stretch of tunnel between exits to the surface points is between Intermediate Window 1 and construction adit at Sta 1490+00.00. This stretch of tunnel is 11 miles long, meaning that the longest distance that passengers would have to travel to the closest emergency egress point would be 5.5 miles (i.e., if the train was stopped at the mid-point of the tunnel, farthest from the exit on either end). Assuming a walking traveling speed of 200 feet/minute it would take approximately 2 hours and 30 minutes to cover that distance at a walking speed. The longest tunnel for the SR14A Build Alternative extends from Portal 1A north of Pearblossom Highway Interchange (Sta 472+31.00) to Agua Dulce Canyon (Sta 1170+00.00). This tunnel has a total length of 13.21 miles. This tunnel has an intermediate window at Acton (Sta 819+00.00). Based on these considerations, the maximum length from a tunnel surface exit to the furthest point in the tunnel between Agua Dulce and the Intermediate Window would be 3.32 miles. Assuming an egress travel speed of 200 feet/minute, it would take approximately 1.5 hours for the passengers to evacuate the tunnel on foot or at a walking speed. Therefore, passengers would not be required to walk the entire length of the tunnel (16.6 miles) to evacuate based on the project design.

The construction contractor will develop and implement a Safety and Security Management Plan (SSMP) in accordance with SS-IAMF#2 prior to construction, documenting how the following requirements, plan, programs and guidelines are considered in design, construction and eventual operation to protect the safety and security of workers and users of project trains (please refer to Appendix 2.0-E, Impact Avoidance and Minimization Features, for full descriptions of IAMFs that will be

## Response to Submission 4459 (Susan Bolan, Crescenta Valley Community Association, December 1, 2022) - Continued

### 4459-9078

incorporated into the project design). The contractor shall be responsible for implementing all construction-related safety and security plans, and the Authority shall be responsible for implementing all safety and security plans related to HSR operation. Regulatory requirements include: (1) Compliance with FRA requirements for tracks, equipment, railroad operating rules and practices, passenger safety, emergency response, and passenger equipment safety standards found in 49 CFR Parts 200-299. (2) Implementation of fire/life safety and security programs (FLSSPs) that promote fire and life safety and security in system design, construction, and implementation. The FLSSP is coordinated with local emergency response organizations to provide them with an understanding of the rail system, facilities, and operations, and to obtain their input for modifications to emergency response operations and facilities, such as evacuation routes. The Authority will establish fire/life safety and security committees throughout the project section. (3) Implementation of standard operating procedures and emergency operating procedures, such as the FRA-mandated Roadway Worker Protection Program, to address the day-to-day operation and emergency situations that will maintain the safety of employees, passengers, and the public.

Railroads have the responsibility for developing and implementing individual emergency preparedness plans that comply with the regulations based on the specific circumstances of each railroad's operations. On May 4, 1998, FRA published rail safety regulations for the preparation, adoption, and implementation of emergency preparedness plans by railroads connected with the operation of passenger trains, including railroads hosting the operations of rail passenger service 63 Federal Register (FR) 24676. These regulations became effective on July 6, 1998, and are codified in Part 239 of Title 49 of the Code of Federal Regulations (CFR). § 239.101(a) (8) –Procedures regarding passengers with disabilities regulatory text reads: *The railroad's emergency preparedness plan shall include procedures to promote the safety of passengers with disabilities under all conditions identified in its emergency preparedness plan, such as during a train evacuation. These procedures shall include, but not be limited to, a process for notifying emergency responders in an emergency situation about the presence and general location of each such passenger when the railroad has knowledge that the passenger is on board the train. The railroad does not have knowledge that such passenger has a disability unless a crewmember has actual knowledge of the disability, such as where a passenger (or his or her companion or*

### 4459-9078

*fellow passenger) has expressly informed a crewmember on the train of the disability or where the disability is readily apparent. Nothing in this part requires the railroad to maintain any list of train passengers.*

The plan would outline the railroads commitment to address passengers with disabilities in an emergency situation. This would include (1) a statement regarding the importance of identifying passengers with disabilities as soon as possible and notifying the control center and emergency response communications center personnel, (2) discussion regarding the training and testing of on-board, control center and emergency response communications center personnel so as to highlight the passenger with disability component, (3) how the railroad engages the disability community. (e.g., an explanation regarding the railroads outreach to the disability community in an effort to have them participate in full-scale simulations) and, (4) how the railroad evaluates the handling of passengers with disabilities after emergencies (e.g., such as during debriefing and critiques after simulations or passenger train emergency situations). We encourage the railroad to duplicate or expand on this information in other elements of the plan to reinforce the passenger with disability position as necessary.

## Response to Submission 4459 (Susan Bolan, Crescenta Valley Community Association, December 1, 2022) - Continued

### **4459-9079**

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process.

The commenter expresses opposition to the E2 and E2A Build Alternatives due to community impacts (on Lake View Terrace and Shadow Hills). Additionally, the commenter expresses concerns regarding impacts to equestrian uses under the E2 and E2A Build Alternative.

Please refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, which describes how alternatives were selected for evaluation in the Draft EIR/EIS. The SR14A Build Alternative is the Preferred Alternative of the project and loosely follows the existing SR 14 transportation corridor. For more information on the Preferred Alternative, please see Chapter 8 of the Final EIR/EIS. Refer to Standard Response PB-Response-PR-2: Impacts on Big Tujunga Wash - Recreational Uses, Equestrian Uses, which discusses impacts to Big Tujunga Wash, including recreational, equestrian, and aesthetic issues.

### **4459-9080**

The commenter (Crescenta Valley Community Association) notes their appreciation for the opportunity to comment on the Draft EIR/EIS and requests that their comments be included in the final document along with responses to their concerns. All comments received on the Draft EIR/EIS, including from this commenter, are published in Volume 4, Responses to Comments, of the Final EIR/EIS and responses are provided for each comment.

# Submission 4464 (Heather Neely, Southern California Edison, December 1, 2022)

**Palmdale - Burbank - RECORD #4464 DETAIL**

**First Name :** Heather  
**Last Name :** Neely  
**Attachments :** SCE\_Comments\_Burbank\_to\_Palmdale\_HSR\_Project\_1\_December\_2022.pdf (226 kb)

**Stakeholder Comments/Issues :**

Attached, please find Southern California Edison's (SCE) comments on the California High Speed Rail Palmdale to Burbank Project Section.

4464-8821

SCE understands that, as currently designed, the Project will protect in place SCE's infrastructure but provides these comments regarding the process if engineering changes affect SCE's Rights-of-Way or utility lines. A separate California Public Utilities review and permitting could be involved if those impacts are not analyzed in this Project's Environmental Impact Report/Statement.

Please do not hesitate to contact me with any questions and please continue to coordinate with your SCE planning and telecommunications teams on any changes in design.

We look forward to working with the California High Speed Rail Authority on completing this Project.

 Rosemead CA 91770

4464-8822

**Encroachment of SCE's Right-of-Way and Access Roads**

SCE understands that the Proposed Project is approximately 15% designed at the time of the DEIR's publication. While the Project's *Appendix 3.6-A High Risk and Major Utility Impact Report* documents that SCE infrastructure will be protected in place, SCE is concerned that the proposed project may impact SCE's infrastructure or Rights-of-Way (ROW) when engineering is complete.

The proposed project should not impose constraints on SCE's ability to access, maintain, and operate its current and future facilities. Additionally, if bike lanes and landscaping are planned within SCE's corridors an agreement between the developer and SCE is required. Any parkways or pathways (either by foot, bicycles, or other means) that invite the public onto SCE's right-of-way will require the installation of fencing and/or Climbing Discouragers on each transmission line tower at the customer's expense.

SCE's rights-of-way and fee-owned properties are purchased for the exclusive use of SCE to operate and maintain its present and future facilities. SCE will review any proposed use on a case-by-case basis. Approvals or denials will be in writing based upon review of the maps provided by the developer and compatibility with SCE right-of-way constraints and rights.

Should design change, please forward five (5) sets of plans depicting SCE's facilities and associated land rights to the following location for further analysis:

Rights-of-Way Analysis Department  
 Southern California Edison Company  
 2 Innovation Way

RE: Palmdale to Burbank Project Section Draft EIR/EIS Comment

Southern California Edison (SCE) is pleased to submit the following comments on the Draft Environmental Impact Report (DEIR) for the California High Speed Rail Project: Palmdale to Burbank Project Section. The Proposed Project will construct approximately 31 to 38 miles of high-speed rail connecting Palmdale, near the vicinity of Spruce Court just west of Sierra Highway in the north to the Burbank Airport Station in the south and connect the Northern and Southern portions of the Statewide High Speed Rail system.

## Submission 4464 (Heather Neely, Southern California Edison, December 1, 2022) - Continued

[date]  
[subject]  
Page 2 of 2

4464-8824

identified and discussed in any revisions to the Draft EIR. If not, SCE may be required to pursue a separate, mandatory CEQA review through the CPUC, which could delay approval of the SCE transmission line portion of the project for two years or longer.

4464-8825

**General Order 95**

SCE must comply with General Order (GO) 95, which establishes rules and regulations for the overhead line design, construction, and maintenance. GO 95 also includes vertical clearance requirements from thoroughfares, ground, and railroads, as well as specific minimum clearances from tree branches and vegetation around overhead wires. The project's landscaping and final engineering should not conflict with SCE's existing and proposed transmission line designs.

4464-8826

**Catenary Wires**

Existing heights of electrical lines above any overhead catenary wires used to power trains could possibly not meet GO 95 vertical clearance standards and could possibly require SCE to increase the height of structures along the adjacent right-of-way if final design changes. Sufficient horizontal clearance must be maintained. Please continue to work with your SCE team to avoid any relocation of electrical infrastructure or realignment of the proposed track. As a reminder, 24-hour access must be provided to SCE employees to repair and maintain all structures and facilities.

SCE appreciates the opportunity to comment on the Palmdale to Burbank Project Section of the High Speed Rail Project. SCE looks forward to working and collaborating with the California High Speed Rail Authority.

If you have any questions regarding this letter, please contact me at [heather.neely@sce.com](mailto:heather.neely@sce.com) or 626.476.7839.

Regards,

## Response to Submission 4464 (Heather Neely, Southern California Edison, December 1, 2022)

### 4464-8821

The commenter notes that the Project will protect in place SCE's infrastructure, but provides comments in the event engineering changes. The commenter additionally notes that additional CPUC review and permitting could be required. The comment does not address technical analysis in the Draft EIR/EIS or suggest edits to the document. No change has been made to the document in response to this comment. The Authority will continue to coordinate with SCE.

### 4464-8822

The commenter expresses concern that refined design of the project might end up impacting additional SCE infrastructure or ROW not identified at this stage. This concern is acknowledged. As noted in the comment, Draft EIR/EIS Appendix 3.6-A High Risk and Major Utility Impact Report identifies all high risk and major transmission lines that would be impacted based on the current level of design. The Authority will continue to coordinate with utility providers during detailed project design. In addition, PUE-IAMF#4 describes the Authority's commitment to coordinate with service providers to minimize or avoid utility service disruptions.

### 4464-8823

The commenter indicates that any construction/alteration within SCE right of way will need to be reviewed and approved by SCE on a case-by-case basis. The Authority will continue to coordinate with SCE during subsequent stages of the project. The commenter indicates that the proposed project should not impose constraints on SCE's ability to access, maintain, and operate its current and future facilities. As indicated on page 3.6-4 of the Draft EIR/EIS the base standards for design, construction, installation, operation, and maintenance established by General Order 176 require coordination and cooperation of the Authority (the entity that owns the HSR system) and other facility owners (e.g., SCE) so that the facilities of both parties are not prevented from performing as required or intended.

### 4464-8824

The commenter summarizes a compliance requirement with California Public Utilities Commission's (CPUC) General Order 131-D. General Order 131 is discussed in the EIR/EIS on page 3.6-4. General Order 131-D establishes rules for implementing Public Utilities Code Section 1001-1013 relating to the planning and construction of electric generation, transmission/power/distribution line facilities, and substations located in California. A permit to construct must be obtained from the CPUC for facilities between 50 kilovolts (kV) and 200 kV. A certificate of public convenience and necessity must be obtained from the CPUC for facilities that are 200 kV and above. Both the permit to construct and the certificate of public convenience and necessity are discretionary decisions by the CPUC, subject to CEQA. EIR/EIS Appendix 2-D Page 2-33 further clarifies that where electrification of the system is required, power companies would design and implement changes to their transmission lines, which includes environmental review and clearance of the reconstruction. If the engineering design for new or upgraded SCE facilities involves new or different significant environmental impacts, additional environmental review and analysis of the new equipment, including reconstruction of transmission lines, would be completed as part of the California Public Utilities Commission permit application process prior to construction. Section 3.6, Public Utilities and Energy, describes impacts to public utilities and utility infrastructure maintained for public service. For the purposes of the EIR/EIS, major utilities are defined as any subsurface, aboveground, or overhead facility used for transmission regardless of size, shape or method of conveyance, which includes transmission lines. Impact PUE#1 analyzes the conflicts with major or high-risk utilities, including nonlinear fixed facilities, that could create lengthy interruptions of service.

### 4464-8825

The comment pertains to standards relative to minimum clearances and indicates that SCE must comply with GO 95. The Authority will comply with such standards relative to SCE facilities. GO 95 is summarized on page 3.6-4 of the Draft EIR/EIS and the analysis assumes compliance with applicable regulatory requirements, including the requirements identified by the commenter, such as landscaping.

## Response to Submission 4464 (Heather Neely, Southern California Edison, December 1, 2022) - Continued

### 4464-8826

The commenter expresses concern about vertical clearance under electrical lines, consistency with General Order (GO) 95, and requests continued coordination with SCE. GO 95 is summarized on page 3.6-4 of the Draft EIR/EIS. The design will comply with applicable standards and regulatory requirements. The Authority will continue to coordinate with SCE regarding any need to alter or relocate their facilities during the detailed design phase in accordance with applicable requirements and PUE-IAMF#4. As indicated in the Draft EIR/EIS (page 3.6-4), the base standards for design, construction, installation, operation, and maintenance established by GO 176 require coordination and cooperation of the Authority (the entity that owns the HSR system) and other facility owners (e.g., SCE) so that the facilities of both parties are not prevented from performing as required or intended.

**RE: Palmdale to Burbank Draft EIR/EIS Comment from Agua Dulce Town Council**

Dear California High Speed Rail Authority:

The Agua Dulce Town Council (the Council) appreciates the opportunity to comment on the Draft Environmental Impact Report/Environmental Impact Statement (Draft EIR/EIS) for the Proposed Palmdale to Burbank Section of the California High Speed Rail Project that would provide High Speed Rail Service between the Palmdale Station and the Burbank Airport Station. We also appreciate the High Speed Rail Authority hosting public meetings in the affected areas to solicit comments from the public. Please accept this public comment and enter it into the public record along with all other correspondence The Council has sent previously or subsequently.

The Agua Dulce Town Council is a local entity representing approximately 5,000 residents in the unincorporated community of Agua Dulce in northern Los Angeles County. Our community is semi-rural and is composed of a town center and small family-owned ranches and homesteads.

The Council has reviewed the Draft EIR/EIS, and while we do not consider ourselves to be experts in the complexities of the proposed project, and we do not have the resources available to analyze the thousands of pages of documents, we do have a number of comments relating to the perceived impacts of the project and how those impacts will directly affect our community of Agua Dulce.

**Evaluation of Build Alternatives**

The Build Alternatives the Council is commenting on are the Refined SR14 and SR1A. Build Alternatives E1, E1A, E2, and E2A do not have direct impacts on the community of Agua Dulce. Therefore, the Council will not comment on those 4 Build Alternatives.

Our community has major concerns regarding the Noise and Vibration impacts to residences near the project alignment. The Refined SR14 and the SR14A Build Alternatives are the only Build Alternatives that would result in construction noise impacts in Agua Dulce. Operation of the SR14A Build Alternative

4466-8281

4466-8282

## Submission 4466 (Mary Johnson, Agua Dulce Town Council, December 1, 2022) - Continued

4466-8282

would cause the fewest moderate noise impact on residences, but the Refined SR14 and SR14A Build Alternatives would result in the most vibration effects on residences. The Refined SR14 Build Alternative would have noise impact on the Pacific Crest Trail and Vasquez Rocks Natural Area. SR14A would avoid those noise impacts by being built in a tunnel through that area. Both the Refined SR14 and the SR14A Build Alternative would result in noise impacts on domestic animals and wildlife.

The Council strongly opposes the Refined SR14 Build Alternative. Many of the significant and unavoidable impacts of that Build Alternative focuses on is a result of the "surface" and "elevated" sections. The SR14A Build Alternative added an additional tunnel area to reduce those impacts.

4466-8283

### **Proposed Modifications to Build Alternative SR14A**

The location of the surface and elevated section of the proposed project near Agua Dulce Canyon Road poses significant noise impacts. The reflection of sound will bounce back and forth on the canyon walls and carry the high speed rail noise north into the heart of the community of Agua Dulce affecting many of the residents.

There is a short section of Build Alternative SR14A near Agua Dulce Canyon Road where the alignment grade comes out of the tunnel at surface and then goes over Agua Dulce Canyon Road with an elevated bridge. The alignment then goes back to surface and the into another tunnel section. The Council is requesting elimination of both of the surface and elevated grades near Agua Dulce Canyon Road. Instead, the Council proposes keeping the grade alignment underground connecting the two tunnels. Many of the significant and unavoidable impacts to Build Alternative SR14A may be reduced to less than significant.

### **In Conclusion**

The Council urges the High Speed Rail Authority to seriously consider our proposed modifications to Build Alternative SR14A. While we as a community support the "No Project" Alternative, we feel the responsibility to protect our residents and keeping the project underground through Agua Dulce will do just that.

We appreciate the High Speed Rail Palmdale to Burbank team working with our communities, hearing our concerns and finding solutions that best serve both the Authority and our neighborhoods.

Respectfully,

*Don Henry*

Don Henry, President  
Agua Dulce Town Council – 2022

## Response to Submission 4466 (Mary Johnson, Agua Dulce Town Council, December 1, 2022)

### **4466-8281**

This comment contains introductory material and states the commenter's appreciation for the opportunity to comment on the Draft EIR/EIS and attend public meetings. The commenter also states that they have a number of comments relating to impacts from the project. The Authority will continue to coordinate with the Agua Dulce Town Council and will notify the public as the project moves forward. Responses are provided for each substantive comment in the comment letter.

### **4466-8282**

Refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors, PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative Only).

The commenter expresses concern about the noise and vibration impacts of the Refined SR14 and SR14A Alternative alignments to the Agua Dulce community and to recreational trails, as well as domestic animals and wildlife. Please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors and Standard Response PB-Response-N&V-3: Noise Impacts on Domestic Animals/Wildlife, for noise impact concerns to residents and wildlife. Additionally, please refer to Standard Response PB-Response-PR-1: Impacts on the Pacific Crest Trail (Refined SR14 Build Alternative only). Please refer to Section 3.15, Parks, Recreation and Open Space, Table 3.15-4 in the Draft EIR/EIS, for discussion of construction and operational impacts to the Vasquez Rocks Natural Area. The Authority evaluated a broad range of environmental and community factors in determining its Preferred Alternative. Please refer to Chapter 8 of the Draft EIR/EIS for a discussion of how the Authority considered these factors in making its determination of the Preferred Alternative.

### **4466-8283**

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors.

The commenter expresses concern about SR14A Build Alternative noise impacts to the Agua Dulce community because of the portions of the alignment that are at grade and elevated. The commenter requests that the SR14A Build Alternative alignment design be modified so that the entire alignment is underground. Tunneling underneath Agua Dulce Canyon Rd would require lowering the SR14A Build Alternative Alignment at least 60 feet under the canyon bottom surface, which is infeasible because it would increase the grade of the tunnel between Acton and Agua Dulce Canyon over 2.5%, which is the maximum grade permissible for the project alignment design as indicated in the Authority's Technical Memorandum (TM) 2.1.2 Alignment Design Standards for High-Speed Train Operation Section 3.3 Vertical Alignment. Technical Memoranda can be found on the Authority's website (<https://hsr.ca.gov/programs/environmental-planning/project-level-environmental-engineering-guidelines-studies-reports/>). For more information regarding operational noise impacts, please refer to Standard Response PB-Response-N&V-1: Operational Noise and Impacts to Sensitive Receptors. For more information regarding alternatives selection and evaluation including why the Authority chose the SR14A Build Alternative as the Preferred Alternative, please see Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process.

RE: California High Speed Rail Authority Palmdale to Burbank Draft EIR/EIS Comments

4473-9081

This letter is submitted on behalf of Lockheed Martin Corporation (“Lockheed Martin”) to provide comments on the September 2, 2022 California High Speed Rail Authority Palmdale to Burbank Draft EIR/EIS (“Palmdale to Burbank Draft EIR/EIS” or “EIR/EIS”) for the California High Speed Rail Project (“Project”) for consideration in this California Environmental Quality Act (“CEQA”) and National Environmental Policy Act (“NEPA”) proceeding. Lockheed Martin objects to the approval of the Project and its implementation to the extent that the California High Speed Rail Authority (“Rail Authority” or “Authority”) does not consider the potentially significant environmental impacts to Lockheed Martin’s remedial activities in the San Fernando Valley and the underlying soil and groundwater conditions in the cleanup area nor plan for avoidance/mitigation of such impacts as discussed below. The impacts of the Project to and the location of the referenced remediation infrastructure are included in the attached letter from Lockheed Martin’s technical consultant, CDM Smith (Exhibit A).

4473-9082

Lockheed Martin is and has been conducting remediation activities in the San Fernando Valley under the oversight of the United States Environmental Protection Agency (“EPA”), pursuant to the Comprehensive Environmental Response, Compensation and Liability Act, 42 U.S.C. §§ 9606 and 9607 (“CERCLA”), as amended by the Superfund Amendments and Reauthorization Act of 1986 (“SARA”) and the Los Angeles Regional Water Quality Control Board (“Regional Board”), pursuant to the Porter-Cologne Water Quality Control Act, California Water Code section 13000 et seq. The Palmdale to Burbank Draft EIR/EIS does not disclose or evaluate potential significant impacts of the Project to soil and groundwater subject to Lockheed Martin’s remediation activities and to the related supply of safe drinking water to local communities. Nor does the draft EIR/EIS identify alternatives or mitigation efforts that may be able to avoid or reduce such impacts. Lockheed Martin suggests that the EIR/EIS should disclose or consider these potentially significant environmental impacts and analyze how such impacts could be avoided or reduced by alternatives to the proposed Project path or through mitigation efforts.

4473-9083

EPA has issued a Record of Decision (“ROD”) prescribing an interim remedy for the San Fernando Valley Burbank Operable Unit (“BOU”) (Exhibit B) and entered into a Consent Decree with Lockheed Martin to implement the remedy (Exhibit C). The interim groundwater remedy includes extraction wells and pipelines that extract and convey groundwater to a

520 Newport Center Drive, Suite 750, Newport Beach, CA 92660

November 30, 2022  
 California High Speed Rail Authority

4473-9083

treatment plant in Burbank to remove contaminants and ultimately provide clean drinking water to citizens in the Burbank area.

There are 70 active groundwater monitoring wells within one mile of either side of the Project’s centerline and southern terminus, some of which could be damaged or may need to be removed or moved because of the Project, at significant cost and impact to Lockheed Martin’s remediation. In addition, vapor intrusion barriers are in place in existing building slabs in zones that are in the pathway of the Project’s construction. The Draft EIR/EIS does not address the potential that Project activities could compromise the integrity of these barriers, which if damaged will need to be reinstalled. The Project’s footprint, which will cover permeable land with impermeable improvements, also will result in the inability to conserve as much of the storm and other waters as practicable in spreading grounds, which permit water to percolate into groundwater basins for later pumping. This may result in a significant drop in groundwater levels. Declining groundwater levels would have a significant negative impact on the effectiveness and long-term sustainability of the BOU groundwater remedy and would require installing deeper, replacement extraction wells that would increase the cost of the remedy. Lockheed Martin understands and expects that the Authority, and not Lockheed Martin will be responsible for any costs that are related to the Project, including the above-referenced costs.

4473-9084

Additionally, certain Project activities, such as tunneling and excavation, could cause migration of contaminants in soil and groundwater. If such migration occurs, or if soil or groundwater conditions are exacerbated as a result of the Project’s tunneling or excavation activities or any other aspect of the Project’s work, the Authority will be considered a potentially responsible party under CERCLA and will be responsible for costs, including costs of disposal of contaminated soil.

4473-9085

Please see the attached letter from CDM Smith for additional specific comments regarding potential impacts from the Project to the BOU remediation effort. Lockheed Martin submits that these potential adverse impacts should be avoided by the Project (and/or mitigated) to the greatest extent possible. All of these potential impacts of the Project should be fully evaluated in the Palmdale to Burbank Draft EIR/EIS, and alternatives or mitigation to avoid or reduce such impacts should be analyzed and presented to the public or decision-makers for review.

4473-9086

The fundamental purpose of an EIR is “to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment.” (Public Resources Code § 21061.) An EIR must include detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project. (Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal.3d 376, 405.) An EIR must contain facts and analysis, not just the agency’s bare conclusions or opinions. (Concerned Citizens of Costa Mesa, Inc. v. 32nd Dist. Agricultural Assn. (1986) 42 Cal.3d 929, 935.)

The Palmdale to Burbank Draft EIR/EIS, as currently drafted, does not identify or discuss alternatives and/or mitigation that could avoid or reduce the costs and likely adverse impacts on Lockheed Martin’s remediation efforts at the San Fernando Valley Superfund Sites, Area 1,

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

November 30, 2022  
California High Speed Rail Authority

4473-9086

including: impacts on contaminant plume containment and potential mobilization of contaminants as a result of the Project; impacts to wells that are in the pathway of the Project; impacts from Project tunneling creating accumulation of vapor causing vapor exposure to humans; costs of disposal of contaminated soil and costs of additional groundwater treatment due to migration of contaminants; loss of spreading grounds impacting the sustainability of the remedy; and impacts on the supply of drinking water to local communities. This results in an inadequate and deficient environmental document inconsistent with both CEQA and NEPA. Lockheed Martin requests that the Rail Authority fully consider the costs and impacts of the Project on the ongoing remediation efforts in the San Fernando Valley and evaluate alternatives and mitigation efforts that could avoid or reduce such costs and impacts.

By this letter, Lockheed Martin formally makes these comments, including all attachments, part of the Administrative Record for this CEQA and NEPA proceeding for consideration by the Rail Authority.

Thank you,

Kimberly L. Bick

**Subject:** Comments on the California High-Speed Rail Project  
Draft Environmental Impact Report/Environmental Impact Statement  
Palmdale to Burbank Project Section

4473-9087

CDM Smith has conducted a review of Sections 3.8, 3.9 and 3.10 of the Draft Environmental Impact Report/Environmental Impact Statement (Draft EIR/EIS) for the California High-Speed Rail Project (HSR Project), Palmdale to Burbank Project Section, prepared by the California High-Speed Rail Authority (Authority). This review focuses primarily on elements of the HSR Project within the Burbank Operable Unit (BOU) and vicinity of the Burbank Airport Station. Lockheed Martin's August 2020 comment letter to the Authority, with an attached CDM Smith comment letter, addressed potential impacts to the BOU Superfund Site remedy, Burbank's groundwater extraction wells, and soil and soil vapor conditions associated with the Burbank to Los Angeles Section of the HSR Project.

**Background**

4473-9088

Between approximately 1925 and 1990 Lockheed Martin and other companies conducted aircraft and component manufacturing and testing in the City of Burbank. All former Lockheed Martin facilities have been closed and redeveloped by others. Figure 1 identifies former Lockheed Martin and other manufacturing facilities with potential contamination activities (PCAs) in and near the BOU. One former site, Plant B-6, was located at the location of the proposed HSR Burbank Airport Station, and another, former Plant A-1 North, was located just south of the Burbank Airport Station. Both sites will be traversed by underground HSR alignments. Additional former Lockheed Martin and non-Lockheed Martin industrial properties with PCAs are located within one-mile of the centerline of the Palmdale to Burbank section. The soil and groundwater conditions associated with the two closest facilities are described below.

**Former Plant B-6, Soil:** B-6 was approximately 132 acres in size and was located along the northeastern section of the Burbank Airport. The property was sold by Lockheed Martin to the Burbank-Glendale-Pasadena Airport Authority in 1997, and most of the site was subsequently redeveloped for private commercial, industrial, retail and office use.

Prior to its sale remediations were conducted and roughly 6,000 tons of metals-, petroleum hydrocarbon- and volatile organic compound (VOC)-impacted soil were removed. The work was conducted in accordance with the Regional Water Quality Control Board Los Angeles Region (Water Board), Cleanup and Abatement Order No. 87-161. The Water Board subsequently issued 12 No Further Requirements (NFR) letters for plant B-6 cleanup actions, and the soil remediations were completed by 1996.

Kimberly L. Bick  
November 28, 2022  
Page 2

4473-9088

In 2013 the Water Board issued Order No. R4-2013-0063 requiring the reevaluation of subsurface conditions at the former plants, including B-6 and A-1 North, primarily for the presence of potential residual hexavalent chromium in soil at specific areas of concern they identified. Based on the results the investigations, the Water Board concurred in 2015 that additional soil remediation was not necessary for former plants B-6 and A-1 North.

To safeguard against potential vapor intrusion (VI) from residual VOCs at the B-6 site, all recent buildings constructed as part of the commercial/retail development (i.e., the Avion Burbank and Amazon structures) were constructed with sub slab vapor barrier systems consisting of geotextile, geomembrane, and sprayed vapor barrier layers, as well as available passive vapor collection/vent systems. The barriers are maintained and any alterations resulting from tenant improvements are repaired and leak tested.

**Former Plant A-1 North Soil:** This facility was approximately 32 acres in size and was located southeast of the Burbank Airport property. Aircraft manufacturing operations were performed at the site between 1941 to 1991. Lockheed Martin sold the property in 2000 for development and use by Burbank Airport and private developers.

Environmental cleanup activities conducted by Lockheed Martin under Order No. 87-161 removed 13,000 tons of soil between 1989 and 1996, and the Water Board issued NFR letters to Lockheed Martin for chemical compounds and metals in soil in 2001. VOC cleanup was then performed between 1999 and 2009 using a soil vapor extraction system (SVE). Following the completion of the VOC remediation, the Water Board issued a NFR determination and the SVE system was dismantled. The Water Board also requested that the new property owners sign land use covenants to assure the State and owners that the properties would be used in a manner consistent with their zoning and former manufacturing history.

**Burbank Groundwater:** After the discovery of impacts to groundwater in the area, the US Environmental Protection Agency (USEPA) designated the regional groundwater plume as the BOU, within Area 1 of the San Fernando Valley Superfund Site. Under the USEPA 1989 Record of Decision, remediation is conducted by extracting groundwater to remove contaminant mass, restrict the migration of the impacted groundwater, and restore drinking water resources. The BOU groundwater extraction wells VO1 through VO8 are identified on Figure 1. Seven of the wells are adjacent to or within the planned HSR Burbank to Los Angeles Project Section and must be protected, as per the comments provided by Lockheed Martin to the Authority in August 2020.

In addition to the extraction wells and their infrastructure, approximately 70 groundwater monitoring wells are located within the one-mile buffer zone on either side and terminus of the Palmdale to Burbank section in BOU (Figure 1). These wells are part of the BOU monitoring

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

Kimberly L. Bick  
November 28, 2022  
Page 3

4473-9088

program required by USEPA to document the effectiveness of the groundwater remedy, monitor changes to the plumes, and provide early warning of new contaminants.

In April 2022 the depth to groundwater in the vicinity of the planned HSR Burbank Airport Station was roughly 240 to 250 feet below ground surface. According to the general Station profile provided in the Draft EIR/EIS, the invert of the station will be roughly 90 feet below ground surface, therefore groundwater dewatering should not be required, although there is potential for localized perched groundwater.

**Palmdale to Burbank Station Draft EIR/EIS Comments**

Comments about potential impacts and mitigation measures associated with the BOU area of the Palmdale to Burbank Section are summarized below.

4473-9089

- CDM Smith agrees with the hazardous materials and wastes impact avoidance and minimization features (LAMFs) identified in Section 3.10.4.

4473-9090

- Impact HWR#4, Section 3.8: The Refined SR14, SR14A, E1 and E1A alternatives would cross the Hansen Spreading Grounds, and new impervious surfaces could interfere with groundwater recharge within the San Fernando Groundwater Basin. Loss of spreading would be a significant impact not only from a drinking water resource perspective but also to the sustainability of the BOU groundwater remedy, which is intended to restore the quality of water in the aquifers in the eastern San Fernando Groundwater Basin. Mitigation measure HWR-MM#3 should be further developed to identify replacement land for spreading upgradient of BOU to ensure continued groundwater recharge is available for the San Fernando Groundwater Basin remedies. .

4473-9091

- The Draft EIR/EIS identifies between 22 and 30 (depending on the build alternative) active groundwater monitoring wells within a one-mile zone on either side of the Palmdale to Burbank corridor in the Project Summary, Section 3.8, and Figures 3.8-A-21 through 3.8-A-23. As shown on the attached Figure 1, there are about 70 active groundwater monitoring wells located within one mile of either side of the HSR centerline and southern terminus, in the BOU only. Damage to or loss of groundwater monitoring wells used to assess progress of the USEPA and Water Board remedies would be significant. Damage could result from not only tunneling and excavation but resurfacing or loss of access due to site reconfiguration. The Draft EIR/EIS should identify any monitoring wells potentially impacted and include mitigation measures for their replacement or protection.

4473-9092

- The Draft EIR/EIS identifies the approximate locations of medium- and high-priority Potential Environmental Concern (PECs) on figures in Appendix 3.10-A but does not

Kimberly L. Bick  
November 28, 2022  
Page 4

4473-9092

identify the sites by name or type of PEC. The document would be more effective if the identification and type of PEC sites were tabulated in the Draft EIR/EIS.

4473-9093

- HMW#1, Section 3.10 – Hazards Due to Transport. Construction of the HSR may generate an estimated 3.0 – 9.2 million cubic yards of hazardous spoils, depending on the build alternative. Per Appendix 2.0-I it is conservatively assumed that 100% of the spoils from the 1) trench and cut-and-cover, 2) Burbank Airport Station Tunnel, and 3) Burbank Airport Station excavation would be contaminated and would need to be off-hauled to a suitable treatment site. The Draft EIS/EIR should also include a statement that the Authority would be the responsible generator for the transport and treatment or disposal of spoils.

4473-9094

- GEO-IAMF#3 and #4, Section 3.9 provides protections against explosive or natural gas via monitoring and ventilation. There should also be discussion regarding protection against potential exposure to VOCs that may be present at low levels in the soil and soil vapor adjacent to the Burbank Airport Station and tunnels. Prevention of vapor exposure risk, including mitigation of potential vapor intrusion pathways and appropriate tunnel/station vapor lining and/or ventilation requirements, should also be discussed in Section 3.10.

4473-9095

- Should the HSR plans include retention of the existing structures at the proposed Burbank Airport Station (i.e., Avion Burbank and/or Amazon buildings) the integrity of their VI barriers must also be preserved. Modifications or damage to the building slabs would require repair, smoke testing, and documentation of the VI barrier integrity.

4473-9096

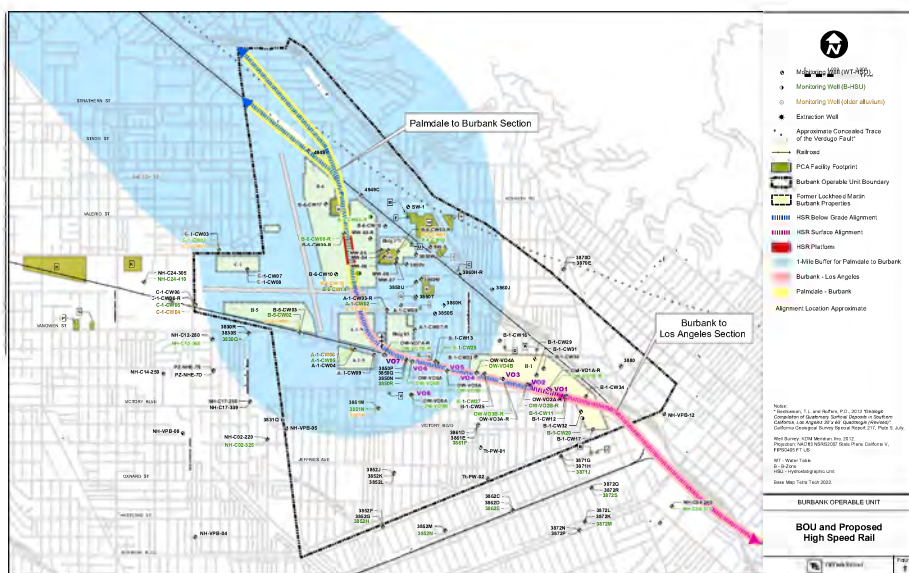

Lockheed Martin has completed remediation of the soil properties described herein and does not anticipate a need for additional investigation or remediation. In cases where a NFR has been issued the Water Board has determined that the contamination has been reduced to levels that are protective of human health for the current land uses. Should land uses change however, those decisions may need to be reconsidered by the appropriate agencies and the Authority. Additional actions associated with land use changes or newly discovered conditions should be the responsibility of the Authority to mitigate.

RECORD OF DECISION  
DECLARATION

#SNL  
SITE NAME AND LOCATION

SAN FERNANDO VALLEY BASIN AREA 1  
BURBANK OPERABLE UNIT  
LOS ANGELES COUNTY, CALIFORNIA

#DR  
STATEMENT OF BASIS AND PURPOSE

THIS DECISION DOCUMENT PRESENTS THE SELECTED REMEDIAL ACTION FOR THE SAN FERNANDO VALLEY BASIN AREA 1, BURBANK OPERABLE UNIT, IN LOS ANGELES COUNTY, CALIFORNIA, DEVELOPED IN ACCORDANCE WITH THE COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION, AND LIABILITY ACT (42 USC SECTION 9601 ET. SEQ.) AND THE NATIONAL CONTINGENCY PLAN (40 CFR SECTION 300 ET. SEQ.). THIS DECISION IS BASED ON THE ADMINISTRATIVE RECORD FOR THESE SITES.

THE STATE OF CALIFORNIA CONCURS ON THE SELECTED REMEDY.

#DE  
DECLARATION

THE SELECTED REMEDY IS PROTECTIVE OF HUMAN HEALTH AND THE ENVIRONMENT, ATTAINS FEDERAL AND STATE REQUIREMENTS THAT ARE APPLICABLE OR RELEVANT AND APPROPRIATE FOR THIS REMEDIAL ACTION, AND IS COST-EFFECTIVE. THIS REMEDY SATISFIES THE STATUTORY PREFERENCE FOR REMEDIES WHICH EMPLOY TREATMENT THAT REDUCES TOXICITY, MOBILITY, OR VOLUME AS A PERMANENT SOLUTION AND ALTERNATIVE TREATMENT (OR RESOURCE RECOVERY) TECHNOLOGIES TO THE MAXIMUM EXTENT PRACTICABLE. AS PART OF THE REMEDY, GROUNDWATER MONITORING WILL BE CONDUCTED TO TRACK CONTAMINANT LEVELS IN THE BURBANK WELL FIELD AND TO MONITOR THE PERFORMANCE OF THE EXTRACTION AND TREATMENT SYSTEM TO ENSURE ADEQUATE PROTECTION OF HUMAN HEALTH AND THE ENVIRONMENT. PERIODIC REVIEWS WILL BE CONDUCTED TO ANALYZE THE EFFECTIVENESS OF THE SYSTEM.

RECORD OF DECISION  
DECISION SUMMARY

#SLD

## 1.0 SITE LOCATION AND DESCRIPTION

THE AREA AROUND THE BURBANK WELL FIELD, LOCATED IN THE SAN FERNANDO AREA 1 (NORTH HOLLYWOOD) NPL SITE WITHIN THE SAN FERNANDO VALLEY BASIN (SFVB), HAS BEEN DESIGNATED AN OPERABLE UNIT (OU). FIGURE 1 SHOWS THE LOCATION OF THE NORTH HOLLYWOOD NPL SITE WITHIN THE SFVB. FIGURE 2 SHOWS THE BOUNDARY OF THE STUDY AREA FOR THE OU WITHIN THE NORTH HOLLYWOOD NPL SITE AND THE APPROXIMATE LOCATION OF THE PROPOSED EXTRACTION WELLS. THE ENTIRE BURBANK WELL FIELD LIES WITHIN THE POLITICAL BOUNDARIES OF THE CITY OF BURBANK, CALIFORNIA.

THE SFVB IS LOCATED IN THE UPPER LOS ANGELES RIVER AREA (ULARA), WHICH CONSISTS OF THE ENTIRE WATERSHED OF THE LOS ANGELES RIVER AND ITS TRIBUTARIES. THE ULARA ENCOMPASSES APPROXIMATELY 328,500 ACRES, OF WHICH 122,800 ACRES ARE ALLUVIAL DEPOSITS WHICH FILL THE SFVB. THE SFVB IS BOUNDED ON THE NORTH AND NORTHWEST BY THE SANTA SUSANA MOUNTAINS, ON THE NORTHEAST BY THE SAN GABRIEL MOUNTAINS, ON THE WEST BY THE SIMI HILLS, AND ON THE SOUTH BY THE SANTA MONICA MOUNTAINS. THESE MOUNTAIN RANGES ARE SHOWN IN FIGURE 1.

FOUR DISTINCT GROUNDWATER BASINS ARE LOCATED WITHIN THE ULARA: THE SAN FERNANDO (WITH 91.2 PERCENT OF THE TOTAL VALLEY FILL, THE VERDUGO (WITH 3.6 PERCENT OF THE TOTAL VALLEY FILL), THE SYLMAR (WITH 4.6 PERCENT OF THE TOTAL VALLEY FILL), AND THE EAGLE ROCK (WITH 0.6 PERCENT OF THE TOTAL VALLEY FILL). BECAUSE THE SFVB AREA 1 NPL SITE IS LOCATED WITHIN THE SAN FERNANDO GROUNDWATER BASIN, THE FOLLOWING DISCUSSION FOCUSES ON THE SAN FERNANDO GROUNDWATER BASIN.

THE GEOLOGY OF THE SFVB GENERALLY CONSISTS OF ALLUVIAL DEPOSITS COMPOSED OF UNCONSOLIDATED GRAVELS AND SAND INTERBEDDED WITH LENSES OF SILT AND CLAY. THE OVERLYING ALLUVIAL DEPOSITS RANGE IN THICKNESS FROM A FEW INCHES AT THE BASE OF THE MOUNTAINS TO AS MUCH AS 1,500 FEET IN THE CENTER OF THE SFVB. THE BURBANK WELL FIELD IS LOCATED IN THE EASTERN PORTION OF THE SAN FERNANDO VALLEY BASIN (SFVB), WHICH CONTAINS COARSER SEDIMENTS THAT TRANSMIT WATER AT HIGHER RATES THAN THE WESTERN AREA OF THE SFVB. MOST OF THE PRODUCTION WELLS IN THE SFVB ARE LOCATED IN THIS EASTERN AREA. RESULTS OF AQUIFER TESTING IN THE SFVB HAVE SHOWN THAT GROUNDWATER VELOCITIES IN THE EASTERN PORTION OF THE BASIN ARE MUCH GREATER THAN IN THE WESTERN PORTION. WITHIN THE EASTERN PORTION OF THE SFVB, THE VELOCITIES ARE ESTIMATED TO BE BETWEEN 300 TO 500 FEET PER YEAR WITH LOCALIZED VELOCITIES OF MORE THAN THREE FEET PER DAY NEAR WELL FIELDS.

HISTORICALLY, GROUNDWATER RECHARGE TO THE SFVB HAS OCCURRED THROUGH BOTH NATURAL RECHARGE FROM PRECIPITATION AND ARTIFICIAL RECHARGE FROM APPLIED WATER AND TREATED WASTEWATER EFFLUENT. THE TOTAL STORAGE CAPACITY OF THE SFVB IS APPROXIMATELY 3 MILLION ACRE-FeET (ACRE-FT), TWO-THIRDS OF WHICH IS LOCATED IN THE EASTERN PORTION OF THE BASIN. IN 1979, THE STATE SUPREME COURT GRANTED THE CITY OF BURBANK THE RIGHT TO EXTRACT 20 PERCENT OF THE IMPORTED AND RECLAIMED WATER FOR DOMESTIC USE. CURRENTLY, THIS 20 PERCENT AMOUNTS TO AN AVERAGE OF 4,700 ACRE-FT PER YEAR. THE CITY OF BURBANK ALSO HAS LIMITED RIGHTS TO PHYSICAL SOLUTION WATER, THAT IS, WATER NORMALLY SUPPLIED TO OTHER PARTIES BUT WHICH MAY BE USED BY THE CITY OF BURBANK UPON PAYMENT OF SPECIFIED CHARGES. IN ADDITION, THE CITY OF BURBANK IS ENTITLED TO STORE WATER IN THE SFVB AND RECEIVES A CREDIT FOR RECHARGING TREATED WASTEWATER EFFLUENT. AS OF MARCH 1989, BURBANK'S WATER CREDITS WERE APPROXIMATELY 38,000 ACRE-FeET.

THE CITY OF BURBANK'S PRODUCTION WELLS HAVE BEEN SHUT DOWN BECAUSE THE WATER THEY PRODUCE CONTAINS TRICHLOROETHYLENE (TCE) AND PERCHLOROETHYLENE (PCE) IN CONCENTRATIONS EXCEEDING STATE AND FEDERAL GUIDELINES. CONSEQUENTLY, THE CITY OF BURBANK NOW IMPORTS 100 PERCENT OF ITS WATER FROM THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA (MWD). IN 1987, THE CITY OF BURBANK IMPORTED APPROXIMATELY 23,100 ACRE-FeET OF WATER.

#SH

## 2.0 SITE HISTORY

IN JUNE 1986, AT THE REQUEST OF THE LOS ANGELES DEPARTMENT OF WATER AND POWER (DWP) AND THE CALIFORNIA DEPARTMENT OF HEALTH SERVICES (DHS), EPA DESIGNATED FOUR WELL FIELDS WITHIN THE SAN FERNANDO AND VERDUGO GROUNDWATER BASINS AS NATIONAL PRIORITIES LIST (NPL) HAZARDOUS WASTE SITES. INDUSTRIAL CHEMICALS HAVE BEEN DETECTED IN GROUNDWATER FROM THESE AREAS. ALTHOUGH EACH WELL FIELD IS LISTED SEPARATELY ON THE NPL, EPA AND DWP ARE MANAGING THE INVESTIGATION OF THE FOUR

4473-9097

SITES AS IF THEY ARE ONE SINGLE, LARGE SITE.

THE SFVB REPRESENTS AN IMPORTANT SOURCE OF DRINKING WATER FOR THE CITIES OF LOS ANGELES, BURBANK, GLENDALE, AND LA CRESCENTA, AND PROVIDES THESE COMMUNITIES WITH ENOUGH WATER TO SERVE APPROXIMATELY 600,000 RESIDENTS.

GROUNDWATER FROM THE AQUIFERS IN THE SFVB IS USED FOR COMMERCIAL, INDUSTRIAL AND RESIDENTIAL PURPOSES, AND IS ESPECIALLY IMPORTANT DURING YEARS OF DROUGHT. THE GROUNDWATER THAT HAS BECOME CONTAMINATED IS DIFFICULT TO REPLACE. THE CURRENT WATER SUPPLY FROM SURFACE WATER VIA THE METROPOLITAN WATER DISTRICT (MWD) MAY NOT ALWAYS BE AVAILABLE IN THE FUTURE BECAUSE OF PERIODIC DROUGHT CONDITIONS AND STATE AND FEDERAL WATER RIGHTS ISSUES.

IN LATE 1979, AS A RESULT OF THE PASSAGE OF ASSEMBLY BILL 1803, DHS REQUESTED THAT ALL MAJOR WATER PURVEYORS USING GROUNDWATER CONDUCT TESTS FOR THE PRESENCE OF CERTAIN INDUSTRIAL CHEMICALS AS PART OF A STATEWIDE GROUNDWATER QUALITY SURVEILLANCE EFFORT. THESE INITIAL TESTS, COMPLETED IN SPRING 1980, INDICATED THAT HAZARDOUS SUBSTANCES SUCH AS TRICHLOROETHYLENE (TCE) AND PERCHLOROETHYLENE (PCE), WERE PRESENT IN CONCENTRATIONS ABOVE STATE ACTION LEVELS (SALS) AND MAXIMUM CONTAMINANT LEVELS (MCLS) IN A NUMBER OF WATER PRODUCTION WELLS IN THE SAN FERNANDO VALLEY BASIN. CONCENTRATION LEVELS IN THE WELLS HAVE BEEN INCREASING SINCE 1980

IN 1987, THE PRIMARY CONTAMINANT, TCE, WAS FOUND AT CONCENTRATIONS EXCEEDING THE STATE ACTION LEVEL (SAL) IN 48% OF THE SFVB'S 120 PRODUCTION WELLS. IN ADDITION, PCE LEVELS ABOVE STATE ACTION LEVEL WERE PRESENT IN 18% OF THE SFVB WELLS.

AT PRESENT, THE CITY OF LOS ANGELES ADDRESSES WELL CONTAMINATION BY EITHER SHUTTING DOWN HEAVILY CONTAMINATED WELLS AND PROVIDING ALTERNATE SOURCES OF DRINKING WATER, OR BLENDING CONTAMINATED WATER WITH OTHER SOURCES TO ACHIEVE TCE AND PCE CONCENTRATIONS IN THE SERVED WATER THAT ARE BELOW STATE ACTION LEVELS AND FEDERAL MCLS. OTHER COMMUNITIES, LIKE THE CITY OF BURBANK, HAVE TURNED TO THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA FOR SURFACE WATER TO AUGMENT THEIR SUPPLIES.

IN SEPTEMBER 1987, EPA SIGNED THE NORTH HOLLYWOOD OU RECORD OF DECISION TO CONSTRUCT AN EXTRACTION AND AERATION FACILITY, TO PUMP AND TREAT CONTAMINATED GROUNDWATER IN THE NORTH HOLLYWOOD AREA WITHIN THE SFVB AREA I NPL SITE. EPA PROVIDED FUNDS TO DWP THROUGH A COOPERATIVE AGREEMENT TO IMPLEMENT THIS PROJECT. ALSO, EPA HAS JOINED WITH DWP AND DHS IN A THREE PARTY AGREEMENT THAT DEFINES SPECIFIC AGENCY RESPONSIBILITIES, COST SHARING, AND OTHER APPLICABLE PROVISIONS FOR CONSTRUCTION, OPERATION, AND MAINTENANCE OF THIS TREATMENT SYSTEM. THE PLANT BECAME OPERATIONAL IN MARCH, 1989.

THE BURBANK OPERABLE UNIT (OU) WILL BE THE SECOND OU IN THE SFVB AREA 1.

## 3.0 ENFORCEMENT

THE SFVB NPL SITES WERE FIRST LISTED BECAUSE OF CONTAMINATED PUBLIC SUPPLY WELLS. AT THE TIME OF LISTING, THE SOURCES OF CONTAMINATION WERE UNKNOWN. EPA AND THE LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD (RWQCB) HAVE AND ARE CONTINUING TO CONDUCT NUMEROUS ACTIVITIES TO IDENTIFY SOURCES OF GROUNDWATER CONTAMINATION IN THE SAN FERNANDO VALLEY BASIN. THE TWO AGENCIES ARE WORKING COOPERATIVELY IN SOURCE IDENTIFICATION AND ENFORCEMENT ACTIVITIES.

THE RWQCB BEGAN SOURCE INVESTIGATION ACTIVITIES IN 1987 UNDER THE AB 1803 PROGRAM. UNDER THIS PROGRAM, AN AREA (TYPICALLY ONE SQUARE MILE) SURROUNDING CONTAMINATED PUBLIC WATER SUPPLY WELLS IS ESTABLISHED WITHIN WHICH A DOOR-TO-DOOR INDUSTRIAL SURVEY IS COMPLETED. INSPECTIONS ARE CONDUCTED AT ALL FACILITIES POTENTIALLY USING SOLVENTS. FACILITIES THAT MAY HAVE HAD A RELEASE DUE TO THEIR HANDLING OR STORAGE PRACTICES ARE REQUESTED TO CONDUCT A SITE ASSESSMENT FOR THEIR FACILITY. IF SOIL CONTAMINATION IS FOUND, EXPANDED SOIL AND/OR GROUNDWATER INVESTIGATIONS ARE REQUIRED. LATER, A CLEANUP AND ABATEMENT ORDER MAY BE ISSUED REQUIRING THE SITE TO BE REMEDIATED.

IN ADDITION, THE RWQCB CONDUCTS SOURCE IDENTIFICATION AND CLEANUP ACTIVITIES UNDER THE UNDERGROUND STORAGE TANK, SOLID WASTE ASSESSMENT TESTING (SWAT), AND WASTE DISCHARGE REQUIREMENTS PROGRAMS.

BETWEEN AUGUST 1987 AND 1988, EPA ISSUED 145 RCRA SECTION 3007/ CERCLA SECTION 104 INFORMATION

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9097

REQUEST LETTERS TO FACILITIES SUSPECTED OF BEING USERS OF CHLORINATED SOLVENTS IN THE SAN FERNANDO VALLEY BASIN. BASED ON THE RESPONSES RECEIVED AND INFORMATION IN STATE AGENCY FILES, EPA ISSUED 34 GENERAL NOTICE LETTERS INFORMING COMPANIES OF THEIR POTENTIAL LIABILITY FOR THE CLEANUP OF THE SEVB AREA 1 AND 2 NPL SITES. ON SEPTEMBER 13, 1988 EPA HELD AN INFORMATION MEETING FOR FACILITIES IDENTIFIED AS PRP'S FOR THE BURBANK WELL FIELD. TO BEGIN NEGOTIATIONS FOR CLEANUP OF THE BURBANK OU AREA, EPA SENT SPECIAL NOTICE LETTERS PURSUANT TO CERCLA SECTION 122 IN MAY 1989. NEGOTIATIONS WITH PRP'S ARE EXPECTED TO END IN SEPTEMBER 1989. EPA AND THE RWQCB WILL CONTINUE BASINWIDE SOURCE IDENTIFICATION AND ENFORCEMENT ACTIVITIES THROUGHOUT THE BASINWIDE RI/FS PROCESS.

#CR

4.0 COMMUNITY RELATIONS

THE COMMENT PERIOD FOR THE OUF'S REPORT AND THE PROPOSED PLAN OPENED ON OCTOBER 19, 1988 AND CLOSED DECEMBER 2, 1988. A PUBLIC MEETING WAS HELD ON NOVEMBER 9, 1988 AT THE THOMAS JEFFERSON ELEMENTARY SCHOOL IN BURBANK AND WAS ATTENDED BY APPROXIMATELY 65 PEOPLE.

PRIOR TO THE BEGINNING OF THE PUBLIC COMMENT PERIOD, EPA AND THE CITY OF BURBANK PUBLISHED A NOTICE BOTH IN THE LOS ANGELES TIMES AND THE BURBANK LEADER. THE NOTICE BRIEFLY DESCRIBED THE PROPOSED PLAN AND ANNOUNCED THE PUBLIC COMMENT PERIOD AND THE PUBLIC MEETING. THE NOTICE ALSO ANNOUNCED THE AVAILABILITY OF FORMATION REPOSITORIES ESTABLISHED AT THE BURBANK PUBLIC LIBRARY, CALIFORNIA STATE UNIVERSITY - NORTHRIDGE LIBRARY, LOS ANGELES DEPARTMENT OF WATER AND POWER LIBRARY AND THE UNIVERSITY OF CALIFORNIA - LOS ANGELES (UCLA) RESEARCH LIBRARY. (SEE FACT SHEET #1 OR #2 FOR THE LOCATIONS.)

A FACT SHEET DESCRIBING THE PROPOSED PLAN WAS DELIVERED TO THE INFORMATION REPOSITORIES. COPIES OF THE FACT SHEET WERE ALSO MAILED TO THE EPA GENERAL MAILING LIST FOR THE SAN FERNANDO VALLEY BASIN SITES, WHICH INCLUDED ABOUT 800 MEMBERS OF THE GENERAL PUBLIC, ELECTED OFFICIALS, AGENCY, AND MEDIA REPRESENTATIVES. FACT SHEETS WERE ALSO HAND-DELIVERED TO RESIDENTS NEAR THE PROPOSED TREATMENT FACILITY LOCATION. IN ADDITION, THE BURBANK WATER SYSTEM MANAGER MADE AN ANNOUNCEMENT OF THE PUBLIC MEETING AND PRESENTED THE PROPOSED PLAN ON LOCAL CABLE TELEVISION. HE ALSO HAD FACT SHEETS AVAILABLE FOR DISTRIBUTION AT THE BURBANK PUBLIC SERVICE DEPARTMENT (PSD) ADDITIONALLY, NEWS STORIES APPEARED IN THE LOCAL NEWSPAPER, THE BURBANK LEADER, AND THE LOS ANGELES TIMES AND THE DAILY NEWS.

FROM MARCH 1987 TO THE PRESENT, EPA AND DWP HAVE MET BIMONTHLY OR QUARTERLY WITH MEMBERS OF THE COMMUNITY WORKGROUP (CWG). THE MEMBERS INCLUDE ELECTED OFFICIALS, INDUSTRY REPRESENTATIVES, COMMUNITY-BASED PUBLIC INTEREST REPRESENTATIVES, AND RESIDENTS FROM THE SAN FERNANDO VALLEY/LOS ANGELES AREA. THE PURPOSE OF THE CWG MEETINGS HAVE BEEN TO DISCUSS TECHNICAL ISSUES AND MANAGEMENT STRATEGIES INVOLVING THE SAN FERNANDO VALLEY BASIN SUPERFUND PROJECT. CWG MEMBERS HAVE BEEN UPDATED ON AGENCY ACTIVITIES AND HAVE HAD THE OPPORTUNITY TO EXPRESS THEIR CONCERNS ABOUT THE BURBANK OPERABLE UNIT THROUGHOUT THE REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS) PROCESS. EPA TRANSMITTED COPIES OF THE OUF'S REPORT TO CWG MEMBERS FOR THEIR REVIEW AND COMMENT.

THE MINUTES OF THE COMMUNITY MEETING WERE TRANSCRIBED. THE TRANSCRIPT AND THE ATTACHED RESPONSE SUMMARY PROVIDE RESPONSES TO THE COMMUNITY COMMENTS SUBMITTED IN WRITING DURING THE PUBLIC COMMENT PERIOD, AS WELL AS ORAL COMMENTS MADE AT THE NOVEMBER 9, 1988 PUBLIC MEETING. THE PUBLIC TRANSCRIPT AND RESPONSE SUMMARY ARE PART OF THE ADMINISTRATIVE RECORD.

5.0 SCOPE AND ROLE OF THE OU WITHIN THE BASINWIDE SITE STRATEGY

AS DISCUSSED IN THE SITE HISTORY SECTION, EPA IS TREATING THE SEVB AREA 1 - 4 NPL SITES AS ONE LARGE SITE. EPA AND DWP ARE CONDUCTING ONE BASINWIDE RI/FS FOR THE 4 NPL SITES. THE RI/FS FOR THE SAN FERNANDO SITES WAS INITIATED IN 1987. THE MAJOR GOAL OF THE RI IS TO IDENTIFY THE SOURCES, PATHWAYS AND RECEPTORS OF THE CONTAMINANTS AND TO CHARACTERIZE THE NATURE AND EXTENT OF THE PUBLIC HEALTH AND ENVIRONMENTAL PROBLEMS PRESENTED BY THE CONTAMINATION. MAJOR COMPONENTS OF THE RI INCLUDE SOIL GAS SURVEYS, INSTALLATION OF MONITORING WELLS, REGIONAL AND SITE SPECIFIC GROUNDWATER FLOW AND SOLUTE TRANSPORT MODELING OF THE BASIN AND SAMPLING OF THE GROUNDWATER AND SOIL. THE FS WILL EVALUATE THE NECESSITY FOR AND PROPOSED EXTENT OF REMEDIAL ACTIONS. DWP HAS THE LEAD FOR THE RI AND EPA HAS THE LEAD FOR THE FS.

EPA PREVIOUSLY SELECTED A REMEDY TO ADDRESS THE PUBLIC HEALTH THREAT POSED BY CONTAMINATION OF THE PUBLIC WATER SUPPLY WELLS LOCATED IN THE CITY OF NORTH HOLLYWOOD WHICH LIES WITHIN THE SEVB

4473-9097

AREA 1 NPL SITE. THE NORTH HOLLYWOOD OU PROJECT WAS DESIGNED TO CONTROL THE MIGRATION OF CONTAMINANTS IN THE GROUNDWATER, WHILE INITIATING AQUIFER RESTORATION IN THE AREA. THE CONTAMINANT PLUME HAS ALREADY AFFECTED NUMEROUS GROUNDWATER PRODUCTION WELLS IN AREA 1 OF THE SEVB AND HAS PRECLUDED THEIR USE FOR PUBLIC WATER SUPPLY. CONSTRUCTION AND OPERATION OF THE BURBANK PROJECT IS INTENDED TO FURTHER ADDRESS THE IMMEDIATE PROBLEM IN AREA 1 WHILE A MORE COMPLETE INVESTIGATION OF THE VALLEY'S OVERALL GROUNDWATER PROBLEM IS BEING DONE THROUGH THE OVERALL REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS) PROCESS.

THE BURBANK RESPONSE ACTION IS DESIGNED TO ACHIEVE TWO OBJECTIVES:

- TO PARTIALLY CONTROL THE MOVEMENT AND SPREAD OF GROUNDWATER CONTAMINANTS IN THE BURBANK OPERABLE UNIT AREA, WHILE CONTRIBUTING TO AQUIFER RESTORATION IN THE SAN FERNANDO VALLEY BASIN AREA 1 NPL SITE.
- TO ADDRESS THE PUBLIC HEALTH THREAT POSED BY CONTAMINATION OF THE CITY OF BURBANK'S PUBLIC WATER SUPPLY WELLS BY PROVIDING RESIDENTS IN THE AREA WITH A WATER SUPPLY THAT MEETS STATE AND FEDERAL DRINKING WATER STANDARDS.

ALL OF THE CITY OF BURBANK'S PSD WELLS ARE SHUT DOWN DUE TO THE VOC CONTAMINATION. MOREOVER, OTHER DOWNGRADE PUBLIC WATER SUPPLY WELLS ARE POTENTIALLY THREATENED BY CONTAMINATION IN THE BURBANK OU AREA. THE RESPONSE ACTION SELECTED IN THIS DECISION DOCUMENT WILL BE INCORPORATED INTO THE EPA RESPONSE ACTION FOR THE ENTIRE SAN FERNANDO SUPERFUND AREAS 1-4.

AS THE OPERABLE UNITS ARE ADDRESSING PART OF THE OVERALL PROBLEM, THE RI/FS AND SUBSEQUENT ROD ARE INTENDED TO ADDRESS THE 4 SEVB NPL SITES AND THE AREAS WHICH IMPACT THESE SITES.

#SBC

6.0 SUMMARY OF THE BURBANK OU SITE CHARACTERISTICS

CONTAMINATION OF GROUNDWATER FROM THE SAN FERNANDO VALLEY BASIN WELLS WAS FIRST DISCOVERED IN 1980. SINCE THEN, VARIOUS MONITORING PROGRAMS HAVE BEEN IMPLEMENTED. RESULTS OF LADWP'S GROUNDWATER MONITORING PROGRAM CONDUCTED FROM 1981 THROUGH 1987 REVEALED THAT TCE AND PCE HAD CONTAMINATED APPROXIMATELY 50 PERCENT OF THE WATER SUPPLY WELLS IN THE EASTERN PORTION OF THE SEVB AT CONCENTRATIONS EXCEEDING STATE AND FEDERAL DRINKING WATER STANDARDS. FIGURE 3 PRESENTS THE APPROXIMATE LOCATION OF THE TCE AND PCE PLUMES IN 1987.

THE CITY OF BURBANK'S WELLS ARE SAMPLED ROUTINELY AS PART OF THE MONITORING OF 112 WELLS IN THE SAN FERNANDO VALLEY BASIN. THE CONCENTRATION RANGES OF TCE AND PCE FOUND IN THE BURBANK WELLS ARE PRESENTED IN TABLES 1 AND 2. SEVERAL OTHER VOCs HAVE ALSO BEEN DETECTED IN THE BURBANK WELLS, INCLUDING ACETONE, TOLUENE, METHYLETHYLKETONE, CARBON TETRACHLORIDE AND TRIHALOMETHANES (THMS) WHICH INCLUDE CHLOROFORM, BROMODICHLOROMETHANE, DIBROMOCHLOROMETHANE, AND BROMOFORM. THE CONCENTRATIONS OF THESE OTHER VOCs HAVE NOT EXCEEDED STATE ACTION LEVELS (SALS) OR FEDERAL MCLS. THE BURBANK WELLS HAVE ALSO BEEN SAMPLED FOR TRACE METALS AND OTHER WATER QUALITY PARAMETERS. ALTHOUGH GROUNDWATER FROM ONE WELL HAD ELEVATED CONCENTRATIONS OF IRON, THE QUALITY OF THE TREATED WATER FROM THESE WELLS IS EXPECTED TO MEET TITLE 22 DRINKING WATER STANDARDS FOR METALS.

THE TABLES CAN BE SUMMARIZED AS FOLLOWS:

- TCE AND PCE ARE THE PRINCIPAL CONTAMINANTS OF CONCERN. TCE AND PCE ARE INDUSTRIAL SOLVENTS COMMONLY USED IN THE METAL DEGRASSING AND DRY-CLEANING INDUSTRIES. BOTH ARE ANIMAL CARCINOGENS AND ARE SUSPECTED OF BEING CARCINOGENIC TO HUMANS. THE FEDERAL MCL FOR TCE IS 5.0 UG/L. THE SAL FOR PCE IS 4.0 UG/L AND THE PROPOSED STATE MCL IS 5 UG/L.
- OTHER VOCs DETECTED IN TRACE QUANTITIES INCLUDE METHYLENE CHLORIDE, TOLUENE, ACETONE, CARBON TETRACHLORIDE, METHYLETHYLKETONE, AND THE THMS (CHLOROFORM, BROMODICHLORO-METHANE AND DIBROMOCHLOROMETHANE). METHYLENE CHLORIDE IS AN INDUSTRIAL SOLVENT COMMONLY USED IN LABORATORIES. IT IS CARCINOGENIC IN ANIMALS AND IS ALSO A SUSPECTED HUMAN CARCINOGEN. THE SAL FOR METHYLENE CHLORIDE IS 40 UG/L. TOLUENE IS AN INDUSTRIAL SOLVENT AND A GASOLINE ADDITIVE. IT IS CARCINOGENIC IN ANIMALS AND IS ALSO A SUSPECTED HUMAN CARCINOGEN. THE SAL FOR TOLUENE IS 100 UG/L. ACETONE IS USED AS AN INDUSTRIAL SOLVENT AND IN THE PRODUCTION OF LUBRICATING OILS. A SAL FOR ACETONE HAS NOT BEEN ESTABLISHED. CARBON TETRACHLORIDE IS AN INDUSTRIAL

## Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9097

SOLVENT. IT IS CARCINOGENIC IN ANIMALS AND IS A SUSPECTED HUMAN CARCINOGEN. THE FEDERAL MCL FOR CARBON TETRACHLORIDE IS 5.0 UG/L AND THE FEDERAL MCLG IS SET AT 0 UG/L. METHYLETHYLKETONE IS USED AS A SOLVENT IN NITROCELLULOSE COATINGS AND VINYL FILM MANUFACTURING AND IN CEMENTS AND ADHESIVES. A SAL HAS NOT BEEN ESTABLISHED FOR METHYLETHYLKETONE. MOST THMS FOUND IN FINISHED DRINKING WATER ARE UNWANTED BY-PRODUCTS CAUSED BY THE CHLORINATION PROCESS. THMS ARE FORMED BY THE CHEMICAL ATTACK OF HYPOCHLORITE ON FULVIC AND HUMIC ACIDS. CHLOROFORM ALSO HAS A VARIETY OF INDUSTRIAL USES, INCLUDING USE AS A SOLVENT IN LACQUER MANUFACTURE. CHLOROFORM IS A SUSPECTED HUMAN CARCINOGEN. THE MCL FOR THE SUM OF THMS IS 100 UG/L.

- THE WELLS WITH THE SHALLOWEST PERFORATED INTERVALS (PSD 10 AND PSD 12) AND THE ONES THAT ARE THE FURTHEST UPGRADIENT (PSD 9, PSD 10, PSD 11A, PSD 13, PSD 14A, PSD 17) HAVE HISTORICALLY HAD THE HIGHEST CONCENTRATIONS OF TCE AND PCE. IN CONTRAST, PSD 6, PSD 7 AND PSD 15 HAVE LOW OR NONDETECTED CONCENTRATIONS OF VOCS. PSD 6 IS LIKELY AT THE EDGE OF THE LATERAL EXTENT OF THE VOC PLUME, AND PSD 7 AND PSD 15 ARE LIKELY AT THE LEADING EDGE OF THE PLUME. FOR RELATIVE LOCATION OF WELLS SEE FIGURE 2.

**#SSR****7.0 SUMMARY OF SITE RISKS**

THE PURPOSE OF THE RISK ASSESSMENT IS TO EVALUATE THE PUBLIC HEALTH AND ENVIRONMENTAL RISKS POSED BY THE BURBANK OU SITE. FOR THE RISK ASSESSMENT EVALUATION, BOTH A BASELINE RISK ASSESSMENT AND A RISK ASSESSMENT FOR ALTERNATIVE 5, PHASE 1 WERE CONDUCTED. THIS SECTION DESCRIBES THE RISK ASSESSMENT PROCESS AND RESULTS.

BASELINE RISK ASSESSMENT: ANALYTICAL RESULTS FROM GROUNDWATER SAMPLES COLLECTED FROM CITY OF BURBANK PRODUCTION WELLS (PSD 6, 7, 10, 12, 15, AND 18) BETWEEN MAY 1987 AND JUNE 1988 FROM THE GROUNDWATER DATABASE THAT WERE USED IN THE BASELINE RISK ASSESSMENT. IN THE BASELINE RISK ASSESSMENTS THE CURRENT RISKS POSED BY DOMESTIC USE OF GROUNDWATER FROM THE BURBANK WELL FIELD WERE ESTIMATED. THE WELL FIELD IS CURRENTLY NOT IN USE AS A WATER SUPPLY. AS A RESULT, NO RECEPTORS ARE CURRENTLY BEING EXPOSED.

A QUANTITATIVE RISK ASSESSMENT WAS DEVELOPED FOR TWO EXPOSURE SOURCE TERMS. ONE SOURCE TERM, "THE POTENTIAL AVERAGE EXPOSURE," OR THE "MOST LIKELY CASE" ASSUMES THAT GROUNDWATER CONCENTRATIONS IN THE BURBANK WELL FIELD ARE AT THE GEOMETRIC MEAN LEVELS (AVERAGED BY WELL) AND AVERAGED ACROSS WELLS (ARITHMETIC MEAN OF GEOMETRIC MEANS). THE OTHER SOURCE TERM IS A "PLAUSIBLE WORSE-CASE" AND ASSUMES THAT THE RECEPTOR IS EXPOSED TO THE MAXIMUM CONTAMINANT LEVEL DETECTED IN ANY ONE WELL.

ASSUMING THAT GROUNDWATER FROM THE WELL FIELD IS USED FOR A LIFETIME, AN INDIVIDUAL RECEPTOR WOULD BE EXPOSED TO AN EXCESS CANCER RISK RANGE (I.E. ABOVE THE NATURAL BACKGROUND RISK) OF APPROXIMATELY  $2.0 \times 10^{-4}$  TO  $1.7 \times 10^{-3}$ . THESE RISK VALUES ARE AT THE HIGHEST RANGE ALLOWED BY MOST REGULATORY AGENCIES. FOR COMPARISON, A LOWER EXCESS RISK RANGE OF  $1.0 \times 10^{-4}$  TO  $1.0 \times 10^{-7}$  WITH  $10^{-6}$  DEPARTURE, IS USED IN CERCLA AS A SITE REMEDIATION TARGET.

THE BASELINE RISK ASSESSMENT CONCLUDED THAT, UNDER THE CONDITIONS POSTULATED IN THE EXPOSURE ASSESSMENT, THE USE OF UNTREATED GROUNDWATER FROM THE BURBANK WELL FIELD AS A DOMESTIC WATER SUPPLY FOR A LIFETIME WOULD PRESENT AN UNACCEPTABLY HIGH CANCER RISK. THIS CONCLUSION ASSUMES THAT THE EXISTING CHEMICAL ANALYTICAL DATABASE SUFFICIENTLY CHARACTERIZED THE GROUNDWATER CONTAMINATION PRESENT.

IT SHOULD BE NOTED THAT THE HIGHEST CONCENTRATION LEVELS FOUND IN THE AREA WERE NOT USED FOR THE BASELINE RISK ASSESSMENT. IN 1987, MONITORING WELLS LOCATED NEAR THE BURBANK WELL FIELD SHOWED CONCENTRATIONS AS HIGH AS 18,000 UG/L FOR PCE AND 3600 UG/L FOR TCE. MOREOVER, IN FEBRUARY 1989, LOCKHEED AERONAUTICAL SYSTEMS COMPANY (LASC) WAS EXTRACTING GROUNDWATER WITH CONCENTRATIONS AS HIGH AS 10,000 PPB FOR PCE AND 2000 PPB FOR TCE AT THEIR TREATMENT FACILITY LOCATED WITHIN THE BURBANK OU AREA. IF THESE CONCENTRATIONS OBSERVED AT LASC HAD BEEN USED, THE BASELINE RISK ASSESSMENT WOULD HAVE SHOWN EVEN HIGHER RISK.

ALTERNATIVE 5, PHASE 1 RISK ASSESSMENT: A RISK ASSESSMENT WAS PERFORMED FOR ALTERNATIVE 5, PHASE 1 (EXTRACTING AND TREATING 12,000 GPM WITH DUAL STAGE AIR STRIPPING AND VAPOR PHASE GAC). BOTH LASC MONITORING WELL DATA AND BURBANK PRODUCTION WELL DATA WERE USED. (SEE THE BURBANK OUF REPORT FOR TABLES AND MORE INFORMATION.) THE CONTAMINANT MASS WAS CALCULATED FROM ESTIMATES OF

4473-9097

THE CONCENTRATIONS IN THE GROUNDWATER (UG/M-) WHICH WOULD LIKELY BE EXTRACTED AND TREATED BY THE SYSTEM. THE EXPECTED CHEMICAL MASS DISCHARGED TO THE ATMOSPHERE (G/SEC) WAS CALCULATED WITH RESPECT TO THE THREE DIFFERENT AIR POLLUTION CONTROL OPTIONS. THE EXPECTED CHEMICAL MASS DISCHARGE WAS INPUT TO AN ATMOSPHERIC DISPERSION MODEL WHICH CALCULATED CONCENTRATIONS OF THE CHEMICALS IN THE AIR (UG/M3). THE CONCENTRATION IN THE AIR WAS MODELED TO BE SPATIALLY DISTRIBUTED IN A TWO-MILE RADIUS SURROUNDING THE PROPOSED AIR STRIPPER LOCATION (SEE FIGURE 2). THE POPULATION ESTIMATED TO RESIDE WITHIN TWO MILES OF THE SITE IN 1990 IS 94,195. THE 2010 POPULATION IS EXPECTED TO BE SLIGHTLY LOWER AT 93,765.

IN THE HEALTH RISK ASSESSMENT, THREE AIR STRIPPING AIR EMISSION CONTROL OPTIONS FOR PHASE I OF ALTERNATIVE 5 WERE EXAMINED;

- NO AIR POLLUTION CONTROL;
- AIR EMISSION CONTROLS LEADING TO 90 % REMOVAL OF VOCS; AND
- AIR EMISSIONS CONTROL LEADING TO 99 % REMOVAL OF VOCS.

TWO TYPES OF CARCINOGENIC RISK CALCULATIONS WERE PERFORMED. THE FIRST TYPE IS INDEPENDENT OF POPULATION AND IS TERMED THE MAXIMALLY EXPOSED INDIVIDUAL (MEI). THE MEI IS THE SITE OF HIGHEST ESTIMATED POTENTIAL EXPOSURE CALCULATED. THE MEI IS INDEPENDENT OF WHETHER THE SITE IS INHABITED. THE TOTAL CANCER RISK TO THE MEI IS EXAMINED BY THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (SCAQMD) TO ASCERTAIN IF A PROPOSED PROJECT IS EXPECTED TO EXCEED A TOTAL RISK OF  $1 \times 10^{-6}$ . THE AIR MODELING RESULTS CONCLUDE THAT THE MEI OCCURS AT A DISTANCE 0.1 TO 0.2 MILES FROM THE SITE. THE TOTAL EXCESS ESTIMATED CANCER RISK (TO THE MEI) FOR THE THREE DIFFERENT AIR EMISSION CONTROL OPTIONS ARE AS FOLLOWS;

- NO AIR POLLUTION CONTROL:  $5.98 \times 10^{-6}$
- 90 % REMOVAL OF VOCS:  $4.07 \times 10^{-7}$
- 99 % REMOVAL OF VOCS:  $4.07 \times 10^{-8}$

THE SECOND TYPE OF RISK CALCULATION PRESENTED WAS FOR A POPULATION. FOR THE POPULATION RISK, THE INDIVIDUAL RISK LEVEL IS MULTIPLIED BY THE SIZE OF THE POTENTIALLY EXPOSED POPULATION. THE AIR CONCENTRATIONS GENERATED BY THE AIR MODEL, EXPRESSED AS THE ASSOCIATED RISK, ARE SUPERIMPOSED ON THE 1990 AND YEAR 2010 POPULATION DATA FOR A TWO-MILE RADIUS. THE PREDICTED TOTAL EXCESS POPULATION CANCER BURDEN IN A TWO-MILE ZONE UNDER CONDITIONS OF THE VARIOUS AIR EMISSION CONTROL OPTIONS ESTIMATED FOR THE 1990 POPULATION DATA ARE AS FOLLOWS;

- NO AIR POLLUTION CONTROL: 0.04 CANCERS/POPULATION;
- 90% REMOVAL OF VOCS: 0.003 CANCERS/POPULATION; AND
- 99% REMOVAL OF VOCS: 0.0003 CANCERS/POPULATION.

THUS, LESS THAN ONE EXCESS CANCER WOULD BE EXPECTED TO OCCUR IN THE POPULATION DUE TO THE EMISSIONS FROM THE PROJECT.

NON-CARCINOGENIC RISKS OR THE "HAZARD INDEX" (HI) WERE CALCULATED BY AN APPROACH SIMILAR TO THAT USED FOR CARCINOGENS. THE RULE OF THUMB IS THAT HI SHOULD NOT EXCEED ONE. THE HIS CALCULATED ARE SEVERAL ORDERS OF MAGNITUDE LESS THAN ONE, FOR ANY OF THE THREE AIR EMISSION CONTROL OPTIONS EXAMINED. AS A RESULT, THE PREDICTED EXPOSURE TO RECEPTORS DUE TO THE NON-CARCINOGENS EMITTED FROM THE AIR STRIPPING TOWERS WERE CONCLUDED TO BE INSIGNIFICANT FROM A HUMAN HEALTH PERSPECTIVE. (SEE THE BURBANK OUF REPORT FOR MORE DETAIL ON THE RISK ASSESSMENT ANALYSIS.)

ALTHOUGH UNCONTROLLED EMISSIONS ARE NEAR EPA'S ACCEPTABLE EXCESS CANCER RISK NUMBER OF  $1 \times 10^{-6}$ , IT IS UNACCEPTABLE TO NOT CONTROL EMISSIONS BECAUSE OF THE POOR AIR QUALITY IN THE BURBANK AREA. MOREOVER, EMISSION CONTROLS WOULD BE NEEDED TO COMPLY WITH REQUIREMENTS OF THE SCAQMD REGULATION 13. SEE SECTION 9, COMPLIANCE WITH ARARS FOR A MORE DETAILED EXPLANATION OF THE ARARS AND OTHER INFORMATION TO BE CONSIDERED (TBC).

**#DA****8.0 DESCRIPTION OF ALTERNATIVES**

MANY TECHNOLOGIES WERE EVALUATED BASED ON THESE CRITERIA DURING THE FEASIBILITY STUDY. TREATMENT TECHNOLOGIES THAT MAY BE APPLICABLE TO GROUNDWATER CONTAMINATED WITH VOLATILE ORGANIC COMPOUNDS, PRIMARILY TCE AND PCE, WERE SCREENED BASED ON TWO CRITERIA: (1) THEIR ABILITY TO MEET THE REMEDIAL RESPONSE OBJECTIVES; AND, (2) THE APPLICABILITY AND FEASIBILITY OF THE

# Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9097

TECHNOLOGY TO THE SITE CONDITIONS.

AFTER THE INITIAL SCREENING, SIX ALTERNATIVES WERE EVALUATED USING THE FOLLOWING SUPERFUND GUIDANCE CRITERIA: TECHNICAL AND ADMINISTRATIVE FEASIBILITY, CAPITAL COSTS, OPERATION AND MAINTENANCE COSTS, ENVIRONMENTAL IMPACTS, PROTECTION OF PUBLIC HEALTH AND THE ENVIRONMENT, COMPLIANCE WITH FEDERAL AND STATE REGULATIONS, AND COMMUNITY AND STATE ACCEPTANCE.

THE FOLLOWING IS A LIST OF THE ALTERNATIVES ANALYZED AND COMPARED DURING THE FS AND FOUND IN THE BURBANK OUF5 REPORT:

- ALT 1 - NO ACTION
- ALT 2 - EXTRACT FROM EXISTING WELLS/TREAT/REINJECT AND REUSE
- ALT 3 - EXTRACT FROM NEW WELLS/TREAT/REINJECT AND REUSE
- ALT 4 - EXTRACT FROM NEW AND EXISTING WELLS/TREAT/SPREAD AND REUSE
- ALT 5 - EXTRACT FROM NEW AND EXISTING WELLS/TREAT/REUSE
- ALT 6 - EXTRACT FROM EXISTING WELLS/TREAT/REUSE.

THE FOLLOWING DESCRIPTIONS GIVE A SUMMARY OF THE ALTERNATIVE FEATURES. SEE THE BURBANK OUF5 REPORT FOR MORE DETAIL.

## ALTERNATIVE 1 - NO ACTION ALTERNATIVE

THE NO ACTION ALTERNATIVE SERVED AS A BASIS FOR COMPARING THE OTHER REMEDIAL ALTERNATIVES. THIS ALTERNATIVE IS EVALUATED TO DETERMINE THE RISKS THAT WOULD BE POSED TO PUBLIC HEALTH AND THE ENVIRONMENT IF NO ACTION WERE TAKEN TO TREAT OR CONTAIN THE CONTAMINATION. THIS ALTERNATIVE WOULD INCLUDE QUARTERLY MONITORING OF THE TEN EXISTING BURBANK PUBLIC SERVICE DEPARTMENT (PSD) WELLS. THE MONITORING PROGRAM WOULD HELP TO ENSURE THAT GROUNDWATER WOULD NOT BE USED WHEN CONCENTRATIONS OF VOCs EXCEED MCLs AND SALS. IT SHOULD BE NOTED THAT CURRENTLY ALL OF THE CITY OF BURBANK'S WELLS HAVE BEEN SHUT DOWN DUE TO THE VOC CONTAMINATION AND THE CITY BUYS ALL ITS WATER FROM THE METROPOLITAN WATER DISTRICT (MWD).

THE FEDERAL AND STATE MCLs ARE RELEVANT AND APPROPRIATE IN THE AQUIFER.

## ALTERNATIVE 2 - 6

ALTERNATIVES 2 THROUGH 6 INCLUDE EXTRACTION OF GROUNDWATER, TREATMENT WITH AIR STRIPPING WITH VAPOR PHASE GAC ADSORPTION UNITS, AND DISCHARGE OF THE TREATED GROUNDWATER. THE FOLLOWING IS A DESCRIPTION OF THE TREATMENT SYSTEM PROPOSED IN THE FEASIBILITY STUDY REPORT.

AIR STRIPPING (OR AERATION) IS A METHOD THAT REMOVES VOCs FROM WATER BY VOLATILIZATION AT THE AIR-WATER INTERFACE. THE PUMPED GROUNDWATER IS RUN DOWN THROUGH A VERTICAL COLUMN WHICH CONTAINS A PACKING MEDIUM. THE MEDIUM PROVIDES SURFACE AREA OVER WHICH A COUNTERCURRENT FLOW OF AIR IS INTRODUCED. THE CONTAMINANT IS TRANSFERRED FROM THE WATER TO THE AIR AND THUS REMOVED FROM THE WATER. THE EFFICIENCY OF THE PROCESS IS DEPENDENT ON THE NATURE OF THE CONTAMINANT, ITS INFLUENT CONCENTRATION, THE RATE OF AIR FLOW, AND THE AVAILABLE SURFACE AREA AFFORDED BY THE PACKING MATERIAL. FOR TCE AND PCE, REMOVAL EFFICIENCIES CAN EXCEED 99 PERCENT. AERATION IS A PROVEN METHOD AND IS COMMONLY USED TO TREAT GROUNDWATER.

DUAL STAGE AIR STRIPPING USES TWO AIRSTRIPPING TOWERS IN SERIES TO REMOVE CONTAMINANTS FROM WATER. TREATED WATER FROM THE BASE OF THE FIRST AIR STRIPPING TOWER IS PUMPED TO THE TOP OF THE SECOND AIR STRIPPING TOWER AND AERATED A SECOND TIME. DUAL STAGE AIR STRIPPING IS PREFERABLE TO SINGLE STAGE AIR STRIPPING BECAUSE THE CONTAMINATED WATER HERE IS EXPECTED TO HAVE HIGH LEVELS OF TCE AND PCE.

AIR STRIPPING HAS TWO DRAWBACKS WITH RESPECT TO PUBLIC HEALTH AND THE ENVIRONMENT. FIRST, THERE IS THE POSSIBILITY OF LOW-LEVEL, LONG-TERM CANCER RISK TO THE LOCAL POPULATION DUE TO THE RELEASE OF VOLATILIZED CONTAMINANTS INTO THE AIR. SECONDLY, THIS RELEASE OF CONTAMINANTS ALSO CONTRIBUTES TO AIR QUALITY DEGRADATION WHICH IN TURN AFFECTS HUMAN HEALTH AND THE ENVIRONMENT.

THEREFORE IF DUAL STAGE AIR STRIPPERS ARE USED AS THE TREATMENT TECHNOLOGY, VAPOR PHASE GAC ADSORPTION UNITS WILL BE INSTALLED TO REMOVE 90 - 99% OF THE VOCs DISCHARGED TO THE AIR. AIR EMISSION CONTROLS WOULD MINIMIZE THE NEGATIVE IMPACT ON PUBLIC HEALTH AND THE ENVIRONMENT. (SEE SECTION 9, COMPLIANCE WITH ARARS, COMMUNITY ACCEPTANCE AND STATE ACCEPTANCE, FOR MORE DETAILED

4473-9097

SUPPORT DOCUMENTATION.)

IT HAS BEEN DETERMINED THAT PURE PRODUCT IN THE FORM OF TCE AND PCE (U210 AND U228) ARE CONTAINED IN THE GROUNDWATER MAKING RCRA SECTION 261.33 APPLICABLE FOR THIS ACTION. THE GROUNDWATER ALSO CONTAINS SPENT TCE AND PCE THAT WAS USED IN DEGREASING. THE LISTING IN 40 CFR SUBPART D SECTION 261.31 THAT PERTAINS TO SPENT HALOGENATED SOLVENTS USED IN DEGREASING IS F001. THIS LISTING REQUIRES KNOWLEDGE OF THE PERCENT SOLVENT BY VOLUME BEFORE USE. THIS INFORMATION IS UNAVAILABLE FOR THE BURBANK OU MAKING THE RCRA F001 LISTING NOT APPLICABLE BUT RELEVANT AND APPROPRIATE FOR THIS ACTION.

IN ALTERNATIVES 2-6, THE SPENT CARBON IS CONSIDERED A RCRA WASTE OR IT IS A MIXTURE OF THE SOLID WASTE CARBON AND THE RCRA LISTED WASTES F001, U210, AND U228 (40 CFR SECTION 261.3(A)(Z)(IV)). THEREFORE THE CARBON MUST SATISFY THE REQUIREMENTS OF 40 CFR PART 263 TO BE SHIPPED OFF SITE FOR REGENERATION.

THE FEDERAL AND STATE MCLs ARE RELEVANT AND APPROPRIATE IN THE AQUIFER. MOREOVER, THE MCLs ARE THE ARARS THAT WILL BE MET IN THE TREATED WATER. THIS WATER WILL BE EITHER REINJECTED, SPREAD, OR REUSED AS A DRINKING WATER SOURCE.

## ALTERNATIVE 2 - EXTRACT FROM EXISTING WELLS, TREAT, REINJECT AND REUSE

THIS ALTERNATIVE INCLUDES PUMPING 16,000 GPM OF WATER FROM EIGHT BURBANK PSD WELLS (LOCATED WEST OF THE HIGHEST KNOWN TCE AND PCE CONTAMINATION) TO AN EXISTING EQUALIZATION BASIN, WHICH WOULD BE RETROFITTED, TO PROVIDE A UNIFORM FEED TO THE TREATMENT FACILITY. THE WATER WOULD BE TREATED BY EIGHT SETS OF DUAL STAGE AIR STRIPPERS (AS) WITH VAPOR PHASE GAC ADSORPTION UNITS FOR THE OFF-GAS.

TREATMENT EFFICIENCY COULD PRODUCE EFFLUENT WATER OF A QUALITY THAT MEETS OR EXCEEDS ALL FEDERAL AND STATE APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS (ARARS). FOUR THOUSAND GALLONS PER MINUTE (4000 GPM) OF THE TREATED WATER WOULD BE INTRODUCED INTO BURBANK'S EXISTING DISTRIBUTION SYSTEM FOR REUSE. THE REMAINDER OF THE TREATED WATER WOULD BE INJECTED INTO THE AQUIFER DOWNGRADIENT OF THE VOC PLUME TO REDUCE VOC MOVEMENT. THE REINJECTION WOULD HELP ENHANCE PLUME CONTAINMENT AND AQUIFER RESTORATION. THE TREATED WATER WOULD BE DELIVERED TO THE INJECTION FIELD BY A NEW PIPELINE TO BE CONSTRUCTED ALONG VICTORY BOULEVARD.

AFTER 20 YEARS OF EXTRACTION, CONCENTRATIONS OF TCE AND PCE IN THE GROUNDWATER WOULD STILL EXCEED MCLs. SINCE THE PLUME MIGRATION WOULD BE DIVERTED FROM ITS CURRENT PATH TOWARDS BURBANK'S PRODUCTION WELLS, THE PSD WELLS COULD PRODUCE GROUNDWATER WITH HIGHER CONCENTRATIONS OF PCE AND TCE.

THIS ALTERNATIVE WOULD BE EXPECTED TO REDUCE TCE CONCENTRATIONS IN THE AQUIFER FROM 3,200 PPB TO 590 PPB IN 20 YEARS. THIS ALTERNATIVE WOULD PARTIALLY ARREST THE MIGRATION OF THE TCE AND PCE PLUMES.

SIX MONITORING WELLS WOULD BE INSTALLED TO MONITOR THE PERFORMANCE OF THE SYSTEM.

SINCE THE GROUNDWATER HAS BEEN DETERMINED TO CONTAIN RCRA LISTED WASTES, IT MUST SATISFY THE REQUIREMENTS OF RCRA LAND DISPOSAL RESTRICTIONS (LDR), 40 CFR SECTION 268. THE LDR DEFINES THE REQUIREMENTS FOR REINJECTION OR LAND DISPOSAL. THEREFORE, THE WATER MUST BE TREATED TO MEET THE BEST DEMONSTRATED AVAILABLE TREATMENT TECHNOLOGY (BDAT) STANDARDS FOR SPENT PCE AND TCE WHICH ARE NEEDED FROM THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD - LOS ANGELES REGION.

APPROVAL FOR REUSE WOULD BE REQUIRED BY CALIFORNIA DEPARTMENT OF HEALTH SERVICES (DHS) AND THE CITY OF BURBANK. EPA, DHS, AND THE CITY HAVE ALREADY BEGUN DISCUSSIONS OVER THE POSSIBILITY OF THE CITY'S REUSE OF THE WATER.

THERE ARE SOME TECHNICAL CONCERNS OVER THE OPERATION OF INJECTION WELLS DUE TO THE UNCERTAINTIES OF THE CONTAMINATION PLUMES AND OPERATIONAL EFFECTIVENESS OF INJECTION WELLS.

## ALTERNATIVE 3 - EXTRACT FROM NEW WELLS, TREAT, REINJECT AND REUSE

THIS ALTERNATIVE IS SIMILAR TO ALTERNATIVE 2 EXCEPT THAT TEN NEW EXTRACTION WELLS WOULD BE CONSTRUCTED TO EXTRACT THE 16,000 GPM OF CONTAMINATED GROUNDWATER. ALTHOUGH THE COST OF

## Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9097

INSTALLING EXTRACTION WELLS WOULD BE GREATER THAN PUMPING THE EXISTING WELLS, THE NEW WELLS WOULD BE OPTIMALLY LOCATED TO MAXIMIZE THE REMOVAL OF CONTAMINANTS FROM THE GROUNDWATER. THE TREATMENT, DISPOSAL, AND MONITORING TECHNOLOGIES WOULD BE THE SAME AS THOSE EMPLOYED IN ALTERNATIVE 2.

THIS ALTERNATIVE IS ESTIMATED TO REDUCE TCE CONCENTRATIONS FROM 3200 PPB TO 81 PPB IN THE FIRST 10 YEARS, AND MORE THEREAFTER. IT IS ESTIMATED IT WOULD REDUCE PCE CONCENTRATIONS FROM OVER 4000 PPB TO 30 PPB IN 20 YEARS. ALTERNATIVE 3 WOULD BE SUCCESSFUL IN HALTING PLUME MIGRATION AND IN MITIGATING THE VOC CONTAMINATION (CONTRIBUTING TO AQUIFER RESTORATION).

SINCE THE GROUNDWATER HAS BEEN DETERMINED TO CONTAIN RCRA LISTED WASTES, IT MUST SATISFY THE REQUIREMENTS OF RCRA LAND DISPOSAL RESTRICTIONS (LDR), 40 CFR SECTION 268. THE LDR DEFINES THE REQUIREMENTS FOR REINJECTION OR LAND DISPOSAL. THEREFORE, THE WATER MUST BE TREATED TO MEET THE BEST DEMONSTRATED AVAILABLE TREATMENT TECHNOLOGY (BDAT) STANDARDS FOR SPENT PCE AND TCE WHICH ARE .079 PPM PCE AND .062 PPM TCE (40 CFR PART 268.42). APPROVAL FOR REINJECTION WOULD ALSO BE NEEDED FROM THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD - LOS ANGELES REGION.

APPROVAL FOR REUSE WOULD BE REQUIRED BY CALIFORNIA DEPARTMENT OF HEALTH SERVICES (DHS) AND THE CITY OF BURBANK. EPA, DHS, AND THE CITY HAVE ALREADY BEGUN DISCUSSIONS OVER THE POSSIBILITY OF THE CITY'S REUSE OF THE WATER.

THERE WOULD BE SIGNIFICANT GAINS IN AQUIFER RESTORATION AND CONTROL OF THE PLUME MIGRATION WITH THIS ALTERNATIVE.

ALTERNATIVE 4 - EXTRACT FROM NEW AND EXISTING WELLS/TREAT/SPREAD AND REUSE.

THE MAJOR FEATURES OF THIS ALTERNATIVE INCLUDE EXTRACTION OF 16,000 GPM FROM 10 NEW WELLS AND 6,000 GPM FROM 5 EXISTING WELLS, TREATMENT WITH EITHER DUAL STAGE OR SINGLE STAGE AS WITH VAPOR PHASE GAC, REUSE OF 4000 GPM BY THE CITY OF BURBANK AND DISCHARGE OF 18,000 GPM TO SPREADING GROUNDS FOR RECHARGE. SIX MONITORING WELLS WOULD BE INSTALLED TO ASSESS THE EFFECTIVENESS OF THE SYSTEM.

ALTERNATIVE 4 WAS DEVELOPED TO COMPARE THE OPTION OF GROUNDWATER RECHARGE BY SPREADING WITH GROUNDWATER RECHARGE BY INJECTION. THIS COMPARISON ADDRESSES UNCERTAINTIES ASSOCIATED WITH THE CAPACITY, OPERATION AND MAINTENANCE OF INJECTION WELLS USED IN ALTERNATIVES 2 AND 3, AND THE OVERALL UNCERTAINTIES ASSOCIATED WITH THE CHARACTERIZATION OF PLUME CONTAMINATION.

BECAUSE THE TREATED WATER WOULD NOT BE REINJECTED INTO THE AQUIFER DOWNGRAIENT OF THE VOC PLUME AS IN ALTERNATIVES 2 AND 3, THE EXTRACTION RATE OF CONTAMINATED GROUNDWATER WOULD HAVE TO BE HIGHER TO ACHIEVE A SIMILAR GRADIENT REVERSAL. IN THIS ALTERNATIVE, THE WATER FROM TEN NEW EXTRACTION WELLS AND FIVE EXISTING BURBANK PSD WELLS WOULD BE PUMPED TO AN EXISTING EQUALIZATION BASIN, WHICH WOULD BE RETROFITTED, TO DELIVER TWO TREATMENT STREAMS TO THE TREATMENT FACILITY. THE WATER WOULD BE TREATED BY SIX SETS OF DUAL STAGE CARBON AIR FILTERING UNITS AND FIVE SINGLE-STAGE AIR STRIPPERS WITH CARBON AIR FILTERING UNITS, DEPENDING ON THE AMOUNT OF WATER FLOWING INTO THE SYSTEM. EACH TREATMENT MODULE WOULD BE DESIGNED TO TREAT THE WATER AND AIR TO MEET THE ARARS AND TBGS (SEE SECTION 9, COMPLIANCE WITH ARARS).

SINCE THE GROUNDWATER HAS BEEN DETERMINED TO CONTAIN THE RCRA LISTED WASTES F001, U210 AND U228, IT MUST BE TREATED TO "NO LONGER CONTAIN" THESE LISTED WASTES BEFORE BEING SPREAD FOR RECHARGE. (SEE MEMORANDUM FROM MARCIA E. WILLIAMS, OFFICE OF SOLID WASTE DIRECTOR, TO PATRICK TOBIN, WASTE MANAGEMENT DIVISION DIRECTOR, REGARDING RCRA REGULATORY STATUS OF CONTAMINATED GROUND WATER, NOVEMBER 13, 1986.)

APPROVAL FOR REUSE WOULD BE REQUIRED BY CALIFORNIA DEPARTMENT OF HEALTH SERVICES (DHS) AND THE CITY OF BURBANK. EPA, DHS, AND THE CITY HAVE ALREADY BEGUN DISCUSSIONS OVER THE POSSIBILITY OF THE CITY'S REUSE OF THE WATER.

THIS ALTERNATIVE IS ESTIMATED TO REDUCE TCE CONCENTRATIONS FROM 3,200 PPB TO 122 PPB IN 10 YEARS AND MORE THEREAFTER. PCE CONCENTRATIONS ARE ESTIMATED TO REDUCE FROM OVER 4000 PPB TO 39 PPB IN 20 YEARS. THERE WOULD BE SIGNIFICANT GAINS IN AQUIFER RESTORATION AND CONTROL OF THE PLUME MIGRATION WITH THIS ALTERNATIVE.

THE CUPS REPORT DETERMINED THAT SPREADING BASINS MAY BE MORE RELIABLE THAN INJECTION WELLS.

4473-9097

ALTERNATIVE 5 - EXTRACT FROM NEW AND EXISTING WELLS/TREAT/REUSE

THIS ALTERNATIVE USES THE SAME EXTRACTION, TREATMENT, AND MONITORING TECHNOLOGIES AS THOSE SPECIFIED IN ALTERNATIVE 4. THIS ALTERNATIVE IS UNIQUE IN THAT ALL OF THE TREATED WATER WOULD BE USED FOR POTABLE WATER SUPPLY. THE TREATED WATER WOULD BE AT OR BELOW THE FEDERAL AND STATE MCLs AND SALS (ARARS).

A PORTION OF THE TREATED WATER WOULD BE INTRODUCED INTO THE BURBANK PSD'S EXISTING DISTRIBUTION SYSTEM FOR REUSE, WHICH WOULD MEET THE CITY OF BURBANK'S CURRENT AVERAGE DAILY DEMAND (12,000 GPM). THE REMAINDER OF THE TREATED WATER (10,000 GPM) COULD BE INTRODUCED INTO THE METROPOLITAN WATER DISTRICT (MWD) DISTRIBUTION LINES.

UNDER THIS ARRANGEMENT, THE PARTIES INVOLVED WOULD HAVE TO ENTER INTO AGREEMENTS FOR THIS EXCHANGE BECAUSE THE SAN FERNANDO VALLEY GROUNDWATER BASIN IS AN ADJUDICATED BASIN AND THE NET EXTRACTION OF GROUNDWATER IN THIS ALTERNATIVE WOULD EXCEED THE BURBANK PSD'S PUMPING RIGHTS. ALSO, MWD DOES NOT HAVE ANY PUMPING RIGHTS. HOWEVER, INSTITUTIONAL ARRANGEMENTS COULD BE WORKED OUT BETWEEN THE LADWP AND THE OTHER PARTIES, SINCE LADWP DOES HAVE PUMPING RIGHTS. PRELIMINARY DISCUSSIONS WITH THE CITY OF BURBANK AND LADWP HAVE BEEN INITIATED AND THE PARTIES ARE IN AGREEMENT THAT ADMINISTRATIVE AGREEMENTS COULD BE ARRANGED (FOR THE REUSE OF 12,000 GPM).

ALTERNATIVE 5 COULD BE IMPLEMENTED IN TWO PHASES. PHASE 1 WOULD CONSIST OF EXTRACTING 12,000 GPM FROM NEW WELLS, TREATING WITH DUAL STAGE AS WITH VAPOR PHASE GAC, AND REUSING THE TREATED WATER BY THE CITY OF BURBANK. PHASE 2 COULD CONSIST OF EXTRACTING THE REMAINDER 10,000 GPM (TOTAL 22,000 GPM) FROM NEW AND EXISTING WELLS, TREATING WITH AS WITH VAPOR PHASE GAC ADSORPTION UNITS AND REUSING BY MWD CUSTOMERS.

IT IS ESTIMATED THAT PHASE 1 WOULD CONTROL MOST OF THE PLUME MIGRATION (100 UG/1 TCE PLUME BOUNDARY AND 5 UG/1 PCE PLUME BOUNDARY) WHILE AIDING WITH AQUIFER RESTORATION AND THE TOTAL PROJECT (PHASE 1 AND PHASE 2) WOULD REDUCE CONCENTRATIONS TO THE SAME LEVELS AS ALTERNATIVE 4.

DUE TO THE LARGE SIZE OF THE TOTAL PROJECT, AND THE UNCERTAINTIES ASSOCIATED WITH THE MODELING AND EXTENT OF CONTAMINATION, EPA BELIEVED IT WAS IMPORTANT TO LOOK AT PHASING ALTERNATIVE 5; THEREBY, INITIATING THE NECESSARY REMEDIATION, WHILE CONDUCTING FURTHER EVALUATIONS TO REFINE TECHNICAL FEATURES IN ORDER TO MAXIMIZE THE EFFECTIVENESS OF THE TOTAL PROJECT.

ALTERNATIVE 6 - EXTRACT FROM EXISTING WELLS/TREAT/REUSE

THE TECHNICAL FEATURES OF THIS ALTERNATIVE INCLUDE EXTRACTING 4000 GPM FROM TWO EXISTING BURBANK PSD WELLS, TREATING THE WATER WITH DUAL STAGE AS WITH VAPOR PHASE GAC ADSORPTION UNITS, AND REUSING THE TREATED WATER BY THE CITY OF BURBANK.

THIS ALTERNATIVE WOULD NOT RESTRICT THE PLUME'S MIGRATION, NOR WOULD IT SIGNIFICANTLY AID IN AQUIFER RESTORATION.

#### #SCAA

#### 9.0 SUMMARY OF COMPARATIVE ANALYSIS OF ALTERNATIVES

THIS SECTION PROVIDES A SUMMARY OF THE ADVANTAGES AND DISADVANTAGES OF EACH OF THE ALTERNATIVES' PERFORMANCE UNDER THE NINE EVALUATION CRITERIA.

TABLE 3 PROVIDES A SUMMARY OF THE ANALYSES OF ALTERNATIVES. THE ALTERNATIVES WERE EVALUATED BASED ON THE FOLLOWING CRITERIA FOR CONDUCTING FEASIBILITY STUDIES:

- (1) OVERALL PROTECTION OF HUMAN HEALTH AND THE ENVIRONMENT,
- (2) SHORT TERM EFFECTIVENESS IN PROTECTING HUMAN HEALTH AND THE ENVIRONMENT,
- (3) LONG-TERM EFFECTIVENESS AND PERMANENCE IN PROTECTING HUMAN HEALTH AND THE ENVIRONMENT,
- (4) COMPLIANCE WITH ARARS,
- (5) REDUCTION OF TOXICITY, MOBILITY, AND VOLUME OF CONTAMINANTS,
- (6) TECHNICAL AND ADMINISTRATIVE FEASIBILITY OF IMPLEMENTATION,
- (7) STATE ACCEPTANCE,
- (8) COMMUNITY ACCEPTANCE, AND
- (9) CAPITAL AND OPERATION AND MAINTENANCE COSTS.

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9097

THE NINE CRITERIA AND THE RELATIVE PERFORMANCE OF THE ALTERNATIVES IN RELATION TO EACH CRITERION AND EACH OTHER IS SUMMARIZED BELOW.

OVERALL PROTECTION OF HUMAN HEALTH AND THE ENVIRONMENT

ALTERNATIVES 3, 4, AND 5 PROVIDE THE BEST PROTECTION TO HUMAN HEALTH AND THE ENVIRONMENT. ENVIRONMENTAL DEGRADATION WOULD BE REDUCED SINCE THE PLUME OF GROUNDWATER CONTAMINATION WOULD BE REDUCED IN CONCENTRATION AND EXTENT. INSTITUTIONAL CONTROLS WOULD CONTROL THE RISK OF INGESTION OF CONTAMINATED GROUNDWATER, SINCE ONLY TREATED WATER WOULD BE SERVED. DRINKING WATER WOULD BE PROVIDED VIA SURFACE WATER FROM THE MWD AND/OR TREATED GROUNDWATER FROM THE STRIPPING UNITS.

ALTERNATIVES 1, 2 AND 6 ARE NOT AS PROTECTIVE OF THE ENVIRONMENT BECAUSE ENVIRONMENTAL DEGRADATION WOULD INCREASE OVER TIME. ALTERNATIVE 1, THE NO ACTION ALTERNATIVE, WOULD ALLOW THE CONTAMINATION TO CONTINUE SPREADING. ALTHOUGH ALTERNATIVES 2 AND 6 EXTRACT AND TREAT SOME OF THE CONTAMINATED GROUNDWATER, THE EXTRACTION WELLS WOULD NOT BE STRATEGICALLY LOCATED TO CAPTURE THE HIGHER GROUNDWATER CONTAMINANT CONCENTRATIONS. INSTITUTIONAL CONTROLS IN ALTERNATIVES 1, 2, AND 6 FOR THE PROTECTION OF DRINKING WATER WOULD BE THE SAME AS IN ALTERNATIVES 3, 4, AND 5.

COMPLIANCE WITH ARARS

THIS SECTION WILL OUTLINE THE APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS (ARARS) AND OTHER INFORMATION THAT EPA CONSIDERED FOR THIS SITE. THEN IT WILL COMPARE THE ALTERNATIVES WITH ONE ANOTHER REGARDING THESE ARARS AND TO BE CONSIDEREDS (TBCS).

THERE ARE ARARS AND TBCS THAT APPLY TO BOTH THE WATER AND AIR FOR THIS RESPONSE ACTION. THESE CAN BE SEPARATED INTO CHEMICAL SPECIFIC AND PRIMARY ACTION SPECIFIC ARARS AND TBCS.

WATER ARARS AND TBCS: THERE ARE CHEMICAL SPECIFIC ARARS AND TBCS FOR WATER WHICH WILL BE DESCRIBED HERE. FIRST, THE ARARS FOR THE WATER ARE THE SAFE DRINKING WATER ACT MAXIMUM CONTAMINANT LEVELS (MCLS). IN ACCORDANCE WITH THE EPA "INTERIM GUIDANCE ON COMPLIANCE WITH APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS (OSWER DIRECTIVE 9234.0-05)," THE MCLS ARE CONSIDERED THE CHEMICAL-SPECIFIC ARARS BECAUSE THEY ARE THE ENFORCEABLE DRINKING WATER STANDARDS. THEY ARE REQUIRED TO BE SET AS CLOSE TO THE MAXIMUM CONTAMINANT LEVEL GOALS (MCLGS) AS IS FEASIBLE, TAKING INTO CONSIDERATION THE BEST AVAILABLE TECHNOLOGY, TREATMENT TECHNIQUES AND OTHER FACTORS (INCLUDING COST). THEY ARE ALSO PROTECTIVE OF PUBLIC HEALTH TO WITHIN EPA'S ACCEPTABLE CARCINOGEN RISK RANGE OF 10<sup>-4</sup> TO 10<sup>-7</sup>. THE MCL OF PARTICULAR IMPORTANCE FOR THIS RESPONSE ACTION IS THE MCL OF 5 PPB FOR TCE.

MCLGS, WHICH ARE BASED ONLY UPON HEALTH CRITERIA, ARE NOT DIRECTLY APPLICABLE AS CHEMICAL-SPECIFIC REQUIREMENTS BECAUSE THEY ARE NOT ENFORCEABLE STANDARDS.

EPA ALSO CONSIDERED THE CALIFORNIA DHS'S ACTION LEVELS FOR VOCs, A FEW OF WHICH ARE MORE STRINGENT THAN THE MCLS OR FOR WHICH NO MCL HAS BEEN ESTABLISHED. WHILE THE DHS ACTION LEVELS ARE NOT PROMULGATED STANDARDS AND ARE NOT, THEREFORE, ARARS, THEY HAVE BEEN TAKEN INTO CONSIDERATION DURING DEVELOPMENT OF REMEDIAL ACTION ALTERNATIVES AS ALLOWED FOR IN THE NATIONAL CONTINGENCY PLAN (NCP). IN ADDITION, DHS HAS RECENTLY PROPOSED MCLS FOR A NUMBER OF VOCs. OF PARTICULAR SIGNIFICANCE, THE PROPOSED MCL FOR PCE IS 5 PPB, WHICH IS JUST SLIGHTLY HIGHER THAN THE CURRENT DHS ACTION LEVEL OF 4 PPB.

TABLE 4 LISTS THE FEDERAL MCLS, MCLGS AND SALS FOR THE PRIMARY CONTAMINANTS DETECTED IN THE BURBANK OPERABLE UNIT AREA. THE REMEDIAL ACTION SELECTED WILL MEET THE FEDERAL MCL FOR TCE (LESS THAN 5 PPB) AND THE SAL FOR PCE (LESS THAN 4 PPB).

IT HAS BEEN DETERMINED THAT PURE PRODUCT IN THE FORM OF TCE AND PCE (U210 AND U228) ARE CONTAINED IN THE GROUNDWATER MAKING RCRA SECTION 261.33 APPLICABLE FOR THIS ACTION. THE GROUNDWATER ALSO CONTAINS SPENT TCE AND PCE THAT WAS USED IN DEGREASING. THE LISTING IN 40 CFR SUBPART D SECTION 261.31 THAT PERTAINS TO SPENT HALOGENATED SOLVENTS USED IN DEGREASING IS F001. THIS LISTING REQUIRES KNOWLEDGE OF THE PERCENT SOLVENT BY VOLUME BEFORE USE. THIS INFORMATION IS UNAVAILABLE FOR THE BURBANK OU MAKING THE RCRA F001 LISTING NOT APPLICABLE BUT RELEVANT AND APPROPRIATE FOR THIS ACTION.

AIR ARARS AND TBCS: THERE ARE PRIMARY ACTION-SPECIFIC ARARS AND TBCS FOR THE AIR DISCHARGE WHICH WILL AFFECT THIS RESPONSE ACTION. IN CALIFORNIA, THE AUTHORITY TO REGULATE STATIONARY

4473-9097

SOURCES OF EMISSIONS HAS BEEN DELEGATED TO LOCAL AIR QUALITY MANAGEMENT DISTRICTS. THE BURBANK OU IS LOCATED IN THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (SCAQMD). THEREFORE, SCAQMD REGULATIONS CONSTITUTE GENERALLY APPLICABLE, PROMULGATED STATE REQUIREMENTS UNDER STATE ENVIRONMENTAL LAW, AS SET FORTH IN SECTION 121(D) OF THE SUPERFUND AMENDMENTS AND REAUTHORIZATION ACT OF 1986 (SARA).

EPA CONSIDERED SCAQMD REGULATION XIII (COMPRISING RULES 1300 TO 1313), WHICH REQUIRES THAT STATIONARY SOURCES OF AIR EMISSIONS MEET BEST AVAILABLE CONTROL TECHNOLOGY (BACT) STANDARDS. REGULATION 13 STATES THAT NEW STATIONARY SOURCES OF AIR CONTAMINANTS IN THE AIR BASIN THAT EMIT REACTIVE ORGANIC GASES MUST EMPLOY BACT AIR POLLUTION CONTROL DEVICES. THESE BACT DEVICES ARE DEFINED AS "THE MOST STRINGENT EMISSION...CONTROL TECHNIQUE WHICH... IS FOUND... TO BE TECHNOLOGICALLY FEASIBLE AND COST EFFECTIVE..." (SEE THE ADMINISTRATIVE RECORD FOR THE BURBANK OU FOR A COPY OF REGULATION XIII.) IT IS ESTIMATED THAT, IF THERE ARE NO EMISSIONS CONTROLS, THE AIR STRIPPERS CONTEMPLATED FOR THE BURBANK OU WOULD EMIT OVER 168 POUNDS PER DAY OF REACTIVE ORGANIC GASES TO THE ATMOSPHERE. FOR AIR STRIPPERS, SCAQMD CONSIDERS VAPOR PHASE GAC (WITH 90 TO 99% REMOVAL EFFICIENCY) DEVICES TO BE BACT.

EPA ALSO CONSIDERED SCAQMD RULES 1401 AND 1167 AS "OTHER INFORMATION TO BE CONSIDERED," PURSUANT TO THE NCP.

PROPOSED RULE 1401 - NEW SOURCE REVIEW OF CARCINOGENIC AIR CONTAMINANTS - SPECIFIES LIMITS FOR INDIVIDUAL CANCER RISK AND EXCESS CANCER CASES FROM NEW STATIONARY SOURCES WHICH EMIT CARCINOGENIC AIR CONTAMINANTS. THE RULE REQUIRES BACT FOR TOXIC AIR DISCHARGE FOR NEW STATIONARY SOURCES WHERE A LIFETIME MAXIMUM INDIVIDUAL CANCER RISK OF ONE IN ONE MILLION OR GREATER IS ESTIMATED TO OCCUR. TCE IS A LISTED CARCINOGENIC AIR CONTAMINANT. RESULTS FROM THE PUBLIC HEALTH ASSESSMENT SHOW THAT TCE EMISSIONS AFTER TREATMENT ON THE VAPOR PHASE WOULD MEET RULE 1401'S REQUIREMENTS.

RULE 1167'S PURPOSE IS TO CONTROL VOCs AS PRECURSOR EMISSIONS TO OZONE FORMATION IN THE SOUTH COAST AIR BASIN. THE SOUTH COAST AIR BASIN IS CURRENTLY IN NON-ATTAINMENT STATUS WITH RESPECT TO THE NATIONAL AMBIENT AIR QUALITY STANDARDS (NAAQS) FOR OZONE, AND VOCs ARE KNOWN PRECURSORS TO OZONE FORMATION. RULE 1167 IS DESIGNED TO REDUCE VOC EMISSIONS FROM NEW AND EXISTING AIR STRIPPING EQUIPMENT USED FOR TREATMENT OF CONTAMINATED WATER. THE RULE REQUIRES THAT ALL AIR STRIPPING FACILITIES TREATING CONTAMINATED GROUNDWATER THAT EMIT MORE THAN ONE POUND PER DAY OF TOTAL VOC EMISSIONS INSTALL AIR EMISSION CONTROLS CAPABLE OF REDUCING AIR EMISSIONS BY 90%.

ALTHOUGH RULE 1167 WAS STAYED BY THE CALIFORNIA SUPERIOR COURT UNTIL AN ENVIRONMENTAL IMPACT REPORT IS COMPLETED, IT IS CONSIDERED IN THE REMEDY SELECTION PROCESS AS A TBC SINCE SCAQMD FULLY INTENDS TO MEET THE REQUIREMENTS SET BY THE COURT JUDGMENT AND PROCEED TOWARD ADOPTION OF THIS RULE AS A PROMULGATED, LEGALLY ENFORCEABLE, GENERALLY APPLICABLE REQUIREMENT IN THE NEAR FUTURE.

INSTALLATION OF AN AIR STRIPPING SYSTEM WITH AIR EMISSION CONTROLS IS MORE PROTECTIVE OF THE ENVIRONMENT IN THAT IT WILL REDUCE OZONE PRECURSOR EMISSIONS TO THE ATMOSPHERE BY 90 TO 99% AND WILL SUPPORT EFFORTS BY SCAQMD TO REACH ATTAINMENT STATUS FOR OZONE IN THE SOUTH COAST AIR BASIN.

COMPARISON OF ALTERNATIVES: ALTERNATIVE 1, THE NO ACTION ALTERNATIVE, WOULD MEET THE DRINKING WATER ARARS BECAUSE INSTITUTIONAL CONTROLS WOULD CONTINUE TO ASSURE THAT THE PUBLIC WAS PROVIDED WITH DRINKING WATER THAT MEETS THE FEDERAL AND STATE MCLS AND SALS. ALSO SINCE NO SYSTEM WOULD BE IN PLACE, THE SCAQMD'S RULES WOULD NOT BE VIOLATED. WATER TREATED AND DISCHARGED FROM ALTERNATIVES 2 - 6 WOULD MEET THE FEDERAL AND STATE MCLS AND SALS BEFORE REUSE, INJECTION OR SPREADING. AIR STRIPPING SYSTEMS WOULD HAVE VAPOR PHASE GAC ADSORPTION UNITS TO CONTROL AIR EMISSIONS TO 90 - 99% REMOVAL EFFICIENCY TO MEET THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT'S RULES. STEAM STRIPPING WOULD RECOVER THE VOCs FOR RECYCLING SO NO AIR EMISSION CONTROL SYSTEM WOULD BE NECESSARY.

HOWEVER, ALTERNATIVES 1, 2, AND 6 DO NOT DO AS MUCH AS ALTERNATIVES 3, 4, AND 5 TO MEET FEDERAL AND STATE MCLS IN THE AQUIFER. ALTERNATIVES 3, 4, AND 5 MORE EFFECTIVELY AID IN RESTORING THE AQUIFER (TO VOC CONCENTRATIONS AT OR BELOW THE MCLS AND SALS) AND CONTROLLING THE PLUME MIGRATION.

BY MEETING THE FEDERAL AND STATE MCLS AND SALS BEFORE REINJECTION, ALTERNATIVES 2 AND 3 WILL

# Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9097

SATISFY THE RCRA LAND DISPOSAL RESTRICTIONS REQUIREMENTS. BY MEETING THE FEDERAL MCLS AND SALS, THE GROUNDWATER WILL NO LONGER CONTAIN THE LISTED WASTES WHEN IT IS SPREAD FOR RECHARGE IN ALTERNATIVE 4.

FOR ALTERNATIVES 1 - 6, THE MCLS ARE RELEVANT AND APPROPRIATE IN THE AQUIFER. UPON COMPLETION OF THE FINAL REMEDIAL ACTION FOR THE SITE, THIS ARAR WILL BE SATISFIED.

LONG-TERM EFFECTIVENESS AND PERMANENCE

ALTERNATIVES 3, 4, AND 5 WOULD HAVE THE GREATEST ABILITY TO MAINTAIN RELIABLE PROTECTION OF HUMAN HEALTH AND THE ENVIRONMENT OVER TIME. AFTER 20 YEARS OF EXTRACTION, CONCENTRATIONS OF TCE AND PCF IN THE GROUNDWATER ARE EXPECTED TO STILL EXCEED THE FEDERAL MCLS AND SALS, HOWEVER THEY WOULD BE GREATLY REDUCED AS DISCUSSED IN THE PREVIOUS SECTION. PLUME MIGRATION WOULD BE CONTROLLED AND AQUIFER RESTORATION WOULD CONTINUE AS LONG AS THE SYSTEM KEPT OPERATING.

ALTERNATIVES 1, 2, AND 6 DO NOT OFFER LONG TERM EFFECTIVENESS OR PERMANENCE. IN FACT, THESE ALTERNATIVES MIGHT ALLOW CONTAMINATION TO SPREAD TO CLEAN ZONES WITHIN THE SFVB.

ALTERNATIVE 1 RELIES SOLELY ON INSTITUTIONAL CONTROLS TO PREVENT EXPOSURE TO THE CONTAMINATED GROUNDWATER. THE CURRENT WATER SUPPLY FROM SURFACE WATER VIA THE MWD MAY NOT ALWAYS BE AVAILABLE IN THE FUTURE BECAUSE OF PERIODIC DROUGHT CONDITIONS AND STATE AND FEDERAL WATER RIGHTS ISSUES.

REDUCTION OF TOXICITY, MOBILITY, OR VOLUME

ALTERNATIVES 3, 4 AND 5 OFFER THE MOST REDUCTION OF TOXICITY, MOBILITY, AND/OR VOLUME OF THE CONTAMINATION. THE MOST CONTAMINATED GROUNDWATER IN THE BURBANK OU AREA WOULD BE EXTRACTED AND TREATED TO REMOVE THE VOCs FROM THE GROUNDWATER, THUS THE VOC CONTAMINATION IN THE GROUNDWATER WOULD BE GREATLY REDUCED IN TOXICITY, VOLUME AND MOBILITY. MOREOVER, THE AIR EMISSION CONTROL UNITS WOULD REDUCE THE MOBILITY OF THE VOCs TO THE AIR.

ALTERNATIVE 1 WOULD HAVE NO REDUCTION IN TOXICITY, MOBILITY, OR VOLUME SINCE NO TREATMENT IS EMPLOYED.

ALTERNATIVE 2 WOULD REDUCE THE VOLUME OF CONTAMINATION BY EXTRACTING AND TREATING 16,000 GPM. ALTERNATIVE 6 WOULD REDUCE THE VOLUME OF CONTAMINATION BY EXTRACTING AND TREATING 4000 GPM. HOWEVER, THE EXISTING WELLS USED FOR ALTERNATIVES 2 AND 6 WOULD NOT BE STRATEGICALLY LOCATED TO CONTROL MIGRATION OR CAPTURE THE CONTAMINATION. THEREFORE, CONTINUED CONTAMINANT MIGRATION WOULD OCCUR AND A LESSER AMOUNT OF CONTAMINATION WOULD BE CAPTURED THEN FOR ALTERNATIVES 3, 4, AND 5.

SHORT TERM EFFECTIVENESS

FOR ALTERNATIVES 3, 4, AND 5, NO ADVERSE IMPACTS WOULD BE EXPECTED DURING THE CONSTRUCTION AND IMPLEMENTATION PERIOD OR REMEDIATION. DRINKING WATER SUPPLIES WOULD BE PROVIDED FROM TREATED GROUNDWATER AND/OR SURFACE WATER FROM THE MWD DURING THE INTERIM BEFORE CONSTRUCTION COMPLETE AND DURING REMEDIATION. INSTITUTIONAL CONTROLS WOULD ASSURE THAT ALL DRINKING WATER WOULD MEET DRINKING WATER STANDARDS. THE PLUME MIGRATION WOULD BE EFFECTIVELY CONTROLLED WITH THESE ALTERNATIVES AND AQUIFER RESTORATION WOULD BE INITIATED IN THIS AREA.

ALTERNATIVE 1, THE NO ACTION ALTERNATIVE, WOULD NOT BE EFFECTIVE IN CONTROLLING MIGRATION OR AQUIFER RESTORATION. IT WOULD ALLOW THE CONTAMINATED GROUNDWATER TO SPREAD TO UNCONTAMINATED DOWNGRADE WELLS. THERE WOULD BE SOLE RELIANCE ON INSTITUTIONAL CONTROLS TO PREVENT EXPOSURE VIA DRINKING WATER INGESTION.

ALTERNATIVE 2 AND 6 WOULD BE MORE EFFECTIVE THAN ALTERNATIVE 1. THERE WOULD BE LESS RELIANCE ON INSTITUTIONAL CONTROLS FOR DRINKING WATER, SINCE TREATED GROUNDWATER THAT MEETS MCLS AND SALS WOULD BE SERVED, AS A PORTION OF THE TOTAL DRINKING WATER SUPPLY FOR THE AFFECTED AREAS. HOWEVER, THESE ALTERNATIVES WOULD NOT BE AS EFFECTIVE IN CONTROLLING PLUME MIGRATION AND IN AQUIFER RESTORATION AS ALTERNATIVES 3, 4, AND 5.

IMPLEMENTABILITY

4473-9097

ALTERNATIVES 1 - 6 WOULD ALL BE TECHNICALLY IMPLEMENTABLE. HOWEVER, ALTERNATIVE 5 APPEARS THE EASIEST TO IMPLEMENT WITH THE CURRENT INFORMATION, DUE TO THE PRACTICAL UNCERTAINTIES ASSOCIATED WITH INJECTION AND SPREADING AND THE TECHNICAL UNCERTAINTIES ASSOCIATED WITH PLUME LOCATION AND MIGRATION.

CONSTRUCTION OF MONITORING WELLS FOR ALL ALTERNATIVES IS STRAIGHT FORWARD, USING WELL KNOWN TECHNOLOGY. THERE ARE MANY MONITORING WELLS IN THE SFVB.

ALTERNATIVES 2 - 6 WOULD EMPLOY AIR STRIPPING WITH VAPOR PHASE GAC ADSORPTION UNITS (OR STEAM STRIPPING\*) WHICH IS A PROVEN TREATMENT TECHNOLOGY AND RELATIVELY EASY TO IMPLEMENT. ADMINISTRATIVE AGREEMENTS WOULD BE NEEDED FOR THE USE OF TREATED GROUNDWATER. APPROVAL FOR HOOKUP TO THE CITY OF BURBANK WOULD ALSO NEED TO BE ARRANGED PRIOR TO DISTRIBUTION. PRELIMINARY DISCUSSIONS HAVE ALREADY TAKEN PLACE AND NO SIGNIFICANT PROBLEMS HAVE BEEN IDENTIFIED.

ALTERNATIVE 5 WOULD REQUIRE AGREEMENTS BETWEEN THE CITY OF BURBANK, LA DWP, AND MWD TO ACCOMMODATE THE EXCHANGE OF WATER BEYOND THE CITY OF BURBANK'S EXTRACTION CREDITS. HOWEVER, PRELIMINARY DISCUSSIONS BETWEEN EPA AND THE AFFECTED PARTIES REGARDING THE REUSE OF THE WATER HAVE SHOWN THAT THE AGREEMENTS COULD BE ARRANGED.

THE USE OF INJECTION WELLS IN ALTERNATIVES 2 AND 3 COULD BE DIFFICULT TO IMPLEMENT TECHNICALLY DUE TO OPERATIONAL PROBLEMS ENCOUNTERED WITH INJECTION WELLS AND THE UNKNOWN ASSOCIATED WITH EXTENT OF CONTAMINATION. FURTHER SPREAD OF CONTAMINATION COULD OCCUR IF THE INJECTION WELLS WERE IMPROPERLY PLACED.

SPREADING IN ALTERNATIVE 4. COULD BE MORE RELIABLE THAN THE INJECTION WELLS. HOWEVER, THERE ARE ALSO UNCERTAINTIES ASSOCIATED WITH POSSIBLE CONTAMINATION IN THE AREA OF THE SPREADING GROUNDS. AN ADDITIONAL LOAD FROM DISCHARGING THE WATER BY SPREADING COULD CAUSE FURTHER CONTAMINATION OF THE AREA BY ENHANCING MOVEMENT OF THE CONTAMINANTS IN THE SOIL AND/OR GROUNDWATER.

ALTERNATIVES 1 AND 6 WOULD ALLOW THE CONTAMINATION TO SPREAD AND THUS MAKE REMEDIATION MORE DIFFICULT IN THE FUTURE.

[\* STEAM STRIPPING IS DISCUSSED IN SECTION 10, DOCUMENTATION OF SIGNIFICANT CHANGES.]  
COST

ALTERNATIVE 1 WOULD BE THE LEAST EXPENSIVE WITH AN EXPECTED PRESENT WORTH VALUE OF \$500,000. (PRESENT WORTH EVALUATIONS ASSUME 10% ANNUAL INTEREST RATE AND 20 YEARS FOR THE PROJECT LIFE.)

ALTERNATIVE 2 HAS AN ESTIMATED CAPITAL COST OF \$36.6 MILLION AND TOTAL O&M OF \$45.2 MILLION. THE EXPECTED PRESENT TOTAL WORTH VALUE IS \$81.8 MILLION.

ALTERNATIVE 3 HAS AN ESTIMATED CAPITAL COST OF \$43.4 MILLION AND TOTAL O&M OF \$44.7 MILLION. THE EXPECTED PRESENT TOTAL WORTH VALUE IS \$88.1 MILLION.

ALTERNATIVE 4 HAS AN ESTIMATED CAPITAL COST OF \$42.3 MILLION AND TOTAL O&M OF \$52.9 MILLION. THE EXPECTED PRESENT TOTAL WORTH VALUE IS \$95.2 MILLION.

ALTERNATIVE 5 HAS AN ESTIMATED CAPITAL COST OF \$32.1 MILLION (\$25.1 M FOR PHASE 1 AND \$7.0 M FOR PHASE 2) AND TOTAL O&M OF \$54.2 MILLION (\$43.9 M FOR PHASE 1 AND \$10.3 M FOR PHASE 2). THE EXPECTED PRESENT WORTH VALUE IS \$86.3 MILLION (\$69.0 M FOR PHASE 1 AND \$17.3 M FOR PHASE 2).

ALTERNATIVE 6 IS ASSUMED TO BE 25% OF THE COST OF ALTERNATIVE 2, OR \$20.5 MILLION.

THE COST SUMMARIES CAN BE FOUND IN GREATER DETAIL IN THE BURBANK OUES REPORT.

COMMUNITY ACCEPTANCE

ALTERNATIVES 3, 4, AND 5 RECEIVED THE MOST COMMUNITY ACCEPTANCE. THE COMMUNITY GENERALLY WANTS THE AQUIFER RESTORED FOR BENEFICIAL USE AND THE PLUME MIGRATION HALTED AS SOON AS POSSIBLE.

COMMUNITY WORKGROUP MEMBERS EXPRESSED SOME CONCERN OVER REINJECTION AND SPREADING DUE TO THE UNCERTAINTIES ASSOCIATED WITH THE EXTENT OF CONTAMINATION. THEIR CONCERN WAS THAT REINJECTION OR SPREADING COULD CONTRIBUTE TO THE SPREAD OF CONTAMINATION IF THE WELLS OR SPREADING AREAS

## Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9097

WERE IMPROPERLY LOCATED. THEREFORE ALTERNATIVE 5, THE WATER REUSE OPTION, WAS MOST ATTRACTIVE TO THE COMMUNITY WORKGROUP.

THE COMMUNITY FEELS STRONGLY THAT AIR EMISSION CONTROLS MUST BE EMPLOYED DUE TO THE POOR AIR QUALITY IN THE BURBANK AREA. EPA ADDRESSES THIS CONCERN WITH THE REQUIREMENT THAT VAPOR PHASE GAC ADSORPTION UNITS WOULD BE INSTALLED IF AIR STRIPPING IS USED.

THE RESPONSE SUMMARY (ATTACHED) ADDRESSES MORE SPECIFIC CONCERNS AND COMMENTS RAISED DURING THE PUBLIC COMMENT PERIOD.

STATE ACCEPTANCE

LIKE THE COMMUNITY, THE STATE (DHS AND RWQCB) WANTS AQUIFER RESTORATION AND CONTROL OF THE PLUME MIGRATION INITIATED AS SOON AS POSSIBLE.

THEY PREFER ALTERNATIVE 5 BECAUSE THEY (LIKE THE COMMUNITY) HAVE CONCERNS WITH REGARDS TO THE REINJECTION AND SPREADING OPTIONS ASSOCIATED WITH ALTERNATIVES 3 AND 4. (SEE PREVIOUS DISCUSSION.)

THEY ALSO BELIEVE IT IS IMPORTANT TO HAVE AIR EMISSION CONTROLS ON THE AIR STRIPPERS. MOREOVER, THE SCAQMD INSISTS THAT IF AERATION IS USED TO TREAT THE WATER THAT VAPOR PHASE GAC ADSORPTION UNITS (OR COMPARABLE BACT) BE INSTALLED.

CALIFORNIA DHS HAS CONCURRED WITH THE BURBANK OU REMEDY SELECTION.

### 10. DOCUMENTATION OF SIGNIFICANT CHANGES

THE PROPOSED PLAN WAS RELEASED FOR PUBLIC COMMENT IN OCTOBER 1988. THE PROPOSED PLAN IDENTIFIED ALTERNATIVE 5, PHASE I, EXTRACTION, TREATMENT, AND REUSE, AS THE PREFERRED ALTERNATIVE.

DUAL STAGE AIR STRIPPERS WITH VAPOR PHASE GAC ADSORPTION UNITS WERE CHOSEN AS THE PREFERRED TREATMENT TECHNOLOGY. DURING THE PUBLIC COMMENT PERIOD, A POTENTIALLY RESPONSIBLE PARTY, LOCKHEED AERONAUTICAL SYSTEMS COMPANY (LASC), PRESENTED EPA WITH A SIMILAR TREATMENT TECHNOLOGY - STEAM STRIPPING, MORE SPECIFICALLY, THE AQUADETOX SYSTEM.

IN THE BURBANK OUES REPORT, CONVENTIONAL STEAM STRIPPING WAS SCREENED OUT BECAUSE TCE AND PCE ARE HIGHLY VOLATILE COMPOUNDS WHICH ARE EASILY REMOVED FROM WATER WITHOUT INPUT OF HEAT. FURTHERMORE, THE EXPECTED CONCENTRATIONS OF TCE AND PCE WERE NOT HIGH ENOUGH TO WARRANT THE ADDED ENERGY INPUT. THEREFORE, STEAM STRIPPING WAS NOT CONSIDERED COST EFFECTIVE AND WAS NOT CONSIDERED FURTHER IN THE OUES.

STEAM STRIPPING WITH THE AQUADETOX SYSTEM WAS ALSO SCREENED OUT DURING THE BURBANK OUES ON THE BASIS THAT ADEQUATE EXPERIENCE DID NOT EXIST EITHER FOR AQUADETOX SYSTEMS WITHOUT EXTERNAL STEAM SUPPLY OR FOR THE EFFLUENT TO BE USED AS DRINKING WATER.

THE AQUADETOX PROCESS IS A PROPRIETARY AND PATENTED STEAM STRIPPING TECHNOLOGY DEVELOPED BY AWD TECHNOLOGIES, INC., WHICH USES STEAM STRIPPING UNDER MODERATE OR DEEP VACUUM PRESSURE. WHILE CONVENTIONAL STEAM STRIPPING WAS CONSIDERED NOT APPLICABLE BECAUSE OF ITS HIGHER COST THAN AIR STRIPPING, THE AQUADETOX SYSTEM, MAY BE COST-EFFECTIVE DUE TO THE LOWER ENERGY REQUIREMENTS. OTHER CLAIMED ADVANTAGES OF THE SYSTEM ARE: (1) THE VOCs CAN BE RECOVERED FOR RECYCLING INSTEAD OF DISCHARGED TO THE AIR OR CARBON, AND (2) IT IS A CLOSED LOOP SYSTEM AND THEREFORE THERE IS MINIMAL VOC DISCHARGE TO THE AIR (LESS THAN 1 LB/DAY, GIVEN ESTIMATED GROUNDWATER VOC CONCENTRATIONS).

THE AQUADETOX SYSTEM UNDER MODERATE VACUUM PRESSURE WAS SELECTED BY LASC FOR GROUNDWATER TREATMENT AT A SITE WITHIN THE BURBANK OU AREA. THIS 1200 GPM EXTRACTION AND TREATMENT FACILITY BEGAN OPERATION IN JANUARY 1989 AND SHOULD PROVIDE PERFORMANCE DATA RELATIVE TO THE USE OF THIS TECHNOLOGY IN THE REMOVAL OF THE VOCs.

INFORMATION ON THE INFLUENT FROM THE LASC AQUADETOX EXTRACTION AND TREATMENT SYSTEM IS SHOWING HIGHER CONCENTRATION LEVELS FOR TCE AND PCE THAN ESTIMATED IN THE BURBANK OUES REPORT. LASC'S TREATMENT FACILITY IS EXTRACTING GROUNDWATER WITH CONCENTRATIONS UP TO 12,000 PPB PCE AND TCE COMBINED (AS OF FEBRUARY 1989). THEREFORE STEAM STRIPPING MAY BE MORE APPLICABLE (E.G.

4473-9097

ECONOMICAL) THAN ORIGINALLY THOUGHT DUE TO THE HIGHER CONCENTRATIONS AND ADDED STRIPPING EFFICIENCY OF STEAM STRIPPING.

SINCE AIR AND STEAM STRIPPING FALL UNDER THE SAME CLASS OF TREATMENT - STRIPPING - EITHER TECHNOLOGY CAN BE EMPLOYED TO MEET THE PERFORMANCE STANDARDS, THEREFORE ACHIEVING THE STATED BURBANK OPERABLE UNIT OBJECTIVES.

AIR STRIPPING WAS USED DURING THE DISCUSSION OF THE DESCRIPTION OF ALTERNATIVES AND COMPARISON ANALYSIS. HOWEVER, THE SELECTED REMEDY WILL BE EITHER AIR OR STEAM STRIPPING, AS LONG AS THE STEAM STRIPPING MEETS THE PERFORMANCE STANDARDS AND IS AS EFFECTIVE AS THE AIR STRIPPING IN MEETING THE EVALUATION CRITERIA. THIS ALLOWS FLEXIBILITY DURING THE REMEDIAL DESIGN TO PROCURE THE MOST COST-EFFECTIVE UNIT THAT ALSO PROTECTS HUMAN HEALTH AND THE ENVIRONMENT.

#SR

### 11.0 THE SELECTED REMEDY

ALTERNATIVE 5, PHASE I, USING EITHER STEAM OR AIR STRIPPING FOR TREATMENT, IS THE SELECTED REMEDY FOR THE BURBANK OPERABLE UNIT. THE REMEDY INCLUDES EXTRACTION OF CONTAMINATED GROUNDWATER, TREATMENT BY STRIPPING, AND REUSE OF THE WATER BY THE CITY OF BURBANK FOR DRINKING WATER. IF AIR STRIPPING IS CHOSEN DURING THE REMEDIAL DESIGN, VAPOR PHASE GAC ADSORPTION UNITS WILL BE NEEDED TO COMPLY WITH THE ARARS AND TBCS.

THE EXTRACTION SYSTEM WILL BE DESIGNED TO CAPTURE GROUNDWATER CONTAINING 100 PPB OR GREATER OF TCE AND 5 PPB OR GREATER OF PCE. THE EXTRACTION FLOW RATE IS CURRENTLY PROJECTED TO BE 12,000 GPM.

THE FEDERAL AND STATE MCLS ARE RELEVANT AND APPROPRIATE IN THE AQUIFER. UPON THE COMPLETION OF THE FINAL REMEDIAL ACTION FOR THE SITE, THIS ARAR WILL BE SATISFIED.

ALTHOUGH IT WAS ESTIMATED IN THE BURBANK OUES REPORT THAT EXTRACTION AT A RATE OF 16,000 GPM COUPLED WITH INJECTION WELLS FOR A PERIOD OF 20 YEARS WAS NECESSARY TO FULLY REMEDIATE THE BURBANK OU AREA (I.E. REMOVING GROUNDWATER UNTIL THAT LEFT CONTAINED CONTAMINANTS TO CONCENTRATION LEVELS AT OR BELOW MCLS AND SALS), THE DECISION TO PUMP AND TREAT 12,000 GPM WAS DETERMINED TO BE THE MOST APPROPRIATE GIVEN THE AMOUNT OF TECHNICAL INFORMATION CURRENTLY AVAILABLE. MORE INFORMATION WILL BE GATHERED DURING THE BASINWIDE RI, NORTH HOLLYWOOD OU REMEDY OPERATION, LASC'S EXTRACTION AND TREATMENT SYSTEM, BURBANK OU REMEDIAL DESIGN, AND THE OPERATION OF THE BURBANK OU TREATMENT SYSTEM TO DETERMINE WHETHER MORE EXTRACTION IS NECESSARY TO CONTINUE AQUIFER RESTORATION AND CONTROLLING THE MIGRATION OF THE PLUME. IF ADDITIONAL EXTRACTION IS DETERMINED NECESSARY, EPA WOULD AGAIN GO OUT FOR PUBLIC COMMENT WITH A PROPOSED PLAN BEFORE SIGNING ANOTHER RECORD OF DECISION.

EXTRACTION WELLS WILL BE STRATEGICALLY PLACED (BOTH Laterally AND VERTICALLY) TO MAXIMIZE THE EFFECTIVENESS OF THE SYSTEM. THE LOCATIONS PRESENTED IN THE OU MAY BE MODIFIED IF WARRANTED BY NEW DATA. STRIPPING IS THE CHOSEN TREATMENT. LASC IS CONDUCTING A TREATABILITY STUDY WITH ITS AQUADETOX SYSTEM. THIS WILL HELP DETERMINE WHETHER STEAM STRIPPING WILL BE USED FOR THE OU REMEDY. AIR STRIPPING WITH VAPOR PHASE GAC ADSORPTION UNITS WILL BE USED UNLESS STEAM STRIPPING IS SHOWN TO MEET OR EXCEED THE TREATMENT ADVANTAGES OF AIR STRIPPING WITH VAPOR PHASE GAC. EPA MAY ALSO DECIDE TO USE THE TWO TECHNOLOGIES TOGETHER IF THAT WOULD MAXIMIZE EFFICIENCY.

THE VOCs - PARTICULARLY THE PRIMARY CONTAMINANTS, TCE AND PCE - IN THE GROUNDWATER MUST BE REMOVED FROM THE GROUNDWATER SUCH THAT TREATMENT PLANT EFFLUENT CONCENTRATIONS ARE BELOW THE FEDERAL MCLS AND SALS (TCE - 5 PPB AND PCE - 4 PPB). THE WATER MUST ALSO MEET ALL DRINKING WATER STANDARDS. THIS MAY REQUIRE FURTHER TREATMENT LIKE CHLORAMINATION FOR DISINFECTION PURPOSES, OR REVERSE OSMOSIS OR ION EXCHANGE FOR NITRATES.

THE TREATED WATER WILL BE FED DIRECTLY INTO BURBANK'S DISTRIBUTION SYSTEM FOR REUSE BY THE CITY'S RESIDENTS.

MONITORING WELLS WILL BE INSTALLED DOWNGRADIENT TO MONITOR THE PERFORMANCE OF THE SYSTEM.

THE EXTRACTION OF CONTAMINATED GROUNDWATER FROM THE BURBANK OU AREA, TREATMENT OF GROUNDWATER TO DRINKING WATER STANDARDS, AND DISTRIBUTION OF THE WATER TO THE BURBANK RESIDENTS IS THE MOST COST EFFECTIVE AND TECHNICALLY SOUND MEANS OF MEETING THE OU OBJECTIVES.

## Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9097

THE SELECTED REMEDY PERMANENTLY AND SIGNIFICANTLY REDUCES THE TOXICITY, MOBILITY, AND VOLUME OF HAZARDOUS SUBSTANCES WITH RESPECT TO THEIR PRESENCE IN THE GROUNDWATER -- THE CONTAMINANTS ARE REMOVED FROM THE GROUNDWATER, THEREBY REDUCING CONTAMINANT MIGRATION IN THE VICINITY OF THE BURBANK OU AREA.

STRIPPING WILL RESULT IN A SMALL INCREASE IN THE TOXICITY, MOBILITY, AND VOLUME OF HAZARDOUS SUBSTANCES WITH RESPECT TO THEIR PRESENCE IN THE AIR. HOWEVER, THE USE OF STEAM STRIPPING RECOVERS MOST OF THE VOCS FOR RECYCLING. IF DUAL STAGE AIR STRIPPING IS USED FOR TREATMENT, VAPOR PHASE GAC ADSORPTION UNITS WILL BE INSTALLED TO MINIMIZE THE AMOUNT OF VOCS DISCHARGED TO THE AIR.

THE AIR EMISSIONS ARE ESTIMATED TO ADD A MINIMAL RISK TO THE PROJECT VIA AIRBORNE CONTAMINANTS, BECAUSE THE AIR EMISSION CONTROLS WILL REMOVE 90 - 99% OF THE CONTAMINANTS BEFORE THEY ARE DISCHARGED TO THE AIR. THE ADDITION OF VAPOR PHASE GAC ADSORPTION UNITS MEETS THE ARARS AND TBCS DISCUSSED IN SECTION 9, COMPLIANCE OF ARARS.

THE SPENT CARBON FROM THE VAPOR PHASE GAC ADSORPTION SYSTEM IS CONSIDERED A RCRA WASTE OR IT IS A MIXTURE OF THE SOLID WASTE CARBON AND THE RCRA LISTED WASTES F001, U210, AND U228 (40 CFR SECTION 261.3(A)(2)(IV)). THEREFORE THE CARBON MUST SATISFY THE REQUIREMENTS OF 40 CFR PART 263 TO BE SHIPPED OFF SITE FOR REGENERATION.

THE PUMP AND TREAT SYSTEM WILL OPERATE FOR AN ESTIMATED 20 YEARS. GROUNDWATER MONITORING AND GROUNDWATER LEVEL MEASURING WILL BE CONDUCTED AS PART OF THE REMEDY TO TRACK CONTAMINANT CONCENTRATIONS IN THE BURBANK OU AREA, TO MONITOR THE PERFORMANCE OF THE TREATMENT SYSTEM AND TO DETERMINE THE EFFICIENCY OF THE SYSTEM IN RESTORING THE AQUIFER. THE SYSTEM WILL BE EVALUATED PERIODICALLY TO DETERMINE THE EFFICIENCY AND NECESSITY OF THE REMEDIATION IN ACHIEVING THE STATED GOALS. THE REVIEWS WILL ALLOW FOR MODIFICATION IN THE SYSTEM AS REQUIRED.

FOR REFERENCE, THE ESTIMATED COST OF THE SELECTED REMEDY WITH THE USE OF DUAL STAGE AIR STRIPPING WITH VAPOR PHASE GAC ADSORPTION UNITS IS \$69M (SEE TABLE 5). LASC'S REMEDIAL ACTION ALTERNATIVE FOR THE BURBANK WELL FIELD OPERABLE UNIT GIVES A COST ESTIMATE OF \$50.1 MILLION NET PRESENT VALUE FOR THE BURBANK OU REMEDY USING THE AQUADETOX SYTEM INSTEAD OF THE AS WITH VAPOR PHASE GAC ADSORPTION UNITS. ALTHOUGH LASC'S ALTERNATIVE IS SIMILAR TO ALTERNATIVE 5, PHASE 1 IN THE BURBANK OUF5 REPORT, LASC'S ALTERNATIVE DOES HAVE SOME DIFFERENT FEATURES. (LASC'S REPORT CAN BE FOUND IN THE ADMINISTRATIVE RECORD.)

#SD

**12.0 STATUTORY DETERMINATIONS**

THE SELECTED REMEDY IS PROTECTIVE OF HUMAN HEALTH AND THE ENVIRONMENT -- AS REQUIRED BY SECTION 121 OF CERCLA -- IN THAT IT TREATS THE EXTRACTED GROUNDWATER SO THAT REMAINING CONTAMINANTS ARE AT OR BELOW THE MCLS AND SALS FOR THE CONTAMINANTS OF CONCERN.

STRIPPING HAS BEEN SHOWN TO BE THE MOST COST EFFECTIVE TECHNOLOGY FOR TREATING THE CONCENTRATIONS OF VOCS FOUND IN THE GROUNDWATER FROM THE BURBANK OU AREA. ALTHOUGH THE ADDITION OF AIR EMISSION CONTROLS (GAC) TO THE DUAL STAGE AIR STRIPPERS (IF STEAM STRIPPING FAILS TO PASS THE TREATABILITY STUDIES) WILL INCREASE THE COST OF THE SELECTED REMEDY, IT IS DETERMINED TO BE JUSTIFIED AS A COST-EFFECTIVE MEASURE FOR THE FOLLOWING REASONS;

(1) IT MEETS THE REQUIREMENTS OF SCAQMD REGULATION XIII, THE ARAR FOR AIR DISCHARGE FROM THE AIR STRIPPING TREATMENT; (2) IT REDUCES OZONE PRECURSOR EMISSIONS IN A NONATTAINMENT AREA (THE SOUTH COAST AIR BASIN) THAT HAS THE WORST AIR QUALITY IN THE NATION; AND (3) IT RESPONDS TO PUBLIC COMMENTS REQUESTING AIR EMISSION CONTROLS TO MINIMIZE THE INCREASE IN EXISTING AIR QUALITY PROBLEMS REGARDLESS OF LEGAL REQUIREMENTS.

THE SELECTED REMEDY (EITHER AIR OR STEAM STRIPPING) MEETS THE ARARS AND TBCS THAT APPLY TO THIS RESPONSE ACTION. THE SELECTED REMEDY WILL MEET THE SAFE DRINKING WATER ACT MCLS AND THE CA DHS STATE ACTION LEVELS IN THE EXTRACTED GROUNDWATER THAT IS TREATED FOR REUSE. UPON THE COMPLETION OF THE FINAL REMEDIAL ACTION FOR THE SITE, THE MCLS WILL BE MET IN THE AQUIFER.

IT WILL ALSO MEET THE SCAQMD'S REGULATION XIII AND RULES 1167 AND 1401 BY ADDING AIR EMISSION CONTROLS TO THE AIR STRIPPERS OR USING STEAM STRIPPING.

4473-9097

FINALLY, IT WILL MEET THE RCRA REQUIREMENTS AS SPECIFIED IN 40 CFR SECTION 261 AND 263. RCRA SUBPART B, 40 CFR 261 - CRITERIA FOR IDENTIFYING LISTED HAZARDOUS WASTE - IDENTIFIES THE WASTE AS RELEVANT AND APPROPRIATE TO FOOL AND APPLICABLE FOR U210 AND U228. RCRA PART 263 - STANDARDS APPLICABLE TO TRANSPORTERS OF HAZARDOUS WASTE - SPECIFIES COMPLIANCE WITH THE MANIFEST SYSTEM FOR SHIPMENT OF THE SPENT CARBON OFF-SITE FOR REGENERATION.

THE SOLVENT PRODUCT GENERATED FROM STEAM STRIPPING IS NOT CONSIDERED A RCRA WASTE IF IN ACCORDANCE WITH 40 CFR SECTION 261.2(E)(I)(II) MATERIALS ARE NOT SOLID WASTES WHEN THEY CAN BE SHOWN TO BE RECYCLED BY BEING USED OR REUSED AS EFFECTIVE SUBSTITUTES FOR COMMERCIAL PRODUCTS.

THE SELECTED REMEDY PERMANENTLY AND SIGNIFICANTLY REDUCES THE TOXICITY, MOBILITY AND VOLUME OF HAZARDOUS SUBSTANCES WITH RESPECT TO THEIR PRESENCE IN GROUNDWATER. THE CONTAMINANTS ARE REMOVED FROM THE GROUNDWATER, THEREBY REDUCING CONTAMINANT MIGRATION AND RESTORING THE AQUIFER IN THE VICINITY OF THE BURBANK OU AREA. THE STRIPPING TECHNOLOGY WILL RESULT IN A VERY SLIGHT INCREASE IN THE TOXICITY, MOBILITY, AND VOLUME OF HAZARDOUS SUBSTANCES WITH RESPECT TO THEIR PRESENCE IN THE AIR.

AIR STRIPPING WITH VAPOR PHASE GAC INCREASES THE VOLUME OF CONTAMINATION IN THE AIR BY TRANSFERRING THAT VOLUME, WHICH IS NOT TRAPPED INTO THE CARBON FOR REGENERATION, FROM THE WATER TO THE AIR. STEAM STRIPPING SLIGHTLY INCREASES THE VOLUME OF CONTAMINATION IN THE AIR BY TRANSFERRING THAT VOLUME, WHICH IS NOT RECOVERED AS PRODUCT FOR RECYCLING, FROM THE WATER TO THE AIR. THE VOC VOLUMES RELEASED BY EITHER METHOD WILL NOT EXCEED THE SCAQMD'S LIMITS.

THE INCLUSION OF AIR EMISSIONS CONTROL (VAPOR PHASE GAC ADSORPTION UNITS) IN THE SELECTED REMEDY (IF AIR STRIPPING IS USED) REDUCES THE IMPACT OF THE AIR EMISSIONS IN A COST-EFFECTIVE MANNER TO THE MAXIMUM EXTENT POSSIBLE. THE AIR EMISSIONS ARE ESTIMATED TO ADD A MINIMAL RISK TO THE PROJECT VIA AIRBORNE CONTAMINANTS. THE MINIMAL RISK ADDITION IS DUE LARGELY TO THE CAPABILITIES OF THE VAPOR PHASE GAC ADSORPTION UNITS TO REMOVE 90 TO 99% OF THE CONTAMINANTS IN THE AIR DISCHARGED TO THE ATMOSPHERE FROM THE STRIPPER. WITH THE ADDITION OF AIR EMISSION CONTROLS, THE SELECTED REMEDY REDUCES THE POTENTIAL FOR OZONE FORMATION.

BOTH AIR AND STEAM STRIPPING MEET THE STATUTORY PREFERENCE FOR REMEDIES THAT USE ALTERNATIVE TREATMENT OR RESOURCE RECOVERY TECHNOLOGIES TO THE MAXIMUM EXTENT PRACTICABLE. STEAM STRIPPING UNDER VACUUM PRESSURE IS AN INNOVATIVE TECHNOLOGY THAT RECOVERS THE VOCS FOR REUSE. IF THE DUAL STAGE AIR STRIPPING WITH VAPOR PHASE GAC ADSORPTION UNITS IS USED, THE SPENT CARBON FROM THE GAC OFF-GAS TREATMENT SYSTEM WILL BE REGENERATED, INSTEAD OF BEING DISPOSED OF IN A LANDFILL. THEREFORE, THE VOCS WILL BE COLLECTED FOR REUSE OR DESTROYED.

CONSENT DECREE

I. BACKGROUND

A. Summary of Site Background.

The following is a summary of the Site background as alleged by the United States which, for the purposes of this Consent Decree, Settling Defendants neither admit nor deny:

1. The United States of America ("United States"), on behalf of the Administrator of the United States Environmental Protection Agency ("EPA"), and the State of California Department of Toxic Substances Control ("State") have filed concurrently with this Consent Decree a supplemental complaint pursuant to Sections 106 and 107 of the Comprehensive Environmental Response, Compensation, and Liability Act, 42 U.S.C. §§ 9606 and 9607 ("CERCLA"), as amended by the Superfund Amendments and Reauthorization Act of 1986 ("SARA").

2. The United States and the State in the supplemental complaint, seek, *inter alia*: (1) reimbursement of costs of response incurred by EPA, the Department of Justice, and the State for response actions at the Burbank Operable Unit Site ("Site") of the San Fernando Valley Superfund sites, with accrued interest; and (2) performance of response work by the Defendants at the Site consistent with the National Contingency Plan, 40 C.F.R. Part 300 (as amended) ("NCP").

3. This is the second complaint the United States has filed in this action. Pursuant to the first complaint, a consent decree ("First Consent Decree") was entered by this Court on

March 25, 1992. A copy of the First Consent Decree is included as Exhibit 1 to this Consent Decree. Under Section XXIII (Continuing Jurisdiction) of the First Consent Decree, this Court retained jurisdiction over both the subject matter and the parties to the original action for the duration of the First Consent Decree and for the purpose of issuing such further orders or directions as may be necessary or appropriate to construe, implement, modify, enforce, terminate or reinstate the terms of the First Consent Decree or for any further relief as the interest of justice may require.

4. The First Consent Decree provided for the defendants to the first complaint, Lockheed Corporation (now Lockheed Martin Corporation, hereinafter "Lockheed Martin"), the City of Burbank, and Weber Aircraft, Inc. ("Weber"), to fund and/or to perform certain response actions at the Site, and for Lockheed Martin and Weber to pay certain costs of response incurred by EPA and the Department of Justice with respect to the Site. This consent decree ("Second Consent Decree" or "this Consent Decree") provides for the defendants that have entered into this Consent Decree (collectively, "Settling Defendants") to fund and/or to perform the remainder of the response actions and to pay part of EPA's, the Department of Justice's, and the State's remaining costs of response for the Site. In general, the Second Consent Decree provides for the continued operation and maintenance of (1) the facilities constructed under the First Consent Decree, and (2) the facilities constructed under EPA Unilateral Administrative Order No. 92-12 ("UAO 92-12") by the

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 parties to UAO 92-12 ("UAO Parties"), during the final eighteen
2 years of the interim remedy operating period. The Second Consent
3 Decree further provides for: (a) the performance of the UAO
4 Remedial Action Work by the UAO Parties (who are all Settling
5 Defendants), pursuant to UAO 92-12, to the extent that work has
6 not been completed at the time the Second Consent Decree is
7 entered; and (b) the possible dismantling or decommissioning of
8 these facilities upon completion of the interim remedy.

9 5. Tests conducted on San Fernando Valley groundwater
10 in the early 1980's revealed significant concentrations of
11 volatile organic compounds ("VOCs") in San Fernando Valley basin
12 ("Basin") groundwater. The primary VOCs found in the Basin
13 groundwater were trichloroethylene ("TCE") and perchloroethylene
14 ("PCE"), which were widely used solvents in machinery degreasing,
15 metal plating and dry cleaning. TCE and PCE have been found at
16 the Site at levels that exceed the Maximum Contaminant Levels
17 ("MCLs") for these hazardous substances. MCLs are safe drinking
18 water standards established under the Safe Drinking Water Act of
19 1974, as amended, 42 U.S.C. § 300f et seq. The Federal MCL for
20 TCE and PCE is 5 parts per billion ("ppb").

21 B. Based on investigations of Basin groundwater, and
22 pursuant to Section 105 of CERCLA, 42 U.S.C. § 9605, in June 1986
23 EPA placed four well field sites in the San Fernando Valley on
24 the National Priorities List, set forth at 40 C.F.R. Part 300,
25 Appendix B, by publication in the Federal Register (see 51 Fed.
26 Reg. 21054): (1) the North Hollywood Superfund site (Area 1);
27 (2) the Crystal Springs Superfund site (Area 2); (3) the Pollock
28

4473-9098

1 Superfund site (Area 3); and (4) the Verdugo Superfund site (Area
2 4).

3 C. EPA is conducting a Basin-wide Remedial Investigation
4 and Feasibility Study ("RI/FS") for the San Fernando Valley
5 Superfund sites, which EPA manages as one large Superfund site.
6 EPA has also entered into a multi-site cooperative agreement with
7 the California Department of Health Services ("DHS") which funds
8 DHS participation in remedial activities at many California
9 Superfund sites, including the San Fernando Valley sites. In
10 September of 1989, EPA entered into a cooperative agreement with
11 the California State Water Resources Control Board ("SWRCB").
12 Under that cooperative agreement, SWRCB funds the Los Angeles
13 Regional Water Quality Control Board's ("RWQCB") ongoing source
14 investigation and source control work in the Basin.

15 D. EPA has designated four operable units within the San
16 Fernando Valley Superfund sites known as the North Hollywood,
17 Burbank, Glendale North and Glendale South operable units. This
18 Site, the Burbank Operable Unit Site, is one of those four
19 operable units.

20 E. EPA has issued interim Records of Decision ("RODs")
21 prescribing interim remedies for each of these operable units.

22 F. The Site is part of the North Hollywood (Area 1)
23 Superfund site, and is the second operable unit in the Basin for
24 which EPA has issued an interim ROD. The Site includes the
25 northeast corner of the North Hollywood Superfund site, as well
26 as the areas to which the plume of TCE and PCE has spread beyond
27 the original boundaries drawn at the time the North Hollywood
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Superfund site was listed on the NPL.  
2 G. EPA completed an Operable Unit Feasibility Study  
3 ("OU/FS") Report on the Site in October 1988.  
4 H. The comment period on the OU/FS Report and the Proposed  
5 Plan for the Site opened on October 19, 1988 and closed December  
6 2, 1988. Pursuant to Section 117 of CERCLA, 42 U.S.C. § 9617,  
7 EPA published notice of the completion of the OU/FS and of the  
8 Proposed Plan in two major local newspapers of general  
9 circulation, the Los Angeles Times and the Burbank Leader. EPA  
10 provided an opportunity for written and oral comments from the  
11 public on the Proposed Plan for remedial action. A copy of the  
12 transcript of the public meeting is available to the public as  
13 part of the Administrative Record upon which the Regional  
14 Administrator based the selection of the interim response actions  
15 selected for the Site.  
16 I. EPA issued an interim ROD for the Site on June 30, 1989,  
17 which the State had a reasonable opportunity to review. A copy  
18 of the ROD is appended as Appendix A to the First Consent Decree.  
19 The ROD included a responsiveness summary responding to the  
20 public comments received at the public meeting. Notice of the  
21 Final Plan was published in accordance with Section 117(b) of  
22 CERCLA. The remedy described in the ROD was modified by EPA's  
23 Explanation of Significant Differences issued by EPA on November  
24 21, 1990 ("ESD 1"). A copy of ESD 1 is included as Appendix B to  
25 the First Consent Decree. Furthermore, EPA included in the First  
26 Consent Decree certain modifications to the interim remedy, as  
27 provided in Subpart F of Section VII of that decree (Work To Be  
28

4473-9098

1 Performed). Those modifications did not represent a fundamental  
2 change to the remedy selected in the ROD and ESD1. The remedy  
3 described in the ROD was further modified by EPA's second  
4 Explanation of Differences executed by EPA on February 12, 1997  
5 ("ESD2"). Those modifications also did not represent a  
6 fundamental change to the remedy selected in the ROD and ESD1. A  
7 copy of EPA's ESD2 is included as Appendix 5 to this Consent  
8 Decree.  
9 J. In 1989, pursuant to Section 122(e) of CERCLA, 42 U.S.C.  
10 § 9622(e), EPA issued Special Notice for Remedial Design and  
11 Remedial Action to potentially responsible parties for the Site.  
12 By its 1989 Special Notice, EPA sought the construction,  
13 operation and maintenance of the interim remedy for the Site. As  
14 more fully described in the ROD, that remedy consists of  
15 groundwater extraction and treatment facilities, a blending  
16 facility, and systems for delivering the treated groundwater to  
17 the public water supply. The treated, blended groundwater  
18 delivered to the public water supply shall meet all drinking  
19 water standards established by the United States and the State of  
20 California. The interim remedy is required to operate for twenty  
21 (20) years.  
22 K. In the First Consent Decree, Lockheed Martin, Weber and  
23 the City of Burbank agreed to construct and/or to fund the  
24 construction of the treatment plant for the Burbank Operable  
25 Unit, and to operate and maintain and/or to fund the operation  
26 and maintenance of the treatment plant for two years after  
27 construction is complete. Lockheed Martin and Weber also agreed  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 to pay part of EPA's and the Department of Justice's costs for  
2 the Site.

3 L. In March 1992, EPA issued UAO 92-12 to six potentially  
4 responsible parties who had received the 1989 Special Notice:  
5 Aeroquip Corporation, Crane Company, Inc., Janco Corporation,  
6 Sargent Industries, Incorporated, the Antonini Family Trust and  
7 Ocean Technology, Incorporated. Copies of UAO 92-12 and the  
8 April 28, 1992 Amendment to UAO 92-12 are included as Exhibit 2  
9 to this Decree. UAO 92-12 ordered these parties to construct a  
10 blending facility to receive and blend the treated groundwater  
11 with another source of water to reduce nitrate levels, and to  
12 deliver the water to the public water supply system.

13 M. In this action, EPA and the State seek reimbursement of  
14 past and future response costs, including Basin-wide Response  
15 Costs for the Site, which are not reimbursed pursuant to the  
16 First Consent Decree. EPA also seeks the performance of the  
17 Operation and Maintenance ("O&M") of the treatment and blending  
18 facilities for the period not provided by the First Consent  
19 Decree or UAO 92-12.

20 N. Based on the information presently available to EPA and  
21 the State, EPA and the State believe that this work will be  
22 properly and promptly conducted by the Settling Defendants if  
23 conducted in accordance with the requirements of this Consent  
24 Decree and its appendices.

25 O. The State is not a party to the First Consent Decree.  
26 In accordance with the NCP and Section 121(f)(1)(F) of CERCLA, 42  
27 U.S.C. § 9621(f)(1)(F), EPA notified the State on September 7,  
28

4473-9098

1 1994 of negotiations with potentially responsible parties  
2 regarding the implementation of the remainder of the remedial  
3 action for the Site, and EPA has provided the State with an  
4 opportunity to participate in such negotiations and be a party to  
5 this Consent Decree.

6 P. The State has joined in the United States' supplemental  
7 complaint and is alleging that the defendants are liable to the  
8 State under Section 107 of CERCLA, 42 U.S.C. § 9607, and under  
9 Chapter 6.8, Section 25300 et seq., of the California Health &  
10 Safety Code, for the State's past and future response costs at  
11 the Site.

12 Q. In accordance with Section 122(j)(1) of CERCLA, 42  
13 U.S.C. § 9622(j)(1), EPA notified the United States Department of  
14 the Interior on September 15, 1994 of negotiations with  
15 potentially responsible parties regarding the release of  
16 hazardous substances that may have resulted in injury to natural  
17 resources under federal trusteeship and encouraged the trustee(s)  
18 to participate in the negotiation of this Consent Decree.

19 R. Settling Defendants deny any and all legal or equitable  
20 liability under any federal, state, or local statute, regulation  
21 or ordinance, or the common law, for any response costs, damages  
22 or claims caused by or arising out of conditions at or arising  
23 from the Burbank well field or the Site. By entering into this  
24 Consent Decree, or by taking any action in accordance with it,  
25 Settling Defendants do not admit any allegations contained herein  
26 or in the complaints, nor do Settling Defendants admit liability  
27 for any purpose or admit any issues of law or fact or any  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 responsibility for releases of hazardous substances into the  
2 environment. Nothing in this Paragraph shall alter Settling  
3 Defendants' agreement not to challenge the Court's jurisdiction  
4 as set forth in Section II ("Jurisdiction"), or in any manner  
5 whatsoever affect Settling Defendants' obligations or rights  
6 under this Consent Decree, the First Consent Decree or UAO 92-12.

7 S. The Parties recognize, and the Court by entering this  
8 Consent Decree finds, that this Consent Decree has been  
9 negotiated by the Parties in good faith and implementation of  
10 this Consent Decree will expedite the cleanup of the Site and  
11 will avoid prolonged and complicated litigation between the  
12 Parties, and that this Consent Decree is fair, reasonable, and in  
13 the public interest.

14 T. Solely for the purposes of Section 113(j) of CERCLA, 42  
15 U.S.C. § 9613(j), the interim remedial action selected by the ROD  
16 and the work to be performed by the Settling Defendants shall  
17 constitute a response action taken or ordered by the President.  
18 NOW, THEREFORE, it is hereby Ordered, Adjudged, and Decreed:

19 II. JURISDICTION

20 This Court has jurisdiction over the subject matter of this  
21 action pursuant to 28 U.S.C. §§ 1331 and 1345, and 42 U.S.C. §§  
22 9606, 9607, and 9613(b). This Court also has personal  
23 jurisdiction over the Settling Defendants. Solely for the  
24 purposes of this Consent Decree and the underlying complaints,  
25 Settling Defendants waive all objections and defenses that they  
26 may have to jurisdiction of the Court or to venue in this  
27 District. Settling Defendants shall not challenge the terms of  
28

4473-9098

1 this Consent Decree or this Court's jurisdiction to enter and  
2 enforce this Consent Decree.

3 III. PARTIES BOUND

4 A. This Consent Decree applies to and is binding upon the  
5 United States and the State and upon Settling Defendants and  
6 their heirs, successors and assigns. Any change in ownership or  
7 corporate status of a Settling Defendant including, but not  
8 limited to, any transfer of assets or real or personal property  
9 shall in no way alter such Settling Defendant's responsibilities  
10 under this Consent Decree.

11 B. Settling Work Defendant (as defined below) shall  
12 provide a copy of this Consent Decree to each contractor hired to  
13 perform the O&M Activities (as defined below) required by this  
14 Consent Decree and to each person representing Settling Work  
15 Defendant with respect to the Site or the O&M Activities and  
16 shall condition all contracts entered into hereunder upon  
17 performance of the O&M Activities in conformity with the terms of  
18 this Consent Decree. Settling Work Defendant or its contractor  
19 shall provide written notice of this Consent Decree to all  
20 subcontractors hired to perform any portion of the O&M Activities  
21 required by this Consent Decree. Settling Work Defendant shall  
22 nonetheless be responsible for ensuring that its contractors and  
23 subcontractors perform the O&M Activities contemplated herein in  
24 accordance with this Consent Decree. With regard to the  
25 activities undertaken pursuant to this Consent Decree, each  
26 contractor and subcontractor shall be deemed to be in a  
27 contractual relationship with Settling Work Defendant within the  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 meaning of Section 107(b)(3) of CERCLA, 42 U.S.C. § 9607(b)(3).

2 IV. DEFINITIONS

3 A. Unless otherwise expressly provided herein, terms used  
4 in this Consent Decree which are defined in CERCLA or in  
5 regulations promulgated under CERCLA shall have the meaning  
6 assigned to them in CERCLA or in such regulations. Whenever  
7 terms listed below are used in this Consent Decree or in the  
8 appendices attached hereto and incorporated hereunder, the  
9 following definitions shall apply:

10 "Basin-wide Response Costs" shall mean all costs, including,  
11 but not limited to, direct and indirect costs and interest,  
12 payroll costs, contractor costs, travel costs, laboratory costs,  
13 attorneys' fees and just compensation, that the United States or  
14 the State has incurred or paid or will incur and pay with regard  
15 to basin-wide non-operable unit-specific response actions.

16 "Blending Facility" shall mean the blending facility and  
17 related pipeline designed and constructed by the UAO Parties  
18 pursuant to UAO 92-12, beginning generally with the B-5  
19 Connection and concluding with the Point of Interconnection, as  
20 "B-5 Connection" and "Point of Interconnection" are defined in  
21 the First Consent Decree.

22 "CERCLA" shall mean the Comprehensive Environmental  
23 Response, Compensation, and Liability Act of 1980, as amended, 42  
24 U.S.C. §§ 9601 et seq.

25 "City" or "City of Burbank" shall mean the City of Burbank,  
26 California, as a charter city, and any of its divisions,  
27 departments and other subdivisions. "City" or "City of Burbank"  
28

4473-9098

1 shall not include any joint powers authority of which the City of  
2 Burbank is a member.

3 "Consent Decree" or "Second Consent Decree" shall mean this  
4 Consent Decree and all appendices attached hereto (listed in  
5 Section XXX). In the event of conflict between this Consent  
6 Decree and any appendix, this Consent Decree shall control.

7 "Date of Commencement" shall mean, in general, the date  
8 specified by EPA that Settling Work Defendant will assume the O&M  
9 responsibilities for the Burbank Operable Unit interim remedy,  
10 and Lockheed Martin and the UAO Parties shall cease their  
11 respective obligations to perform under the First Consent Decree  
12 or UAO 92-12. The parties anticipate that this date will be two  
13 years after the System Operation Date for phase two of the  
14 Remedial Action Work as specified in the First Consent Decree  
15 unless delays, including without limitation delays which any  
16 party attributes to a force majeure event, cause that date to be  
17 extended. Within thirty (30) days of the System Operation Date  
18 for phase two of the Remedial Action Work as specified in the  
19 First Consent Decree, EPA will specify the tentative Date of  
20 Commencement and notify the Settling Work Defendant, Lockheed  
21 Martin and the UAO Parties of the tentative Date of Commencement.  
22 EPA may revise the tentative Date of Commencement at any time  
23 during phase two of the Remedial Action Work as specified in the  
24 First Consent Decree, and shall notify the Settling Work  
25 Defendant, Lockheed Martin and the UAO Parties of any such  
26 revision. EPA's specified tentative Date of Commencement shall  
27 control all reporting and similar requirements which are required  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 to occur in relation to the Date of Commencement. However, in no  
2 event shall the Date of Commencement specified by EPA extend the  
3 amount of time the interim remedy is required to operate under  
4 the ROD.

5 "Day" shall mean a calendar day unless expressly stated to  
6 be a working day. "Working Day" shall mean a day other than a  
7 Saturday, Sunday, or federal or State of California holiday. In  
8 computing any period of time under this Consent Decree, where the  
9 last day would fall on a Saturday, Sunday, or federal or State of  
10 California holiday, the period shall run until the close of  
11 business of the next Working Day.

12 "Department of Health Services," or "DHS" shall mean the  
13 California pollution control agency of that name and any  
14 successor departments or agencies of the State of California with  
15 authority to implement the Safe Drinking Water Act.

16 "Department of Toxic Substances Control" or "DTSC" shall  
17 mean the California pollution control agency of that name and any  
18 successor departments or agencies of the State of California.

19 "Design Defect" shall mean a failure of any system required  
20 to be designed and constructed pursuant to the First Consent  
21 Decree or UAO 92-12 to perform as originally designed, which  
22 results from a failure by a design professional used by Lockheed  
23 Martin or the UAO Parties to adequately design the system to  
24 perform in the manner intended, and as described in the design  
25 specifications contained in the Final Remedial Design Reports  
26 prepared by Lockheed Martin pursuant to the First Consent Decree  
27 or the UAO Parties pursuant to UAO 92-12.  
28

4473-9098

1 "Downstream Facilities" shall mean the Blending Facility  
2 constructed by the UAO Parties pursuant to UAO 92-12 and  
3 facilities constructed or repaired by the City of Burbank  
4 pursuant to the First Consent Decree. Downstream Facilities also  
5 shall mean additional facilities which may be constructed  
6 pursuant to this Consent Decree downstream of the Upstream  
7 Facilities, as defined in this Section. "Downstream" shall mean  
8 the flow of extracted, treated groundwater beginning generally  
9 with the Point of Delivery as "Point of Delivery" is defined by  
10 the First Consent Decree.

11 "EPA" shall mean the United States Environmental Protection  
12 Agency and any successor departments or agencies of the United  
13 States.

14 "Explanation of Significant Differences 1" or "ESD1" shall  
15 mean the document dated November 21, 1990, Appendix B to the  
16 First Consent Decree. "Explanation of Significant Differences 2"  
17 or "ESD2" shall mean the Explanation of Significant Differences  
18 dated February 12, 1997, Appendix 5 to this Consent Decree.

19 "First Consent Decree" shall mean the consent decree entered  
20 by this Court on March 25, 1992, resolving the underlying  
21 complaint filed by the United States against defendants Lockheed  
22 Martin, the City of Burbank and Weber, appended to this Consent  
23 Decree as Exhibit 1, and any amendments or modifications to that  
24 consent decree.

25 "Future Basin-wide Response Costs" shall mean all Basin-wide  
26 Response Costs incurred or paid by EPA after September 30, 1995  
27 or incurred or paid by the State after March 31, 1996.  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 "Future Site-Specific Response Costs" shall mean all types  
2 of costs described in the definition of Basin-wide Response  
3 Costs, (e.g., payroll costs) above, incurred or paid by the  
4 United States after the Certification of Completion issues with  
5 respect to the First Consent Decree, or by the State after March  
6 31, 1996, with regard to Burbank Operable Unit-specific response  
7 actions.

8 "Interest" shall mean interest at the rate specified for  
9 interest on investments of the Hazardous Substance Superfund  
10 established under Subchapter A of Chapter 98 of Title 26 of the  
11 U.S. Code, compounded on October 1 of each year, in accordance  
12 with 42 U.S.C. § 9607(a).

13 "Los Angeles Department of Water and Power" or "LADWP" shall  
14 mean the department of the City of Los Angeles, and any successor  
15 agencies or departments, with which EPA has entered into  
16 cooperative agreements for the performance of the Basin-wide  
17 Remedial Investigation and Feasibility Study for the San Fernando  
18 Valley Superfund sites.

19 "National Contingency Plan" or "NCP" shall mean the National  
20 Oil and Hazardous Substances Pollution Contingency Plan  
21 promulgated pursuant to Section 105 of CERCLA, 42 U.S.C. § 9605,  
22 codified at 40 C.F.R. Part 300, including, but not limited to,  
23 any amendments thereto.

24 "Operation and Maintenance" or "O&M" or "O&M Activities"  
25 shall mean the activities required to operate, maintain and  
26 monitor the effectiveness of the interim remedial action as  
27 required under the Operation and Maintenance Plan(s) approved or  
28

4473-9098

1 developed by EPA in conformance with this Consent Decree, UAO 92-  
2 12, the Second Stage O&M Work Plan to be developed under this  
3 Consent Decree, and the Second Stage Statement of Work attached  
4 as Appendix 4 to this Consent Decree.

5 "O&M Trust Account" shall mean the trust account which  
6 Lockheed Martin shall be required to establish pursuant to  
7 Section XIV (Funding of Response Activities), Paragraph D of this  
8 Consent Decree.

9 "Operations and Maintenance Contractor" or "O&M Contractor"  
10 shall mean the principal contractor retained by the Settling Work  
11 Defendant to perform the O&M Activities. The O&M Contractor  
12 shall, inter alia: (1) provide the staff to operate and maintain  
13 the Plant Facilities; (2) conduct the day-to-day physical tasks  
14 of operating the Plant Facilities; (3) perform routine water  
15 quality monitoring; (4) physically perform the routine and non-  
16 routine maintenance of the Plant Facilities; and (5) maintain the  
17 daily operational records of the Plant Facilities.

18 "Owner Settling Defendants" shall mean the Settling  
19 Defendants listed in Appendix 2.

20 "Paragraph" shall mean a portion of this Consent Decree or  
21 the First Consent Decree identified by an Arabic numeral or an  
22 upper case letter.

23 "Parties" shall mean the United States, the State of  
24 California DTSC and the Settling Defendants.

25 "Past Basin-wide Response Costs" shall mean all Basin-wide  
26 Response Costs incurred and paid by EPA prior to September 30,  
27 1995, or incurred and paid by the State prior to March 31, 1996.  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 "Past Site-Specific Response Costs" shall mean all costs,  
2 including, but not limited to, all types of costs described in  
3 the definition of Basin-wide Response Costs, (e.g. payroll  
4 costs), above, that the United States incurred and paid with  
5 regard to the Burbank Operable Unit Site prior to the issuance of  
6 the Certification of Completion for the First Consent Decree or  
7 that the State incurred and paid prior to March 31, 1996.

8 "Performance Standards" shall mean those operation and  
9 maintenance standards, standards of control, and other  
10 substantive requirements, criteria or limitations set forth in  
11 the ROD, the First Consent Decree or this Consent Decree, the  
12 Second Stage Statement of Work, Appendix 4 to this Consent  
13 Decree, and any work plan established pursuant to the First  
14 Consent Decree or this Consent Decree. In the event of any  
15 conflict between the First Consent Decree and this Consent  
16 Decree, or between any work plan established pursuant to the  
17 First Consent Decree or this Consent Decree as to the Performance  
18 Standards that apply to the O&M Activities, this Consent Decree  
19 or the work plan established pursuant to this Consent Decree  
20 shall control.

21 "Plaintiffs" shall mean the United States and the State of  
22 California, DTSC.

23 "Plant Facilities" shall mean all parts of the  
24 infrastructure necessary to carry out the Burbank Operable Unit  
25 interim remedy, as constructed pursuant to the First Consent  
26 Decree and UAO 92-12, including without limitation the extraction  
27 wellfield, treatment plant, disinfection facility, booster  
28

4473-9098

1 station, blending water interconnection and pipeline, connecting  
2 pipelines for extraction wells to treatment plant, and Blending  
3 Facility.

4 "Regional Water Quality Control Board" or "RWQCB" shall mean  
5 the California pollution control agency and any successor  
6 agencies or departments of the State of California, which  
7 performs ongoing source investigation and source control work in  
8 the San Fernando Valley Basin pursuant to a cooperative agreement  
9 between EPA and the State Water Resources Control Board.

10 "RCRA" shall mean the Solid Waste Disposal Act, as amended,  
11 42 U.S.C. §§ 6901 et seq., (also known as the Resource  
12 Conservation and Recovery Act).

13 "Record of Decision" or "ROD" shall mean the EPA Record of  
14 Decision relating to the Burbank Operable Unit, signed on June  
15 30, 1989, by the Regional Administrator, EPA Region IX, and all  
16 attachments thereto, as modified by the First Consent Decree,  
17 ESD1 and ESD2.

18 "Related Settling Defendants" shall mean entities related to  
19 Settling Cash Defendants and identified as such in Appendix 1.

20 "Released Parties" shall mean Settling Defendants and their  
21 officers, directors, employees and agents; where the Settling  
22 Defendant or other Released Party is a trust, Released Party also  
23 shall mean its trustees and successor trustees appointed to carry  
24 out the purposes of said trust; where the Settling Defendant or  
25 other Released Party is a corporate entity, Released Party also  
26 shall mean its corporate successors to potential liability for  
27 the Site; and where the Settling Defendant or other Released  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Party is a partnership, Released Party also shall mean its  
2 partners. "Released Parties" also shall mean the named entities  
3 described in Appendix 1 as Released Parties related to one or  
4 more of the Settling Defendants.

5 "Remedial Action" or "Remedial Action Work" shall mean those  
6 activities, except for Operation and Maintenance, to be  
7 undertaken or which have been undertaken by any of the Settling  
8 Defendants to implement the final plans and specifications  
9 submitted by certain of the Settling Defendants pursuant to the  
10 Remedial Design Work Plan under the First Consent Decree or the  
11 UAO Remedial Design Work Plan under UAO 92-12 and approved by  
12 EPA.

13 "Remedial Action Work Plan" shall mean the documents  
14 submitted by Lockheed Martin and/or the City of Burbank pursuant  
15 to the Statement of Work, Appendix D to the First Consent Decree.

16 "Remedial Design" shall mean those activities which were  
17 undertaken by Lockheed Martin and/or the City of Burbank pursuant  
18 to the Statement of Work ("SOW"), Appendix D to the First Consent  
19 Decree, to develop the final plans and specifications for the  
20 Remedial Action pursuant to the Remedial Design Statement of  
21 Work, or by the UAO Parties pursuant to the Work Schedule,  
22 Appendix A to UAO 92-12, to develop the final plans and  
23 specifications for the Blending Facility.

24 "Remedial Design Statement of Work" or "SOW" shall mean the  
25 document appended as Appendix D to the First Consent Decree.

26 "Remedial Design Work Plan" shall mean the work plans  
27 prepared by Lockheed Martin and/or the City of Burbank pursuant  
28

4473-9098

1 to the SOW, Appendix D to the First Consent Decree, to describe  
2 the final plans and specifications for the Remedial Action.

3 "Second Consent Decree Trust Account" pertains to the trust  
4 account which Lockheed Martin shall be required to establish  
5 pursuant to Section XIV (Funding of Response Activities),  
6 Paragraph C of this Consent Decree.

7 "Second Stage Operation and Maintenance Work Plan" or  
8 "Second Stage O&M Work Plan" shall mean the document prepared  
9 pursuant to Section VI of this Consent Decree (Performance of the  
10 Work), which shall describe certain Settling Defendants'  
11 obligations to operate and maintain, and to dismantle,  
12 decommission or otherwise dispose of the Plant Facilities.

13 "Second Stage Statement of Work" or "Second Stage SOW" shall  
14 mean the statement of work for implementation of the O&M  
15 Activities, attached as Appendix 4 to this Consent Decree.

16 "Section" shall mean a portion of this Consent Decree or the  
17 First Consent Decree identified by a Roman numeral.

18 "Settling Cash Defendants" shall mean those Settling  
19 Defendants who have funded, in whole or in part, the Second  
20 Consent Decree Trust Account described in Section XIV (Funding of  
21 Response Activities), via a settlement with Lockheed Martin in  
22 the action Lockheed Martin Corporation v. Crane Company et al.,  
23 United States District Court, Central District of California,  
24 Case No. CV 94 2717 MRP (Tx). This term includes each of the UAO  
25 Parties.

26 "Settling Defendants" shall mean Lockheed Martin, Settling  
27 Cash Defendants, Related Settling Defendants and Settling Work  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Defendant.

2 "Settling Work Defendant" shall mean the Settling Defendant

3 that is obligated to perform the Operation and Maintenance

4 Activities pursuant to this Consent Decree, except as to Design

5 Defects as provided in Section VI (Performance of the Work),

6 capital expenditures that are not integral to the Upstream

7 Facilities as provided in Section XIV (Funding Obligations),

8 Paragraph K (Capital Expenditures), and as provided for in

9 Section XIV (Funding Obligations), Paragraph M (Funding

10 Obligation for Design Defects). The City of Burbank is the sole

11 Settling Work Defendant pursuant to this Consent Decree.

12 "Site" shall mean the areal extent of hazardous substance

13 groundwater contamination that is presently located in the

14 vicinity of the Burbank well field and includes any areas to

15 which and from which such hazardous substance groundwater

16 contamination migrates.

17 "State" shall mean the Department of Toxic Substances

18 Control and any successor agencies or departments of the State.

19 "State Water Resources Control Board" or "SWRCB" shall mean

20 the California pollution control agency and any successor

21 agencies or departments of the State of California, with which

22 EPA has entered into a series of cooperative agreements for the

23 ongoing source identification and source control in the Basin

24 conducted by the RWQCB.

25 "Statement of Work" or "SOW" shall mean the statement of

26 work for implementation of the Remedial Action, and the first two

27 years of Operation and Maintenance at the Site, as set forth in

28

4473-9098

1 Appendix D to the First Consent Decree and any modifications made

2 pursuant to the First Consent Decree.

3 "Supervising Contractor" shall mean the principal contractor

4 retained or otherwise selected by the Settling Work Defendant,

5 and approved by EPA, to (1) develop the Second Stage O&M Work

6 Plan; (2) prepare the Project Time Line and Staffing Plan

7 required by Section VI, Paragraph C.8 of this Consent Decree; (3)

8 prepare bid documents to select the O&M Contractor; and (4)

9 conduct periodic oversight, including engineering oversight of

10 the O&M Contractor, and submit reports on such periodic oversight

11 to EPA.

12 "UAO 92-12" shall mean the unilateral administrative order

13 executed by EPA on March 26, 1992 as amended by a letter of April

14 28, 1992, from Jeffrey Zelikson to the UAO Parties, appended as

15 Exhibit 2 to this Consent Decree.

16 "UAO Parties" shall mean the Respondents as defined in

17 Section VII.V of UAO 92-12: Aeroquip Corporation, Crane Company,

18 Inc., Janco Corporation, Sargent Industries, Incorporated,

19 Antonini Family Trust, and Ocean Technology, Incorporated.

20 "UAO Remedial Action Work Plan" shall mean the document

21 submitted by the UAO Parties pursuant to Attachment A to UAO 92-

22 12.

23 "UAO Remedial Design" shall mean those activities which were

24 undertaken by the recipients of UAO 92-12 to develop the final

25 plans and specifications for the Blending Facility pursuant to

26 Attachment A to UAO 92-12.

27 "UAO Remedial Design Statement of Work" or "UAO SOW" shall

28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 mean the remedial design document prepared by the recipients of  
 2 UAO 92-12 and submitted pursuant to Attachment A to UAO 92-12.  
 3 "UAO Remedial Design Work" shall mean the activities to be  
 4 undertaken by the UAO Parties as defined in Section VII.T of UAO  
 5 92-12.  
 6 "UAO Remedial Design Work Plan" shall mean the work plan  
 7 prepared by the UAO Parties pursuant to the Work Schedule,  
 8 Appendix A to UAO 92-12, to describe the final plans and  
 9 specifications for the Blending Facility.  
 10 "Upstream Facilities" pertains to all facilities designed  
 11 and constructed by Lockheed Martin pursuant to the First Consent  
 12 Decree and modifications thereto, and to additional facilities  
 13 which may be constructed pursuant to this Consent Decree upstream  
 14 of the Blending Facility as originally constructed by the UAO  
 15 Parties pursuant to UAO 92-12. "Upstream" pertains to the flow  
 16 of extracted, treated groundwater beginning with its extraction  
 17 from the aquifer and generally concluding with the Point of  
 18 Delivery as "Point of Delivery" is defined in the First Consent  
 19 Decree.  
 20 "United States" shall mean the United States of America.  
 21 "Waste Material" shall mean (1) any "hazardous substance"  
 22 under Section 101(14) of CERCLA, 42 U.S.C. § 9601(14); (2) any  
 23 pollutant or contaminant under Section 101(33), 42 U.S.C.  
 24 § 9601(33); (3) any "solid waste" under Section 1004(27) of RCRA,  
 25 42 U.S.C. § 6903(27); and (4) any "hazardous material" under  
 26 California Health & Safety Code Section 25100 et seq.  
 27 "Working Day" shall mean a day other than a Saturday, Sunday  
 28

4473-9098

1 or federal or State of California holiday.  
 2 V. GENERAL PROVISIONS  
 3 A. Purpose.  
 4 The purposes of this Consent Decree are to protect public  
 5 health, welfare or the environment at the Site by the  
 6 implementation of response actions at the Site, to reimburse part  
 7 of the Plaintiffs' response costs related to the Site, and to  
 8 resolve amicably the claims asserted against Settling Defendants  
 9 in the underlying complaints filed in this matter.  
 10 B. Commitments by Settling Defendants.  
 11 1. Lockheed Martin, the City of Burbank, the UAO  
 12 Parties and the other Settling Cash Defendants shall finance  
 13 and/or perform the O&M Activities and other obligations, if any,  
 14 described in Sections VI, (Performance of the Work), VII  
 15 (Additional Response Actions), VIII (EPA Periodic Review) and XIV  
 16 (Funding of Response Activities) herein in accordance with this  
 17 Consent Decree and all plans, standards, specifications, and  
 18 schedules set forth in or developed or approved by EPA pursuant  
 19 to this Consent Decree. Lockheed Martin shall also reimburse the  
 20 United States and the State for Past and Future Site-Specific and  
 21 Past Basin-wide Response Costs as provided in Section XVII of  
 22 this Consent Decree (Reimbursement of Response Costs).  
 23 2. The obligations of Lockheed Martin, the City of  
 24 Burbank, the UAO Parties and the other Settling Cash Defendants  
 25 to finance and/or to perform the O&M Activities, and other  
 26 obligations, if any, and to pay amounts owed to the United States  
 27 and the State under this Consent Decree are several, except with  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 respect to the UAO Parties' obligation to fund response actions  
2 pursuant to Section XIV (Funding of Response Activities),  
3 Paragraph M, which is joint and several as among the UAO Parties,  
4 and the Settling Cash Defendants' obligation to fund response  
5 actions pursuant to Section XIV, Paragraph N, which is joint and  
6 several among the Settling Cash Defendants.

7 3. Compliance With Applicable Law.

8 All response activities undertaken by any Settling  
9 Defendants pursuant to this Consent Decree shall be performed in  
10 accordance with the requirements of all applicable federal and  
11 State of California laws and regulations. Settling Defendants  
12 who perform response activities also shall comply with all  
13 applicable or relevant and appropriate requirements of all  
14 federal and State of California environmental laws as set forth  
15 in the ROD, the Explanations of Significant Differences, the SOW,  
16 the First Consent Decree, this Consent Decree, and any  
17 deliverables developed or approved by EPA under the First Consent  
18 Decree, UAO 92-12 or this Consent Decree. The activities  
19 conducted in accordance with this Consent Decree shall be  
20 considered to be consistent with the NCP.

21 C. Permits.

22 1. As provided in Section 121(e) of CERCLA, 42 U.S.C.  
23 § 9621(e) and Section 300.5 of the NCP, no permit shall be  
24 required for any portion of the O&M Activities conducted entirely  
25 on-site. Where any portion of the O&M Activities requires a  
26 federal or State of California permit or approval, Settling Work  
27 Defendant shall submit timely and complete applications and take  
28

4473-9098

1 all other reasonable actions necessary to obtain all such permits  
2 or approvals. Nothing in this Paragraph shall require the City  
3 of Burbank to exercise condemnation, eminent domain, or similar  
4 powers or authorities.

5 2. Settling Work Defendant may seek relief under the  
6 provisions of Section XIX (Force Majeure) of this Consent Decree  
7 for any delay in the performance of the O&M Activities resulting  
8 from a failure to obtain, or a delay in obtaining, any permit  
9 required for the O&M Activities.

10 3. This Consent Decree is not, and shall not be  
11 construed to be, a permit issued pursuant to any federal or State  
12 of California statute or regulation.

13 D. Notice of Obligations to Successors-in-Title.

14 1. The obligations of each Owner Settling Defendant  
15 with respect to the properties it owns which are identified in  
16 Appendix 2 to this Consent Decree, and the provision of access  
17 under Section X (Access) shall be binding upon such Owner  
18 Settling Defendant and any and all persons who subsequently  
19 acquire by conveyance any fee ownership interest in such property  
20 or portion thereof within the Site, hereinafter "Successors in  
21 Title." Each Owner Settling Defendant warrants and represents  
22 that to the best of its knowledge and belief, the properties it  
23 owns which are identified in Appendix 2 to this Consent Decree  
24 are the only properties it owns within the Site, and the United  
25 States relies upon such representations with respect to the  
26 mutual agreements in this Consent Decree concerning properties  
27 within the Site which are owned by any Settling Defendant.  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1           2. In the event of any conveyance of such fee  
2 ownership or portion thereof, each such Owner Settling  
3 Defendant's obligations under this Consent Decree, including its  
4 obligations to provide or secure access pursuant to Section X,  
5 shall continue to be met by such Owner Settling Defendant. In no  
6 event shall the conveyance of an interest in property that  
7 includes, or is a portion of, the Site release or otherwise  
8 affect the liability of such Owner Settling Defendant to comply  
9 with this Consent Decree.

10           3. Any Owner Settling Defendant and any Successor-in-  
11 Title shall, at least thirty (30) days prior to the conveyance of  
12 any fee ownership interest in such property, give written notice  
13 of this Consent Decree to the grantee. The City shall, at least  
14 thirty (30) days prior to the conveyance of any such interest in  
15 the real property it owns at 164 West Magnolia Boulevard in the  
16 City of Burbank, as depicted in Appendix 8 to this Consent  
17 Decree, give written notice of this Consent Decree to the  
18 grantee. No later than thirty (30) days after the conveyance of  
19 any such interest, such Owner Settling Defendant, Successor-in-  
20 Title, or the City shall give written notice to EPA and the State  
21 of the conveyance, including the name and address of the grantee,  
22 and the date on which notice of the Consent Decree was given to  
23 the grantee, and evidence such action by providing a copy of its  
24 notice to the grantee.

25           E. The obligation to provide notice pursuant to this  
26 Section shall terminate upon issuance of the Certification of  
27 Completion pursuant to Section XV (Certification of Completion)  
28

4473-9098

1 of this Consent Decree.

2           F. In the event of any such conveyance by the City of the  
3 property at 164 West Magnolia Boulevard in the City of Burbank,  
4 the City's obligations under this Consent Decree shall continue  
5 to be met by the City. In no event shall the conveyance of an  
6 interest in the property release or otherwise affect the  
7 liability of the City to comply with the Consent Decree. Any  
8 Successor-in-Title to the real property at 164 West Magnolia  
9 Boulevard shall be bound by the provisions of Paragraph D.1  
10 through D.3 of this Section.

11 VI. PERFORMANCE OF THE WORK

12 A. Selection of Supervising Contractor.

13           1. All aspects of the O&M Activities to be performed  
14 by Settling Work Defendant pursuant to Sections VI (Performance  
15 of the Work), VII (Additional Response Actions), VIII (U.S. EPA  
16 Periodic Review), and IX (Quality Assurance, Sampling and Data  
17 Analysis) of this Consent Decree shall be under the direction and  
18 supervision of the Supervising Contractor, the selection of which  
19 shall be subject to disapproval by EPA after a reasonable  
20 opportunity for review and comment by the State. Within one  
21 hundred and eighty (180) days after the entry of this Consent  
22 Decree, Settling Work Defendant shall notify EPA and the State in  
23 writing of the name, title, and qualifications of any contractor  
24 proposed to be the Supervising Contractor. Settling Work  
25 Defendant may submit a list of contractors for pre-qualification  
26 prior to engaging in any bidding process. Settling Work  
27 Defendant may also propose to directly serve in the role of  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Supervising Contractor, subject to EPA's review and approval.  
2 EPA will issue a notice of approval or disapproval of the  
3 Supervising Contractor. Upon its approval of the Supervising  
4 Contractor, EPA will issue an authorization to proceed. If at  
5 any time thereafter, Settling Work Defendant proposes to change a  
6 Supervising Contractor, Settling Work Defendant shall give such  
7 notice to EPA and the State and must obtain an authorization to  
8 proceed from EPA, after a reasonable opportunity for review and  
9 comment by the State, before the new Supervising Contractor  
10 performs, directs, supervises or implements any O&M Activities  
11 under this Consent Decree. In addition, if the Supervising  
12 Contractor proposes to subcontract any portion of the  
13 supervision, direction or implementation of the O&M Activities  
14 under this Consent Decree, Settling Work Defendant shall give  
15 such notice to EPA and the State and must obtain an authorization  
16 to proceed from EPA, after a reasonable opportunity for review  
17 and comment by the State, before the subcontractor supervises,  
18 directs, or implements any O&M Activities under this Consent  
19 Decree.  
20 2. If EPA disapproves a proposed Supervising  
21 Contractor, EPA will notify Settling Work Defendant in writing.  
22 Settling Work Defendant shall submit to EPA and the State a list  
23 of contractors, including the qualifications of each contractor,  
24 that would be acceptable to it within thirty (30) days of receipt  
25 of EPA's disapproval of the contractor previously proposed. EPA  
26 will provide written notice of the names of any contractor(s)  
27 that it disapproves and an authorization to proceed with respect  
28

4473-9098

1 to any of the other contractors. Settling Work Defendant may  
2 select any contractor from that list that is not disapproved and  
3 shall notify EPA and the State of the name of the contractor  
4 selected within twenty-one (21) days of EPA's authorization to  
5 proceed.  
6 3. If EPA fails to provide written notice of its  
7 approval, authorization to proceed or disapproval as provided in  
8 this Paragraph, and this failure prevents Settling Work Defendant  
9 from meeting one or more deadlines pursuant to this Consent  
10 Decree, Settling Work Defendant may seek relief under the  
11 provisions of Section XIX (Force Majeure) hereof.  
12 B. Selection of O&M Contractor.  
13 1. The day-to-day conduct of the O&M Activities will  
14 be performed by the O&M Contractor as defined in Section IV  
15 (Definitions) of this Consent Decree. The selection of the O&M  
16 Contractor shall be subject to disapproval by EPA after a  
17 reasonable opportunity for review and comment by the State.  
18 Within one hundred and eighty (180) days after the System  
19 Operation Date for Phase Two of the Remedial Action Work as  
20 specified in the First Consent Decree, Settling Work Defendant  
21 shall notify EPA and the State in writing of the name, title and  
22 qualifications of any contractor proposed to be the O&M  
23 Contractor. EPA will issue a notice of approval or disapproval.  
24 Upon issuance of a notice of approval, EPA shall issue an  
25 authorization to proceed. If at any time thereafter, Settling  
26 Work Defendant proposes to change the O&M Contractor, Settling  
27 Work Defendant shall give such notice to EPA and the State and  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 must obtain an authorization to proceed from EPA, after a
2 reasonable opportunity for review and comment by the State,
3 before the new O&M Contractor performs, directs, supervises or
4 implements any O&M Activities under this Consent Decree. In
5 addition, if the O&M Contractor proposes to subcontract any
6 portion of O&M Activities under this Consent Decree, Settling
7 Work Defendant shall give such notice to EPA and the State and
8 must obtain an authorization to proceed from EPA, after a
9 reasonable opportunity for review and comment by the State,
10 before the subcontractor supervises, directs, or implements any
11 O&M Activities under this Consent Decree.

12 2. EPA's approval or disapproval of Settling Work
13 Defendant's selection of an O&M Contractor shall be governed by
14 the procedures set forth in Section VI (Performance of the Work),
15 Paragraphs A.2 and A.3 of this Consent Decree.

16 C. Completion of the Response Action.

17 1. Under Section VII of the First Consent Decree,
18 Lockheed Martin, Weber and the City of Burbank submitted to EPA,
19 inter alia, a work plan for the Remedial Design ("Remedial Design
20 Work Plan"), a work plan for the Remedial Action at the Site
21 ("Remedial Action Work Plan") and a plan for the first two years
22 of the Operation & Maintenance ("O&M Work Plan") of the interim
23 remedy. The Remedial Design, Remedial Action and O&M Work Plans
24 provided for design and implementation of part of the interim
25 remedy set forth in the ROD in accordance with the SOW and, upon
26 approval by EPA, were incorporated into and became enforceable
27 under the First Consent Decree. Under Section VII, Paragraph H.1
28

4473-9098

1 of the First Consent Decree, the City of Burbank agreed to accept
2 the treated, blended groundwater for distribution to the public
3 water supply.

4 2. Lockheed Martin, Weber and the City of Burbank are
5 performing their obligations under the First Consent Decree.
6 Unless otherwise stated in this Consent Decree, these parties'
7 obligations under the First Consent Decree are not altered in any
8 manner by this Consent Decree.

9 3. Under Section X of UAO 92-12, the UAO Parties were
10 required to submit, inter alia, a Remedial Design Work Plan and
11 Remedial Action Work Plan for the design, construction and
12 operation of the Blending Facility.

13 4. The UAO Parties are performing their obligations
14 under UAO 92-12. Unless otherwise stated in this Consent Decree,
15 these parties' obligations under UAO 92-12 are not altered in any
16 manner by this Consent Decree. The UAO Parties agree to perform
17 and complete their obligations under UAO 92-12.

18 5. Settling Work Defendant shall begin conducting the
19 Operation and Maintenance of the Plant Facilities, beginning on
20 the Date of Commencement and concluding upon EPA's issuance of a
21 Certification of Completion in accordance with Section XV
22 (Certification of Completion) of this Consent Decree.

23 Specifically, Settling Work Defendant shall operate and maintain
24 the Plant Facilities and monitor the effectiveness of such
25 facilities, for the duration of the time required by the ROD.

26 6. Lockheed Martin shall perform all work necessary to
27 dismantle and decommission the Plant Facilities upon EPA's
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 determination pursuant to Paragraph A.1 of Section XV  
2 (Certification of Completion) of this Consent Decree that  
3 dismantling and/or decommissioning is required.  
4 7. As provided in Section XIV (Funding of Response  
5 Activities), Paragraphs D and M, Lockheed Martin shall fund the  
6 O&M Activities for the Upstream Facilities and any response  
7 activities required because of a Design Defect in the Upstream  
8 Facilities. As is also provided in Section XIV (Funding of  
9 Response Activities), Paragraph C, the Settling Cash Defendants  
10 shall fund the Second Consent Decree Trust Account according to  
11 their respective shares as set forth in Appendix 6 to this  
12 Consent Decree, which is submitted under seal. As provided in  
13 Section XIV, Paragraph M.2(c)(2), the UAO Parties also shall fund  
14 any response activities required because of a Design Defect in  
15 the Blending Facility. Lockheed Martin, the City of Burbank, and  
16 the Settling Cash Defendants shall fund any response activities  
17 required because of an earthquake or Uninsurable Force Majeure  
18 Event, as defined in Section XIV, Paragraph N, as provided in  
19 that Paragraph. The City of Burbank shall fund the Operation and  
20 Maintenance of the Downstream Facilities except insofar as the  
21 UAO Parties may be required to fund such activities because of a  
22 Design Defect, or Lockheed Martin or the Settling Cash Defendants  
23 may be required to fund such activities because of an earthquake  
24 or Uninsurable Force Majeure Event.  
25 8. Within one year after the Effective Date of this  
26 Consent Decree, as defined in Section XXVIII (Effective Date),  
27 Settling Work Defendant shall submit to EPA:  
28

4473-9098

1 a. A Staffing Plan indicating lines of  
2 responsibility and communication for day-to-day operations, and  
3 designating the person or persons responsible for oversight of  
4 the O&M Activities on behalf of Settling Work Defendant. Such  
5 person or persons may be a member or members of Settling Work  
6 Defendant's staff or a member of Settling Work Defendant's  
7 Supervising or O&M Contractors' staffs. Settling Work Defendant  
8 shall also designate a single contact for communications with EPA  
9 for the O&M Activities from the Effective Date of this Consent  
10 Decree, as defined in Section XXVIII (Effective Date), through  
11 completion of the Remedial Action.  
12 b. A Time Line and Schedule describing the timing  
13 of the O&M Activities which will be carried out during the period  
14 of time covered by the First Consent Decree, including but not  
15 limited to any transitions in operations responsibility to take  
16 place between Lockheed Martin and the City of Burbank prior to or  
17 at the Date of Commencement.  
18 9. Within two (2) years after the Effective Date of  
19 this Consent Decree, as defined in Section XXVIII (Effective  
20 Date), the Settling Work Defendant shall submit to EPA a Second  
21 Stage O&M Work Plan describing in detail the tasks to be  
22 performed to operate and maintain the Plant Facilities.  
23 D. Settling Defendants acknowledge and agree that nothing  
24 in the First Consent Decree, this Consent Decree, the Second  
25 Stage O&M Work Plan or in any plan approved pursuant to the First  
26 Consent Decree or this Consent Decree constitutes a warranty or  
27 representation of any kind by Plaintiffs that compliance with the  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

4473-9098

1 work requirements set forth in the O&M Second Stage Work Plan and  
2 completion of the O&M Activities will achieve the Performance  
3 Standards. Settling Work Defendant's compliance with the  
4 requirements of Section VI (Performance of the Work) shall not  
5 foreclose Plaintiffs from seeking achievement of all requirements  
6 of the ROD including, but not limited to, the applicable  
7 Performance Standards.

8 E. Settling Work Defendant shall, prior to any off-site  
9 shipment of Waste Material from the Site to an out-of-state waste  
10 management facility, provide written notification to the  
11 appropriate state environmental official in the receiving  
12 facility's state and to the EPA Project Coordinator of such  
13 shipment of Waste Material. However, this notification  
14 requirement shall not apply to any off-site shipments when the  
15 total volume of all such shipments will not exceed 10 cubic  
16 yards.

17 1. The Settling Work Defendant shall include in the  
18 written notification the following information, where available:  
19 (1) the name and location of the facility to which the Waste  
20 Material(s) are to be shipped; (2) the type and quantity of the  
21 Waste Material to be shipped; (3) the expected schedule for the  
22 shipment of the Waste Material; and (4) the method of  
23 transportation. The Settling Work Defendant shall notify the  
24 state in which the planned receiving facility is located of major  
25 changes in the shipment plan, such as a decision to ship the  
26 Waste Material to another facility within the same state, or to a  
27 facility in another state.  
28

1 2. The Settling Work Defendant shall provide the  
2 information required by this Section, Paragraph E.1 as soon as  
3 practicable and before the Waste Material is actually shipped.

4 F. Miscellaneous Standards of Control.

5 1. Settling Work Defendant may discharge extracted  
6 water to any offsite conveyance(s) leading to any Publicly Owned  
7 Treatment Works ("POTW") or to any off-site conveyance(s) leading  
8 to any water(s) of the United States for a period of up to five  
9 (not necessarily consecutive) days during any month, if the water  
10 is not accepted by the City and cannot be vended, provided that  
11 the following requirements are met for such discharge:

12 a. All substantive and procedural requirements  
13 applicable to such discharge at the time of such discharge shall  
14 be met, including any limits on the quantity of water to be  
15 discharged;

16 b. The total combined amount of any discharge(s)  
17 of extracted water to any off-site conveyance(s) leading to any  
18 POTW(s) at any time shall not exceed 6,000 gpm; and

19 c. The total combined amount of extracted water  
20 discharged to any off-site conveyance(s) leading to any POTW(s)  
21 and to any off-site conveyance(s) leading to any water(s) of the  
22 United States at any time shall not exceed 9,000 gpm.

23 Nothing in this Paragraph shall excuse Settling Work Defendant  
24 from stipulated penalties for failure to comply with any other  
25 requirements of this Consent Decree.

26 2. Settling Work Defendant may discharge development  
27 and purge water from wells to any off-site conveyance(s) leading  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 to any POTW or to any offsite conveyance(s) leading to any  
2 water(s) of the United States, provided that any such discharge  
3 is in compliance with all substantive and procedural requirements  
4 applicable to such discharge at the time of such discharge.

5 Water discharged pursuant to this Section, Paragraph F.2 shall  
6 not be included in the limits on the amount of water allowed to  
7 be discharged pursuant to this Section, Paragraph F.1.

8 3. Any water containing hazardous constituents and  
9 stored onsite for more than ninety (90) days shall be handled as  
10 a hazardous waste onsite. Such storage shall be accomplished in  
11 compliance with the substantive requirements of 40 C.F.R. Part  
12 264, Subparts I and J, and 22 California Code of Regulations,  
13 Chapter 30, Article 24 ("Use and Management of Containers") and  
14 Article 25 ("Tank Systems"). These requirements are applicable  
15 or relevant and appropriate requirements for the O&M Activities.

16 4. With respect to requirements for the operation of  
17 the groundwater treatment plant's VOC-stripper (i.e., air  
18 stripper with vapor phase granulated activated carbon absorption  
19 units), South Coast Air Quality Management District ("SCAQMD")  
20 Rule 1167 was rescinded in December of 1988 and Settling Work  
21 Defendant is not required to comply with this Rule despite any  
22 other language in this Consent Decree. Furthermore, some of the  
23 regulations cited in the ROD have been changed by the SCAQMD.  
24 The only requirements of the SCAQMD that Settling Work Defendant  
25 is required to comply with in performing Work onsite are the  
26 substantive requirements of the following applicable or relevant  
27 and appropriate requirements for the groundwater treatment plant  
28

4473-9098

1 VOC stripper:

2 a. SCAQMD Regulation XIII, as amended through  
3 June 28, 1990; and

4 b. SCAQMD Rule 1401, as adopted on June 1, 1990.

5 G. System Operation Minimum Standards. The work to be  
6 performed shall achieve the Performance Standards and shall, at a  
7 minimum, achieve the following standards during system operation:

8 1. All groundwater to be extracted shall be treated by  
9 Settling Work Defendant to a level such that the following chemi-  
10 cals do not exceed their respective MCL:

11 Chemical	12 MCL
13 PCE	5.0 micrograms/liter
14 TCE	5.0 micrograms/liter

15 2. All treated groundwater shall be disinfected and  
16 then blended by the Settling Work Defendant to meet all legal  
17 requirements for introduction of the blended water into the  
18 City's water supply system, including, but not limited to, the  
19 MCL for nitrate.

20 3. Settling Work Defendant shall operate and maintain  
21 the facilities it is required to operate and maintain in such a  
22 way as to ensure that failure to attain drinking water standards  
23 promulgated and in effect on the date of delivery (other than the  
24 MCL for nitrate), regardless of when any such standards were  
25 promulgated, shall result in the immediate, and, in all cases  
26 where possible, automatic shut-down of the groundwater treatment  
27 plant and water delivery system. Such a shut-down shall not, in  
28 and of itself, release Settling Work Defendant from any other

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 requirement of this Consent Decree and specifically shall not, in  
2 and of itself, affect the requirement that Settling Work  
3 Defendant pay stipulated penalties for failure to extract and  
4 deliver water in the amounts and of the quality required by  
5 Paragraphs G.3 and H.1 of this Section.

6 H. Extraction Requirements.

7 1. The Settling Work Defendant shall extract and treat  
8 an annual average of 9,000 g.p.m. of contaminated groundwater  
9 except as otherwise provided in this Section. Settling Work  
10 Defendant shall purvey all treated groundwater which satisfies  
11 the treatment standards established by Paragraphs G and H of this  
12 Section up to an amount which, when blended with the blending  
13 water, will meet the City's Water Demand (as defined in the  
14 Second Stage Statement of Work) without resulting in a nitrate  
15 concentration in the blended water that exceeds the promulgated  
16 MCL for nitrate in effect at that time; provided however that, in  
17 order to maximize the Settling Work Defendant's use of treated  
18 groundwater while providing a margin of safety in achieving  
19 compliance with the MCL for nitrate, the Settling Work Defendant  
20 shall be deemed to be in compliance with this Paragraph if it

21 a. Achieves at all times a level of nitrate in  
22 the blended water which is no greater than eighty-nine percent  
23 (89%) of the promulgated MCL for nitrate that is in effect at the  
24 time of the blending;

25 b. Extracts contaminated groundwater at an annual  
26 average rate of 9,000 g.p.m. at all times when the nitrate level  
27 in the extracted groundwater does not exceed 50 mg/l as nitrate;  
28

4473-9098

1 and

2 c. Maximizes the use of the extracted groundwater  
3 to the degree possible when the nitrate level in the extracted  
4 groundwater exceeds 50 mg/l as nitrate.

5 2. Notwithstanding the requirements of Paragraph H.1  
6 of this Section, the Settling Work Defendant shall not be charged  
7 a stipulated penalty for failure to meet a nitrate level  
8 specified in that Paragraph except where the nitrate  
9 concentrations of the blended water exceed the promulgated MCL  
10 for nitrate in effect at the time of the blending.

11 3. Settling Work Defendant shall maximize the amount  
12 of extraction from the Phase I and Phase II extraction wells and  
13 shall preferentially extract groundwater from these wells to meet  
14 its Water Demand as limited by the amount of water the Settling  
15 Work Defendant is required to accept pursuant to Paragraph H.1 of  
16 this Section.

17 4. Settling Work Defendant shall extract, treat and  
18 use its best efforts to vend or discharge, in compliance with  
19 Paragraphs F and G of this Section, additional groundwater such  
20 that the total amount of water extracted, treated and then  
21 delivered by the Settling Work Defendant, or vended or discharged  
22 by the Settling Work Defendant, equals or exceeds 9,000 g.p.m. on  
23 an annual average. Extraction from the City's liquid phase GAC  
24 wellfield located at 164 West Magnolia Boulevard, Burbank,  
25 California, as depicted in the plot plan attached as Appendix 8  
26 to this Consent Decree, may be counted towards Settling Work  
27 Defendant's achievement of the 9,000 g.p.m. annual average  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 extraction requirement. Settling Work Defendant shall be subject  
2 to stipulated penalties if it fails to achieve the 9,000 g.p.m.  
3 annual average extraction requirement, unless such failure is due  
4 to nitrate levels in the extracted groundwater which exceed 50  
5 mg/l as nitrate.

6 I. Settling Work Defendant shall not be obligated to meet  
7 the requirements of this Section, Paragraph H.1 if a new drinking  
8 water standard is promulgated after March 1, 1997, EPA has  
9 identified such standard as applicable or relevant and  
10 appropriate for the treated groundwater and necessary to protect  
11 public health or the environment and such standard cannot be met  
12 without modifying the facilities constructed pursuant to Section  
13 VII, Subpart A of the First Consent Decree or changing their  
14 operation.

15 VII. ADDITIONAL RESPONSE ACTIONS

16 A. In the event that EPA determines or the Settling Work  
17 Defendant proposes that additional response actions are necessary  
18 to meet the Performance Standards or to carry out the interim  
19 remedy selected in the ROD, notification of such additional  
20 response actions shall be provided to EPA and to each of the  
21 Settling Defendants.

22 B. Within thirty (30) days of receipt of notice from EPA or  
23 Settling Work Defendant pursuant to Paragraph A of this Section  
24 that additional response actions are necessary (or such longer  
25 time as may be specified by EPA), Settling Work Defendant shall  
26 submit for approval by EPA, after reasonable opportunity for  
27 review and comment by the State, a work plan for the additional  
28

4473-9098

1 response actions. The plan shall conform to the applicable  
2 requirements under law or EPA guidance. Upon approval of the  
3 plan pursuant to Section XII (Submissions Requiring Agency  
4 Approval), Settling Work Defendant shall implement the plan for  
5 additional response actions in accordance with the schedule  
6 contained therein.

7 C. Any additional response actions that Settling Work  
8 Defendant proposes are necessary to meet the Performance  
9 Standards or to carry out the interim remedy selected in the ROD  
10 shall be subject to approval by EPA, after reasonable opportunity  
11 for review and comment by the State, and, if authorized by EPA,  
12 shall be completed by Settling Work Defendant in accordance with  
13 plans, specifications, and schedules approved or established by  
14 EPA pursuant to Section XII (Submissions Requiring Agency  
15 Approval).

16 D. Any Settling Defendant required to fund, perform, or  
17 operate and maintain completed additional response actions may  
18 invoke the procedures set forth in Section XX (Dispute  
19 Resolution) to dispute EPA's determination that additional  
20 response actions are necessary to meet the Performance Standards  
21 or to carry out the interim remedy selected in the ROD. Such a  
22 dispute shall be resolved pursuant to Section XX (Dispute  
23 Resolution), Paragraph F of this Consent Decree.

24 E. The United States and the State reserve all rights  
25 against Settling Defendants, pursuant to Paragraph E of Section  
26 XXII (Covenants Not to Sue by Plaintiffs), if any new  
27 requirement(s) are promulgated or if any requirement(s)  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 promulgated on or before the Effective Date of this Consent  
2 Decree as defined in Section XXVIII (Effective Date) subsequently  
3 are changed and such requirement(s) are determined by EPA to be  
4 both (a) applicable or relevant and appropriate and (b) necessary  
5 to insure that the interim remedy is protective of human health  
6 and the environment and such standard cannot be met without  
7 modifying the Plant Facilities or significantly changing their  
8 operation.

9 F. If EPA determines that reinjection capacity is necessary  
10 for the remedy to meet the Performance Standards or to protect  
11 human health or the environment, the development of such capacity  
12 shall not be considered an additional response action under this  
13 Section. The United States and the State reserve all rights  
14 against Settling Defendants as provided in Paragraph E of Section  
15 XXII (Covenants Not to Sue by Plaintiffs) concerning installation  
16 of such capacity.

17 VIII. EPA PERIODIC REVIEW

18 A. Settling Work Defendant shall conduct any studies and  
19 investigations as requested by EPA in order to permit EPA to  
20 conduct reviews at least every five years as required by Section  
21 121(c), 42 U.S.C. § 9621(c) of CERCLA and any applicable  
22 regulations.

23 B. Settling Defendants and, if required by Sections  
24 113(k)(2) or 117 of CERCLA, 42 U.S.C. §§ 9613(k)(2) or 9617, the  
25 public will be provided with an opportunity to comment on any  
26 further response actions proposed by EPA as a result of the  
27 review conducted pursuant to Section 121(c), of CERCLA, 42 U.S.C.  
28

4473-9098

1 § 9621(c), and to submit written comments for the record during  
2 the public comment period. After the period for submission of  
3 written comments is closed, the Regional Administrator, EPA  
4 Region IX, or his/her delegate will determine in writing whether  
5 further response actions are appropriate.

6 C. The United States reserves the right pursuant to Section  
7 XXII, Paragraphs A and E of this Consent Decree (Covenants Not to  
8 Sue by Plaintiffs) to institute proceedings in this action or in  
9 a new action, or to issue an administrative order seeking to  
10 compel Settling Defendants or any of them (1) to perform further  
11 response actions relating to the Site or (2) to reimburse the  
12 United States for additional costs of response if the Regional  
13 Administrator, EPA Region IX, or his/her delegate determines that  
14 information received, in whole or in part, during the review  
15 conducted pursuant to Section 121(c) of CERCLA, 42 U.S.C.  
16 § 9621(c), indicates that the Remedial Action or the O&M  
17 Activities are not protective of human health or the  
18 environment.

19 IX. QUALITY ASSURANCE, SAMPLING, AND DATA ANALYSIS

20 A. Settling Work Defendant shall use quality assurance,  
21 quality control, and chain of custody procedures for all  
22 treatability, design, compliance and monitoring samples in  
23 accordance with EPA's "Interim Guidelines and Specifications For  
24 Preparing Quality Assurance Project Plans," December 1980, (QAMS-  
25 005/80); "Data Quality Objective Guidance," (EPA/540/G87/003 and  
26 004); "EPA NEIC Policies and Procedures Manual," May 1978,  
27 revised November 1984, (EPA 330/9-78-001-R); and subsequent  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 amendments to such guidelines upon notification by EPA to  
2 Settling Work Defendant of such amendment. Amended guidelines  
3 shall apply only to procedures conducted after such notification.  
4 Prior to the commencement of any monitoring project under this  
5 Consent Decree, Settling Work Defendant shall submit to EPA for  
6 approval, after a reasonable opportunity for review and comment  
7 by the State, a Quality Assurance Project Plan ("QAPP") that is  
8 consistent with the Second Stage O&M Work Plan, the NCP and  
9 applicable guidance documents. If relevant to the proceeding,  
10 the Parties agree that validated sampling data generated in  
11 accordance with the QAPP(s) and reviewed and approved by EPA  
12 shall be admissible as evidence, without objection, in any  
13 proceeding under this Consent Decree. Settling Work Defendant  
14 shall ensure that EPA and State personnel and their authorized  
15 representatives are allowed access at reasonable times to all  
16 laboratories utilized by Settling Work Defendant in implementing  
17 this Consent Decree. In addition, Settling Work Defendant shall  
18 ensure that such laboratories shall analyze all samples submitted  
19 by EPA pursuant to the QAPP for quality assurance monitoring.  
20 Settling Work Defendant shall ensure that the laboratories it  
21 utilizes for the analysis of samples taken pursuant to this  
22 Consent Decree perform all analyses according to accepted EPA  
23 methods. Accepted EPA methods consist of those methods which are  
24 documented in the "Contract Lab Program Statement of Work for  
25 Inorganic Analysis" and the "Contract Lab Program Statement of  
26 Work for Organic Analysis," dated February 1988, and any  
27 amendments made thereto during the course of the implementation  
28

4473-9098

1 of this Consent Decree. Settling Work Defendant shall ensure  
2 that all laboratories it uses for analysis of samples taken  
3 pursuant to this Consent Decree participate in an EPA or EPA-  
4 equivalent QA/QC program.  
5 B. Upon request, Settling Work Defendant shall allow split  
6 or duplicate samples to be taken by EPA and the State or their  
7 authorized representatives. Settling Work Defendant shall  
8 include in the O&M Second Stage Work Plan a schedule of routine,  
9 pre-scheduled sampling events, for example those required by the  
10 California Department of Health Services under the operating  
11 permit for the Plant Facilities, or under existing regulations.  
12 As regulations or permit conditions change and affect this  
13 schedule, Settling Work Defendant shall submit revised schedules  
14 as amendments to the Second Stage O&M Work Plan. For  
15 non-routine, non-emergency sampling events, for example, an  
16 unscheduled performance evaluation study of the Plant Facilities,  
17 Settling Work Defendant shall notify EPA and the State not less  
18 than fourteen (14) days in advance of any sample collection  
19 activity unless shorter notice is agreed to by EPA. In addition,  
20 EPA and the State shall have the right to take any additional  
21 samples that EPA or the State deem necessary. Upon request, EPA  
22 and the State shall allow any Settling Defendant to take split or  
23 duplicate samples of any samples either Plaintiff takes as part  
24 of either Plaintiff's oversight of the implementation of the O&M  
25 activities.  
26 C. Settling Work Defendant shall submit to EPA three (3)  
27 copies each of the results of all sampling and/or tests  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 performed, or data gathered pursuant to the implementation of  
2 this Consent Decree unless EPA agrees otherwise. Such results  
3 and other data may be submitted as part of the progress reports  
4 required pursuant to Paragraph A.1 of Section XI (Reporting  
5 Requirements). EPA will provide to Settling Work Defendant's  
6 Project Coordinator results of analyses conducted by EPA pursuant  
7 to Section IX, (Quality Assurance, Sampling and Data Analysis),  
8 Paragraph B of this Consent Decree.

9 D. Notwithstanding any provision of this Consent Decree,  
10 the United States and the State hereby retain all of their  
11 information gathering and inspection authorities and rights,  
12 including enforcement actions related thereto, under CERCLA, RCRA  
13 and any other applicable statutes or regulations.

14 E. Settling Work Defendant may deviate from EPA guidance on  
15 Quality Assurance/Quality Control ("QA/QC") as referenced in  
16 Section IX, Paragraph A of this Consent Decree under the  
17 following circumstances. For compliance monitoring required  
18 under federal and/or State of California drinking water  
19 regulations, Settling Work Defendant may follow QA/QC procedures  
20 required under those regulations so long as EPA determines that  
21 such procedures are equally protective of human health and the  
22 environment as EPA QA/QC procedures.

23 X. ACCESS

24 A. Commencing upon the Effective Date of this Consent  
25 Decree and terminating upon issuance of a final ROD for the Site,  
26 each Owner Settling Defendant agrees to provide the United  
27 States, the State, and their representatives, including EPA and  
28

4473-9098

1 its contractors, access at all reasonable times to real property  
2 to which EPA informs such Owner Settling Defendant access is  
3 required for the implementation of this Consent Decree, to the  
4 extent access to the property is controlled by such Owner  
5 Settling Defendant, for the purposes of conducting any activity  
6 related to this Consent Decree including, but not limited to:

- 7 a. Monitoring the O&M Activities;
- 8 b. Verifying any data or information submitted to the  
9 United States;
- 10 c. Conducting investigations relating to contamination  
11 at or near the Site;
- 12 d. Obtaining samples;
- 13 e. Assessing the need for, planning, or implementing  
14 additional response actions at or near the Site;
- 15 f. Inspecting and copying records, operating logs,  
16 contracts, or other documents maintained or generated by Settling  
17 Defendants or their agents, pursuant to Section XXV (Access to  
18 Information); and
- 19 g. Assessing Settling Defendants' compliance with this  
20 Consent Decree.

21 B. Except to the extent Plaintiffs deem necessary to  
22 protect human health or the environment, Plaintiffs will provide  
23 the affected Settling Defendant with twenty-four (24) hours  
24 notice prior to entry to properties accessed pursuant to this  
25 Consent Decree. In exercising their rights to access under this  
26 Paragraph, Plaintiffs shall to the extent practicable not  
27 unreasonably interfere with Settling Defendants' business or  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 municipal activities. However, nothing in this Paragraph shall  
2 provide Settling Defendants with any claim or cause of action  
3 whatsoever against Plaintiffs, including without limitation any  
4 claim for injunctive relief. In addition, it shall not  
5 constitute an unreasonable interference for Plaintiffs to take  
6 any action they deem necessary to avoid endangerment to human  
7 health or the environment or to respond to an emergency.

8 C. To the extent that any other real property to which  
9 access is required for the implementation of this Consent Decree  
10 is owned or controlled by persons other than Owner Settling  
11 Defendants, Settling Work Defendant shall use best efforts to  
12 secure from such persons access for Settling Work Defendant, as  
13 well as for the United States and the State and their  
14 representatives, including, but not limited to, their  
15 contractors, as necessary to effectuate this Consent Decree. For  
16 purposes of this Paragraph, "best efforts" may include the  
17 payment of reasonable sums of money in consideration of access.  
18 "Best efforts" does not include the exercise of eminent domain,  
19 condemnation or similar authorities. Settling Defendants shall  
20 coordinate and cooperate with Settling Work Defendant as  
21 appropriate and necessary to obtain such access to properties  
22 which they own, control, or to which they otherwise have access.  
23 If any access required to effectuate this Consent Decree is not  
24 obtained within forty-five (45) days of the date of lodging of  
25 this Consent Decree, or within forty-five (45) days of the date  
26 EPA notifies the Settling Work Defendant in writing that  
27 additional access beyond that previously secured is necessary,  
28

4473-9098

1 Settling Work Defendant shall promptly notify the United States,  
2 and shall include in that notification a summary of the steps  
3 Settling Work Defendant, or other Settling Defendants in  
4 coordination and cooperation with Settling Work Defendant, have  
5 taken pursuant to this Section to attempt to obtain access. The  
6 United States or the State may, as either deems appropriate,  
7 assist Settling Work Defendant in obtaining access. Lockheed  
8 Martin shall reimburse the United States or the State, in  
9 accordance with the procedures in Section XVII (Reimbursement of  
10 Response Costs), for all costs incurred by the United States or  
11 the State in obtaining access pursuant to this Section.

12 D. Notwithstanding any provision of this Consent Decree,  
13 the United States and the State retain all of their access  
14 authorities and rights, including enforcement authorities related  
15 thereto, under CERCLA, RCRA and any other applicable statute or  
16 regulations.

17 XI. REPORTING REQUIREMENTS

18 A. In addition to any other requirement of this Consent  
19 Decree, Settling Work Defendant shall submit to EPA and the  
20 State, with the frequency described below, three (3) copies each  
21 of written progress reports that: (a) describe the actions which  
22 have been taken toward achieving compliance with this Consent  
23 Decree during the previous reporting period; (b) include a summary  
24 of all results of sampling and tests and all other data received  
25 or generated by Settling Work Defendant or its contractors or  
26 agents in the previous reporting period; (c) identify all work  
27 plans, plans and other deliverables required by this Consent  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Decree completed and submitted during the previous period; (d)  
 2 describe all actions, including, but not limited to, data  
 3 collection and implementation of work plans, which are scheduled  
 4 for the subsequent two reporting periods, (e) include information  
 5 regarding unresolved delays encountered or anticipated that may  
 6 affect the future schedule for implementation of the O&M  
 7 Activities, and a description of efforts made to mitigate those  
 8 delays or anticipated delays; (f) include any modifications to  
 9 the O&M Second Stage Work Plan or other schedules that Settling  
 10 Work Defendant has proposed to EPA or that have been approved by  
 11 EPA; (g) describe all activities undertaken in support of the  
 12 Community Relations Plan during the period dating from the  
 13 submission of the last progress report and those to be undertaken  
 14 prior to the submission of the next progress report, and (h)  
 15 report any out-of-state shipments of Waste Materials that  
 16 occurred during the previous reporting period. Settling Work  
 17 Defendant shall submit these progress reports to EPA with the  
 18 frequency described below, commencing from the Effective Date of  
 19 this Consent Decree until EPA notifies the Settling Work  
 20 Defendant pursuant to Paragraph A.5 of Section XV (Certification  
 21 of Completion). If requested by EPA or the State, Settling Work  
 22 Defendant shall also provide briefings for EPA and the State to  
 23 discuss the progress of the work.

24 1. The progress reports shall be submitted with the  
 25 following frequency:

26 a. Semi-annually from the Effective Date of this  
 27 Consent Decree until one year prior to the Date of Commencement;  
 28

4473-9098

1 b. Quarterly during the year prior to the Date of  
 2 Commencement;  
 3 c. Monthly commencing with the Date of  
 4 Commencement for a period of three years ("the Monthly Reporting  
 5 Requirement").  
 6 d. Quarterly from completion of the Monthly  
 7 Reporting Requirement until EPA notifies the Settling Work  
 8 Defendant pursuant to Paragraph A.5 of Section XV (Certification  
 9 of Completion) of this Consent Decree.

10 2. The Settling Work Defendant shall notify EPA of  
 11 any change in the schedule described in the progress reports for  
 12 the performance of any activity, including, but not limited to,  
 13 data collection and implementation of work plans, no later than  
 14 seven (7) days prior to the performance of the activity.

15 B. Upon the occurrence of any event during performance of  
 16 the O&M Activities that Settling Work Defendant is required to  
 17 report pursuant to Section 103 of CERCLA, 42 U.S.C. § 9603, or  
 18 Section 304 of the Emergency Planning and Community Right-to-Know  
 19 Act (EPCRA), 42 U.S.C. § 11004, Settling Work Defendant shall  
 20 within twenty-four (24) hours of the onset of such event orally  
 21 notify the EPA Project Coordinator or the Alternate EPA Project  
 22 Coordinator (in the event of the unavailability of the EPA  
 23 Project Coordinator), or, in the event that neither the EPA  
 24 Project Coordinator or Alternate EPA Project Coordinator is  
 25 available, the Emergency Response Section, Region IX, United  
 26 States Environmental Protection Agency. These reporting  
 27 requirements are in addition to the reporting required by CERCLA  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Section 103, 42 U.S.C. § 9603 or EPCRA Section 304, 42 U.S.C.  
 2 § 11004.  
 3 C. Within twenty (20) days of the onset of such an event,  
 4 Settling Work Defendant shall furnish to Plaintiffs a written  
 5 report, signed by the Settling Work Defendant's Project  
 6 Coordinator, setting forth the events which occurred and the  
 7 measures taken, and to be taken, in response thereto. Within  
 8 thirty (30) days of the conclusion of such an event, Settling  
 9 Work Defendant shall submit a report setting forth all actions  
 10 taken in response thereto.  
 11 D. Settling Work Defendant shall submit three (3) copies of  
 12 all plans, reports, and data required by the Second Stage O&M  
 13 Work Plan to EPA. Settling Work Defendant shall simultaneously  
 14 submit three (3) copies of all such plans, reports and data to  
 15 the State.  
 16 E. All reports and other documents submitted by Settling  
 17 Work Defendant to EPA (other than the progress reports referred  
 18 to above) which purport to document Settling Work Defendant's  
 19 compliance with the terms of this Consent Decree shall be signed  
 20 by an authorized representative of the Settling Work Defendant.  
 21 F. Settling Work Defendant shall immediately notify EPA of  
 22 any failure to attain MCLs or State of California Action Levels  
 23 ("SALs") when such failures occur at a point of compliance as  
 24 defined under federal or State of California drinking water  
 25 regulations.

4473-9098

1  
 2 XII. SUBMISSIONS REQUIRING AGENCY APPROVAL  
 3 A. After review of the Second Stage O&M Work Plan or other  
 4 item which is required to be submitted for approval pursuant to  
 5 this Consent Decree, EPA, after reasonable opportunity for review  
 6 and comment by the State, shall: (1) approve, in whole or in  
 7 part, the submission; (2) approve the submission upon specified  
 8 conditions; (3) modify the submission to cure the deficiencies;  
 9 (4) disapprove, in whole or in part, the submission, directing  
 10 that the Settling Work Defendant modify the submission; or (5)  
 11 any combination of the above.  
 12 B. In the event of approval, approval upon conditions,  
 13 modification, disapproval or partial disapproval by EPA, pursuant  
 14 to this Section, Paragraph A, Settling Work Defendant shall  
 15 proceed to take any action required by the Second Stage O&M Work  
 16 Plan or other item, as approved or modified by EPA, subject only  
 17 to its right to invoke the dispute resolution procedures set  
 18 forth in Section XX (Dispute Resolution) with respect to the  
 19 modifications or conditions made by EPA. However, in the event  
 20 that EPA modifies the submission pursuant to this Section,  
 21 Paragraphs A and D, to cure continued deficiencies, and the  
 22 submission has a material defect not cured upon resubmittal, EPA  
 23 retains its right to impose stipulated penalties, as provided in  
 24 Section XXI (Stipulated Penalties), retroactive to the date of  
 25 the initial submittal.  
 26 C. Upon receipt of a notice of disapproval of a  
 27 resubmitted Second Stage O&M Work Plan or other item, or portion  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 thereof, pursuant to this Section, Paragraph C or D, Settling  
 2 Work Defendant shall, within fourteen (14) days or such other  
 3 time as specified by EPA in such notice, correct the remaining  
 4 deficiencies and resubmit the Second Stage O&M Work Plan or other  
 5 item for approval. Any disapproval by EPA shall include an  
 6 explanation of why the deliverable is inadequate. If the  
 7 resubmitted deliverable is inadequate, Settling Work Defendant  
 8 shall be deemed to be in violation of this Consent Decree. Any  
 9 stipulated penalties applicable to the submission, as provided in  
 10 Section XXI (Stipulated Penalties), shall accrue during the  
 11 fourteen-day (14-day) period or otherwise specified period but  
 12 shall not be payable unless the resubmission is disapproved or  
 13 modified due to a material defect as provided in this Section,  
 14 Paragraph E.

15 Notwithstanding the receipt of an initial notice of  
 16 disapproval pursuant to this Section, Paragraph A, D or E,  
 17 Settling Work Defendant shall proceed, at the direction of EPA,  
 18 to take any action required by any non-deficient portion of the  
 19 submission. Implementation of any non-deficient portion of a  
 20 submission shall not relieve Settling Work Defendant of any  
 21 liability for stipulated penalties under Section XXI (Stipulated  
 22 Penalties).

23 D. In the event that a resubmitted Second Stage O&M Work  
 24 Plan or other item, or portion thereof, is disapproved by EPA,  
 25 EPA may again require the Settling Work Defendant to correct the  
 26 deficiencies, in accordance with the preceding Paragraphs. EPA  
 27 also retains the right to amend or develop the Second Stage O&M  
 28

4473-9098

1 Work Plan or other item. Settling Work Defendant shall implement  
 2 the Second Stage O&M Work Plan or other item as amended or  
 3 developed by EPA, subject only to its right to invoke the  
 4 procedures set forth in Section XX (Dispute Resolution).

5 E. If upon resubmission, the Second Stage O&M Work Plan or  
 6 other item is disapproved or modified by EPA due to a material  
 7 defect, Settling Work Defendant shall be deemed to have failed to  
 8 submit the Second Stage O&M Work Plan or other item timely and  
 9 adequately unless Settling Work Defendant invokes the dispute  
 10 resolution procedures set forth in Section XX (Dispute  
 11 Resolution) and EPA's action is overturned pursuant to that  
 12 Section. The provisions of Section XX (Dispute Resolution) and  
 13 Section XXI (Stipulated Penalties) shall govern the  
 14 implementation of the O&M Activities and accrual and payment of  
 15 any stipulated penalties during dispute resolution. If EPA's  
 16 disapproval or modification is upheld, stipulated penalties shall  
 17 accrue for such violation from the date on which the initial  
 18 submission was originally required, as provided in this Section,  
 19 Paragraph C.

20 F. The Second Stage O&M Work Plan and other items required  
 21 to be submitted to EPA under this Consent Decree shall, upon  
 22 approval or modification by EPA, be enforceable under this  
 23 Consent Decree. In the event EPA approves or modifies a portion  
 24 of the Second Stage O&M Work Plan or other item required to be  
 25 submitted to EPA under this Consent Decree, the approved or  
 26 modified portion shall be enforceable under this Consent Decree.

27 G. Items required to be submitted for approval by EPA  
 28

## Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 pursuant to this Consent Decree are set forth in the Second Stage  
2 Statement of Work, Appendix 4 to this Consent Decree.

3 XIII. PROJECT COORDINATORS

4 A. Within thirty (30) days of the Effective Date of this  
5 Consent Decree, Settling Work Defendant, Lockheed Martin, the UAO  
6 Parties, the State and EPA will notify each other, in writing, of  
7 the name, address and telephone number of their respective  
8 designated Project Coordinators and Alternate Project  
9 Coordinators. If a Project Coordinator or Alternate Project  
10 Coordinator initially designated is changed, the identity of the  
11 successor will be given to the other parties at least five (5)  
12 working days before the change occurs, unless impracticable, but  
13 in no event later than the actual day the change is made. The  
14 Settling Work Defendant's Project Coordinator shall be subject to  
15 disapproval by EPA and shall have the technical expertise  
16 sufficient to adequately oversee all aspects of the O&M  
17 Activities. The Settling Work Defendant's Project Coordinator  
18 shall not be an attorney for any of the Settling Defendants in  
19 this matter. He or she may assign other representatives,  
20 including other contractors, to serve as a Site representative  
21 for oversight of performance of daily operations during O&M  
22 Activities.

23 B. Plaintiffs may designate other representatives,  
24 including, but not limited to, EPA and State employees, and  
25 federal and State contractors and consultants, to observe and  
26 monitor the progress of any activity undertaken pursuant to this  
27 Consent Decree. EPA's Project Coordinator and Alternate Project  
28

57

4473-9098

1 Coordinator shall have the authority lawfully vested in a  
2 Remedial Project Manager (RPM) and an On-Scene Coordinator (OSC)  
3 by the National Contingency Plan, 40 C.F.R. Part 300. In  
4 addition, EPA's Project Coordinator or Alternate Project  
5 Coordinator shall have authority, consistent with the National  
6 Contingency Plan, to halt any O&M Activities required by this  
7 Consent Decree and to take any necessary response action when the  
8 Project Coordinator determines that conditions at the Site  
9 constitute an emergency situation or may present an immediate  
10 threat to public health or welfare or the environment due to  
11 release or threatened release of Waste Material.

12 C. EPA's Project Coordinator and the Defendants' Project  
13 Coordinators will meet on a regular basis as deemed appropriate  
14 by EPA's Project Coordinator.

15 XIV. FUNDING OF RESPONSE ACTIVITIES

16 A. Within sixty (60) days of the Effective Date, Lockheed  
17 Martin shall establish and maintain financial security in the  
18 amount of \$ 48 million, in one or a combination of the following  
19 forms:

- 20 1. A surety bond guaranteeing performance of the O&M  
21 Activities for the Upstream Facilities;
- 22 2. One or more irrevocable letters of credit;
- 23 3. A trust fund or combination of trust funds;
- 24 4. A guarantee to fund the O&M Activities for the  
25 Upstream Facilities by one or more parent corporations or  
26 subsidiaries, or by one or more unrelated corporations that have  
27 a substantial business relationship with Lockheed Martin;
- 28

58

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 5. A demonstration that Lockheed Martin satisfies the  
2 requirements of 40 C.F.R. Part 264.143(f); or  
3 6. A demonstration, by submittal of its annual report  
4 on Form 10-K filed with the Securities and Exchange Commission,  
5 that Lockheed Martin possesses the requisite financial ability to  
6 assure completion of the O&M Activities for the Upstream  
7 Facilities.  
8 B. The amount of financial security that Lockheed Martin is  
9 required to maintain shall be decreased in the following  
10 increments:  
11 1. Nine years after the Date of Commencement,  
12 Lockheed Martin shall maintain financial security in the amount  
13 of \$ 39 million.  
14 2. Twelve years after the Date of Commencement,  
15 Lockheed Martin shall maintain financial security in the amount  
16 of \$ 31 million.  
17 3. Fifteen years after the Date of Commencement,  
18 Lockheed Martin shall maintain financial security in the amount  
19 of \$ 18 million.  
20 4. Upon decreasing the amount of financial security  
21 as provided by this Paragraph, Lockheed shall make a new  
22 demonstration of such financial security in the manner described  
23 in Paragraph A.1 through A.6 of this Section.  
24 C. Within sixty (60) days of the Effective Date, each  
25 Settling Cash Defendant shall cause the funds in the escrow  
26 account established pursuant to the settlement agreement reached  
27 in the action entitled Lockheed Corporation v. Crane Company,  
28

4473-9098

1 United States District Court, Central District of California No.  
2 CV 94-2717 MRP (Tx) ("Escrow Account") to be transferred into a  
3 segregated account ("Second Consent Decree Account"), which shall  
4 be used to satisfy Lockheed Martin's obligations as required by  
5 this Consent Decree.  
6 D. Within thirty (30) days prior to the Date of  
7 Commencement, Lockheed Martin shall establish a trust account  
8 ("O&M Trust Account"). The O&M Trust Account shall be used to  
9 satisfy Lockheed Martin's obligation to fund the O&M Activities  
10 for the Upstream Facilities and other obligations as required by  
11 this Section XIV (Funding of Response Activities), Section VI  
12 (Performance of the Work), Paragraph C.7, and Section XVIII  
13 (Indemnification and Insurance), of this Consent Decree.  
14 Lockheed Martin also shall fund transition activities and the  
15 Settling Work Defendant's preparation of an integrated O&M manual  
16 for the combined Plant Facilities as agreed to in a separate  
17 agreement between Lockheed Martin and Settling Work Defendant.  
18 1. The costs of O&M Activities with respect to the  
19 Upstream Facilities, including but not limited to the costs of  
20 rectifying any construction defect in the Upstream Facilities,  
21 all costs of additional response actions required by EPA pursuant  
22 to Section VII (Additional Response Actions) related to the  
23 Upstream Facilities, and costs incurred for the Site pursuant to  
24 Section VIII (EPA Periodic Review) shall be paid from the O&M  
25 Trust Account subject to the limitations and in accordance with  
26 the provisions set forth in this Section.  
27 2. All costs of O&M Activities with respect to the  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

4473-9098

1 Downstream Facilities, including but not limited to the costs of  
 2 rectifying any construction defect in the Downstream Facilities,  
 3 and all costs of additional response actions required by EPA  
 4 pursuant to Section VII (Additional Response Actions) related to  
 5 the Downstream Facilities shall be paid directly by the City and  
 6 shall not be subject to reimbursement from the O&M Trust Account.  
 7 The City's contracting and accounting systems shall be  
 8 established so as to clearly distinguish between costs incurred  
 9 for O&M Activities or other activities associated with the  
 10 Upstream Facilities and costs incurred for O&M Activities or  
 11 other activities associated with the Downstream Facilities.

12 3. Prior to the Date of Commencement and  
 13 contemporaneously with the execution of appropriate documents  
 14 under Section XIV, Paragraph L of this Consent Decree, the UAO  
 15 Parties shall execute such agreements as are necessary to assign  
 16 to the City of Burbank any and all express and implied  
 17 warranties, rights, claims or causes of action they have or may  
 18 have as against their construction contractors related to the  
 19 construction of the Blending Facility, specifically including,  
 20 but not limited to, claims for defects in the construction of the  
 21 Blending Facility, but not including claims arising from delays  
 22 in or excess costs of construction.

23 E. Lockheed Martin and the City shall, by January 1, 1999,  
 24 jointly retain an independent cost estimating consultant ("Cost  
 25 Consultant") acceptable to both parties and EPA, whose  
 26 responsibilities shall include preparation of the annual budgets  
 27 and audit reports for O&M Activities with respect to the Upstream  
 28

1 Facilities required by this Section. The Cost Consultant may be  
 2 replaced by mutual agreement of Lockheed Martin and the City upon  
 3 thirty (30) days written notice to EPA and the Cost Consultant,  
 4 subject to approval by EPA. Either the City or Lockheed Martin  
 5 may petition EPA for the replacement of the Cost Consultant.

6 1. If Lockheed Martin, the City and EPA are unable to  
 7 agree upon a Cost Consultant by January 1, 1999, Lockheed Martin  
 8 and the City shall, within thirty (30) days thereafter, each  
 9 submit a list of three (3) cost estimating consultants to the  
 10 other party and to EPA, along with information regarding the  
 11 qualifications of each cost estimating consultant on its list.  
 12 Within ten (10) days after both lists have been submitted, the  
 13 City and Lockheed Martin may each veto one cost estimating  
 14 consultant from the other's list. EPA shall select the Cost  
 15 Consultant from the cost estimating consultants remaining on one  
 16 or both of the lists, unless all such consultants are  
 17 unacceptable to EPA.

18 2. The Cost Consultant may retain a subcontractor to  
 19 perform some of his or her functions, as described herein. Any  
 20 such subcontractor shall be approved by the City, Lockheed Martin  
 21 and EPA prior to performing any work.

22 3. In the event of the resignation of the Cost  
 23 Consultant, the City, Lockheed Martin and EPA shall attempt to  
 24 agree upon the selection of a replacement. If the parties cannot  
 25 agree upon a replacement, the procedures described in Paragraph  
 26 E.1 above shall be employed to select a replacement. The lists  
 27 of three (3) cost estimating consultants referred to in Paragraph  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

4473-9098

1 E.1 shall be submitted forty-five (45) days prior to the  
2 effective date of resignation of the Cost Consultant or such  
3 other date as may be mutually agreed upon by the City, Lockheed  
4 Martin and EPA.

5 4. The Cost Consultant's fees shall be paid from the  
6 O&M Trust Account.

7 F. It shall be the Cost Consultant's responsibility to  
8 independently use his or her best technical judgment to prepare  
9 an annual budget for O&M Activities with respect to the Upstream  
10 Facilities for each of the years during which such O&M Activities  
11 are required by this Consent Decree ("Annual Budget"). The  
12 Annual Budget shall be developed in the following manner:

13 1. No later than one hundred and twenty (120) days  
14 prior to the Date of Commencement, Lockheed Martin shall provide  
15 the Cost Consultant and the City with non-proprietary information  
16 regarding its operation and maintenance costs with respect to the  
17 Upstream Facilities for the prior year.

18 2. Ninety (90) days prior to the Date of Commencement,  
19 and annually thereafter, the City may submit to the Cost  
20 Consultant, Lockheed Martin and EPA its estimate of the cost of  
21 O&M Activities with respect to the Upstream Facilities for the  
22 one-year period beginning on the Date of Commencement or on the  
23 anniversary thereof for the upcoming year. Such an estimate may  
24 be submitted by the City in advance of each of the eighteen (18)  
25 years for which O&M Activities are required by this Decree.

26 3. Sixty (60) days prior to the Date of Commencement,  
27 and annually thereafter, Lockheed Martin and EPA may submit  
28

1 comments to the Cost Consultant on the City's estimate submitted  
2 pursuant to Paragraph F.2 of this Section.

3 4. Thirty (30) days prior to the Date of Commencement,  
4 and annually thereafter, the Cost Consultant shall establish the  
5 Annual Budget based on: (1) O&M Activities expenditures with  
6 respect to the Upstream Facilities during prior years; (2) the  
7 City of Burbank's estimate; (3) Lockheed Martin's comments  
8 thereon, if any; (4) EPA's comments thereon, if any; and (5) any  
9 other cost estimating factors deemed relevant by the Cost  
10 Consultant.

11 5. The Annual Budget shall contain the following cost  
12 categories relating to the Upstream Facilities: direct labor,  
13 contracted-for labor, power, natural gas, liquid phase carbon,  
14 vapor phase carbon, laboratory costs, supplies and materials,  
15 disposal costs, permitting costs, replacement costs, insurance  
16 (including but not limited to insurance described solely in  
17 Exhibit 3 to this Consent Decree), fees of the Cost Consultant  
18 and any other cost categories related to the O&M Activities with  
19 respect to the Upstream Facilities that the Cost Consultant deems  
20 appropriate for cost accounting purposes. In addition, costs of  
21 compliance with the provisions of Sections VII (Additional  
22 Response Actions) with respect to the Upstream Facilities and  
23 VIII (EPA Periodic Review) of this Consent Decree shall be deemed  
24 to be O&M Activities and may be included in the Annual Budget.

25 6. The Cost Consultant shall include a 10% contingency  
26 for each cost category in the Annual Budget.

27 7. Lockheed Martin, the City and EPA shall each have  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

4473-9098

1 the right to invoke dispute resolution pursuant to Section XX  
2 (Dispute Resolution) of this Consent Decree regarding the total  
3 budgeted amount set forth in any Annual Budget, the amount  
4 budgeted for any cost item, the inclusion or exclusion of any  
5 item from the Annual Budget, or any other matter related to the  
6 establishment of the Annual Budget.

7 G. Lockheed Martin shall ensure that the O&M Trust Account  
8 contains funds equal to or in excess of the Annual Budget  
9 established for the upcoming year as of the Date of Commencement,  
10 and as of each anniversary of that date, by causing funds from  
11 the Second Consent Decree Account or its own funds to be  
12 transferred to the O&M Trust Account. The City shall have no  
13 obligation to undertake O&M Activities with respect to the  
14 Upstream Facilities if the O&M Trust Account has not been funded  
15 in the manner required by this Paragraph.

16 H. The City shall submit monthly statements to the trustee  
17 of the O&M Trust Account ("Trustee") for payment. Each statement  
18 shall be broken down into the same cost categories as set forth  
19 in the Annual Budget. The statement shall include copies of all  
20 relevant documentation, including purchasing documents, backup  
21 documentation for all internal costs, and all invoices, including  
22 backup documentation to support all invoiced contracted-for  
23 costs, and a declaration by an authorized representative of the  
24 City that each amount requested in the statement is due and  
25 payable to a party who provided materials or services for O&M  
26 Activities with respect to the Upstream Facilities conducted in  
27 accordance with the Second Consent Decree and the Second Stage  
28

1 O&M Work Plan. The City shall simultaneously provide a copy of  
2 each monthly statement to the Cost Consultant, Lockheed Martin  
3 and EPA.

4 1. Any monthly statement seeking payment for an  
5 expenditure outside a cost category in the Annual Budget and any  
6 statement which will cause the applicable Annual Budget cost  
7 category amount to be exceeded must be accompanied by an  
8 explanation of the necessity for that expenditure.

9 2. Disbursements by the Trustee.

10 a. The Trustee shall promptly pay all amounts  
11 requested in a monthly statement that satisfies the requirements  
12 of this Section. Lockheed Martin and EPA shall have the right to  
13 invoke dispute resolution pursuant to Section XX (Dispute  
14 Resolution) of this Consent Decree with regard to the necessity  
15 for any expenditure for which an explanation is required, within  
16 thirty (30) days of receipt of the monthly statement. If either  
17 Lockheed Martin or EPA invokes dispute resolution as to any  
18 amount included in a monthly statement, EPA shall make a  
19 preliminary determination, within ten (10) working days of  
20 dispute resolution being invoked, concerning whether the disputed  
21 amount should be paid. Such amount shall be promptly reimbursed  
22 to Lockheed Martin if Lockheed Martin thereafter prevails in  
23 dispute resolution.

24 b. In the event that EPA decides to take over  
25 some or all of the work related to the Upstream Facilities  
26 required to be performed by the Settling Work Defendant pursuant  
27 to Section XXII (Covenants Not to Sue by Plaintiffs), Paragraph  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 F, or Section XVIII (Indemnification and Insurance), Paragraph B,  
2 the Trustee shall reimburse EPA within thirty (30) days of EPA's  
3 written demand for EPA's costs not inconsistent with the National  
4 Contingency Plan which are incurred to take over and/or to  
5 perform such work. In the alternative, EPA may elect to be  
6 reimbursed for some or all of such costs as Future Site-Specific  
7 Response Costs pursuant to Section XVII (Reimbursement of  
8 Response Costs).

9 c. Notwithstanding whether EPA elects to be  
10 reimbursed for such costs pursuant to this Section or pursuant to  
11 Section XVII (Reimbursement of Response Costs), EPA shall not be  
12 subject to the requirements of this Section, including but not  
13 limited to Annual Budget and audit requirements, concerning such  
14 costs.

15 d. As is set forth in Section XXII (Covenants Not  
16 to Sue by Plaintiffs), Paragraph F of this Consent Decree, and  
17 subject to the limitations described in that Section and  
18 Paragraph, Lockheed Martin shall have the right to be reimbursed  
19 by Settling Work Defendant for that portion of such costs which  
20 is caused by the necessity for EPA to take over such work. As is  
21 set forth in Section XVIII (Indemnification and Insurance),  
22 Paragraph B, and subject to the limitations described in that  
23 Section and Paragraph, the City of Burbank shall not be required  
24 to reimburse Lockheed Martin for any portion of such costs if EPA  
25 takes over the work pursuant to that Section and Paragraph.

26 3. The Cost Consultant shall audit the City's  
27 requests for payments for expenditures on O&M Activities with  
28

4473-9098

1 respect to the Upstream Facilities on an annual basis. The audit  
2 shall cover the one-year period ending one hundred eighty (180)  
3 days prior to the beginning of the period covered by the next  
4 Annual Budget and the Cost Consultant's audit report ("Audit  
5 Report") shall be provided to the City, Lockheed Martin and EPA  
6 at least one hundred fifty (150) days prior to the beginning of  
7 the period covered by the next Annual Budget. The purpose of the  
8 audit is to: (1) assist the Cost Consultant in preparing the  
9 Annual Budget; and (2) allow the parties to determine whether any  
10 unnecessary costs have been incurred.

11 4. Within sixty (60) days of receipt of an annual  
12 Audit Report, the City shall reimburse the O&M Trust Account for  
13 expenditures found to be unnecessary during the audited period.

14 5. Lockheed Martin, the City and EPA shall each have  
15 the right to invoke dispute resolution with respect to any  
16 finding in an Audit Report.

17 6. The Cost Consultant shall perform a final audit of  
18 the City's request for payments for O&M Activities with respect  
19 to the Upstream Facilities within ninety (90) days following  
20 EPA's approval of the Certificate of Completion pursuant to  
21 Section XV of this Decree. Lockheed and the City shall settle  
22 all accounts with the O&M Trust Account within thirty (30) days  
23 of the issuance of the Cost Consultant's final Audit Report. At  
24 that time, the Cost Consultant shall direct the Trustee and the  
25 Trustee shall be required to pay over all remaining funds in the  
26 O&M Trust Account, if any, to Lockheed Martin. Lockheed Martin,  
27 the City and EPA shall have the right to invoke dispute  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 resolution with regard to the final accounting or the final Audit  
2 Report.

3 I. The City of Burbank shall utilize a competitive bidding  
4 process to secure all services and materials required to perform  
5 O&M Activities with respect to the Upstream Facilities that are  
6 susceptible to contract. Award of any contract to other than the  
7 "lowest responsible bidder" within the meaning of Burbank  
8 Municipal Code § 9-122 (Section 54 of the Charter of the City of  
9 Burbank, as amended January 14, 1971), shall require a  
10 justification by the City pursuant to applicable state and local  
11 law. Lockheed Martin hereby reserves all of its rights under  
12 state or local law concerning award of any such contract to any  
13 person or persons except the "lowest responsible bidder" within  
14 the meaning of Burbank Municipal Code § 9-122.

15 J. For operation of the Upstream Facilities, the City of  
16 Burbank shall utilize the lowest cost power source available  
17 under any of the following options: (1) under ordinances or  
18 resolutions of general application adopted by the City, (2)  
19 mandated by federal law, or (3) in accordance with Public  
20 Utilities Code section 9602 or other applicable state law.  
21 Should a separate power generation facility, or any other capital  
22 improvement not integral to the Upstream Facilities, be proposed  
23 by Lockheed Martin as a capital expenditure under Paragraph K  
24 below, the city will consider such a proposal on the same fair  
25 and equitable basis as it would treat any similar proposal by any  
26 other industrial power consumer in the City. Power for operating  
27 the Upstream Facilities, when provided by the City, shall be  
28

4473-9098

1 billed by the City of Burbank at the lowest rate then charged by  
2 the City for comparable service conditions. As of September 1,  
3 1996, "comparable service conditions" for the Upstream Facilities  
4 are Rate Class "Industrial" and Rate Code "P." If the City  
5 adopts a rate for "comparable service conditions" other than the  
6 rate charged by the City to any public or private school, or  
7 charged to any user under an agreement entered into in  
8 conjunction with a "redevelopment project" pursuant to the  
9 California Redevelopment Act, Health & Safety Code § 33000 et  
10 seq., which provides power at lower cost than Rate Code "P," the  
11 lower rate shall apply to power sold to the Upstream Facilities.

12 K. Lockheed Martin may at any time propose that a capital  
13 expenditure be incurred to reduce O&M expenditures with respect  
14 to the Upstream Facilities. Any such proposal shall be  
15 simultaneously submitted to the Cost Consultant, the City and  
16 EPA. Any such proposal shall be limited to facilities that can  
17 be fully accommodated within "Area F" (except necessary  
18 utilities) as shown on Appendix F to the First Consent Decree.

19 1. Settling Work Defendant shall have no obligation  
20 to operate any separate power generation facility. Nor shall  
21 Settling Work Defendant have any obligation to operate any  
22 capital improvement constructed pursuant to this Paragraph K,  
23 where such capital improvement is not integral to the Upstream  
24 Facilities. It shall be the obligation of Lockheed Martin to  
25 operate any such capital improvement.

26 2. A capital improvement shall be considered to be  
27 "integral to the Upstream Facilities" if such capital improvement  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 either (a) would effectively replace a facility or portion of a  
2 facility constructed by Lockheed Martin pursuant to the First  
3 Consent Decree, or (b) would be intrinsically linked to a  
4 facility or portion of a facility constructed by Lockheed Martin  
5 pursuant to the First Consent Decree.

6 3. The Cost Consultant shall review the proposal and  
7 any comments submitted by the City and/or the O&M Contractor,  
8 and/or EPA, and determine, based on generally accepted cost  
9 engineering principles, whether the capital expenditure is  
10 economically justified based on the size of the expenditure, the  
11 projected O&M savings and the remaining life of the project. The  
12 Cost Consultant may meet with Lockheed Martin, the City and/or  
13 the O&M Contractor, and/or EPA, with respect to the proposal and  
14 comments thereon.

15 4. If the Cost Consultant determines that the capital  
16 expenditure is economically justified, Lockheed Martin may submit  
17 the proposal and a conceptual design of the proposed work to EPA  
18 for approval. The City and/or the O&M Contractor may submit  
19 comments to EPA regarding the proposal and the conceptual design.

20 5. EPA shall review the proposal and the conceptual  
21 design, and any comments submitted by the City and/or the O&M  
22 Contractor, and determine based on relevant regulations and  
23 policies (which may include but shall not be limited to the  
24 remedy selection criteria set forth in the National Contingency  
25 Plan), whether the proposed capital expenditure may be  
26 incorporated into the remedy. EPA shall document its decision in  
27 accordance with applicable laws and regulations. EPA may meet  
28

4473-9098

1 with Lockheed Martin and/or the City and/or the O&M Contractor  
2 with respect to the proposal and conceptual design and any  
3 comments thereon. Nothing contained in this Paragraph shall be  
4 deemed or construed to limit or abrogate in any way the City's  
5 exercise of its police powers or EPA's authority under CERCLA.

6 6. If EPA approves the conceptual design, Lockheed  
7 Martin shall submit a final design for the proposed work. If EPA  
8 approves the final design, Lockheed Martin shall proceed to  
9 implement the capital improvement. Lockheed Martin shall be  
10 solely responsible for funding and constructing the capital  
11 improvement.

12 7. Lockheed Martin shall take reasonable measures to  
13 minimize any noise and other disruptions that may be associated  
14 with the construction of any capital improvements.

15 8. Lockheed Martin shall defend, indemnify and hold  
16 harmless the City of Burbank with respect to actions against the  
17 City based upon disturbances related to the installation of  
18 capital improvements.

19 L. With the exception of the four extraction wells (VO-1,  
20 2, 3 and 4) located at the former Lockheed Martin Plant B-1 in  
21 Burbank, California, as depicted in Appendix 8 to this Consent  
22 Decree, both the Upstream Facilities and the Downstream  
23 Facilities shall be acknowledged by the City as its property for  
24 all purposes; provided, however, that any capital improvement  
25 constructed pursuant to Paragraph K of this Section that is not  
26 integral to the Upstream Facilities, including but not limited to  
27 any separate power generation facility, shall not be considered  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 or deemed to be the property of the City. Any such capital  
2 improvement shall be the property of Lockheed Martin, unless the  
3 City or a third party agrees to own the improvement. On or  
4 before the Date of Commencement, the UAO Parties, Lockheed Martin  
5 and the City shall execute appropriate writings documenting the  
6 City's ownership interest in such property. As to the extraction  
7 wells located on Lockheed Martin property, there shall be a  
8 recorded right of access.

9 M. Commencing from the Date of Commencement, and for a  
10 period not to exceed the applicable state statutes of limitations  
11 or statutes of repose under which Lockheed Martin may bring such  
12 an action against its design contractors less sixty (60) days,  
13 the Settling Work Defendant may assert as against Lockheed Martin  
14 that any of the Upstream Facilities' failure (if any) to perform  
15 as originally designed is due to a Design Defect. Commencing  
16 upon the Effective Date of this Consent Decree (as defined in  
17 Section XXVIII), and for a period not to exceed the applicable  
18 state statutes of limitations or statutes of repose under which  
19 the UAO Parties may bring such an action against their design  
20 contractors less sixty (60) days, the Settling Work Defendant may  
21 assert as against the UAO Parties that the Blending Facility's  
22 failure (if any) to perform as originally designed is due to a  
23 Design Defect. The Parties agree that the date of substantial  
24 completion of the Upstream Facilities was March 1, 1994 and the  
25 date of the substantial completion of the Blending Facility was  
26 January 6, 1996.

27 1. The Settling Work Defendant, Lockheed, the UAO  
28

4473-9098

1 Parties and EPA agree to the following procedures for the  
2 resolution of disputes arising from claims that the Upstream  
3 Facilities or the Blending Facility have failed to perform as  
4 originally designed due to a Design Defect. These disputes may  
5 include but are not limited to a determination as to whether or  
6 not a failure to perform as originally designed occurred, whether  
7 the failure (if any) was due to a Design Defect, the nature,  
8 extent and scope of the repair or other work required to cause  
9 the facility in question to meet designated operating standards,  
10 the reasonableness and necessity of the costs incurred or to be  
11 incurred for such work, and the reasonableness, necessity and  
12 timeliness of steps taken to address or mitigate such damage  
13 claims.

14 a. Upon the occurrence of a facility's failure to  
15 perform as originally designed which the Settling Work Defendant  
16 alleges to be due, in whole or in part, to a Design Defect in the  
17 Upstream Facilities or the Blending Facility:

18 (1) If the alleged occurrence or failure  
19 causes or threatens a release of Waste Material from the Site  
20 that constitutes an emergency situation or may present an  
21 immediate threat to public health or welfare or the environment,  
22 the Settling Work Defendant shall take all actions and provide  
23 notifications required by Section XVI (Emergency Response). If  
24 the alleged occurrence or failure does not come within the  
25 provisions of Section XVI (Emergency Response), Settling Work  
26 Defendant shall immediately advise the EPA of the alleged  
27 occurrence or failure, by telephone or facsimile transmission.  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 (2) Settling Work Defendant shall provide a  
2 written Notice of Design Defect to EPA within ten (10) days of  
3 the date when Settling Work Defendant knew, or reasonably should  
4 have known that the alleged occurrence or failure was caused by  
5 an alleged Design Defect. The written Notice of Design Defect  
6 shall include the basis for the allegation. The Settling Work  
7 Defendant shall concurrently provide a copy of the written Notice  
8 of Design Defect to either: 1) Lockheed Martin if the alleged  
9 Design Defect relates to the Upstream Facilities, or 2) the UAO  
10 Parties if the alleged Design Defect relates to the Blending  
11 Facility.

12 b. The Settling Work Defendant shall take such  
13 steps as EPA directs to commence repairs to the facility, and  
14 shall take reasonable steps to mitigate all damages and costs  
15 incurred as a result of the alleged Design Defect. Within five  
16 (5) days of undertaking such steps, the Settling Work Defendant  
17 shall advise EPA and all interested Parties, in writing and by  
18 facsimile transmission, of the repairs and steps it has taken or  
19 intends to undertake.

20 c. The Parties shall cooperate with one another  
21 and immediately make available to each other: all facilities  
22 pertaining to the failure and the alleged Design Defect; all  
23 records pertaining to the failure and the alleged Design Defect;  
24 all records pertaining to the operations and maintenance of the  
25 facility including all repair records, all work plans or designs  
26 for repair or mitigation of damages; all persons with information  
27 about the failure and the alleged Design Defect; and all systems  
28

4473-9098

1 that are claimed to be defective. The information to be made  
2 available by the UAO Parties and Lockheed Martin shall include  
3 but shall not be limited to applicable contracts and  
4 correspondence with Lockheed Martin's or the UAO Parties' design  
5 contractors, internal documentation relating to the design of the  
6 facility with the alleged Design Defect, and "as-builts" of the  
7 facility with the alleged Design Defect. The Parties shall make  
8 good faith efforts to preserve evidence and information. The  
9 Settling Work Defendant's good faith efforts may include but  
10 shall not be limited to maintaining a videotape record or log of  
11 the status or condition of the facility prior to the performance  
12 of repairs or alterations, where practicable.

13 2. Not less than fifteen (15) nor more than thirty  
14 (30) days after receipt of the Settling Work Defendant's written  
15 Notice of Design Defect, the EPA shall make a Preliminary  
16 Finding.

17 a. Lockheed Martin or the UAO Parties may submit  
18 a written or oral response to the Settling Work Defendant's  
19 allegation within the fifteen (15) days.

20 b. The EPA's Preliminary Finding shall include a  
21 preliminary determination as to whether the affected facility or  
22 facilities failed to perform as originally designed; whether that  
23 failure was, in whole or in part, due to a Design Defect; a  
24 preliminary allocation of financial responsibility among the  
25 Settling Work Defendant, Lockheed Martin and the UAO Parties; and  
26 a preliminary finding as to the reasonableness and necessity of  
27 any repairs or other work done or proposed by the Settling Work  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Defendant as a result of the alleged Design Defect.

2 c. According to the preliminary allocation of  
3 financial responsibility in the EPA Preliminary Finding, the  
4 Settling Work Defendant, Lockheed Martin, and/or the UAO Parties  
5 shall finance the work deemed necessary by EPA to cause the  
6 affected facility to perform as originally designed, as follows.

7 (1) If EPA determines that the failure was  
8 caused, in whole or in part, by a Design Defect in any of the  
9 Upstream Facilities, Lockheed Martin shall, within twenty-five  
10 (25) days of receipt of the EPA Preliminary Finding, or within  
11 twenty-five (25) days of receipt of an itemized statement by the  
12 Settling Work Defendant of all repairs or other work performed or  
13 to be undertaken as a result of the alleged Design Defect,  
14 whichever is later, remit to the Settling Work Defendant the cost  
15 of all such work which Lockheed is required to finance pursuant  
16 to the preliminary allocation of financial responsibility.

17 (2) If EPA determines that the failure was  
18 caused, in whole or in part, by a Design Defect in the Blending  
19 Facility, the UAO Parties shall, within twenty-five (25) days of  
20 receipt of the EPA Preliminary Finding, or within twenty-five  
21 (25) days of receipt of an itemized statement by the Settling  
22 Work Defendant of all repairs or other work performed or to be  
23 undertaken as a result of the alleged Design Defect, whichever is  
24 later, remit to the Settling Work Defendant the cost of all such  
25 work which the UAO Parties are required to finance pursuant to  
26 the preliminary allocation of financial responsibility. Among  
27 the UAO Parties, the obligations of this Paragraph shall be joint  
28

4473-9098

1 and several.

2 (3) If EPA determines that the failure of  
3 the affected facility was not caused, in whole or in part, by a  
4 Design Defect in the Upstream Facilities or the Blending  
5 Facility, the Settling Work Defendant and Lockheed Martin shall  
6 finance such work as these parties are required to finance  
7 pursuant to this Section, Paragraphs A-L.

8 (4) The Settling Work Defendant shall use  
9 such funds as are remitted by Lockheed Martin or the UAO Parties  
10 pursuant to the Preliminary Finding to pay for work necessary to  
11 cause the facility with the alleged Design Defect to perform as  
12 originally designed and for no other purpose.

13 (5) The Preliminary Finding may require a  
14 party whose facility has been determined to have a Design Defect  
15 to provide for advance or ongoing funding of any work necessary  
16 to cause the affected facility to perform as originally designed.

17 (6) The Preliminary Finding also may require  
18 the Settling Work Defendant to account for expenditures of funds  
19 remitted to it under this Paragraph, and to reimburse any party  
20 who has remitted such funds if the amount remitted exceeds the  
21 expenditures necessary to perform the work necessary to cause the  
22 affected facility to perform as originally designed.

23 (7) EPA shall have continuing jurisdiction  
24 over the implementation of the Preliminary Finding.

25 d. Subject to EPA's approval, the Settling Work  
26 Defendant shall perform such work as is necessary to cause the  
27 affected facility to perform as originally designed. EPA may  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 require the Settling Work Defendant to submit a schedule and work  
2 plan for such work within a specified period of time. Such  
3 schedule(s) and work plan(s) shall be submitted, approved and  
4 implemented in accordance with Section XII (Submissions Requiring  
5 Agency Approval).

6 3. Not less than ninety (90) nor more than one hundred  
7 twenty (120) days after receipt of the Settling Work Defendant's  
8 Notice of Design Defect, the EPA shall make a further evaluation  
9 and issue a Further Determination based upon the following  
10 procedure:

11 a. The Settling Work Defendant, Lockheed Martin  
12 and/or the UAO Parties, upon receipt of a copy of a Notice of  
13 Design Defect pursuant to Paragraph M.1.a.2 of this Section shall  
14 have sixty (60) days from receipt of the statement to further  
15 inspect the facilities and submit a written statement to EPA.  
16 Any such Settling Defendant may request the opportunity to make  
17 an oral presentation to the EPA by sending written notice of such  
18 intent to EPA and other Settling Defendants who receive a copy of  
19 the Notice of Design Defect. EPA shall set a reasonable date,  
20 time and location for the presentation. The EPA, in its  
21 discretion, may require oral presentations from the affected  
22 Settling Defendants.

23 b. If any party submits a written statement as  
24 described in Paragraph M.3.a of this Section, EPA shall issue a  
25 Further Determination. In the Further Determination, if any, EPA  
26 shall determine whether or not a failure to perform as originally  
27 designed occurred; whether the failure (if any) was due, in whole  
28

4473-9098

1 or in part, to a Design Defect; the nature, extent and scope of  
2 any repairs or other work required to cause the facility to  
3 perform as originally designed; the reasonableness and necessity  
4 of the costs incurred or to be incurred for such work; the  
5 reasonableness, necessity and timeliness of steps taken to  
6 address or mitigate damage claims; the comparative fault of  
7 Settling Work Defendant, Lockheed Martin and/or the UAO Parties;  
8 and an allocation of financial responsibility among Settling Work  
9 Defendant, Lockheed Martin and/or the UAO Parties. EPA shall  
10 provide written notice of its decision to the parties..

11 c. According to the allocation of financial  
12 responsibility in the EPA Further Determination:

13 (1) If EPA determines that the failure was  
14 caused, in whole or in part, by a Design Defect in any of the  
15 Upstream Facilities, Lockheed Martin shall, within twenty-five  
16 (25) days of receipt of the EPA Further Determination, or within  
17 twenty-five (25) days of receipt of an itemized statement by the  
18 Settling Work Defendant of all repairs or other work performed or  
19 to be undertaken as a result of the alleged Design Defect,  
20 whichever is later, 1) remit to the Settling Work Defendant the  
21 cost of all such work which Lockheed Martin is required to  
22 finance by the Further Determination, less any portion of such  
23 amounts previously remitted to the Settling Work Defendant  
24 pursuant to the Preliminary Finding, and 2) reimburse other  
25 Settling Defendant(s) if required by the Further Determination.

26 (2) If EPA determines that the failure was  
27 caused, in whole or in part, by a Design Defect in the Blending  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Facility, the UAO Parties shall, within twenty-five (25) days of  
2 receipt of the EPA Further Determination, or within twenty-five  
3 (25) days of receipt of an itemized statement by the Settling  
4 Work Defendant of all repairs or other work performed or to be  
5 undertaken as a result of the alleged Design Defect, whichever is  
6 later, 1) remit to the Settling Work Defendant the cost of all  
7 such work which the UAO Parties are required to finance pursuant  
8 to the Further Determination, less any portion of such amounts  
9 previously remitted to the Settling Work Defendant pursuant to  
10 the Preliminary Finding, and 2) reimburse other Settling  
11 Defendant(s) if required by the Further Determination. Among the  
12 UAO Parties, the obligations of this Paragraph shall be joint and  
13 several.

14 (3) If EPA determines that the failure of  
15 the affected facility was not caused, in whole or in part, by a  
16 Design Defect, the Settling Work Defendant and Lockheed Martin  
17 shall finance such work as these parties are required to finance  
18 pursuant to this Section, Paragraphs A-L. If required by the  
19 Further Determination, Settling Work Defendant shall reimburse  
20 Lockheed Martin or the UAO Parties for amounts advanced pursuant  
21 to the Preliminary Finding.

22 (4) The Settling Work Defendant shall use  
23 such funds as are remitted by Lockheed Martin or the UAO Parties  
24 pursuant to the Further Determination to pay for work necessary  
25 to cause the facility with the alleged Design Defect to perform  
26 as originally designed and for no other purpose.

27 (5) The Further Determination may require a  
28

4473-9098

1 party whose facility has been determined to have a Design Defect  
2 to provide for advance or ongoing funding of any work necessary  
3 to cause the affected facility to perform as originally designed.

4 (6) The Further Determination shall require  
5 the Settling Work Defendant to account for expenditures of funds  
6 remitted to it under this Paragraph M, and to reimburse any  
7 party who has remitted such funds if the amount remitted exceeds  
8 the expenditures necessary to perform the work necessary to cause  
9 the affected facility to perform as originally designed. The  
10 Further Determination also shall require that the Settling Work  
11 Defendant make any such reimbursement within a reasonable,  
12 specified period of time.

13 (7) EPA shall have continuing jurisdiction  
14 over the Further Determination.

15 4. If a dispute exists among Settling Work Defendant,  
16 Lockheed Martin and/or the UAO Parties as to the EPA Further  
17 Determination, the Parties' participation in or satisfaction of  
18 the terms or conditions set forth in the EPA Preliminary Finding  
19 or Further Determination shall not act as a waiver of any claims  
20 or defenses by any party, and the Settling Work Defendant,  
21 Lockheed Martin and/or the UAO Parties may proceed to seek  
22 judicial review of such a dispute as follows:

23 a. The Settling Work Defendant, Lockheed Martin  
24 or the UAO Parties may seek a final resolution of the dispute  
25 between or among them concerning the EPA Further Determination by  
26 filing suit against one another in a court of competent  
27 jurisdiction. Nothing in this Section shall be construed to  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 provide any party with a claim or cause of action against the  
 2 United States or the State.

3 b. The court shall determine all issues regarding  
 4 the dispute among the Settling Work Defendant, Lockheed Martin,  
 5 and/or the UAO Parties concerning the EPA Further Determination  
 6 de novo. Discovery and evidence as to such dispute(s) shall not  
 7 be limited to the Administrative Record, except that nothing in  
 8 this Paragraph shall be construed to affect the restrictions on  
 9 judicial review set forth in CERCLA section 113 (j) and (k), 42  
 10 U.S.C. § 9613(j)-(k) or California Health & Safety Code section  
 11 25356.1(g), Cal. Health & Safety Code § 25356.1(g).

12 c. Upon the entry of a final judgment by the  
 13 court or upon final resolution of the dispute as agreed upon by  
 14 the parties, if the court's determination and allocation or the  
 15 parties' final resolution differs from that set forth in the  
 16 EPA's Further Determination, then each party shall be reimbursed  
 17 or the responsible party shall pay another party's previous  
 18 allocation so that each party's final share of total costs shall  
 19 correspond to the court's judgment or the parties' final  
 20 resolution. Any such reimbursement may include pre-judgment  
 21 interest pursuant to California Civil Code section 3287, Cal.  
 22 Civ. Code § 3287, unless otherwise agreed by the parties. The  
 23 court's final judgment or the parties' final resolution shall  
 24 supersede EPA's Further Determination. Should additional costs  
 25 be incurred relating to the Design Defect(s) at issue after the  
 26 court's final judgment or the parties' final resolution, the  
 27 court's final judgment or the parties' final resolution shall be  
 28

4473-9098

1 followed by the parties and EPA.

2 N. Funding of Repairs Required by Earthquakes or Other  
 3 Force Majeure Events

4 1. Definition of "Major Damage" As used in this  
 5 Paragraph, "Major Damage" shall mean physical damage which EPA  
 6 has determined was caused by a force majeure event pursuant to  
 7 Section XIX (Force Majeure) of this Consent Decree and will cost  
 8 more than the following amounts to repair or rebuild with respect  
 9 to the affected Plant Facilities:

10 a. more than one million dollars (\$ 1,000,000)  
 11 with respect to the Upstream Facilities; or

12 b. more than one hundred and fifty thousand  
 13 dollars (\$ 150,000) with respect to the Blending Facility.

14 2. Definition of "Uninsurable Force Majeure Event"  
 15 "Uninsurable Force Majeure Event" shall mean a force majeure  
 16 event as defined in Section XIX (Force Majeure) of this Consent  
 17 Decree, other than an earthquake or damage resulting from an  
 18 earthquake, that causes physical damage to any of the Plant  
 19 Facilities which is not covered by any insurance maintained by  
 20 the Settling Work Defendant, the O&M Contractor or its  
 21 subcontractors, including but not limited to insurance maintained  
 22 pursuant to this Consent Decree or Exhibit 3 hereto, and which  
 23 EPA has determined such persons could not have insured at a  
 24 commercially reasonable cost.

25 3. Earthquake  
 26 In the event of an earthquake which causes damage to any of  
 27 the Plant Facilities, including but not limited to Major Damage  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 to the Upstream Facilities and/or the Blending Facility, and EPA  
2 determines that the damage should be repaired:

3 a. Lockheed Martin shall fund the repair and/or  
4 rebuilding of the affected Upstream Facilities up to the first  
5 one million dollars (\$ 1,000,000) of necessary expenditure,  
6 and/or the repair and/or rebuilding of the Blending Facility up  
7 to the first one hundred and fifty thousand dollars (\$ 150,000)  
8 of necessary expenditure; and

9 b. The City of Burbank shall fund the repair  
10 and/or rebuilding of the other affected Downstream Facilities.

11 4. Uninsurable Force Majeure Event

12 In the event of an Uninsurable Force Majeure Event that  
13 causes damage, including but not limited to Major Damage to the  
14 Upstream Facilities and/or the Blending Facility, and EPA  
15 determines that the damage should be repaired:

16 a. Lockheed Martin shall fund the repair and/or  
17 rebuilding of the affected Upstream Facilities;

18 b. The Settling Cash Defendants shall fund the  
19 repair and/or rebuilding of the Blending Facility up to the first  
20 one hundred and fifty thousand dollars (\$ 150,000) of necessary  
21 expenditure. The obligations of this Paragraph shall be joint  
22 and several among the Settling Cash Defendants; and

23 c. The City of Burbank shall fund the repair  
24 and/or rebuilding of the other affected Downstream Facilities.

25 5. Force Majeure Events Other Than Earthquake or  
26 Uninsurable Force Majeure Events

27 In the event of a force majeure event (as is defined in  
28 Section XIX (Force Majeure)), other than an earthquake or

4473-9098

1 Uninsurable Force Majeure Event, which causes damage, including  
2 but not limited to Major Damage to the Upstream Facilities and/or  
3 the Blending Facility, Lockheed Martin and/or the City of Burbank  
4 shall fund the repair and/or rebuilding of the affected Plant  
5 Facilities pursuant to their respective funding obligations as  
6 described in this Section (Funding of Response Activities), and  
7 otherwise in accordance with this Consent Decree, including but  
8 not limited to Sections VI (Performance of the Work), VII  
9 (Additional Work), and XIX (Force Majeure).

10 6. In the event of Major Damage to the Upstream  
11 Facilities and/or the Blending Facility as the result of an  
12 earthquake or to the Blending Facility as the result of an  
13 Uninsurable Force Majeure Event, and except as to those Settling  
14 Defendants described in Appendix 3 to this Consent Decree, EPA  
15 reserves all of its rights against Settling Defendants pursuant  
16 to Section XXII (Covenants Not to Sue by Plaintiffs), including  
17 but not limited to the right to issue an administrative order to  
18 require the complete repair and/or rebuilding of the affected  
19 Plant Facilities.

20 7. If EPA exercises its rights pursuant to Paragraph  
21 N.6 of this Section, the Settling Defendants agree between and  
22 among themselves that:

23 a. In the event of an earthquake, Lockheed  
24 Martin and the Settling Cash Defendants shall not seek funding,  
25 contribution or reimbursement from the City of Burbank for  
26 funding any repairs and/or rebuilding that EPA determines should  
27 be made to the Upstream Facilities and/or the Blending Facility;  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 and the City shall not seek funding, contribution or  
 2 reimbursement from Lockheed Martin or the Settling Cash  
 3 Defendants for funding any repairs and/or rebuilding that EPA  
 4 determines should be made to the Downstream Facilities; and  
 5           b. In the event of an Uninsurable Force Majeure  
 6 Event, the Settling Cash Defendants shall not seek funding,  
 7 contribution or reimbursement from the City of Burbank or  
 8 Lockheed Martin for funding any repairs and/or rebuilding that  
 9 EPA determines should be made to the Blending Facility; the City  
 10 shall not seek funding, contribution or reimbursement from  
 11 Lockheed Martin or the Settling Cash Defendants for any repairs  
 12 and/or rebuilding that EPA determines should be made to the  
 13 Downstream Facilities; and Lockheed Martin shall not seek  
 14 funding, contribution or reimbursement from the Settling Work  
 15 Defendant or the Settling Cash Defendants for any repair and/or  
 16 rebuilding that EPA determines should be made to the Upstream  
 17 Facilities.  
 18           8. Lockheed Martin's, the City of Burbank's, and/or  
 19 the Settling Cash Defendants' obligations to make repairs or to  
 20 rebuild pursuant to this Paragraph shall cease if EPA notifies  
 21 the affected party that EPA does not intend to require the repair  
 22 and/or rebuilding of the affected Plant Facilities.  
 23           9. Any repairs that EPA determines should be made to  
 24 the Plant Facilities pursuant to this Paragraph shall be  
 25 performed by the City of Burbank and funded as provided in this  
 26 Paragraph.  
 27           10. Any disputes between EPA and any of the Parties,  
 28

4473-9098

1 or between or among any of the Settling Defendants concerning the  
 2 cause, cost or necessity for any repairs and/or rebuilding of the  
 3 affected Plant Facilities pursuant to this Paragraph shall be  
 4 subject to dispute resolution pursuant to Section XX of this  
 5 Consent Decree (Dispute Resolution). Notwithstanding the  
 6 foregoing:  
 7           a. If the City of Burbank claims that an  
 8 earthquake or Uninsurable Force Majeure Event necessitates the  
 9 repair and/or rebuilding of the Plant Facilities, and EPA  
 10 determines that the repair and/or rebuilding should be made, EPA  
 11 shall make an initial determination whether such work is required  
 12 as the result of an earthquake or Uninsurable Force Majeure  
 13 Event. As appropriate, EPA may also make an initial  
 14 determination as to the means and manner of funding to be  
 15 provided by the designated Party or Parties responsible for  
 16 funding such work pursuant to this Paragraph.  
 17           b. The Parties shall fund and/or perform such  
 18 repairs as EPA determines are necessary according to EPA's  
 19 initial determination, and otherwise in accordance with their  
 20 respective obligations under this Section (Funding Of Response  
 21 Activities).. If a Party prevails in dispute resolution on the  
 22 contention that it should not have been required to fund repairs  
 23 pursuant to this Paragraph, such Party shall be promptly  
 24 reimbursed by the appropriate Party or Parties determined to be  
 25 responsible for funding such repairs in accordance with the final  
 26 decision in the Dispute Resolution.

27  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 XV. CERTIFICATION OF COMPLETION  
 2 Defendants' obligations for performance of the work pursuant  
 3 to Section VI of this Consent Decree and Funding of Response  
 4 Activities pursuant to Section XIV of this Consent Decree shall  
 5 be deemed satisfied upon issuance of the Certification of  
 6 Completion. It is anticipated by the Parties that the  
 7 certification process set forth below will occur eighteen (18)  
 8 years after the Date of Commencement.

9 A. Completion of the O&M Activities.  
 10 1. At least ninety (90) days prior to the date that  
 11 Settling Work Defendant anticipates that the work will have been  
 12 fully performed, Settling Work Defendant shall submit a written  
 13 report requesting certification to EPA for approval, with a copy  
 14 to the State, pursuant to Section XII (Submissions Requiring  
 15 Agency Approval). During the 90-day period, EPA shall determine  
 16 whether dismantling and/or decommissioning of any facilities  
 17 constructed pursuant to the First Consent Decree or UAO 92-12 is  
 18 required pursuant to Section VI (Work to be Performed), Paragraph  
 19 C.6 of this Consent Decree.

20 2. In the Settling Work Defendant's report seeking  
 21 Certification of Completion, a registered professional engineer  
 22 and the Settling Work Defendant's Project Coordinator shall state  
 23 that the O&M Activities, except for dismantling and/or  
 24 decommissioning activities, will be complete in full satisfaction  
 25 of the requirements of this Consent Decree. The written report  
 26 shall include all appropriate and necessary information to a  
 27 determination of completion, including the date upon which  
 28

4473-9098

1 completion is anticipated, and if appropriate, drawings signed  
 2 and stamped by a professional engineer. The report shall contain  
 3 the following statement, signed by the Settling Work Defendant's  
 4 authorized Project Coordinator:

5 "To the best of my knowledge, after thorough  
 6 investigation, I certify that the information contained  
 7 in or accompanying this submission is true, accurate  
 8 and complete. I am aware that there are significant  
 9 penalties for submitting false information, including  
 10 the possibility of fine and imprisonment for knowing  
 11 violations."

12 3. If EPA deems necessary, EPA may conduct a pre-  
 13 certification inspection concerning completion of the O&M  
 14 Activities. If, after review of the written report and  
 15 conducting a pre-certification inspection, if EPA deems such an  
 16 inspection necessary, and after reasonable opportunity to review  
 17 and comment by the State, EPA determines that the O&M Activities  
 18 or any portion thereof except dismantling and/or decommissioning  
 19 activities will not be completed in accordance with this Consent  
 20 Decree on the date anticipated by Settling Work Defendant, EPA  
 21 will notify the Settling Work Defendant in writing of the  
 22 activities that must be undertaken to complete the O&M Activities  
 23 except dismantling and/or decommissioning activities.

24 4. EPA will set forth in the notice to the Settling  
 25 Work Defendant a schedule for performance of such activities  
 26 consistent with this Consent Decree and the Second Stage O&M Work  
 27 Plan or require the Settling Work Defendant to submit a schedule  
 28 to EPA for approval pursuant to Section XII (Submissions  
 Requiring Agency Approval). Settling Work Defendant shall  
 perform all activities described in the notice in accordance with

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 the specifications and schedules established pursuant to this  
2 Paragraph, subject to its right to invoke the dispute resolution  
3 procedures set forth in Section XX (Dispute Resolution).

4 5. If EPA concludes, based on the initial or any  
5 subsequent report(s) requesting Certification of Completion and  
6 after a reasonable opportunity for review and comment by the  
7 State, that the O&M Activities, except for dismantling or  
8 decommissioning activities, have been fully performed in  
9 accordance with this Consent Decree, EPA will so certify in  
10 writing to all Settling Defendants. This certification shall  
11 constitute the Certification of Completion of the O&M Activities  
12 for purposes of this Consent Decree, including, but not limited  
13 to, Section XXII (Covenants Not to Sue by Plaintiffs).  
14 Certification of Completion of the O&M Activities shall not  
15 affect Settling Work Defendant's or any other Settling  
16 Defendant's other obligations under this Consent Decree,  
17 including, but not limited to, Lockheed Martin's obligation to  
18 dismantle or decommission the treatment and blending facilities,  
19 if such dismantling and/or decommissioning activities are not  
20 complete at the time the Certification of Completion issues.

21 6. As to Lockheed Martin, the Certification of  
22 Completion shall not apply until Lockheed Martin has completed  
23 any dismantling and/or decommissioning activities EPA may require  
24 pursuant to this Section.

25 B. Dismantling and/or Decommissioning of Facilities.

26 1. If, during the 90-day period referenced in  
27 Paragraph A.1 of this Section, EPA determines that dismantling  
28

4473-9098

1 and/or decommissioning of the treatment and/or blending  
2 facilities is required, Lockheed Martin shall, if requested by  
3 EPA, submit a work plan for such activities to EPA, with a copy  
4 to the State, in accordance with Section XII of this Consent  
5 Decree (Submissions Requiring Agency Approval). At least ninety  
6 (90) days prior to the date Lockheed Martin anticipates that  
7 dismantling and/or decommissioning activities will have been  
8 fully completed, Lockheed Martin shall submit a written report to  
9 EPA requesting approval of such work, and confirmation that such  
10 work is complete, with a copy to the State, pursuant to Section  
11 XII (Submissions Requiring Agency Approval).

12 2. The report and EPA's response to the report,  
13 including but not limited to an inspection of the work and/or a  
14 notice concerning additional work to be performed, shall conform  
15 to the applicable requirements, as determined by EPA, of  
16 Paragraph A.2-5 of this Section.

17 3. If EPA has determined that dismantling and/or  
18 decommissioning is required and confirms that such work is  
19 complete, EPA shall promptly issue a Certificate of Completion to  
20 Lockheed Martin, with a copy to the State. If EPA has determined  
21 that dismantling and/or decommissioning is not required, it shall  
22 issue a Certificate of Completion to Lockheed Martin promptly  
23 upon making that determination.  
24  
25  
26  
27

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 XVI. EMERGENCY RESPONSE

2 In the event of any action or occurrence during the  
3 performance of the O&M Activities which causes or threatens a  
4 release of Waste Material from the Site that constitutes an  
5 emergency situation or may present an immediate threat to public  
6 health or welfare or the environment, Settling Work Defendant  
7 shall, subject to this Section, immediately take all appropriate  
8 action to prevent, abate, or minimize such release or threat of  
9 release. Settling Work Defendant shall report such a situation  
10 to the appropriate regulatory authorities as required by law. As  
11 soon as possible and reasonable under the circumstances, but in  
12 no event more than one Working Day after making the report  
13 required by law, Settling Work Defendant shall notify EPA's  
14 Project Coordinator, or if the Project Coordinator is  
15 unavailable, EPA's Alternate Project Coordinator. If neither of  
16 these individuals is available, Settling Work Defendant shall  
17 notify the Emergency Response Unit, EPA, Region IX. Settling  
18 Work Defendant shall take such actions in consultation with EPA's  
19 Project Coordinator or other available authorized EPA officer and  
20 in accordance with all applicable provisions of the Health and  
21 Safety Plans, the Contingency Plans, and any other applicable  
22 plans or documents developed pursuant to the Second Stage SOW or  
23 the Second Stage O&M Work Plan. In the event that Settling Work  
24 Defendant fails to take appropriate response action as required  
25 by this Section, and EPA or, as appropriate, the State takes such  
26 action instead, Settling Work Defendant shall reimburse EPA and  
27 the State all costs of the response action not inconsistent with  
28

4473-9098

1 the NCP pursuant to Section XVII (Reimbursement of Response  
2 Costs).

3 Nothing in the preceding Paragraph or in this Consent  
4 Decree shall be deemed to limit any authority of the United  
5 States, or the State, to take, direct, or order all appropriate  
6 action or to seek an order from the Court to protect human health  
7 and the environment or to prevent, abate, respond to, or minimize  
8 an actual or threatened release of Waste Material on, at, or from  
9 the Site.

10 XVII. REIMBURSEMENT OF RESPONSE COSTS

11 A. Within sixty (60) days of the Effective Date of this  
12 Consent Decree as defined in Section XXVIII (Effective Date),  
13 Lockheed Martin shall:

14 1. Pay to the United States \$ 11,827,869 in the form  
15 of an EFT to the U.S. Department of Justice Lockbox referencing  
16 the San Fernando Valley Superfund Site/Burbank Operable Unit, and  
17 referencing CERCLA Number SSID #59, DOJ Case Number 90-11-2-442  
18 and USAO File No. 91-03-463 in reimbursement of Past Basin-wide  
19 Response Costs.

20 2. Provide written verification to EPA regarding EFT  
21 transfers pursuant to this Section as specified in Section XXVII  
22 (Notices and Submissions).

23 3. Pay to the State \$ 22,348.60 in reimbursement of  
24 Past Basin-wide Response Costs incurred by the State and  
25 \$ 25,264.14 in reimbursement of Past Site-Specific Response Costs  
26 incurred by the State in the form of a certified check or checks  
27 made payable to the State of California, Department of Toxic  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Substances Control, Project No. 300173. Lockheed Martin shall  
 2 send the certified check(s) to: Department of Toxic Substances  
 3 Control, Accounting Office, 400 P Street, 4th floor, Sacramento,  
 4 California, 95814.

5 B. Lockheed Martin shall reimburse the United States and  
 6 the State for all Future Site-Specific Response Costs not  
 7 inconsistent with the National Contingency Plan incurred by the  
 8 United States and the State. The United States and the State  
 9 will send Lockheed Martin bills for Future Site-Specific Response  
 10 Costs incurred by EPA, DOJ, the State and their contractors no  
 11 more frequently than annually; provided, however, that failure to  
 12 include all such costs in the submittal during any calendar year  
 13 will not preclude EPA or the State from submitting such costs in  
 14 any subsequent year. EPA's Agency Financial Management System  
 15 Summary Data (SCORES) Report or equivalent shall constitute  
 16 documentation of EPA's costs. Lockheed Martin shall make payment  
 17 within sixty (60) days of the date of each bill requiring  
 18 payment, except as otherwise provided in this Section, Paragraphs  
 19 C and D. Lockheed Martin shall make all payments required by  
 20 this Paragraph in the following manner: Lockheed Martin shall  
 21 transmit such amounts in the form of a EFT to the U.S. Department  
 22 of Justice Lockbox referencing the San Fernando Valley Superfund  
 23 Site/Burbank Operable Unit, and referencing CERCLA Number SSID #  
 24 L6, DOJ Case Number 90-11-2-442 and USAO File No. 91-03-463.

25 C. Lockheed Martin may contest a bill for Future Site-  
 26 Specific Response Costs under this Section and Paragraph if it  
 27 determines that the United States or the State has made an  
 28

4473-9098

1 accounting error or if it alleges that a cost item that is  
 2 included represents costs that are inconsistent with the NCP.  
 3 Such objection shall be made in writing within sixty (60) days of  
 4 receipt of the bill and must be sent to the United States (if the  
 5 United States' accounting is being disputed) or the State (if the  
 6 State's accounting is being disputed) pursuant to Section XXVII  
 7 (Notices and Submissions). Any such objection shall specifically  
 8 identify the contested Future Site-Specific Response Costs and  
 9 the basis for objection. In the event of such an objection,  
 10 Lockheed Martin shall within the sixty (60) day period pay all  
 11 uncontested Future Site-Specific Response Costs to the United  
 12 States or the State in the manner described in this Section,  
 13 Paragraph B. Simultaneously, Lockheed Martin shall establish an  
 14 interest-bearing escrow account in a federally-insured bank duly  
 15 chartered in the State of California and remit to that escrow  
 16 account funds equivalent to the amount of the contested Future  
 17 Site-Specific Response Costs. Lockheed Martin shall send to the  
 18 United States, as provided in Section XXVII (Notices and  
 19 Submissions), and the State a copy of the transmittal letter and  
 20 check paying the uncontested Future Site-Specific Response Costs,  
 21 and a copy of the correspondence that establishes and funds the  
 22 escrow account, including, but not limited to, information  
 23 containing the identity of the bank and bank account under which  
 24 the escrow account is established as well as a bank statement  
 25 showing the initial balance of the escrow account.  
 26 Simultaneously with establishment of the escrow account, within  
 27 the sixty (60) day period, Lockheed Martin shall initiate the  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 dispute resolution procedures in Section XX (Dispute Resolution).  
 2 If the United States or the State prevails in the dispute or  
 3 concerning any aspect of the contested costs in dispute, within  
 4 five (5) days of the resolution of the dispute, Lockheed Martin  
 5 shall pay the sums due (with accrued interest) to the United  
 6 States in the manner described in this Section, Paragraph B, or  
 7 the State, if State costs are disputed, in the manner described  
 8 in this Section, Paragraph A.3. If Lockheed Martin prevails  
 9 concerning any aspect of the contested costs, Lockheed Martin  
 10 shall pay that portion of the costs (plus associated accrued  
 11 interest) as to which it did not prevail to the United States or  
 12 the State, if State costs are disputed in the manner described in  
 13 this Section, Paragraph A.3 or B, as applicable; Lockheed Martin  
 14 shall be disbursed any balance of the escrow account. The  
 15 dispute resolution procedures set forth in this Paragraph in  
 16 conjunction with the procedures set forth in Section XX (Dispute  
 17 Resolution) shall be the exclusive mechanisms for resolving  
 18 disputes regarding Lockheed Martin's obligation to reimburse the  
 19 United States and the State for their Future Site-Specific  
 20 Response Costs, including without limitation allegations of  
 21 accounting errors or allegations that costs billed are  
 22 inconsistent with the NCP.  
 23 D. In the event that any payment required by this Section,  
 24 Paragraph A.1 is not made within sixty (60) days of the Effective  
 25 Date of this Consent Decree (as defined by Section XXVIII),  
 26 Lockheed Martin shall pay interest on the unpaid balance. The  
 27 interest to be paid shall begin to accrue sixty (60) days after  
 28

4473-9098

1 the Effective Date of this Consent Decree. Interest shall accrue  
 2 at the rate specified through the date of Lockheed Martin's  
 3 payment. Payments of interest made under this Paragraph shall be  
 4 in addition to such other remedies or sanctions available to  
 5 Plaintiffs by virtue of a failure to make timely payments under  
 6 this Section.  
 7 XVIII. INDEMNIFICATION AND INSURANCE  
 8 The United States and the State do not assume any liability  
 9 by entering into this Consent Decree or by virtue of any  
 10 designation of Settling Work Defendant or any other defendant who  
 11 performs work pursuant to this Consent Decree as EPA's authorized  
 12 representative under Section 104(e) of CERCLA, 42 U.S.C.  
 13 § 9604(e). Settling Work Defendant, with respect to response  
 14 activities performed by Settling Work Defendant, and other  
 15 Settling Defendants with respect to response activities performed  
 16 by them, if any, shall indemnify, save and hold harmless the  
 17 United States, the State and their officials, agents, employees,  
 18 contractors, subcontractors, or representatives for or from any  
 19 and all claims or causes of action arising from, or on account  
 20 of, acts or omissions of such Settling Defendant, its officers,  
 21 employees, agents, contractors, subcontractors, and any persons  
 22 acting on its behalf or under its control, in carrying out  
 23 activities pursuant to this Consent Decree, including, but not  
 24 limited to, any claims arising from the designation of Settling  
 25 Work Defendant or any other Settling Defendant as EPA's  
 26 authorized representative under Section 104(e) of CERCLA, 42  
 27 U.S.C. § 9604(e). Further, such Settling Defendant agrees to pay  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 the United States and the State all costs they incur including,  
 2 but not limited to, attorneys fees and other expenses of  
 3 litigation and settlement arising from, or on account of, claims  
 4 made against the United States or the State based on acts or  
 5 omissions of such Settling Defendant, its officers, employees,  
 6 agents, contractors, subcontractors, and any persons acting on  
 7 its behalf or under its control, in carrying out activities  
 8 pursuant to this Consent Decree. Neither the United States nor  
 9 the State shall be held out as a party to any contract entered  
 10 into by or on behalf of such Settling Defendant in carrying out  
 11 activities pursuant to this Consent Decree. Neither such  
 12 Settling Defendant nor any such contractor shall be considered an  
 13 agent of the United States or the State.

14 A. Settling Defendants waive all claims against the United  
 15 States and the State for damages or reimbursement or for set-off  
 16 of any payments made or to be made to the United States or the  
 17 State arising from or on account of any contract, agreement, or  
 18 arrangement between such Settling Defendants and any person for  
 19 performance of O&M Activities on or relating to the Site,  
 20 including, but not limited to, claims on account of construction  
 21 delays. In addition, such Settling Defendant shall indemnify and  
 22 hold harmless the United States and the State with respect to any  
 23 and all such claims for damages or reimbursement arising from or  
 24 on account of any contract, agreement, or arrangement between any  
 25 one or more of Settling Defendants and any person for performance  
 26 of O&M Activities on or relating to the Site, including, but not  
 27 limited to, claims on account of construction delays.  
 28

4473-9098

1 B. No later than thirty (30) days prior to the Date of  
 2 Commencement, Settling Work Defendant shall secure, and shall  
 3 maintain until the first anniversary of EPA's Certification of  
 4 Completion pursuant to Section XV (Certification of Completion),  
 5 comprehensive general liability insurance with limits of not less  
 6 than \$ 20 million dollars (\$ 20,000,000) combined single limit  
 7 each occurrence, and in the annual aggregate, ten million  
 8 (\$ 10,000,000) of which is dedicated to the Interim Remedial  
 9 Action, naming as additional insureds the United States and the  
 10 State. In addition, for the duration of this Consent Decree,  
 11 Settling Work Defendant shall satisfy, or shall ensure that its  
 12 contractors or subcontractors satisfy, all applicable laws and  
 13 regulations regarding the provision of worker's compensation  
 14 insurance for all persons performing the O&M Activities on behalf  
 15 of Settling Work Defendant in furtherance of this Consent Decree.  
 16 Prior to commencement of the O&M Activities under this Consent  
 17 Decree, Settling Work Defendant shall provide to EPA and the  
 18 State certificates of such insurance and a copy of each insurance  
 19 policy. Settling Work Defendant shall resubmit such certificates  
 20 and copies of policies each year on the anniversary of the Date  
 21 of Commencement. If Settling Work Defendant demonstrates by  
 22 evidence satisfactory to EPA and the State that its contractor or  
 23 subcontractor maintains insurance equivalent to that described  
 24 above, or insurance covering the same risks but in a lesser  
 25 amount, then, with respect to that contractor or subcontractor,  
 26 Settling Work Defendant need provide only that portion of the  
 27 insurance described above which is not maintained by the  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 contractor or subcontractor. If Settling Work Defendant fails to  
 2 submit proof of insurance as described in this Paragraph, and no  
 3 other Settling Defendant submits such proof, EPA shall have the  
 4 right to take over all of the work required by this Consent  
 5 Decree with respect to the Upstream Facilities, and the City of  
 6 Burbank shall continue to fund and perform all of the work  
 7 required by this Consent Decree with respect to the Downstream  
 8 Facilities. If EPA takes over the work required by this Consent  
 9 Decree with respect to the Upstream Facilities pursuant to this  
 10 Section and Paragraph, Lockheed Martin shall fund EPA's  
 11 performance of such work pursuant to Section XIV (Funding of  
 12 Response Activities), Paragraph H.2.b-c of this Consent Decree.  
 13 If EPA takes over such work pursuant to this Section and  
 14 Paragraph, the City of Burbank shall not be required to reimburse  
 15 Lockheed Martin for any portion of the costs incurred by EPA to  
 16 take over and/or to perform such work.

17 C. If Settling Work Defendant obtains insurance as  
 18 described in this paragraph, and such insurance is subsequently  
 19 cancelled, Settling Work Defendant shall so notify EPA within ten  
 20 (10) days of Settling Work Defendant's receipt of notice that  
 21 such insurance had been cancelled. Furthermore, in the event of  
 22 such cancellation, equivalent insurance for the O&M Activities  
 23 shall be obtained as soon as reasonably practicable, and proof of  
 24 such insurance shall be submitted by Settling Work Defendant to  
 25 EPA within ten (10) days of such insurance being obtained.  
 26 Delays in the O&M Activities or EPA's decision to take over the  
 27 work due to the failure to obtain or submit proof of insurance  
 28

4473-9098

1 shall not constitute a force majeure event under this Consent  
 2 Decree.

3 D. In its bid documents, Settling Work Defendant shall  
 4 require that all contractors submitting bids to become O&M  
 5 Contractor agree to provide comprehensive general liability  
 6 insurance in the amount specified in Paragraph B of this Section.  
 7 Settling Work Defendant shall condition awarding the bid for O&M  
 8 Contractor upon a contractor's ability to provide the  
 9 comprehensive general liability insurance specified in Paragraph  
 10 B of this Section. The contract entered into between the  
 11 Settling Work Defendant and the O&M Contractor shall require the  
 12 O&M Contractor to provide worker's compensation insurance in  
 13 compliance with all applicable laws and regulations and  
 14 comprehensive general liability insurance as specified in  
 15 Paragraph B of this Section. Settling Work Defendant's  
 16 compliance with this Paragraph shall constitute compliance with  
 17 its obligation in Paragraph B of this Section to secure and  
 18 retain insurance, provided the O&M Contractor complies with its  
 19 obligations to provide the comprehensive general liability  
 20 insurance specified in Paragraph B of this Section.

21 E. In addition to the insurance required by this Section,  
 22 Lockheed Martin, the Settling Work Defendant, and the UAO Parties  
 23 hereby agree among themselves that the Upstream Facilities and  
 24 Blending Facility shall be insured by additional coverages as set  
 25 forth in Exhibit 3 to this Consent Decree, and Lockheed Martin  
 26 agrees to fund such coverages through the O&M Trust Fund.

27 1. The Settling Work Defendant will promptly and  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

4473-9098

1 diligently make and pursue claims against any available insurance  
2 for reimbursement of costs and expenses of any repairs or other  
3 work required as a result of an alleged Design Defect as  
4 described in Section XIV, Paragraph M, will not receive  
5 reimbursement under Section XIV, Paragraph M for any such costs  
6 and expenses that are recovered from insurance, and will refund  
7 to Lockheed Martin and/or the UAO Parties any monies paid by  
8 Lockheed Martin and/or the UAO Parties for costs and expenses  
9 which are subsequently paid by insurance.

10 2. The obligations set forth in Paragraph E.1 of this  
11 Section shall not be the subject of stipulated penalties or  
12 enforceable by Plaintiffs.

13 3. EPA agrees that disputes arising with regard to  
14 Exhibit 3 to this Consent Decree may be submitted to dispute  
15 resolution under Section XX (Dispute Resolution), Paragraph G of  
16 this Consent Decree.

17 4. Nothing in this Paragraph shall affect the  
18 obligations of Lockheed Martin, Settling Work Defendant or the  
19 UAO Parties pursuant to Section XIV of this Consent Decree  
20 (Funding of Response Activities).

21 XIX. FORCE MAJEURE

22 A. "Force majeure," for purposes of this Consent Decree, is  
23 defined as any event arising from causes beyond the control of a  
24 Settling Defendant or of any entity controlled by such Settling  
25 Defendant, including, but not limited to, its contractors and  
26 subcontractors, that delays or prevents the performance of any  
27 obligation under this Consent Decree despite such Settling  
28

1 Defendant's best efforts to fulfill the obligation. The  
2 requirement that the Settling Defendant exercise "best efforts to  
3 fulfill the obligation" includes using best efforts to anticipate  
4 any potential force majeure event and best efforts to address the  
5 effects of any potential force majeure event (1) as it is  
6 occurring and (2) following the potential force majeure event,  
7 such that the delay is minimized to the greatest extent possible.  
8 "Force majeure" does not include financial inability to complete  
9 the O&M Activities or a failure to attain the Performance  
10 Standards.

11 B. If any event occurs or has occurred that may delay the  
12 performance of any O&M Activities under this Consent Decree, or  
13 any other response activities performed under this Consent  
14 Decree, whether or not caused by a force majeure event, the  
15 Settling Defendant responsible for performing the activities  
16 shall notify orally EPA's Project Coordinator or, in his or her  
17 absence, EPA's Alternate Project Coordinator or, in the event  
18 both of EPA's designated representatives are unavailable, the  
19 Director of the Superfund Division, EPA Region IX, as soon as  
20 possible under the circumstances. It shall be presumed that  
21 notice not made within two (2) Working Days of when such Settling  
22 Defendant first knew or should have known that the event might  
23 cause a delay is untimely unless evidence credible to EPA and to  
24 the contrary is provided to EPA by the Settling Work Defendant.  
25 Within ten (10) days thereafter, such Settling Defendant shall  
26 provide in writing to EPA and the State an explanation and  
27 description of the reasons for the delay; the anticipated  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 duration of the delay; all actions taken or to be taken to  
2 prevent or minimize the delay; a schedule for implementation of  
3 any measures to be taken to prevent or mitigate the delay or the  
4 effect of the delay; the Settling Defendant's rationale for  
5 attributing such delay to a force majeure event if it intends to  
6 assert such a claim; and a statement as to whether, in the  
7 opinion of the Settling Defendant, such event may cause or  
8 contribute to an endangerment to public health, welfare or the  
9 environment. The Settling Defendant shall include with any  
10 notice all available documentation supporting its claim that the  
11 delay was attributable to a force majeure. Unless the force  
12 majeure event is a natural catastrophe or similar event which  
13 inherently justifies departure from the above requirements,  
14 failure to comply with the above requirements shall preclude  
15 Settling Defendant from asserting any claim of force majeure for  
16 that event. A Settling Defendant shall be deemed to have notice  
17 of any circumstance of which its contractors or subcontractors  
18 had or should have had notice.

19 C. If EPA, after a reasonable opportunity for review and  
20 comment by the State, agrees that the delay or anticipated delay  
21 is attributable to a force majeure event, the time for  
22 performance of the obligations under this Consent Decree that are  
23 affected by the force majeure event will be extended by EPA,  
24 after a reasonable opportunity for review and comment by the  
25 State, for such time as is necessary to complete those  
26 obligations. An extension of the time for performance of the  
27 obligations affected by the force majeure event shall not, of  
28

4473-9098

1 itself, extend the time for performance of any other obligation.  
2 If EPA, after a reasonable opportunity for review and comment by  
3 the State, does not agree that the delay or anticipated delay has  
4 been or will be caused by a force majeure event, EPA will notify  
5 the Settling Defendant claiming force majeure in writing of its  
6 decision. If EPA, after a reasonable opportunity for review and  
7 comment by the State, agrees that the delay is attributable to a  
8 force majeure event, EPA will notify the Settling Defendant  
9 claiming force majeure in writing of the length of the extension,  
10 if any, for performance of the obligations affected by the force  
11 majeure event. Notification to EPA of any other claimed force  
12 majeure event affecting other obligations of parties to this  
13 Consent Decree shall be made by the party claiming force majeure  
14 in writing to EPA within five (5) Working Days of when such party  
15 knew or should have known that the event might cause a delay in  
16 such party's obligations. It shall be presumed that notice not  
17 made within such time is untimely unless evidence credible to EPA  
18 and to the contrary is provided to EPA by such party.

19 D. If the Settling Defendant claiming force majeure elects  
20 to invoke the dispute resolution procedures set forth in Section  
21 XX (Dispute Resolution), it shall do so no later than fifteen  
22 (15) days after receipt of EPA's notice. In any such proceeding,  
23 the Settling Defendant shall have the burden of demonstrating by  
24 a preponderance of the evidence that the delay or anticipated  
25 delay has been or will be caused by a force majeure event, that  
26 the duration of the delay or the extension sought was or will be  
27 warranted under the circumstances, that best efforts were  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 exercised to avoid and mitigate the effects of the delay, and  
2 that the Settling Defendant complied with the requirements of  
3 this Section, Paragraphs A and B, above or was excused from such  
4 compliance under the terms of this Decree. If the Settling  
5 Defendant carries this burden, the delay at issue shall be deemed  
6 not to be a violation by such Settling Defendant of the affected  
7 obligation of this Consent Decree identified to EPA and the  
8 Court.

9 XX. DISPUTE RESOLUTION

10 A. Unless otherwise expressly provided for in this Consent  
11 Decree, the dispute resolution procedures of this Section shall  
12 be the exclusive mechanism to resolve disputes arising under or  
13 with respect to this Consent Decree. However, the procedures set  
14 forth in this Section shall not apply to actions by the United  
15 States to enforce obligations of a Settling Defendant that have  
16 not been disputed in accordance with this Section.

17 B. Any dispute which arises under or with respect to this  
18 Consent Decree shall in the first instance be the subject of  
19 informal negotiations between the parties to the dispute. The  
20 period for informal negotiations shall not exceed twenty (20)  
21 days from the time the dispute arises, unless it is modified by  
22 written agreement of the parties to the dispute. The dispute  
23 shall be considered to have arisen when one party sends the other  
24 party a written Notice of Dispute.

25 C. In the event that the parties cannot resolve a dispute  
26 by informal negotiations under the preceding Paragraph, then the  
27 position advanced by EPA shall be considered binding unless,  
28

4473-9098

1 within ten (10) days after the conclusion of the informal  
2 negotiation period, the Settling Defendant asserting that there  
3 is a dispute invokes the formal dispute resolution procedures of  
4 this Section by serving on the United States a written Statement  
5 of Position on the matter in dispute, including, but not limited  
6 to, any factual data, analysis or opinion supporting that  
7 position and any supporting documentation relied upon by such  
8 Settling Defendant. The Statement of Position shall specify the  
9 Settling Defendant's position as to whether formal dispute  
10 resolution should proceed under this Section XX, Paragraph F or  
11 G.

12 D. Within fourteen (14) days after receipt of the Settling  
13 Defendant's Statement of Position, EPA will serve on such  
14 Settling Defendant its Statement of Position, including, but not  
15 limited to, any factual data, analysis, or opinion supporting  
16 that position and all supporting documentation relied upon by  
17 EPA. EPA's Statement of Position shall include a statement as to  
18 whether formal dispute resolution should proceed under this  
19 Section XX, Paragraph F or G.

20 E. If there is disagreement between EPA and a Settling  
21 Defendant asserting there is a dispute as to whether dispute  
22 resolution should proceed under Section XX, Paragraph F or G, the  
23 parties to the dispute shall follow the procedures set forth in  
24 the Paragraph determined by EPA to be applicable. However, if  
25 the Settling Defendant ultimately appeals to the Court to resolve  
26 the dispute, the Court shall determine which Paragraph is  
27 applicable in accordance with the standards of applicability set  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 forth in Section XX, Paragraphs F and G.

2 F. Formal dispute resolution for disputes pertaining to the

3 selection or adequacy of any response action and all other

4 disputes that are accorded review on the administrative record

5 under applicable principles of administrative law shall be

6 conducted pursuant to the procedures set forth in this Paragraph.

7 For purposes of this Paragraph, the adequacy of any response

8 action includes, without limitation: (1) the adequacy or

9 appropriateness of plans, procedures to implement plans, or any

10 other items requiring approval by EPA under this Consent Decree;

11 and (2) the adequacy of the performance of response actions taken

12 pursuant to this Consent Decree. Nothing in this Consent Decree

13 shall be construed to allow any dispute by Settling Defendants

14 regarding the validity of the ROD's provisions.

15 1. An administrative record of the dispute shall be

16 maintained by EPA and shall contain all Statements of Position,

17 including supporting documentation, submitted pursuant to this

18 Paragraph. Where appropriate, EPA may allow submission of

19 supplemental Statements of Position by the parties to the

20 dispute.

21 2. The Director of the Superfund Division, EPA Region

22 IX, will issue a final administrative decision resolving the

23 dispute based on the administrative record described in this

24 Section, Paragraph F.1. This decision shall be binding upon the

25 Settling Defendant asserting that there is a dispute, subject

26 only to the right to seek judicial review pursuant to this

27 Section, Paragraphs F.3 and F.4.

28

4473-9098

1 3. Any administrative decision made by EPA pursuant to

2 this Section, Paragraph F.2 shall be reviewable by this Court,

3 provided that a notice of judicial appeal is filed by the

4 Settling Defendant with the Court and served on all parties

5 within thirty (30) days of receipt of EPA's decision. The notice

6 of judicial appeal shall include a description of the matter in

7 dispute, the efforts made by the parties to resolve it, the

8 relief requested, and the schedule, if any, within which the

9 dispute must be resolved to ensure orderly implementation of this

10 Consent Decree. The United States may file a response to the

11 Settling Defendant's notice of judicial appeal.

12 4. In proceedings on any dispute governed by this

13 Paragraph, the Settling Defendant asserting that there is a

14 dispute shall have the burden of demonstrating that the decision

15 of the Superfund Division Director is arbitrary and capricious or

16 otherwise not in accordance with law. Judicial review of EPA's

17 decision shall be on the administrative record compiled pursuant

18 to this Section, Paragraph F.1.

19 G. Formal dispute resolution for disputes that neither

20 pertain to the selection or adequacy of any response action nor

21 are otherwise accorded review on the administrative record under

22 applicable principles of administrative law, shall be governed by

23 this Paragraph.

24 1. Following receipt of the Settling Defendant's

25 Statement of Position submitted pursuant to Section XX, Paragraph

26 C, the Director of the Superfund Division, EPA Region IX, will

27 issue a final written decision resolving the dispute. The

28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

4473-9098

1 Superfund Division Director's decision shall be binding on the  
 2 Settling Defendant asserting that there is a dispute unless,  
 3 within thirty (30) days of receipt of the decision, such Settling  
 4 Defendant files with the Court and serves on the other party or  
 5 parties a notice of judicial appeal setting forth the matter in  
 6 dispute, the efforts made by the parties to resolve it, the  
 7 relief requested, and the schedule, if any, within which the  
 8 dispute must be resolved to ensure orderly implementation of the  
 9 Consent Decree. The United States may file a response to  
 10 Settling Defendant's notice of judicial appeal.

11 2. Notwithstanding Paragraph R of Section I  
 12 (Background) of this Consent Decree, judicial review of any  
 13 dispute governed by this Paragraph shall be governed by  
 14 applicable provisions of law.

15 H. The invocation of formal dispute resolution procedures  
 16 under this Section shall not extend, postpone or affect in any  
 17 way any obligation not directly in dispute of the Settling  
 18 Defendant asserting that there is a dispute under this Consent  
 19 Decree, unless EPA or the Court agrees otherwise. If a Settling  
 20 Defendant prevails, the deadlines for any requirements which it  
 21 could not practicably meet because of the dispute resolution  
 22 proceedings shall be extended to account for any delays because  
 23 of such proceedings. Stipulated penalties with respect to the  
 24 disputed matter shall continue to accrue but payment shall be  
 25 stayed pending resolution of the dispute as provided in Section  
 26 XXI (Stipulated Penalties), Paragraph I. Notwithstanding the  
 27 stay of payment, stipulated penalties shall accrue from the first  
 28

1 day of noncompliance with any applicable provision of this  
 2 Consent Decree. In the event that the Settling Defendant does  
 3 not prevail on the disputed issue, stipulated penalties shall be  
 4 assessed and paid as provided in Section XXI (Stipulated  
 5 Penalties), unless EPA in its discretion elects not to assess  
 6 some or all of such penalties.

7 XXI. STIPULATED PENALTIES

8 Unless excused by EPA or a force majeure event, a Settling  
 9 Defendant shall be liable for stipulated penalties to the United  
 10 States, as set forth in this Section, for each failure by such  
 11 Settling Defendant to comply with the requirements of this  
 12 Consent Decree. "Compliance" by the Settling Work Defendant  
 13 shall include completion of the O&M activities under this Consent  
 14 Decree or any work plan or deliverable approved under this  
 15 Consent Decree or incorporated by this Consent Decree, in  
 16 accordance with all applicable requirements of law, this Consent  
 17 Decree, the Second Stage O&M Work Plan and any plans or other  
 18 documents approved by EPA pursuant to this Consent Decree or any  
 19 such work plan or deliverable, and within the specified time  
 20 schedules established by and approved under this Consent Decree  
 21 or any such work plan or deliverable.

22 A. Unless expressly stated otherwise in this Consent  
 23 Decree, any reports, plans, specifications, schedules,  
 24 deliverables, appendices, and attachments required by this  
 25 Consent Decree, or implemented in whole or in part by this  
 26 Consent Decree, are, upon approval by EPA, incorporated into this  
 27 Consent Decree. A failure by the Settling Work Defendant to  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 comply with applicable EPA-approved reports, plans, specifica-  
 2 tions, schedules, deliverables, appendices or attachments shall  
 3 be considered a failure to comply with this Consent Decree and  
 4 shall subject such Settling Work Defendant to stipulated  
 5 penalties as provided in Paragraphs D through F of this Section.  
 6 B. Failure to comply with this Consent Decree shall also  
 7 include but is not limited to the following:  
 8 1. Failure by Settling Work Defendant to submit  
 9 deliverables specified in this Consent Decree in an acceptable  
 10 manner and by the date due pursuant to this Consent Decree;  
 11 provided, however, that if the failure to comply results from a  
 12 determination by EPA that a written deliverable is inadequate,  
 13 the Settling Work Defendant shall have ten (10) working days from  
 14 receipt of EPA's written notice of disapproval, or such other  
 15 longer time period as provided by EPA in the notice of  
 16 disapproval, within which to correct the inadequacy and resubmit  
 17 the deliverable for approval. Any disapproval by EPA shall  
 18 include an explanation of why the deliverable is inadequate. If  
 19 the resubmitted deliverable is inadequate, the Settling Work  
 20 Defendant shall be deemed to be in violation of this Consent  
 21 Decree.  
 22 2. Failure by Settling Work Defendant to use best  
 23 efforts to obtain any permits necessary for offsite work which  
 24 Settling Work Defendant is required to perform or failure by  
 25 Settling Work Defendant to use best reasonable efforts to obtain  
 26 necessary access agreements.  
 27 3. Failure by Settling Work Defendant to comply with  
 28

4473-9098

1 any permit obtained for the purpose of implementing the  
 2 requirements of this Consent Decree in any offsite location.  
 3 C. Stipulated penalties for failure to perform any require-  
 4 ment of this Consent Decree for which a deadline is specified  
 5 shall begin to accrue on the first day after the deadline.  
 6 Stipulated penalties for any other violation of this Consent  
 7 Decree shall begin to accrue on the first day after a Settling  
 8 Defendant subject to penalties receives notice from EPA of such  
 9 violation. For any violation, stipulated penalties shall  
 10 continue to accrue up to and including the day on which the non-  
 11 compliance is corrected. EPA, in its sole discretion, may waive  
 12 or reduce stipulated penalties. If EPA does not waive stipulated  
 13 penalties, EPA shall provide the Settling Defendant subject to  
 14 penalties with written notice of the alleged deficiency in  
 15 compliance with this Consent Decree, and accrued stipulated  
 16 penalties shall become payable thirty (30) days after such  
 17 Settling Defendant's receipt of EPA's written notice of  
 18 deficiency; provided, however, that if EPA provides notice of an  
 19 alleged deficiency, and that deficiency continues, EPA shall not  
 20 be required to provide any additional notice in order for  
 21 stipulated penalties to continue to accrue and become payable.  
 22 D. Stipulated penalties shall accrue in the following  
 23 amounts for the violations described in this Paragraph, and a  
 24 Settling Defendant subject to such penalties may not dispute the  
 25 amount of stipulated penalties due per type of violation:  
 26 1. Monthly Progress Reports and Other Periodic Reports  
 27 Settling Work Defendant shall pay a stipulated  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 penalty of \$ 750 per day for the submission of a late or  
 2 deficient periodic progress report.  
 3 2. MCL Effluent Violations  
 4 a. At any time if the concentration of TCE in the  
 5 treated water is greater than 5.0 parts per billion ("ppb"),  
 6 Settling Work Defendant shall be considered to have been out of  
 7 compliance for each day for which the representative treated  
 8 water sample indicates that the concentration of TCE was greater  
 9 than 5.0 ppb. Settling Work Defendant shall be subject to  
 10 stipulated penalties in the amount of \$ 3,750 per day for each  
 11 such day of noncompliance.  
 12 b. At any time if the concentration of PCE in the  
 13 treated water is greater than 5.0 ppb, Settling Work Defendant  
 14 shall be considered to have been out of compliance for each day  
 15 for which the representative treated water sample indicates that  
 16 the concentration of PCE was greater than 5.0 ppb. Settling Work  
 17 Defendant shall be subject to stipulated penalties in the amount  
 18 of \$ 3,750 per day for each such day of noncompliance.  
 19 c. At any time if the concentration of a volatile  
 20 organic compound ("VOC") other than TCE or PCE in the treated  
 21 water is greater than the MCL in effect at that time for such  
 22 VOC, Settling Work Defendant shall be considered to have been out  
 23 of compliance for each day for which the representative treated  
 24 water sample indicates that the concentration of that VOC was  
 25 greater than the MCL in effect, provided that the MCL in effect  
 26 was promulgated on or before the Effective Date of this Consent  
 27 Decree. Settling Work Defendant shall be subject to stipulated  
 28

4473-9098

1 penalties in the amount of \$ 3,750 per day for each such day of  
 2 noncompliance.  
 3 d. At any time after the first sixty (60) days  
 4 after an analytical sample result shows that the concentration of  
 5 a contaminant in the treated water other than a VOC or nitrate is  
 6 greater than the MCL in effect at that time for such contaminant,  
 7 Settling Work Defendant shall be considered to have been out of  
 8 compliance for each day for which the representative treated  
 9 water sample indicates that the concentration of that contaminant  
 10 was greater than the MCL in effect, provided that the MCL in  
 11 effect was promulgated on or before the Effective Date of this  
 12 Consent Decree. Settling Work Defendant shall be subject to  
 13 stipulated penalties in the amount of \$ 2,250 per day for each  
 14 such day of noncompliance.  
 15 E. Class I Violations  
 16 Stipulated penalties shall accrue in the following amounts  
 17 for the violations described in this Paragraph, and a Settling  
 18 Defendant subject to such penalties may not dispute the amount of  
 19 stipulated penalties due per type of violation:  
 20 Period of Noncompliance Penalty Per Day Per Violation  
 21 Days 1 - 5 \$ 750  
 22 Days 6 - 30 \$ 2,250  
 23 After 30 Days \$ 3,750  
 24 1. Each failure to comply in a timely and adequate  
 25 manner with the terms of this Consent Decree or any work plan  
 26 implemented in whole or in part by this Consent Decree, that is  
 27 not specifically listed as a violation elsewhere under this  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Section, and specifically including any failure to comply with  
 2 the substantive standards of any applicable or relevant and  
 3 appropriate requirement ("ARAR") identified in the ROD (as  
 4 modified by the ESD and SOW) and not identified as a violation  
 5 under Paragraphs D through F of this Section.

6 2. Failure by Settling Work Defendant to submit any  
 7 of the following:

- 8 i. Draft Second Stage Operations and Maintenance Work  
 9 Plan
- 10 ii. Draft Second Stage Operations and Maintenance  
 11 Staffing Plan
- 12 iii. Draft Second Stage Operations and Maintenance Time  
 13 Line and Schedule
- 14 iv. Draft Quality Assurance Project Plan
- 15 v. Draft Health and Safety Plan

16 3. Violation by Settling Work Defendant of ARARs,  
 17 other than MCL violations, and South Coast Air Quality Management  
 18 District Regulation XIII.

19 F. Class II Violations

20 Stipulated penalties shall accrue in the following amounts  
 21 for the violations described in this Paragraph, and a Settling  
 22 Defendant subject to such penalties may not dispute the amount of  
 23 stipulated penalties due per type of violation:

24 <u>Period of Noncompliance</u>	<u>Penalty Per Day Per Violation</u>
25 Days 1 - 5	\$ 1,500
26 Days 6 - 30	\$ 3,500
27 After 30 Days	\$ 10,000

4473-9098

1 Each violation by Settling Work Defendant of the following:

- 2 i. Obligation to hold Final Inspection(s)
- 3 Failure by Settling Work Defendant to submit any of the  
 4 following:
- 5 i. Second Stage Operations and Maintenance Work Plan
- 6 ii. Second Stage Operations and Maintenance Staffing  
 7 Plan
- 8 iii. Second Stage Operations and Maintenance Time Line  
 9 and Schedule
- 10 iv. Notification of Selection of O&M  
 11 Contractors/Subcontractors
- 12 v. Quality Assurance Project Plan
- 13 vi. Health and Safety Plan

14 Failure by Settling Work Defendant to comply with any of the  
 15 following:

- 16 i. Quality Assurance Project Plan
- 17 ii. Health and Safety Plan
- 18 iii. Second Stage O&M Work Plan

19 G. Payments of stipulated penalties shall be made by a  
 20 Settling Defendant as follows:

- 21 1. Stipulated penalties assessed for failure to make  
 22 full and timely payment to the O&M Trust Account pursuant to  
 23 Section XIV (Funding of Response Activities) or to the United  
 24 States pursuant to Section XVII (Reimbursement of Response Costs)  
 25 shall be paid by Lockheed Martin. Lockheed Martin shall not be  
 26 subject to stipulated penalties for failure to fund insurance  
 27 costs for insurance coverages described solely in Exhibit 3 to  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 this Consent Decree.

2           2. Stipulated penalties for failure to make full and

3 timely payment pursuant to Paragraph M of Section XIV (Funding of

4 Response Activities) of this Consent Decree shall be paid by

5 Lockheed Martin or the UAO Parties according to the EPA

6 Preliminary Finding and/or Further Determination required by that

7 Section and Paragraph. Stipulated penalties for failure to make

8 payments pursuant to Paragraph N of Section XIV (Funding of

9 Response Activities) shall be paid by Lockheed Martin, the

10 Settling Cash Defendants or the City of Burbank in accordance

11 with their obligations under that Section and Paragraph.

12           3. Except for stipulated penalties which arise due to

13 Lockheed Martin's or the UAO Parties' failure to comply with

14 their obligations under Section XIV (Funding of Response

15 Activities) as described in this Paragraph, all other stipulated

16 penalties assessed for failure to comply with Section VI

17 (Performance of the Work By Settling Defendants) shall be the

18 responsibility of and be paid by the City of Burbank. No such

19 stipulated penalties shall be paid or reimbursed from the O&M

20 Trust Account.

21           H. If a Settling Defendant fails to pay stipulated

22 penalties in accordance with this Section, the United States may

23 institute proceedings in this action or a new action to collect

24 the penalties and any Interest due. Notwithstanding the

25 stipulated penalties provided for in this Section, and to the

26 extent authorized by law, EPA may elect to assess civil penalties

27 or bring an action in District Court to enforce the provisions of

28

4473-9098

1 this Consent Decree. Payment of stipulated penalties shall not

2 preclude EPA from electing to pursue any other remedy or sanction

3 it may have to enforce this Consent Decree, and nothing in this

4 Decree shall preclude EPA from seeking statutory penalties

5 against a Settling Defendant who violates statutory or regulatory

6 requirements, except that the total civil penalties (including

7 stipulated penalties) collected by EPA for any such violation

8 shall not exceed \$ 25,000 per day per violation.

9           I. A Settling Defendant may dispute any notice of

10 deficiency issued to it. Penalties shall continue to accrue as

11 provided in this Section but need not be paid until the

12 following:

13           1. If the dispute is resolved by agreement or by

14 decision or order of EPA which is not appealed to this Court,

15 accrued penalties, plus Interest, shall be paid to EPA within

16 thirty (30) days of the agreement or Settling Defendant's receipt

17 of EPA's decision or order;

18           2. If the Settling Defendant appeals EPA's decision

19 pursuant to Section XX (Dispute Resolution) and prevails upon

20 final resolution of the dispute, no stipulated penalties or

21 Interest thereon will be payable and any assessment of stipulated

22 penalties and Interest thereon shall be set aside in writing by

23 EPA;

24           3. If the Settling Defendant appeals EPA's decision

25 pursuant to Section XX (Dispute Resolution) and does not prevail

26 upon final resolution of the dispute, all accrued stipulated

27 penalties, plus Interest shall be paid within thirty (30) days of

28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 a final Court order.

2 4. If a Settling Defendant appeals EPA's decision to

3 this Court and the Court's decision is appealed by any Party, the

4 Settling Defendant shall pay all accrued penalties determined by

5 the District Court to be owing to the United States into an

6 interest-bearing escrow account within sixty (60) days of receipt

7 of the Court's decision or order. Penalties determined by the

8 Court to be accruing shall be paid into this account as they

9 continue to accrue, at least every sixty (60) days. Within

10 fifteen (15) days of receipt of the final appellate court

11 decision, the escrow agent shall pay the balance of the account

12 to EPA or to the Settling Defendant to the extent that it

13 prevails.

14 J. In the event that EPA assumes performance of a portion

15 or all of the O&M Activities pursuant to Paragraph F of Section

16 XXII (Covenants Not to Sue by Plaintiffs), Settling Work

17 Defendant shall remain liable for any stipulated penalties that

18 have accrued or that may accrue under this Consent Decree.

19 K. All penalties owed to the United States under this

20 section shall be due and payable within thirty (30) days of the

21 Settling Defendant's receipt from EPA of a demand for payment of

22 the penalties, unless the Settling Defendant invokes the dispute

23 resolution procedures under Section XX (Dispute Resolution). All

24 payments under this Section shall be transmitted via EFT to the

25 U.S. Department of Justice Lockbox, and shall reference CERCLA

26 Number SSID # L6, DOJ Case Number 90-11-2-442 and USAO File NO.

27 91-03-463. Written verification of EFTs pursuant to this Section

28

4473-9098

1 shall be sent to the United States as provided in Section XXVII

2 (Notices and Submissions).

3 L. The payment of penalties shall not alter in any way the

4 Settling Work Defendant's obligation to complete the performance

5 of the O&M Activities required under this Consent Decree.

6 M. If a Settling Defendant fails to pay stipulated

7 penalties when due, the United States may institute proceedings

8 to collect the penalties, as well as Interest. The Settling

9 Defendant shall pay Interest on the unpaid balance, which shall

10 begin to accrue thirty (30) days after the date of demand made

11 pursuant to this Section, Paragraph K.

12 N. Nothing in this Consent Decree shall be construed as

13 prohibiting, altering, or in any way limiting the ability of the

14 United States or the State to seek any other remedies or

15 sanctions available by virtue of a Settling Defendant's violation

16 of this Consent Decree or of the statutes and regulations upon

17 which it is based, including, but not limited to, penalties

18 pursuant to Section 122(1) of CERCLA, 42 U.S.C. § 9622(1).

19 XXII. COVENANTS NOT TO SUE BY PLAINTIFFS

20 In consideration of the actions that will be performed

21 and/or the payments that will be made by the Settling Defendants

22 under the terms of the Consent Decree, and except as specifically

23 provided in this Section, the United States covenants not to sue

24 or to take administrative action against Settling Defendants

25 and/or the Released Parties pursuant to Sections 106 and 107(a)

26 of CERCLA and Section 7003 of RCRA, and the State covenants not

27 to sue or to take administrative action pursuant Section 107(a)

28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 of CERCLA, and to Chapters 6.5, Sections 25100 et seq., and 6.8  
 2 Sections 25300 et seq. of the California Health and Safety Code  
 3 for all Covered Matters expressly specified in Section XXIV  
 4 (Effect of Settlement; Contribution Protection), Paragraph C. As  
 5 to each Settling Defendant and its related Released Parties,  
 6 these covenants not to sue are conditioned upon the complete and  
 7 satisfactory performance by such Settling Defendant of its then-  
 8 current obligations under this Consent Decree and shall remain in  
 9 effect as to each Settling Defendant and its related Released  
 10 Parties until and unless such Settling Defendant is not in  
 11 compliance with the obligations imposed upon it by this Consent  
 12 Decree. As to each Settling Defendant, Related Settling  
 13 Defendant, or Related Released Party, as described in Appendix 1  
 14 to this Consent Decree, these covenants not to sue are  
 15 conditioned upon the complete and satisfactory performance by  
 16 that party's principal Settling Defendant of its then-current  
 17 obligations pursuant to Section XIV (Funding of Response Actions)  
 18 of this Consent Decree. These covenants not to sue extend only  
 19 to each Settling Defendant and its related Released Parties.  
 20 These covenants not to sue do not extend to any other person. No  
 21 person otherwise liable independent of liability associated with  
 22 its status as a corporate or institutional predecessor or  
 23 successor to a Settling Defendant or Related Released Party shall  
 24 benefit from this provision.

A. United States' Pre-certification Reservations.

25 Except as to the parties listed in Appendix 3, and  
 26 notwithstanding any other provision of this Consent Decree, the  
 27  
 28

4473-9098

1 United States reserves, and this Consent Decree is without  
 2 prejudice to, the right to institute proceedings in this action  
 3 or in a new action, or to issue an administrative order seeking  
 4 to compel Settling Defendants, Released Parties, or any of them  
 5 (1) to perform further response actions relating to the Site or  
 6 (2) to reimburse the United States for additional costs of  
 7 response if, prior to Certification of Completion of O&M  
 8 Activities pursuant to Section XV (Certification of Completion)  
 9 of this Consent Decree:

10 (i) conditions at the Site, previously unknown to EPA,  
 11 are discovered, or

12 (ii) information, previously unknown to EPA, is  
 13 received, in whole or in part,

14 and these previously unknown conditions or information together  
 15 with any other relevant information indicate that the Remedial  
 16 Action or the O&M Activities are not protective of human health  
 17 or the environment.

18 B. Except as to the parties listed in Appendix 3, the  
 19 United States also reserves the right to institute proceedings in  
 20 this action or in a new action, or to issue an administrative  
 21 order seeking to compel Settling Defendants, Released Parties, or  
 22 any of them to (1) perform further response actions relating to  
 23 the Site or (2) to reimburse the United States for additional  
 24 costs of response if, prior to Certification of Completion of the  
 25 O&M Activities, (a) the Settling Work Defendant substantially  
 26 fails and/or refuses to perform the O&M Activities, or (b) an  
 27 earthquake or Uninsurable Force Majeure Event causes Major Damage  
 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 (as defined in Section XIV (Funding of Response Activities),  
2 Paragraph N) to the Plant Facilities, and EPA has reserved its  
3 rights in such circumstances in that Section and Paragraph.

4 C. United States' Post-certification Reservations. Except  
5 as to the parties listed in Appendix 3, and notwithstanding any  
6 other provision of this Consent Decree, the United States  
7 reserves, and this Consent Decree is without prejudice to, the  
8 right to institute proceedings in this action or in a new action,  
9 or to issue an administrative order seeking to compel Settling  
10 Defendants, Released Parties, or any of them (1) to perform  
11 further response actions relating to the Site or (2) to reimburse  
12 the United States for additional costs of response if, subsequent  
13 to Certification of Completion of the O&M Activities pursuant to  
14 Section XV (Certification of Completion) of this Consent Decree:

- 15 (i) conditions at the Site, previously unknown to
- 16 EPA, are discovered, or
- 17 (ii) information, previously unknown to EPA, is
- 18 received, in whole or in part,
- 19 and these previously unknown conditions or this information
- 20 together with any other relevant information indicate that the
- 21 Remedial Action or the O&M Activities are not protective of human
- 22 health or the environment.

23 D. For purposes of this Section, Paragraph A, the  
24 information and the conditions known to EPA shall include only  
25 that information and those conditions set forth in the ROD for  
26 the Site, the administrative record supporting the ROD, and  
27 information required to be and actually submitted to EPA pursuant  
28

4473-9098

1 to the First Consent Decree or UAO 92-12 prior to the date of  
2 lodging of this Consent Decree. For purposes of this Section,  
3 Paragraph C, the information received by and the conditions known  
4 to EPA shall include only that information and those conditions  
5 set forth in the ROD, the administrative record supporting the  
6 ROD, and any information received by or required to be and  
7 actually submitted to EPA pursuant to the requirements of the  
8 First Consent Decree, this Consent Decree or UAO 92-12 prior to  
9 Certification of Completion of the O&M Activities.

10 E. General Reservations of Rights. The covenants not to  
11 sue set forth above do not pertain to any matters other than the  
12 Covered Matters expressly specified in Section XXIV (Effect of  
13 Settlement; Contribution Protection), Paragraph C. The United  
14 States and the State reserve, and this Consent Decree is without  
15 prejudice to, all rights against a Settling Defendant or a  
16 Released Party with respect to all other matters, including but  
17 not limited to, the following:

- 18 (1) claims based on a failure by such Settling
- 19 Defendant to meet a requirement of this Consent Decree;
- 20 (2) liability arising from the past, present, or
- 21 future disposal, release, or threat of release of hazardous
- 22 substances outside of the Site;
- 23 (3) liability for damages for injury to, destruction
- 24 of, or loss of natural resources;
- 25 (4) liability for response costs that have been or may
- 26 be incurred by any federal or State of California agency
- 27 which is the trustee for natural resources and which has, or
- 28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 may in the future, spend funds relating to the Site;

2 (5) criminal liability;

3 (6) liability for violations of federal or State of

4 California law which occur during or after implementation of

5 the Remedial Action or O&M Activities;

6 (7) liability for additional response actions as may

7 be required pursuant to Section VII (Additional Response

8 Actions) or VIII (Periodic Review) of this Consent Decree,

9 to the extent Settling Defendants do not agree in this

10 Consent Decree to fund and/or perform such response actions

11 under this Consent Decree;

12 (8) liability for additional operable units or interim

13 remedies at the Site, for other operable units outside the

14 Site, or any interim or final Basin-wide response action;

15 and

16 (9) liability for Future Basin-wide Response Costs, and

17 any costs that the United States or the State will incur or

18 have incurred related to the Site which are not within the

19 definition of Past Site-Specific Response Costs, Future

20 Site-Specific Response Costs, or Past Basin-wide Response

21 Costs.

22 F. In the event EPA determines that Settling Work

23 Defendant has failed to implement any provisions of the O&M

24 Activities in an adequate or timely manner, EPA may perform any

25 and all portions of the O&M Activities as EPA determines

26 necessary. In such event, Lockheed Martin shall fund EPA's

27 performance of such O&M Activities pursuant to Section XIV

28

4473-9098

1 (Funding of Response Activities), Paragraph H.2.b-c. Settling

2 Work Defendant shall reimburse Lockheed Martin for that portion

3 of EPA's costs incurred to fund EPA's takeover and/or performance

4 of O&M Activities which is caused by the necessity for EPA to

5 take over such O&M Activities from the Settling Work Defendant

6 pursuant to this Section and Paragraph. If EPA takes over the

7 performance of some or all of the O&M Activities pursuant to this

8 Section and Paragraph, EPA shall issue a determination at the

9 request of Settling Work Defendant or Lockheed Martin concerning

10 which costs incurred by EPA were due to the necessity for EPA to

11 take over such O&M Activities from the Settling Work Defendant.

12 In no event shall the accounting of such costs for which the

13 Settling Work Defendant may be required to reimburse Lockheed

14 Martin pursuant to this Paragraph continue for a period longer

15 than one year from EPA's takeover of such O&M Activities.

16 Settling Work Defendant or Lockheed Martin may invoke the

17 procedures set forth in Section XX (Dispute Resolution) to

18 dispute EPA's determination concerning such costs.

19 G. Settling Work Defendant may invoke the procedures set

20 forth in Section XX (Dispute Resolution) to dispute EPA's

21 determination that the Settling Work Defendant failed to

22 implement a provision of the O&M Activities in an adequate or

23 timely manner as arbitrary and capricious or otherwise not in

24 accordance with law. Such dispute shall be resolved on the

25 administrative record. Except as is necessary to address an

26 imminent and substantial endangerment to human health or the

27 environment, EPA shall provide Settling Work Defendant with ten

28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 (10) days written notice of its intent to perform a portion or  
2 all of the O&M Activities. In the notice, EPA shall also  
3 describe the alleged deficiency. If the Settling Work Defendant  
4 disagrees with EPA's determination that it has failed to perform,  
5 in an adequate and timely manner, the O&M Activities required to  
6 be performed by this Consent Decree, and Settling Work Defendant  
7 desires to dispute EPA's determination in this regard, Settling  
8 Work Defendant shall invoke the dispute resolution provisions of  
9 Section XX (Dispute Resolution) within thirty (30) days of  
10 receiving written notice of EPA's intent. Invocation of dispute  
11 resolution shall not divest EPA of its right to perform the O&M  
12 Activities during the dispute. Upon receipt of notification that  
13 EPA intends to take over the performance of a portion or all of  
14 the O&M Activities, Settling Work Defendant's obligations to  
15 perform such O&M Activities pursuant to this Consent Decree shall  
16 terminate and stipulated penalties, if any are being incurred due  
17 to Settling Work Defendant's failure to perform such O&M  
18 Activities in a timely or adequate manner, shall cease to accrue  
19 against Settling Work Defendant for such failure.

20 H. Notwithstanding any other provision of this Consent  
21 Decree, the United States and the State retain all authority and  
22 reserve all rights to take any and all response actions  
23 authorized by law. However, the obligation, if any, of the  
24 Settling Defendants to reimburse the United States for taking  
25 such actions shall be governed by the provisions of this Consent  
26 Decree to the extent Settling Defendants comply with their  
27 obligations to fund or perform such response actions pursuant to  
28

4473-9098

1 this Consent Decree.

2 XXIII. COVENANTS BY SETTLING DEFENDANTS

3 A. Settling Defendants hereby covenant not to sue and agree  
4 not to assert any claims or causes of action against the United  
5 States with respect to the Site or this Consent Decree,  
6 including, but not limited to, any direct or indirect claim for  
7 reimbursement from the Hazardous Substance Superfund (established  
8 pursuant to the Internal Revenue Code, 26 U.S.C. § 9507) through  
9 CERCLA Sections 106(b)(2), 111, 112, 113, 42 U.S.C.  
10 §§ 9606(b)(2), 9611, 9612, and 9613, or any other provision of  
11 law, any claim against the United States, including any  
12 department, agency or instrumentality of the United States under  
13 CERCLA Sections 107 or 113, 42 U.S.C. §§ 9607 or 9613, related to  
14 the Site except as expressly reserved in this Section, Paragraphs  
15 (A)(1), (2), or (3) of this Consent Decree or Section XVII,  
16 Paragraph B of the First Consent Decree, or any claims arising  
17 out of response activities at the Site. However, the Settling  
18 Defendants reserve, this Consent Decree is without prejudice to,  
19 and nothing in this Consent Decree shall be interpreted as  
20 waiving, abrogating or resolving:

21 (1) any claims which any Settling Defendant has or may  
22 have based upon any alleged liability of the United States  
23 Department of Defense, any branch or division thereof ("DOD"), or  
24 any predecessor agency to DOD for conditions at the Site pursuant  
25 to CERCLA Sections 106, 107, 113, 120 or 310, 42 U.S.C. §§ 9606,  
26 9607, 9613, 9620 or 9659 or RCRA Section 7002, 42 U.S.C. § 6972;

27 (2) any claims which any Settling Defendant has or may  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 have with respect to the Site against the United States pursuant  
2 to any contract between any Settling Defendant and the United  
3 States or between any Settling Defendant and any government  
4 contractor(s) related to the Site; or  
5 (3) actions against the United States based on  
6 negligent actions taken directly by the United States (not  
7 including oversight or approval of the Settling Defendants' plans  
8 or activities) that are brought pursuant to any statute other  
9 than CERCLA and for which the waiver of sovereign immunity is  
10 found in a statute other than CERCLA.  
11 (4) actions against the State based on negligent  
12 actions taken directly by the State (not including oversight or  
13 approval of the Settling Defendants' plans or activities) that  
14 are brought pursuant to any statute or law other than CERCLA,  
15 RCRA, and Chapters 6.5, Sections 25100 *et seq.*, and 6.8, Sections  
16 25300 *et seq.* of the California Health & Safety Code.  
17 B. In agreeing to these reservations, the United States and  
18 the State do not admit liability on any such claims and expressly  
19 reserve any and all defenses that either of them may have to any  
20 such claims.  
21 C. Except as expressly set forth in this Consent Decree,  
22 Settling Defendants do not waive any claim against and do not  
23 release or covenant not to sue the United States or the State  
24 with respect to any matter. Nothing in this Consent Decree shall  
25 be deemed to constitute preauthorization of a claim within the  
26 meaning of Section 111 of CERCLA, 42 U.S.C. § 9611, or 40 C.F.R.  
27 § 300.700(d).  
28

4473-9098

1 D. Settling Defendants hereby covenant not to sue and agree  
2 not to assert any claims or causes of action against the State  
3 with respect to the Site or this Consent Decree, including, but  
4 not limited to, (1) any direct or indirect claim for  
5 reimbursement from the Hazardous Waste Control Account, Hazardous  
6 Substance Account, or Hazardous Substance Cleanup Fund through  
7 Health and Safety Code section 25375 or any other provision of  
8 law; (2) any claim against the State under Sections 107 or 113 of  
9 CERCLA, 42 U.S.C. §§ 9607 or 9613, or Section 7003 of RCRA, 42  
10 U.S.C. § 9673; or (3) any other claims arising out of Settling  
11 Defendants' response activities at the Site, including but not  
12 limited to nuisance, trespass, taking, equitable indemnity and  
13 indemnity under California law, contribution under California and  
14 federal law, or strict liability under California law.  
15 XXIV. EFFECT OF SETTLEMENT: CONTRIBUTION PROTECTION  
16 A. Nothing in this Consent Decree shall be construed to  
17 create any rights in, or grant any cause of action to, any person  
18 not a Settling Defendant or a Released Party under this Consent  
19 Decree. The preceding sentence shall not be construed to waive  
20 or nullify any rights that any person not a signatory to this  
21 Consent Decree may have under applicable law. Each of the  
22 Parties expressly reserves any and all rights (including, but not  
23 limited to, any right to contribution), defenses, claims,  
24 demands, and causes of action which each party may have with  
25 respect to any matter, transaction, or occurrence relating in any  
26 way to the Site against any person not a Settling Defendant or  
27 Released Party under this Consent Decree.  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 B. At such time as a judgment is entered and becomes final  
2 judicially approving this Consent Decree, each Settling Defendant  
3 hereby expressly waives any and all rights (including, but not  
4 limited to, any right to contribution, defenses, claims, demands,  
5 and causes of action under State of California or federal law)  
6 against all other Settling Defendants and Released Parties with  
7 respect to Covered Matters specified in Paragraph C of this  
8 Section. Notwithstanding the foregoing, any funding of the  
9 repair of earthquake damage ("Earthquake Funding") by Lockheed  
10 Martin pursuant to Section XIV (Funding of Response Activities),  
11 Paragraph N of this Consent Decree, is without prejudice to its  
12 right to assert claims against other Settling Defendants (except  
13 the Appendix 3 parties and Settling Work Defendant) for  
14 reimbursement of Earthquake Funding. No Settling Defendant  
15 (except the Appendix 3 parties and Settling Work Defendant) shall  
16 assert that any agreement which exists between any of the  
17 Settling Defendants at the time of entry of this Second Consent  
18 Decree acts as a bar or provides a defense to any reimbursement  
19 or contribution claim by any other Settling Defendant for  
20 Earthquake Funding. The provisions of this Paragraph  
21 specifically supersede the provisions of Paragraph B of Section  
22 XXII (Contribution Protection) of the First Consent Decree. With  
23 regard to claims by third parties for contribution against  
24 Settling Defendants and/or Released Parties for such Covered  
25 Matters specified in Paragraph C of this Section, the Parties  
26 hereto agree that the Settling Defendants and Released Parties  
27 are entitled to such protection from contribution actions or  
28

4473-9098

1 claims as is provided by CERCLA Section 113(f)(2), 42 U.S.C.  
2 § 9613(f)(2). Certain defendants have entered into private  
3 agreements with regard to certain matters which relate to those  
4 that form the subject matter of this Consent Decree; the waiver  
5 expressed in this Paragraph shall not operate to preclude  
6 enforcement of those private agreements.  
7 C. The Covered Matters in this Consent Decree are:  
8 1. EPA's and the State's Past Site-Specific Response  
9 Costs and Past Basin-wide Response Costs,  
10 2. EPA's and the State's Future Site-Specific Response  
11 Costs,  
12 3. all matters addressed in the First Consent Decree  
13 and this Consent Decree,  
14 4. all matters addressed in UAO 92-12 through the  
15 period covered during this Consent Decree, and  
16 5. all costs of implementing the O&M Activities and  
17 any other response activity to be performed under this Consent  
18 Decree, except to the extent this Consent Decree does not provide  
19 for one or more of the Settling Defendants to fund and/or to  
20 perform any part of such activities.  
21 D. The Settling Defendants agree that with respect to any  
22 suit or claim for contribution brought by them for Covered  
23 Matters they will notify the United States and the State in  
24 writing no later than sixty (60) days prior to the initiation of  
25 such suit or claim.  
26 E. The Settling Defendants also agree that with respect to  
27 any suit or claim for contribution brought against them for  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Covered Matters they will notify the United States and the State
2 in writing within sixty (60) days of service of the complaint on
3 them. In addition, Settling Defendants shall notify the United
4 States and the State in writing within ten (10) days of service
5 or receipt of any Motion for Summary Judgment and within ten (10)
6 days of receipt of any order from a court setting a case for
7 trial.

8 F. In any subsequent administrative or judicial proceeding
9 initiated by the United States or the State for injunctive
10 relief, recovery of response costs, or other appropriate relief
11 relating to the Site, Settling Defendants shall not assert, and
12 may not maintain, any defense or claim based upon the principles
13 of waiver, res judicata, collateral estoppel, issue preclusion,
14 claim-splitting, or other defenses based upon any contention that
15 the claims raised by the United States or the State in the
16 subsequent proceeding were or should have been brought in the
17 instant case; provided, however, that nothing in this Paragraph
18 affects the enforceability of the covenants not to sue set forth
19 in Section XXII (Covenants Not to Sue by Plaintiffs).

20 G. Payment of all sums which a Settling Cash Defendant is
21 obligated to pay pursuant to Section XIV (Funding of Response
22 Activities) of this Consent Decree, comprises full settlement as
23 to that Settling Cash Defendant, any related Released Party as
24 described in Appendix 1, and any Related Settling Defendant as
25 described in Appendix 1, for all Covered Matters and thus, such
26 Settling Cash Defendants, Related Settling Defendants and related
27 Released Parties are entitled to such protection from
28

4473-9098

1 contribution actions or claims as is provided by CERCLA Section
2 113(f)(2), 42 U.S.C. § 9613(f)(2).

3 XXV. ACCESS TO INFORMATION

4 A. Settling Defendants shall provide to EPA and the State,
5 upon request, copies of all documents or portions thereof which
6 are not privileged by the attorney-client privilege, the attorney
7 work product doctrine, or any other privilege recognized by law,
8 and information within their possession or control or that of
9 their contractors or agents relating to response actions at the
10 Site or to the implementation of this Consent Decree including,
11 but not limited to, sampling, analysis, chain of custody records,
12 manifests, trucking logs, receipts, reports, sample traffic
13 routing, correspondence, or other documents or information
14 related to the O&M Activities. Settling Defendants shall also
15 make available to EPA and the State, for purposes of
16 investigation or information gathering, their employees, agents,
17 or representatives with knowledge of relevant facts concerning
18 the performance of the O&M Activities.

19 B. Settling Defendants may assert confidentiality claims
20 covering part or all of the documents or information submitted to
21 Plaintiffs under this Consent Decree to the extent permitted by
22 and in accordance with Section 104(e)(7) of CERCLA, 42 U.S.C.
23 § 9604(e)(7), and 40 C.F.R. § 2.203(b). Documents or information
24 determined to be confidential by EPA will be afforded the
25 protection specified in 40 C.F.R. Part 2, Subpart B. If no claim
26 of confidentiality accompanies documents or information when they
27 are submitted to EPA and the State, or if EPA has notified
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 Settling Defendants that the documents or information are not  
2 confidential under the standards of Section 104(e)(7) of CERCLA,  
3 the public may be given access to such documents or information  
4 without further notice to Settling Defendants.

5 C. The Settling Defendants may assert that certain  
6 documents, records and other information are privileged under the  
7 attorney-client privilege, the attorney work product doctrine, or  
8 any other privilege recognized by law. In the case of documents,  
9 if a Settling Defendant asserts such a privilege in lieu of  
10 providing documents, it shall provide the Plaintiffs with the  
11 following: (1) the title of the document, record, or  
12 information; (2) the date of the document, record, or  
13 information; (3) the name and title of the author of the  
14 document, record, or information; (4) the name and title of each  
15 addressee and recipient; (5) a description of the contents of the  
16 document, record, or information; and (6) the privilege asserted  
17 by such Settling Defendant. However, no documents, reports or  
18 other information created or generated pursuant to the  
19 requirements of this Consent Decree shall be withheld on the  
20 grounds that they are privileged. If a claim of privilege  
21 applies only to a portion of a document, the document shall be  
22 provided to EPA in redacted form.

23 D. No claim of confidentiality or privilege shall be made  
24 with respect to any document that falls within Section  
25 104(e)(7)(F) of CERCLA, 42 U.S.C. § 9604(e)(7)(F).  
26  
27  
28

4473-9098

1 XXVI. RETENTION OF RECORDS

2 A. Until ten (10) years after the Settling Defendants'  
3 receipt of EPA's notification pursuant to Paragraph B.2 of  
4 Section XV (Certification of Completion of the Work), each  
5 Settling Defendant shall preserve and retain all records and  
6 documents now in its possession or control or which come into its  
7 possession or control that relate in any manner to the  
8 performance of the O&M Activities or liability of any person for  
9 response actions conducted and to be conducted at the Site,  
10 regardless of any document retention policy to the contrary.  
11 Until ten (10) years after Settling Defendants' receipt of EPA's  
12 notification pursuant to Paragraph A.2 of Section XV  
13 (Certification of Completion), Settling Defendants shall also  
14 instruct their contractors and agents to preserve all documents,  
15 records, and information of whatever kind, nature or description  
16 relating to the performance of the O&M Activities.

17 B. At the conclusion of this document retention period,  
18 Settling Defendants shall notify the United States and the State  
19 at least ninety (90) days prior to the destruction of any such  
20 records or documents, and, upon request by the United States or  
21 the State such Settling Defendant shall deliver any such records  
22 or documents to EPA or the State. A Settling Defendant may  
23 assert that certain documents, records and other information are  
24 privileged under the attorney-client privilege, the attorney work  
25 product doctrine, or any other privilege recognized by law. In  
26 the case of documents, if a Settling Defendant asserts such a  
27 privilege, it shall provide the Plaintiffs with the following:  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 (1) the title of the document, record, or information; (2) the  
2 date of the document, record, or information; (3) the name and  
3 title of the author of the document, record, or information; (4)  
4 the name and title of each addressee and recipient; (5) a  
5 description of the subject of the document, record, or  
6 information: and (6) the privilege asserted by the Settling  
7 Defendant. However, no documents, reports or other information  
8 created or generated pursuant to the requirements of this Consent  
9 Decree shall be withheld on the grounds that they are privileged.

10 If a claim of privilege applies only to a portion of the  
11 document, it shall be provided to EPA in redacted form.

12 C. Each Settling Defendant hereby certifies, individually,  
13 that it has not willfully and for an improper purpose altered,  
14 mutilated, discarded, destroyed or otherwise disposed of any  
15 records, documents or other information relating to its potential  
16 liability regarding the Site since notification of potential  
17 liability by the United States or the State or the filing of suit  
18 against it regarding the Site and that to the best of its  
19 knowledge, that it has fully complied with any and all EPA  
20 requests for information pursuant to Section 104(e) and 122(e) of  
21 CERCLA, 42 U.S.C. § 9604(e) and 9622(e), and Section 3007 of  
22 RCRA, 42 U.S.C. § 6927.

23 XXVII. NOTICES AND SUBMISSIONS

24 A. Whenever, under the terms of this Consent Decree,  
25 written notice is required to be given or a report or other  
26 document is required to be sent by one party to another, it shall  
27 be directed to the individuals at the addresses specified below,  
28

4473-9098

1 unless those individuals or their successors give notice of a  
2 change to the other parties in writing. All notices and  
3 submissions shall be considered effective upon receipt, unless  
4 otherwise provided. Written notice as specified herein shall  
5 constitute complete satisfaction of any written notice  
6 requirement of the Consent Decree with respect to the United  
7 States, EPA, the State, and the Settling Defendants,  
8 respectively.

9 As to the United States:

10 Chief, Environmental Enforcement Section  
11 Environment and Natural Resources Division  
12 U.S. Department of Justice  
13 P.O. Box 7611  
14 Ben Franklin Station  
15 Washington, D.C. 20044  
16 Re: DJ # 90-11-2-442

17 and

18 Director, Waste Management Division  
19 United States Environmental Protection Agency  
20 Region IX  
21 75 Hawthorne St.  
22 San Francisco, CA 94105

23 As to EPA:

24 EPA Project Coordinator, San Fernando Valley  
25 Burbank Operable Unit  
26 United States Environmental Protection Agency  
27 Region IX  
28 75 Hawthorne Street, H-6-4  
San Francisco, CA 94105

23 As to the State:

24 Hamid Saebfar, Chief  
25 Site Mitigation Cleanup Operations  
26 Department of Toxic Substances Control  
27 Region 3  
28 1011 N. Grandview Avenue  
Glendale, CA 91201

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 As to the Settling Work Defendant:

2 City of Burbank  
3 Peter Frankel, P.E.  
4 Supervising Civil Engineer  
5 City of Burbank  
6 Public Service Department  
7 165 West Magnolia Boulevard  
8 Burbank, CA 91503-0631

6 As to the Settling Defendants Other Than Settling Work Defendant:

7 As set forth in Appendix 7.

8 XXVIII. EFFECTIVE DATE

9 A. The Effective Date of this Consent Decree shall be the  
10 date upon which it is entered by the Court, except as otherwise  
11 provided herein.

12 XXIX. RETENTION OF JURISDICTION

13 A. This Court retains jurisdiction over both the subject  
14 matter of this Consent Decree and the Settling Defendants for the  
15 duration of the performance of the terms and provisions of this  
16 Consent Decree for the purpose of enabling any of the Parties to  
17 apply to the Court at any time for such further order, direction,  
18 and relief as may be necessary or appropriate for the  
19 construction or modification of this Consent Decree, or to  
20 effectuate or enforce compliance with its terms, or to resolve  
21 disputes in accordance with Section XX (Dispute Resolution)  
22 hereof.

23 XXX. APPENDICES

24 A. The following appendices are attached to and  
25 incorporated into this Consent Decree:

26 Appendix 1 is the complete list of the Settling Cash  
27 Defendants and Released Parties and/or other Settling Defendants  
28

4473-9098

1 who are related to a Settling Cash Defendant, to Lockheed Martin  
2 or to the City of Burbank in the manner described in Appendix 1.

3  
4 Appendix 2 is the complete list of the Owner Settling  
5 Defendants and the properties they own within the Site.

6  
7 Appendix 3 is the complete list of Settling Defendants  
8 who are excepted from the operation of Section XXII (Covenants  
9 not to Sue by Plaintiffs), Paragraphs A, B and C.

10  
11 Appendix 4 is the Second Stage Statement of Work.

12  
13 Appendix 5 is ESD2.

14  
15 Appendix 6 is a list of the Settling Defendants and for each  
16 Settling Defendant, the person to whom notices and submissions  
17 shall be sent pursuant to Section XXVII (Notices and Submissions)  
18 of this Consent Decree.

19  
20 Appendix 7 is a plot plan or plans which depict extraction  
21 wells VO-1, 2, 3 and 4 as described in Paragraph L of Section XIV  
22 (Funding of Response Activities), and the City's liquid phase GAC  
23 wellfield located at 164 West Magnolia Boulevard, Burbank,  
24 California, as described in Paragraph G of Section V (General  
25 Provisions) and Paragraph H.4 of Section VI (Performance of the  
26 Work).

27 B. The following exhibits are attached to this Consent  
28 Decree for reference purposes and are not incorporated herein

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 unless otherwise noted.

2 Exhibit 1 is the First Consent Decree.

3 "Appendix A" to the First Consent Decree is the ROD

4 prior to its modification in ESD1, the First Consent Decree, and

5 ESD2.

6 "Appendix B" to the First Consent Decree is ESD 1.

7 "Appendix C" to the First Consent Decree is the Map of

8 Corrected Well Locations.

9 "Appendix D" to the First Consent Decree is the SOW.

10 "Appendix E" to the First Consent Decree is Schematics.

11 "Appendix F" to the First Consent Decree is a Plot Map.

12 Exhibit 2 is Unilateral Administrative Order 92-12 and the

13 April 26, 1992 Amendment to Unilateral Administrative Order 92-

14 12.

15 Exhibit 3 is a Scope of Work regarding Plant Facilities

16 Insurance.

17 XXXI. COMMUNITY RELATIONS

18 A. Settling Work Defendant shall participate and cooperate

19 with to EPA and the State concerning its participation in the

20 community relations plan ("Plan") for the Site to be developed or

21 which has been previously developed by EPA. In consultation with

22 Settling Work Defendant, EPA will determine the appropriate role

23 for the Settling Work Defendant under the Plan. Settling Work

24 Defendant shall cooperate with EPA and the State in implementing

25 the Plan and pursuant thereto, in providing information regarding

26 the O&M Activities to the public. As requested by EPA, or the

27 State, Settling Work Defendant, Lockheed Martin, and/or the

28

4473-9098

1 Settling Cash Defendants (including the UAO Parties) shall

2 participate in the preparation of information for dissemination

3 to the public and in public meetings which may be held or

4 sponsored by EPA or the State to explain activities at or

5 relating to the Site.

6 XXXII. MODIFICATION

7 A. Schedules specified in this Consent Decree, in the

8 Second Stage Statement of Work, or in any work plan approved by

9 EPA pursuant to this Consent Decree for completion of the O&M

10 Activities or any other response activities may be modified by

11 agreement of EPA and the Settling Work Defendant, and any other

12 Settling Defendant whose rights and/or obligations would be

13 substantially affected thereby. All such modifications shall be

14 made in writing.

15 B. No modifications shall be made to the Second Stage

16 Statement of Work without written notification to and consent by

17 any Settling Defendant whose rights or obligations would be

18 substantially affected thereby, and written approval of the

19 United States. Prior to providing its approval to any

20 modification, the United States will provide the State with a

21 reasonable opportunity to review and comment on the proposed

22 modification.

23 C. Nothing in this Consent Decree shall be deemed to alter

24 EPA's authority to make changes to the interim remedy for the

25 Burbank Operable Unit in compliance with CERCLA, the National

26 Contingency Plan, and any other applicable laws or regulations,

27 or to require court approval of such changes.

28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 D. Nothing in this Consent Decree shall be deemed to alter  
2 the Court's power to enforce, supervise or approve modifications  
3 to this Consent Decree.

4 XXXIII. LODGING AND OPPORTUNITY FOR PUBLIC COMMENT

5 A. This Consent Decree shall be lodged with the Court for a  
6 period of not less than thirty (30) days for public notice and  
7 comment in accordance with Section 122(d)(2) of CERCLA, 42 U.S.C.  
8 § 9622(d)(2), and 28 C.F.R. § 50.7. The United States also shall  
9 publish notice of the proposed settlement described in this  
10 Consent Decree in the Federal Register pursuant to section 122(1)  
11 of CERCLA, 42 U.S.C. § 9622(1). The United States hereby gives  
12 notice and opportunity to the public for a public meeting in the  
13 affected area, and a reasonable opportunity to comment on the  
14 proposed settlement prior to its final entry, pursuant to section  
15 6973(d) of RCRA, 42 U.S.C. § 7003(d).

16 B. The United States reserves the right to withdraw or  
17 withhold its consent or suggest modifications to this Consent  
18 Decree if the comments regarding the Consent Decree disclose  
19 facts or considerations which indicate that the Consent Decree is  
20 inappropriate, improper, or inadequate. Settling Defendants  
21 consent to the entry of this Consent Decree without further  
22 notice. However, Settling Defendants' consent to the entry of  
23 this Consent Decree is not consent to any modifications, and no  
24 Settling Defendant shall be bound by modifications to this  
25 Consent Decree without its prior written consent.

26 C. If for any reason the Court should decline to approve  
27 this Consent Decree in the form presented, this Consent Decree is  
28

4473-9098

1 voidable as to any party at the sole discretion of such party and  
2 the terms of this Consent Decree may not be used as evidence in  
3 any litigation between the Parties.

4 XXXIV. SIGNATORIES/SERVICE

5 A. Each undersigned representative of a Settling Defendant  
6 to this Consent Decree, Plaintiffs, and the Assistant Attorneys  
7 General for the Environment and Natural Resources Division of the  
8 Department of Justice and for the State of California, certifies  
9 that he or she is fully authorized to enter into the terms and  
10 conditions of this Consent Decree and to execute and legally bind  
11 such Party to this document.

12 B. Each Settling Defendant hereby agrees not to oppose  
13 entry of this Consent Decree by this Court or to challenge any  
14 provision of this Consent Decree unless the United States has  
15 notified the Settling Defendants in writing that it no longer  
16 supports entry of this Consent Decree.

17 C. Each Settling Defendant shall identify, on the attached  
18 signature page, the name, address and telephone number of an  
19 agent who is authorized to accept service of process by mail on  
20 behalf of that Party with respect to all matters arising under or  
21 relating to this Consent Decree. Concerning any action brought  
22 by the United States or the State to enforce the terms of this  
23 Consent Decree, Settling Defendants hereby agree to accept  
24 service in that manner and to waive the formal service  
25 requirements set forth in Rule 4 of the Federal Rules of Civil  
26 Procedure and any applicable local rules of this Court,  
27 including, but not limited to, service of a summons. Concerning  
28

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

1 the lodging and entry of this Consent Decree, Settling Defendants  
2 agree to accept in lieu of service by mail or the formal service  
3 requirements set forth in Rule 4 of the Federal Rules of Civil  
4 Procedure, service by the United States and the State by mail of  
5 one (1) copy of any document(s), motions or related matters upon  
6 the following persons:

SECOND  
EXPLANATION OF SIGNIFICANT DIFFERENCES  
DECLARATION

SITE NAME AND LOCATION  
San Fernando Valley Area 1  
Burbank Operable Unit  
Los Angeles County, California

I. Statement of Basis and Purpose

This decision document presents the Second Explanation of Significant Differences (ESD2) to the interim remedial action selected by the Burbank Operable Unit (Burbank OU) Record of Decision (ROD) signed June 1989. The Burbank OU ROD was previously modified by an Explanation of Significant Differences dated November 1990 (ESD1). Additional changes to the remedy were made in a 1992 Consent Decree, which was approved by the Central District of California federal court. ESD2 has been developed in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (42 U.S.C. Section 9601 et. seq.) and the National Contingency Plan (40 C.F.R. Section 300 et. seq.).

II. Description of the Selected Remedy in the ROD and ESD1

The Burbank OU ROD selected the interim remedy for an area of groundwater contamination, located within the San Fernando Valley Area 1 Superfund Site, which encompasses wellfields which were operated by the City of Burbank prior to being shut down as a result of the contamination. The ROD selected extraction of contaminated groundwater, treatment by air or steam stripping, and use of the treated water as a public water supply by the City of Burbank. The interim remedy was estimated to cost \$69 million over 20 years (in 1989 dollars).

The ROD selected as the interim remedy the extraction and treatment of groundwater at a rate of 12,000 gallons per minute (gpm). This was considered to be the extraction rate necessary to hydraulically control, i.e. to prevent the spreading of, groundwater at concentrations of 100 parts per billion (ppb) of trichloroethylene (TCE) and 5 ppb of perchloroethylene (PCE). Extraction wells were to be placed in locations which would control plume migration while initiating aquifer restoration. The treatment technology specified was either air stripping or steam stripping, with off-gas control.

240

4473-9098

ESD2  
Page 3

The ROD states that the treated water must meet all existing federal and state Maximum Contaminant Levels (MCLs) and State Action Levels (SALs). It also states that the water must meet all drinking water treatment technology requirements. The ROD states a preference for delivering the treated water to the City of Burbank's distribution system for use as a public water supply. Using the treated water in this manner was considered preferable to discharging the water to waste because it represents a beneficial use of the groundwater resource in a water-poor region.

III. Summary of ESD1

ESD1 clarified and superseded certain parts of the Burbank OU ROD, as follows.

Based on new information regarding the occurrence of nitrate in the groundwater (nitrate levels turned out to be higher than anticipated), it became clear that additional treatment measures would be required in order for the extracted and treated groundwater to be used as a public water supply. EPA decided to require blending of the extracted and treated Burbank OU groundwater with a water supply lower in nitrates, such that the MCL is achieved in water served to the public.

The nitrate blending requirement increased the total amount of water produced by the interim remedy. The total amount to be produced was high enough that the possibility was raised that the City of Burbank would not be able to accept the total quantity of water produced at the Burbank OU. Other local water purveyors were unwilling to commit to accept excess water produced by the Burbank OU treatment plant. Therefore, in order to ensure that the interim remedy would continue to extract contaminated groundwater at the intended capacity, EPA decided to require reinjection of any excess water.

EPA clarified that the interim remedy could be designed, constructed, and operated in phases. Phasing the project allows for initial completion of a portion of the total extraction wellfield and treatment plant capacity. Operation of this first phase of the project allows collection of data on aquifer response and treatment plant efficiency. This data helps the design engineer to optimize the design of the following project phases, and helps to optimize overall groundwater containment and treatment efficiency for the project.

EPA clarified statements in the ROD pertaining to containment of groundwater containing TCE at 100 ppb and PCE at 5 ppb. These levels are not treatment goals to be attained in groundwater, but

241

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 4

are to be used in designing the containment area to be developed by the extraction wellfield.

Because of the addition of reinjection as a component of the project, ARARs pertaining to reinjection of extracted and treated groundwater were identified. Specifically mentioned was the "Statement of Policy with Respect to Maintaining High Quality of Waters in California," which requires that reinjected water not degrade existing water quality.

The additional cost due to ESD1 changes in the interim remedy were estimated at \$8.8 million over 20 years (in 1990 dollars).

IV. Summary of Additional Significant Differences (ESD2)

Based on additional study of the local (Burbank OU) groundwater system by Lockheed Martin, and by EPA's consultant CH2M Hill, EPA has concluded that an extraction rate of 9,000 gpm results in substantially the same level of groundwater containment as an extraction rate of 12,000 gpm. Overall costs are reduced at the lower extraction rate, because the need to construct and operate expensive reinjection facilities is eliminated. Cost effectiveness is improved because the lower extraction rate makes it less likely that the upper groundwater zone will become de-watered, and thus will allow EPA to achieve its goal of preferentially pumping the most contaminated zones. Based on these factors, EPA has lowered the interim remedy extraction rate to 9,000 gpm.

EPA has decided to eliminate reinjection as a requirement based on projections that there will essentially be no excess water at the revised groundwater extraction rate. The City of Burbank can substantially accept, and has committed to accept, an average of 9,000 gpm from the interim remedy facilities.

Due to elimination of reinjection from the project, the Burbank OU groundwater extraction rate will not be a continuous 9,000 gpm. The instantaneous extraction rate will fluctuate with the City of Burbank's water demand. In recognition of the likelihood that it will not be possible to extract groundwater at a rate of 9,000 gpm, twenty-four hours a day, three hundred and sixty-five days a year, EPA is specifying that the new extraction rate will be achieved as an average rate, not an instantaneous rate.

EPA has also decided to suspend the 9,000 gpm extraction rate requirement during times when nitrate levels in the extracted groundwater exceed 50 mg/l as nitrate. The ability to maintain an annual extraction rate of 9,000 gpm is not only dependent on the City of Burbank's water demand, but also upon nitrate concentrations in the extracted groundwater. It is possible that

242

4473-9098

ESD2  
Page 5

these concentrations may rise high enough such that, during periods of low water demand, it is not possible to extract an average of 9,000 gpm and also meet the nitrate MCL. EPA's analysis suggests that even under the worst case scenario for nitrates, an average of 8,500 gpm would be pumped. EPA believes the interim remedy will continue to be protective of human health and the environment even at this slightly reduced groundwater extraction rate, which, if it occurs, will only occur on an occasional basis.

EPA estimates that changes to the interim remedy effected by ESD2 will reduce implementation costs by \$49 million (1995 dollars).

Further, the City of Burbank holds a public water supply operating permit, issued by the California Department of Health Services. This permit has been amended to cover operation of the Burbank OU treatment facilities. The requirements of this permit will govern off-site requirements for drinking water protectiveness.

V. Declaration

The selected remedy, as modified by this ESD, is protective of human health and the environment, attains federal and state requirements that are applicable, or relevant and appropriate, to this interim remedial action, and is cost-effective. This remedy satisfies the statutory preference for remedies that employ treatment which permanently and significantly reduces the volume, toxicity or mobility of the hazardous substances as a principal element. It also complies with the statutory preference for remedies that utilize permanent solutions and alternative treatment technologies or resource recovery technologies to the maximum extent practicable. As part of the remedy, groundwater monitoring will be conducted to track contaminant levels at the Burbank Operable Unit and to monitor the performance of the extraction and treatment system in order to ensure adequate protection of human health and the environment.

San Fernando Valley Area 1, Burbank Operable Unit

SECOND EXPLANATION OF SIGNIFICANT DIFFERENCES  
February 12, 1997

I. Introduction

On June 30, 1989, the U.S. Environmental Protection Agency (EPA) signed a Record of Decision (ROD) for the San Fernando Valley Area 1 Superfund Site, Burbank Operable Unit (Burbank OU). On November 21, 1990, EPA signed an Explanation of Significant Differences (ESD1) modifying the interim remedial action selected in the ROD. The purpose of this Second Explanation of Significant Differences (ESD2) is to explain additional modifications to the interim remedial action.

Under Section 117 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980, as amended by the Superfund Amendment and Reauthorization Act of 1986, and pursuant to 40 C.F.R. Sec. 300.435(c)(2)(i) (55 Fed. Reg. 8666, 8852 (March 8, 1990)), EPA is required to publish an Explanation of Significant Differences when significant (but not fundamental) changes are made to a final remedial action plan as described in a ROD.

This document provides a brief background of the Site, a summary of the remedy selected in the Burbank OU ROD, a summary of changes made to the remedy by ESD1, a description of the changes to the remedy EPA is making in this ESD2 (including how the changes affect and better refine the remedy selected in the ROD), and an explanation of why EPA is making these changes.

EPA is issuing ESD2 in order to take into account technical data received after ESD1 was signed in November, 1990. The changes are: (1) Based on additional study of the local (Burbank OU) groundwater system, EPA has concluded that an extraction rate of 9,000 gallons per minute (gpm) results in substantially the same level of groundwater containment as an extraction rate of 12,000 gpm. Therefore, the interim remedy extraction rate has been reduced to 9,000 gpm; (2) EPA is specifying that the new extraction rate will be achieved as an average rate, not an instantaneous rate; (3) EPA has decided to eliminate reinjection as a requirement based on projections that, on an annual basis, there will be no excess water at the revised groundwater extraction rate; and, (4) EPA has decided that the specified average extraction rate need not be met during times when nitrate levels in the extracted groundwater exceed 50 mg/l, because under this circumstance a greater quantity of blending water will be

244

4473-9098

ESD2  
Page 7

required, leaving the City of Burbank less capacity to accept extracted groundwater for use as a public water supply.

ESD2 and the supporting documentation will become part of the Burbank OU Administrative Record. Copies of the Administrative Record have been placed at the following locations:

City of Burbank Public Library  
110 North Glenoaks Boulevard  
Burbank, CA 91502  
818-953-9737

City of Glendale Public Library  
222 East Harvard Street  
Glendale, CA 91205  
818-956-2027

II. Background

A. Site background and description

The following gives a brief background of the Burbank OU and a short summary of the remedy selected in the ROD and modified by ESD1. Further background information can be found in the ROD (dated June 30, 1989), and in ESD1 (dated November 20, 1990), as well as in other documents in the Burbank OU Administrative Record.

In June 1986, EPA evaluated the threat posed by groundwater contamination at a number of water supply wellfields within the San Fernando Valley and Verdugo groundwater basins. The chief contaminants of concern are trichloroethylene (TCE) and perchloroethylene (PCE). As a result of its investigation, EPA designated four wellfield areas as National Priorities List (NPL) sites. EPA is managing the four sites as a single project consistent with CERCLA Section 104(d)(4).

The San Fernando Valley Groundwater Basin has historically been an important source of drinking water for the Los Angeles metropolitan area, including the City of Burbank. The groundwater basin provides enough water to serve approximately 600,000 residents.

Groundwater extracted from the basin is especially important during years of drought. Due to contamination by volatile organic chemicals (VOCs), including TCE and PCE, beneficial use of the groundwater resource has been partially lost. Surface water supplies have replaced the lost resource, but are costly, and may not be available in the future due to periodic drought conditions and the potential for changing water rights policy.

245

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 8

The Burbank OU is located within the San Fernando Valley groundwater basin and encompasses wellfields which were operated by the City of Burbank prior to being shut down as a result of contamination. The Burbank OU was specifically developed to address this areal extent of groundwater contamination.

The City of Burbank's production wells have been shut down since the early 1980s because of the presence of TCE and PCE in concentrations exceeding federal and state Maximum Contaminant Levels (MCLs). Consequently, the city purchases close to one hundred percent of its water from the Metropolitan Water District of Southern California, which supplies surface water imported from outside the San Fernando basin. (The city does operate a granular activated carbon groundwater extraction and treatment plant during parts of the year, but the contribution of this plant toward meeting the overall water demand is small.)

B. Selected remedy as modified by ESD1

The Burbank OU ROD selected the interim remedy for an area of groundwater contamination generally located within the San Fernando Valley Area 1 Superfund Site. The ROD selected extraction of contaminated groundwater, treatment by air or steam stripping, and use of the treated water as a public water supply by the City of Burbank. The interim remedy was estimated to cost \$69 million over the 20 year planned length of the interim remedy. ESD1 added the requirement to blend the extracted, treated, water with a lower nitrate source in order to meet nitrate MCLs. ESD1 also added the requirement for reinjection of excess water that the city could not accept due to water demand limitations. The changes to the interim remedy caused by ESD1 were estimated to cost \$8.8 million, raising the total estimated project cost to \$77.8 million (in 1989/1990 dollars).

Based on analyses conducted by the Los Angeles Department of Water and Power, through their consultant James M. Montgomery, in the Burbank OU Feasibility Study, the ROD specified that groundwater would be extracted and treated at a rate of 12,000 gpm. This rate was considered necessary in order to control plume migration and to initiate aquifer restoration. The 12,000 gpm rate was projected to hydraulically contain groundwater having a concentration of 100 parts per billion (ppb) of TCE and 5 ppb of PCE. ESD1 clarified that these levels are not treatment goals to be attained in groundwater, but are to be used in designing the containment area to be developed by the extraction wellfield.

The ROD states that the treated water must meet all existing federal and state MCLs and State Action Levels (SALs). It also states that the water must meet all drinking water treatment technology requirements. The treated water is being delivered to

246

4473-9098

ESD2  
Page 9

the City of Burbank's distribution system for use as a public water supply. Use of the treated water in this manner is considered preferable to discharging the water to waste because it restores the groundwater resource to beneficial use.

With respect to meeting drinking water standards, ESD1 concluded that, based on new information suggesting high nitrate levels in the groundwater, additional measures were required to meet the MCL for nitrate in the extracted and treated water. EPA decided to require blending of the extracted and treated groundwater with a water supply lower in nitrates, such that the MCL is achieved in water served to the public.

Addition of the nitrate blending requirement raised the possibility that the City of Burbank would not be able to accept the total quantity of water produced by the interim remedy. This is because nitrate blending raises water production, from the initially anticipated rate of 12,000 gpm, to a rate as high as 24,000 gpm. Under ESD1, EPA decided to require reinjection of any excess water, or water the City of Burbank could not use as a public water supply due to insufficient demand. EPA also identified Applicable or Relevant and Appropriate Requirements (ARARs) pertaining to reinjection of extracted and treated groundwater, specifically, the "Statement of Policy with Respect to Maintaining High Quality of Waters in California," which requires that reinjected water not degrade existing water quality.

Under ESD1, EPA also clarified that the interim remedy could be designed, constructed, and operated in phases. Phasing the project allows for initial completion of a portion of the total extraction wellfield and capacity treatment plant capacity. Operation of this first phase of the project allows collection of data on aquifer response and treatment plant efficiency. This data helps the design engineer to optimize the design of the following project phases, and helps to optimize overall groundwater containment and treatment efficiency for the project.

Portions of the Burbank OU ROD and ESD1 have already been implemented through a 1992 Consent Decree and a Unilateral Administrative Order. EPA also made additional operational changes in the interim remedy in the 1992 consent decree, which was approved by the Central District of California federal court. The 1992 consent decree, captioned United States of America v. Lockheed Corporation et al., Civil Action No. 91-4527 MRP(Tx), is included in the Administrative Record.

Under the Consent Decree, Lockheed Martin and the City of Burbank have constructed the first phase of the interim remedy. Under the Unilateral Administrative Order, a group of parties associated with six other Burbank facilities have constructed the

247

## Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 10

blending facility, the purpose of which is to reduce nitrates in the extracted, treated groundwater. The first phase of the interim remedy was completed and became operational in January 1996. The first phase consists of groundwater extraction and treatment at a rate of 6,000 gpm, blending with Metropolitan Water District water, and use of the treated, blended water as a public water supply.

## III. Summary of Significant Differences

ESD2 provides for the following changes to the interim remedy:

- 1) EPA has lowered the interim remedy extraction rate to 9,000 gpm. Based on additional study of the local (Burbank OU) groundwater system during the Remedial Design phase, EPA has concluded that an extraction rate of 9,000 gpm results in substantially the same level of groundwater containment as an extraction rate of 12,000 gpm. Cost effectiveness is improved at the lower extraction rate, not only due to the reduced cost of pumping less water, but because the need to construct and operate expensive reinjection facilities is eliminated. In addition, the lower extraction rate makes it less likely that the upper groundwater zone will become de-watered, and thus will allow EPA to achieve its goal of preferentially pumping the most contaminated zones.
- 2) EPA has decided to eliminate reinjection as a requirement. This decision is based on projections that, under existing aquifer conditions, there will be no excess water (i.e. water that cannot be used by the City of Burbank as a public water supply) produced at the revised groundwater extraction rate. The City of Burbank has committed to accept an annual average of 9,000 gpm from the interim remedy facilities.
- 3) EPA is specifying that the 9,000 gpm extraction rate will be achieved as an average rate, not as an instantaneous rate. Due to elimination of reinjection, the instantaneous rate will fluctuate with the City of Burbank's water demand. EPA recognizes that it will not be possible to extract groundwater at a rate of 9,000 gpm, twenty-four hours a day, three hundred and sixty-five days a year. However, EPA's analysis suggests that under the worst case scenario for nitrates, groundwater can be extracted at a minimum rate of 8,500 gpm. EPA believes protectiveness of human health and the environment is maintained even at this slightly reduced rate, which, if necessary, will only be necessary on an occasional basis. In order to maximize the amount of groundwater pumped, EPA has decided to count groundwater extraction from the city's granular activated carbon treatment plant toward the 9,000 gpm average rate. This wellfield will most likely be used by the city during the summer

248

4473-9098

ESD2  
Page 11

to meet peak water demand. The City of Burbank has agreed to maximize its use of treated groundwater. These decisions and agreements are to be included in a second consent decree between EPA, the city, and numerous Burbank parties.

4) EPA has decided to suspend the 9,000 gpm extraction rate requirement during times when nitrate levels in the extracted groundwater exceed 50 mg/l as nitrate. This decision is being made to ensure that under no circumstances will the MCL for nitrate be exceeded in the treated water. The ability to maintain an annual extraction rate of 9,000 gpm is not only dependent on the City of Burbank's water demand, but also upon nitrate concentrations in the extracted groundwater and in the blending water. It is possible that these concentrations may rise high enough such that, during periods of low water demand, it is not possible to extract an average of 9,000 gpm and also meet the nitrate MCL. However, as mentioned in the above paragraph, the City of Burbank has agreed to maximize its use of treated groundwater.

Lockheed Martin has estimated that changes to the interim remedy effected by ESD2 will reduce implementation costs by 49 million dollars (1995 dollars), and EPA is in agreement with this estimate.

## IV. Explanation and Detailed Description of Changes and Clarifications

After the ROD and ESD1 were signed, EPA received and reviewed new data from its Alternative Remedial Contracting Strategy (ARCS) contractor CH2M Hill, from the City of Burbank, and from the Lockheed Martin Corporation, regarding the Burbank OU groundwater system. This new information included both data collected in the field (from groundwater monitoring wells) and the output from computer modeling exercises. Reports and technical memoranda were generated compiling this data, which project that the implementation of ESD2 will not reduce the protectiveness of the Burbank OU interim remedy. Thus, EPA's conclusion in the ROD and ESD1 that the interim remedy is protective of human health and the environment has not changed. The new and existing technical information that EPA relied upon to prepare ESD2 is identified in the discussion which follows, and this information can be found in the Burbank OU Administrative Record.

## A. Background

Based on this new information, EPA has concluded that a lower pumping rate than originally projected will result in the desired degree of containment of the VOC contaminant plume in the vicinity of the Burbank OU. This projection results from an

249

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 12

improved ability on EPA's part to predict aquifer response to pumping, made possible because real operating data is now available from Phase 1 of the Burbank OU interim remedy, which includes a 6,000 gpm groundwater extraction wellfield. In addition, the local groundwater flow models designed by CH2M Hill and by Lockheed Martin have undergone additional improvement and verification since the ROD was written. Results from both models predict that a 9,000 gpm extraction rate achieves the goals of the ROD.

EPA believes it is important to implement this change not only because it is based on sound scientific analysis, but also because of cost savings to the project. Reducing the pumping rate allows for elimination of costly reinjection facilities required under ESD1. The lower pumping rate also ensures that EPA will be able to pump from the most contaminated zones of the aquifer without dewatering the aquifer.

EPA, with the assistance of CH2M Hill, the City of Burbank, and Lockheed Martin, performed the following analysis in reaching these conclusions.

B. Options

While CERCLA Section 117(c) and 40 C.F.R. Section 300.435(c)(2)(i) merely require an explanation of significant differences and the reason for these differences, ESD2 sets out in detail four options regarding the rate of groundwater extraction, along with EPA's analysis of these options. The four options are as follows:

1. Extraction and treatment of an annual average of 6,000 gpm of groundwater from the existing Phase 1 Burbank OU wellfield, with use of the treated water by the City of Burbank (this phase of the project is currently in operation; therefore, if Option 1 were selected, no further construction would be required at the Burbank OU);
2. Extraction and treatment of an annual average of 9,000 gpm of groundwater from the existing Phase 1 Burbank OU wellfield, and the planned Phase 2 wellfield, with use of the treated water by the City of Burbank;
3. Extraction and treatment of an annual average of 12,000 gpm of groundwater from the existing Phase 1 and proposed Phase 2 and Phase 3 Burbank OU wellfields, with use of the treated water by the City of Burbank, with conveyance of excess water to other purveyors;
4. Extraction and treatment of an annual average of 12,000 gpm of groundwater from the existing Phase 1 and proposed Phase 2 and

250

4473-9098

ESD2  
Page 13

Phase 3 Burbank OU wellfields, with use of the treated water by the City of Burbank, and reinjection of excess water (this is the option selected by the ROD as modified by ESD1).

C. Analysis of options

The four options presented above were compared with each other based on the nine criteria listed and explained in the National Contingency Plan (NCP), 40 C.F.R. Section 300.430(e)(9)(iii). The nine criteria and the results of the comparison of the options are presented in this subsection. The nine criteria are as follows:

1. compliance with ARARs
2. overall protection of human health and the environment
3. short-term effectiveness in protecting human health and the environment
4. long-term effectiveness and permanence in protecting human health and the environment
5. reduction of toxicity, mobility, and volume of contaminants
6. technical and administrative feasibility of implementation
7. capital and operation and maintenance costs
8. state acceptance
9. community acceptance

An analysis of the four options in terms of the above criteria follows.

1. Compliance with ARARs

The Burbank OU ROD recognizes that chemical-specific ARARs for the groundwater itself will be addressed in the final remedy. The remedial action adopted pursuant to the ROD, ESD1, and ESD2, is an interim action; therefore, chemical-specific ARARs for the groundwater contaminant plume do not apply to the activities taken pursuant to the ROD, ESD1, and ESD2.

However, for each of the four options being considered, drinking water standards, including state and federal MCLs, source water monitoring protocols, and treatment technology requirements, must be met. The existing treatment plant designed under Phase 1 has been shown to meet these standards during operation at flows up to 6,000 gpm. Option 1 is essentially Phase 1 of the Burbank OU interim remedy, which EPA has previously concluded meets drinking water ARARs.

The Phase 1 Burbank OU treatment plant is currently being operated to meet all standard state drinking water requirements.

251

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 14

and several special conditions, as specified in the public water supply operating permit issued to the City of Burbank by the California Department of Health Services (DHS). Since the treatment plant was designed with excess capacity, and can produce up to 9,000 gpm with no loss in treatment efficiency, EPA is confident that Option 2 will also meet drinking water ARARs. Options 3 and 4 would require modification to the treatment plant, but EPA is also confident that such modifications could be performed such that these standards would be met.

The treatment standards applicable to the Burbank OU treatment system were initially established in the ROD. The ROD required that the treatment system meet MCLs for all constituents (other than nitrates). Because water from the Burbank OU treatment system is conveyed offsite for use as a public water supply, and applicable drinking water standards may change, the consent decrees governing operation of the treatment plant recognize that EPA may identify requirements promulgated after the date of the ROD as ARARs in accordance with section 300.430(f)(1)(ii)(B)(1) of the NCP. That section requires attaining (or waiving) requirements promulgated after the date of the ROD where necessary to protect human health or the environment. This ESD does not change the treatment standards for operation of the treatment plant.

With respect to groundwater reinjection, ARARs include the California Regional Water Quality Control Board's (RWQCB) Non-degradation Policy, and Resource Conservation and Recovery Act (RCRA) Section 3020. The only option studied which involves reinjection is Option 4.

Any water reinjected on-site must meet all action-specific ARARs for reinjection. The reinjection must meet the "Statement of Policy With Respect to Maintaining High Quality of Waters in California," which requires that reinjected water not unreasonably degrade existing water quality. Nitrates are of concern with respect to reinjection; to avoid degradation, water from the Burbank OU treatment plant would have to be reinjected into an area of the aquifer containing as high or higher nitrate concentrations.

RCRA Section 3020 provides that the ban on the disposal of hazardous waste into a formation which contains an underground source of drinking water shall not apply to the injection of contaminated groundwater into the aquifer if: (i) such reinjection is part of a response action under CERCLA; (ii) such contaminated groundwater is treated to substantially reduce hazardous constituents prior to such reinjection; and (iii) such response action will, upon completion, be sufficient to protect human health and the environment.

252

4473-9098

ESD2  
Page 15

Compliance with reinjection ARARs could be problematic for implementation of Option 4 due to high nitrate levels in the extracted and treated groundwater, and limited areas of the aquifer available for reinjection based on ARARs criteria.

Based on consideration of drinking water ARARs, Options 1, 2, and 3 are considered equivalent. Option 4 is considered less favorable than Options 1-3 due to potential difficulties in meeting reinjection ARARs.

2. Overall protection of human health and the environment

Options 1-4 are all protective of human health and the environment. In each case, direct threat of human contact with contaminated groundwater has been minimized. Extracted groundwater is being treated to meet drinking water standards before being served to the public. Therefore, the selection of any of the four options for interim remedial action would result in no change in protection to human health and the environment from that achieved under the interim remedial action established in the ROD and ESD1.

Options 1-4 all inhibit the spreading of the VOC plume to downgradient wellfields, and along with federal and state source water monitoring requirements minimize the likelihood that contaminated water from downgradient wells would be served to the public. As far as the degree of overall containment is concerned, based on studies performed by CH2M Hill and Lockheed, EPA believes that protection of the aquifer is adequate under Options 2, 3, and 4, and may be adequate under Option 1. This issue is discussed further in the section on long-term protectiveness below.

Options 1-4 all protect the environment from contact with contaminated groundwater. Under all four options, extracted groundwater is being treated and used as a public water supply and is not being discharged to the land surface. Option 4 differs from the other three options in that it requires reinjection of excess water. As long as reinjection ARARs are followed, Option 4 will not result in degradation of groundwater quality.

3. Short-term effectiveness in protecting human health and the environment

The analysis regarding short-term effectiveness of the Burbank OU interim remedy in protecting human health and the environment does not differ from the above analysis of overall protection of human health and the environment. Options 1-4 are all protective in the short-term. Phase 1 of the Burbank OU project has already been constructed, and treated groundwater is being provided to

253

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 16

the residents of the City of Burbank without negative impact; therefore, Option 1 would not produce additional short-term impacts.

Options 2-4 would require additional construction activity. The only potential additional short-term impact to human health and the environment would be limited to minor, standard, construction concerns such as exposure to wind-blown dust, and noise impacts. The well drilling activities necessitated under these three options would be limited to one to two months in duration, would produce very little airborne dust, and noise would be limited to daytime hours. Option 2 would not produce any other short-term impacts. Options 3 and 4 would require an upgrade of the Burbank OU treatment plant, but this would consist of modifications to an existing plant and would not require significant excavation or earth moving activities, merely the addition or modification of existing physical components to the plant.

EPA believes any construction impacts would be minimal, and that Options 1-4 are all protective of human health and the environment in the short-term.

4. Long-term effectiveness and permanence in protecting human health and the environment

Options 1-4 would all maintain reliable protection of human health and the environment over time. Minor differences arise in the permanence of the various options. Since this is an interim remedial action, and the action itself is not considered permanent, permanence has not been considered a major factor in this evaluation.

However, in ranking the options with respect to permanence, EPA has evaluated to what degree they would contribute to aquifer restoration. Option 2 results in the greatest mass removal of PCE and TCE, suggesting that the combination of pumping rate and location of extraction wells is optimized under this alternative. The other options result in a similar degree of mass removal, with differences of only a few percent. This suggests that the 20 year period of groundwater extraction, which is not changed by this ESD, may be the controlling factor for mass removal. One unknown factor in this analysis is how much mass will continue to enter the groundwater system over the 20 year period of time. The final remedy will attempt to assess this effect and will attempt to address permanence in a more thorough analysis.

A comparison of mass removal for Options 1-4 over 20 years is presented below. These figures derive from an analysis performed by Lockheed Martin Corporation and reviewed by EPA, and EPA's consultant CH2M Hill. (See the Administrative Record: document entitled Evaluation of Extraction Scenarios for the BOU, dated

254

4473-9098

ESD2  
Page 17

March 20, 1995, prepared by Hydro-Search, Inc.) The comparison of percent removal uses as a baseline the Burbank OU groundwater plume as defined by the 5 ppb contour line. Percent removal refers to the percentage of the mass within the 5 ppb contour which is removed by the Burbank OU extraction wells over the 20 year projected length of the interim remedy.

As noted, the amount of mass removed is greater at a 9,000 gpm extraction rate (Option 2) than at a 12,000 gpm extraction rate (Option 4). This is due to the need to meet reinjection ARARs for nitrates under Option 4. The locations where reinjection wells may be placed to meet ARARs are not favorable for mass removal, because under Option 4, the treated water must be reinjected in an area close to the extraction wells. The reinjected water actually displaces and dilutes contaminated water such that overall removal efficiency for TCE and PCE decreases.

Table 1 - Mass Removal Over Twenty Years

	% mass PCE removed	% mass TCE removed
Option 1 <sup>1</sup>	89	73
Option 2 <sup>2</sup>	92	78
Option 3 <sup>3</sup>	91	78
Option 4 <sup>4</sup>	88	75

The only other long-term protectiveness issue relates to air emissions from the Burbank OU treatment plant. The off-gas from the plant's aeration towers contains TCE and PCE molecules which have been stripped from the groundwater. Although this off-gas is treated with the use of air-phase granular activated carbon, a small quantity of TCE and PCE (less than 1% of the total present in the off-gas) is released to the atmosphere at an elevation of approximately sixty feet above the ground surface. The South Coast Air Quality Management District has reviewed the emission levels and found them well within ARARs for air emissions. EPA believes that emissions from Options 1-4 will not negatively impact human health and the environment, due to the low level of emissions, and due to their emission at a significant height above ground surface, away from people.

<sup>1</sup>6,000 gpm pumping rate, no reinjection

<sup>2</sup>9,000 gpm pumping rate, no reinjection

<sup>3</sup>12,000 gpm pumping rate, no reinjection

<sup>4</sup>12,000 gpm pumping rate, with reinjection

255

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 18

Nonetheless, Options 1-4 can be ranked in terms of overall emissions. The lower the groundwater extraction rate, the lower the rate of TCE and PCE removal, and the lower the rate of TCE and PCE emissions. Option 1 at a groundwater extraction rate of 6,000 gpm results in the least air emissions. Option 2 performs the next best in this respect. Options 3 and 4 result in slightly higher emissions.

5. Reduction of toxicity, mobility, and volume of contaminants

As stated above, EPA has evaluated to what degree the four options will contribute to mass removal. Mass removal of contaminants relates very closely to reduction in toxicity and volume of contaminants in the groundwater. Based on EPA's evaluation, all four options would result in similar degrees of reduction in toxicity and volume.

An assessment has also been made regarding the degree of hydraulic control Options 1-4 would exert over the groundwater contamination (Evaluation of Extraction Scenarios for the ROU, dated March 20, 1995, prepared by Hydro-Search). The degree of hydraulic control achieved relates very closely to reduction in mobility of the contaminants. The following comparison of hydraulic control is made based upon the groundwater plume as defined by the 5 ppb contour line (percent control refers to the percentage of the area within the 5 ppb contour which is contained, i.e. which does not move downgradient):

Table 2 - Hydraulic Control Over Twenty Years

	% control PCE	% control TCE
Option 1 <sup>5</sup>	66	51
Option 2 <sup>6</sup>	72	60
Option 3 <sup>7</sup>	74	68
Option 4 <sup>8</sup>	71	58

Based on this analysis, Option 3 would result in the greatest reduction in mobility, particularly with respect to control of the TCE plume. Options 2, 3, and 4 control to a similar degree the PCE plume. Option 1 clearly results in a lesser degree of

- <sup>5</sup>6,000 gpm pumping rate, no reinjection
- <sup>6</sup>9,000 gpm pumping rate, no reinjection
- <sup>7</sup>12,000 gpm pumping rate, no reinjection
- <sup>8</sup>12,000 gpm pumping rate, with reinjection

256

4473-9098

ESD2  
Page 19

control. Option 3 turns out to be more efficient than Option 4, despite the fact that these options use the same pumping rate of 12,000 gpm, because based on current projections nitrate levels in the aquifer will not accommodate reinjection in hydraulically advantageous locations. A hydraulically advantageous location would be one where the reinjected water would assist in plume containment. ARARs requirements would restrict the placement of reinjection wells in areas where groundwater quality would not be degraded, meaning in areas where nitrates in groundwater are higher than nitrates in the water to be reinjected. If reinjection wells could be placed in the most hydraulically advantageous locations, Option 4 would be slightly superior to Option 3 in this regard.

When the interim remedial action is complete, EPA projects that contamination will remain in the groundwater under each of the four options. The final remedial action will determine how to address this remaining contamination.

Based on current data, Options 2 and 3 appear superior in terms of this criterion, but all options fulfill the goal of the ROD to partially control the movement and spread of groundwater contaminants in the Burbank OU area, while contributing to aquifer restoration.

6. Technical and administrative feasibility of implementation

The technical differences between the four options are as follows:

- Option 1 would require no additional construction. (Option 1 has already been implemented as Phase 1 of the interim remedy; therefore, it has been proven feasible.)
- Option 2 would require construction of 3,000 gpm of additional extraction wellfield capacity.
- Option 3 would require construction of 6,000 gpm of additional extraction wellfield capacity, plus a 3,000 gpm upgrade to treatment facility capacity.
- Option 4 would require construction of 6,000 gpm of additional extraction wellfield capacity, plus a 3,000 gpm upgrade to treatment facility capacity, plus construction of a 8,500 gpm reinjection wellfield.

In general, technical implementability increases in complexity as construction tasks are added to a project. Some construction tasks are more complex than others; for example, construction of a reinjection wellfield is more complicated than construction of an extraction wellfield due to more complex well specifications

257

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 20

intended to reduce clogging of the well screens. Using this rationale, Option 4 is more complex than Option 3, which is more complex than Option 2, which is more complex than Option 1. As stated above, Option 1 has already been implemented technically (as well as administratively).

Ease of operation also factors into implementability. Application of proven technology generally reduces uncertainty of implementability, while application of a new technology increases uncertainty. Options 1, 2, and 3 all use common technology, while Option 4, by adding reinjection, uses a technology that has not been implemented widely in the geographic region of the Burbank OU.

Administratively, Options 1, 2, and 3, would be relatively simple because they would follow the framework developed during start-up of Phase 1 of the Burbank OU interim remedy. As part of Phase 1 start-up, EPA, the City of Burbank, Lockheed Martin Corporation, and DHS reached agreement on operational plans for the facility. Once again, Option 1, since it has been constructed and placed in operation, is not expected to present any administrative difficulties.

Construction of additional facilities, which would be necessary under Options 2, 3, and 4, would require amending the City of Burbank's public water supply operating permit, issued by DHS. Although this would be an additional administrative task, EPA is confident that additional permit conditions required by virtue of the addition of such facilities, would be achievable.

Option 3 would have the administrative complication of committing additional purveyors to accept water the City of Burbank could not accept. It is not likely that these additional purveyors would be willing to sign a consent decree, the chosen implementation document for the interim remedy. Lockheed Martin Corporation and the City of Burbank have both attempted, without success as of the date of this ESD2, to obtain the commitment of other local purveyors to accept Burbank OU water. Without this commitment, there is a good deal of uncertainty whether 12,000 gpm of groundwater could be purveyed on a routine basis, during periods when the City of Burbank could not accept the entire production of the Burbank OU facilities.

Option 4 would be more complicated to implement administratively due to the likely increased involvement of a regulatory agency, RWQCB, in the process. RWQCB has previously expressed reservations about reinjection based on water quality degradation concerns. However, EPA believes this additional administrative step would not present a barrier to implementation.

258

4473-9098

ESD2  
Page 21

Based on technical and administrative considerations, Options 1 and 2 are considered superior. Options 3 and 4 have administrative complications, which would need to be resolved prior to implementation. Option 3 may present a barrier to implementation while Option 4 probably does not.

7. Capital and operation and maintenance costs

The following discussion compares the costs of Options 1-4 on a net present value basis. Costs include construction and 20 years of operation and maintenance. These costs are not based on the original estimates set forth in the ROD and in ESD1, but are based on more recent estimates prepared by a consultant to Lockheed Martin Corporation, the entity which has undertaken design and construction of the interim remedy under EPA oversight. (See the Administrative Record: document entitled Burbank Operable Unit Costs Comparison Summary, dated March 20, 1995, prepared by Parks, Palmer, Turner & Yemenidjian.) These estimates were independently reviewed by CH2M Hill, EPA's ARCS contractor. Therefore, the actual cost of the Phase 1 Burbank OU treatment facilities constructed by Lockheed Martin, the City of Burbank, and six other businesses, has been incorporated into these estimates. CH2M Hill's analysis is presented in a memorandum entitled Review of Burbank Operable Unit Costs Comparison Summary, dated November 11, 1996. EPA has concluded that the cost estimates prepared by Lockheed Martin used appropriate assumptions and are therefore appropriate for purposes of comparison of alternatives.

Option 1 is the least expensive of the four options. The capital cost for this option is estimated at \$31 million in 1996 dollars. The present value of the 20 years of operation and maintenance is estimated at \$88 million. Therefore, the total net present value of Option 1 is estimated at \$119 million. Economic assumptions used by Lockheed Martin's consultant in this analysis are as follows: a discount rate of 8% was used; an inflation rate of 3% was used; calculations are in 1995 dollars.

Option 2 is more expensive than Option 1 but less expensive than Option 3. The capital cost for this option is estimated at \$38 million in 1996 dollars. The present value of 20 years of operation and maintenance is estimated at \$93 million. Therefore, the total net present value for Option 2 is estimated at \$131 million.

Option 3 is more expensive than option 2 but less expensive than Option 4. The capital cost for this option is estimated at \$49 million in 1996 dollars. The present value of 20 years of operation and maintenance is estimated at \$97 million. Therefore, the total net present value for Option 3 is estimated at \$146 million.

259

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 22

Option 4 is the most expensive of the four options. The capital cost for this option is estimated at \$70 million in 1996 dollars. The present value of 20 years of operation and maintenance is estimated at \$110 million. Therefore, the total net present value for Option 4 is estimated at \$180 million.

For purposes of comparison, this information is set out in the following table:

Table 3 - Cost Comparison

Option	Capital	O&M	Total
1 <sup>9</sup>	\$31 million	\$ 88 million	\$119 million
2 <sup>10</sup>	\$38 million	\$ 93 million	\$131 million
3 <sup>11</sup>	\$49 million	\$ 97 million	\$146 million
4 <sup>12</sup>	\$70 million	\$110 million	\$180 million

8. State acceptance

EPA has coordinated with state agencies throughout this project, specifically RWQCB, the California Department of Toxic Substances Control (DTSC), and DHS. These agencies either accepted, or did not object to, the interim remedy originally designated by the ROD and ESD1. The Administrative Record details the communications between EPA and these State agencies throughout the interim remedy selection process.

Regarding the remedy discussed in the ROD and ESD1, the record reflects that the RWQCB supports the use of the treated water as drinking water, provided that all requirements for the serving of public drinking water are met. RWQCB agrees that reinjection may be implemented as long as compliance is achieved with respect to the "Statement of Policy With Respect to Maintaining High Quality Waters in California." (See the Administrative Record: letter dated June 8, 1990, from Hank Yacoub, RWQCB, to Alisa Greene, EPA; letter dated June 20, 1990, from Robert Ghirelli, RWQCB, to Alisa Greene, EPA.)

The record reflects that neither DTSC nor DHS stated a preference or rejection of any of the options presented in the ROD and ESD1. (See the Administrative Record: letter dated May 15, 1990, from

- <sup>9</sup>6,000 gpm pumping rate, no reinjection
- <sup>10</sup>9,000 gpm pumping rate, no reinjection
- <sup>11</sup>12,000 gpm pumping rate, no reinjection
- <sup>12</sup>12,000 gpm pumping rate, with reinjection

260

4473-9098

ESD2  
Page 23

Hamid Saebfar, DTSC, to Alisa Greene, EPA, and letter dated June 11, 1990, from Gary Yamamoto, DHS, to Alisa Greene, EPA.)

In addition to reviewing the Administrative Record through the ROD and ESD1, EPA notified the state agencies regarding the proposed changes which would be made by ESD2. Neither RWQCB nor DTSC provided written comments on the options presented in ESD2. However, as stated above, EPA also has presented EPA's position on the ESD2 options to the state and other agencies at quarterly Management Committee meetings. EPA's understanding based on exchanges with representatives from these agencies is that neither RWQCB nor DTSC objects to EPA's approach.

DHS did provide written comments on the changes proposed by ESD2, but did not state a preference for any of the options presented herein. (See the Administrative Record: letter dated September 6, 1996, from Gary Yamamoto, DHS, to David Seter, EPA.) DHS raised the issue that "limiting the pumping rate to a maximum of 9,000 gpm and the elimination of the re-injection option may limit U.S. EPA's future success in containing the contaminant plume." In response to this comment, EPA believes the analysis presented in this ESD2, in terms of the nine NCP criteria, thoroughly considers the impact of the various options including the impact on plume containment.

Specifically, the nitrate levels currently projected in the aquifer do not accommodate reinjection in hydraulically advantageous locations. The City of Burbank has already agreed to maximize its use of treated groundwater, which will be an average of 9,000 gpm. An extraction rate of 9,000 gpm without reinjection thus accomplishes better hydraulic control than an extraction rate of 12,000 gpm with reinjection.

9. Community acceptance

The basic groundwater extraction and treatment concepts being evaluated in ESD2 do not differ greatly from the concepts evaluated in the ROD and in ESD1. The same degree of treatment will be applied to water made available as a public water supply. During the thirty day comment period provided for by EPA during the development of ESD1, there were no comments submitted by the public.

In addition, EPA will publish notice of availability of this ESD2 in a local newspaper of general circulation, and will consider any comments submitted by the public as required by 40 C.F.R. Section 300.825(c).

261

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 24

D. Decision on options

Based on the above analysis of Options 1-4, EPA has chosen Option 2, which consists of groundwater extraction at an average rate of 9,000 gpm, treatment by air stripping and granular activated carbon to remove VOCs, nitrate reduction by blending with a low nitrate water source, and use of the treated and blended water by the City of Burbank as a public water supply.

Option 2 was chosen because:

- 1) it performs equally as well as Options 3 and 4 and better than Option 1 at removing contaminant mass over a 20 year period of time;
- 2) it performs substantially as well as Option 3 and better than Options 1 and 4 at retarding migration of the groundwater contamination plume;
- 3) its total implementation cost is  
\$15 million less than Option 3  
\$49 million less than Option 4;
- 4) it avoids the potential administrative difficulties of Options 3 (identifying additional water purveyors) and 4 (resolving reinjection regulatory issues);
- 5) it complies with ARARs;
- 6) it is protective of human health and the environment.

This is an interim remedy. In the future, after the Burbank OU facilities have been operational for a substantial period of time, the optimal extraction rate may be better determined. This information will eventually factor into a decision on the final remedy. But for the purposes of ESD2, the data suggest that a groundwater extraction rate of 6,000 gpm may be too low to meet the groundwater containment objective. However, the data do not justify the added expense of raising pumping to a rate of 12,000 gpm. EPA has concluded that the Option 2 rate of 9,000 gpm is a reasonable, efficient, and cost-effective solution.

Although under ideal conditions pumping 12,000 gpm would provide greater containment than pumping 9,000 gpm, the reality of the ground water system as it exists in Burbank presents certain limitations. Under ideal conditions, nitrate levels would be low enough to meet ARARS reinjection requirements in areas determined to be hydraulically advantageous to reinjection. This is not the case, and is not likely to be the case throughout the time frame for implementation of the interim remedy. Because reinjection must take place in hydraulically disadvantageous locations, the effectiveness of Option 4 is lessened.

The Option 2 pumping rate is 9,000 gpm, which represents a 25% reduction in pumping versus Options 3 and 4. Yet, according to analyses performed by Lockheed Martin with which EPA concurs,

262

4473-9098

ESD2  
Page 25

Option 2 is superior in containment to Option 4 and provides only slightly less containment than Option 3.<sup>13</sup> Furthermore, cost savings for Option 2 are significant (a savings of 27% versus Option 4).

Although additional cost savings are projected from further reducing the pumping rate to 6,000 gpm (Option 1), EPA believes that, should water levels increase in the aquifer system, capture could fall below acceptable levels under this option. As long as 9,000 gpm can be extracted and used without being wasted or reinjected, EPA concludes that Option 2 presents the best balance of reducing mobility of contaminants and cost-effectiveness.

As described above, EPA has also concluded that, for the purposes of long-term containment, groundwater extraction need not equal 9,000 gallons per minute each day. This is why EPA has set a goal of 9,000 gallons per minute as an annual average instead of an instantaneous average. EPA also believes its approach of allowing reduced groundwater extraction during periods of high nitrate concentration increases protectiveness to public health without adversely affecting long-term containment.

V. Support Agency Comments

The State of California agencies discussed in Section IV.C.8. above are the support agencies for this action. Their comments are addressed in that section.

VI. Summary of Selected Remedy

The interim remedy for the Burbank Operable Unit, as selected in the ROD and as modified by ESD1 and ESD2, consists of groundwater extraction at an average rate of 9,000 gpm, treatment by air stripping and granular activated carbon to remove VOCs, nitrate reduction by blending with a low nitrate water source, and use of the treated and blended water by the City of Burbank as a public water supply.

VII. Statutory Determinations

Considering the new information that has been developed, the EPA believes that the interim remedy as modified by ESD2 remains

<sup>13</sup>This comparison was made based upon the degree of hydraulic control exerted by the various options on the TCE/PCE groundwater plume.

263

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

ESD2  
Page 26

protective of human health and the environment, complies with federal and state requirements that are applicable or relevant and appropriate to this interim remedial action, and is cost effective. In addition, this remedy satisfies the statutory preference for remedies that employ treatment which permanently and significantly reduces the volume, toxicity or mobility of the hazardous substances as a principal element. It also complies with the statutory preference for remedies that utilize permanent solutions and alternative treatment technologies or resource recovery technologies to the maximum extent practicable. The changes and clarifications contained in ESD2 are significant but do not fundamentally change the remedy. They do not change the decision to conduct an interim pump and treat action to inhibit the spreading of the contaminated groundwater plume and to begin aquifer restoration. They also do not alter the technologies used in the interim remedy.

VIII. Public Participation Activities

EPA has presented these changes to the remedy in the form of an Explanation of Significant Differences because the changes are of a significant, but not fundamental, nature. The basic groundwater extraction and treatment concepts being evaluated in ESD2 do not differ greatly from the concepts evaluated in the ROD and in ESD1. ESD2 and underlying information have been added to the Burbank OU Administrative Record. Additional provisions for public comment are not required for an ESD (see 40 C.F.R. Section 300.435(c)(2)(i)), and EPA is not providing a formal public comment period for ESD2. However, EPA has published notice of the availability of ESD2 in a local newspaper as required by 40 C.F.R. Section 300.435(c)(2)(i)(B), and per 40 C.F.R. Section 300.825, will consider any significant comments submitted in a timely manner.

4473-9098

BURBANK OPERABLE UNIT  
SECOND STAGE STATEMENT OF WORK  
(LONG TERM O&M)

I. General Provisions

A. Definitions: All words, as defined in the Consent Decree, have the same meaning when used herein.

B. Warranty: EPA has exercised its best efforts to include in this Statement of Work all activities necessary to fulfill Operation and Maintenance requirements for the Burbank Operable Unit. However, the settling parties acknowledge and agree that nothing in this Statement of Work or any deliverable approved by EPA pursuant hereto constitutes a warranty or representation, either express or implied, by the United States that compliance with this document and/or deliverables approved pursuant to this document will result in the achievement of the Performance Standards that the Settling Work Defendant is required to meet under the Consent Decree. Nothing in this Statement of Work or in deliverables approved pursuant hereto shall be deemed to limit EPA's rights pursuant to Subpart D (General Reservation of Rights) of Section XXII of the Consent Decree.

266

# Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

C. EPA Approval: EPA approval of any submittal by a Settling Defendant within the context of this Consent Decree, including but not limited to plans, specifications, and reports, is administrative in nature and designed to permit the Settling Defendants to proceed with the deliverables. The Settling Defendants acknowledge and agree that EPA's approval of deliverables does not constitute a warranty or representation, as discussed in Paragraph B above.

II. Schedule

A. Dates: The schedule of deliverables for this Statement of Work is presented in Attachment 1 and shall be referred to as the Work Schedule. In the Work Schedule, EPA has provided an approximation of its review time; however, failure to review a deliverable within the estimated time shall not constitute a violation of the Consent Decree by the United States. Settling Defendants are required to submit deliverables within the time periods stated, and failure to do so constitutes a violation of the Consent Decree. See Consent Decree, Section XIII (Submissions Requiring Agency Approval).

B. Items Triggered by Date of Entry of Consent Decree:

1. Designation of Project Coordinator: Pursuant to Section XIII (Project Coordinators) of the Consent Decree, within

267

4473-9098

30 days of the date of entry of the Consent Decree, the Settling Work Defendant (City of Burbank), Lockheed Martin, the UAO Parties, and EPA shall submit to one another, in writing, the name, title, and qualifications of their proposed respective Project Coordinators and Alternate Project Coordinators. The coordinators for the Settling Defendants may be members of the Settling Defendants' staff or an independent contractor.

2. Designation and Review of Supervising Contractor:

Pursuant to Section VI (Performance of the Work) of the Consent Decree, within 180 days of the date of entry of the Consent Decree, the Settling Work Defendant shall notify EPA and the State in writing of the name, title, and qualifications of its proposed Supervising Contractor. Prior to this date, the Settling Work Defendant may submit to EPA and the State a list of contractors for pre-qualification. It is the Settling Work Defendant's responsibility to provide any pre-qualification information to EPA and the State in a time frame that allows for timely designation of the Supervising Contractor. The Supervising Contractor may come from within the ranks of the Settling Work Defendant's staff. The factors to be considered in approving or disapproving the Supervising Contractor shall include: professional and ethical reputation; professional

268

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

registration; demonstrated project management experience; experience and qualifications in the field of water treatment and supply; sufficient capacity (professional, technical and support staff) to accomplish the project tasks according to the Work Schedule; and sufficient business background and financial resources to provide uninterrupted services throughout the life of the project. Upon its approval of the Supervising Contractor, EPA will issue an authorization to proceed.

3. Progress Reports: These reports shall be prepared by the Settling Work Defendant pursuant to Section XI (Reporting Requirements) of the Consent Decree. The schedule for submittal of progress reports is summarized in Attachment 2 and shall be referred to as the Reporting Schedule. Progress Reports shall include at a minimum:

a. A brief narrative describing any noteworthy accomplishments or problems encountered at the Plant Facilities during the reporting period (including but not limited to: the implementation of process improvements; non-routine maintenance; and a summary of any violations of the Consent Decree, the cause of such violations, and the steps being taken to avoid future violations);

b. Status of expenditures in comparison to the

4

269

4473-9098

Annual Budget;

c. The quantity of water pumped by each Burbank OU extraction well, and each GAC Wellfield extraction well;

d. A daily summary of water production broken down into categories of: Burbank OU Treatment Plant; GAC Wellfield; Blending Water; and Total Production;

e. A compliance calculation of the project's water budget showing whether the 9,000 gpm average groundwater extraction rate is being met; and specifically, the status of the Cumulative Pumping Credit for the reporting period, including designation of any days on which the Cumulative Pumping Credit fell below zero gallons;

f. Copies or summaries of compliance data submitted by the Settling Work Defendant to the California Department of Health Services;

g. Status of Maintenance Credits; and

h. Report of nitrate levels in: the extracted groundwater; the blending water; and the product water.

4. Second Stage O&M Work Plan: Pursuant to Section VI (Performance of the Work) of the Consent Decree, the Settling Work Defendant shall submit, within one year of the date of entry of the Consent Decree, the Second Stage O&M Work Plan. The

5

270

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

4473-9098

Second Stage O&M Work Plan shall incorporate Operation and Maintenance activities to be performed on all portions of the Plant Facilities to ensure that the facilities continue to run according to specification. The Second Stage O&M Work Plan shall include: a detailed description, including drawings, of the Plant Facilities; manufacturer specifications for the Plant Facilities and equipment; easily understood, stepwise standard operating procedures for the Plant Facilities at all foreseeable flow rates; startup and shutdown procedures for all facilities, including emergency shutdown procedures; a detailed description of manual and electronic control systems; and any other elements pertaining to efficient and safe operation of the Plant Facilities. The Second Stage O&M Work Plan shall describe in detail: the routine maintenance activities to be performed on each element of the Plant Facilities; a schedule for these routine maintenance activities; a schedule of visual inspection of the Plant Facilities; a schedule of equipment overhauling per manufacturers specifications; a description and schedule of cleaning and backflushing; detailed chemical handling procedures; and any other elements pertaining to efficient and safe maintenance of the Plant Facilities. The Second Stage O&M Work Plan shall incorporate by reference the Staffing Plan, Health and

Safety Plan, Operational Sampling Plan, and Contingency Plan. The Second Stage O&M Work Plan in conjunction with the Staffing Plan shall delineate clear lines of responsibility for performing the activities referenced within the plan, designating which activities are the responsibility of the O&M Contractor, especially with respect to emergency shutdown and implementation of the Contingency Plan if it becomes necessary.

5. Staffing Plan: Pursuant to Section VI

(Performance of the Work) of the Consent Decree, the Settling Work Defendant shall submit, within one year of the date of entry of the Consent Decree, the Staffing Plan. The Staffing Plan shall identify the supervisory chain of command for the project; shall provide an organizational chart identifying specific individuals in the chain of command where possible; and shall define the roles of the Settling Work Defendant, the Supervising Contractor, and the O&M Contractor. The position of the Settling Work Defendant's Project Coordinator in the chain of command shall be made clear. The plan shall also estimate staffing levels required to implement the O&M activities, including the levels of expertise required.

6. Time Line and Schedule: Pursuant to Section VI

(Performance of the Work) of the Consent Decree, the Settling

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

Work Defendant shall submit, within one year of the date of entry of the Consent Decree, the Time Line and Schedule. The Time Line and Schedule shall list the major milestones to be accomplished in order for the Settling Work Defendant to efficiently assume long term Operation and Maintenance of the Plant Facilities. It shall include the items listed in the Work Schedule, and also intermediate milestone activities such as: the Settling Work Defendant's projected bidding schedule for hiring the O&M Contractor; the schedule for transition of O&M Activities as agreed upon by Lockheed Martin and the Settling Work Defendant; and any other items relevant to orderly implementation of O&M Activities. The identification of intermediate milestones, which are defined as those milestones not specified in the Work Schedule, is solely for planning purposes. Any failure by the Settling Work Defendant to meet the Time Line's intermediate milestones shall not be deemed a violation of the Consent Decree.

7. Quality Assurance Project Plan: Pursuant to Section IX (Quality Assurance, Sampling, and Data Analysis), the Settling Work Defendant shall prepare and submit a Quality Assurance Project Plan addressing analytical and data quality methods and objectives to be applied in support of Operation and Maintenance Activities. The Quality Assurance Project Plan shall

4473-9098

be submitted to EPA and the State for review within eighteen months of the date of entry of the Consent Decree. Addenda to the Quality Assurance Project Plan shall be prepared by the Settling Work Defendant on an as-needed basis to reflect major changes in analytical methods.

8. Operational Sampling Plan: In conjunction with the Quality Assurance Project Plan, the Settling Work Defendant shall submit, within eighteen months of the date of entry of the Consent Decree, an Operational Sampling Plan which defines the data gathering methods and schedules to be used in performing the sampling and analytical portion of the Operation and Maintenance activities. At a minimum, the Operational Sampling Plan shall address sampling of water treatment system influent and effluent, airborne discharges, and any hazardous materials generated at the Plant Facilities. The monitoring requirements of the domestic water supply permit as issued and amended by the California Department of Health Services shall be incorporated into the Operational Sampling Plan.

9. Health and Safety Plan: The Settling Work Defendant shall submit, within eighteen months of the date of entry of the Consent Decree, a Health and Safety Plan which describes the minimum health, safety, and emergency response

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

requirements for the Operation and Maintenance activities to be undertaken by the Settling Work Defendant, the Supervising Contractor, and/or the O&M Contractor. The plan shall be prepared in accordance with U.S. Occupational Health and Safety Administration ("OSHA") requirements and any other applicable requirements.

10. Contingency Plan: The Settling Work Defendant shall submit, within eighteen months of the date of entry of the Consent Decree, a Contingency Plan which is written for the local affected population in the event of an accident or emergency at the Site. It shall incorporate an Air Monitoring Plan and a Spill Control and Countermeasures Plan. The following is a suggested list of items that shall be included in the Contingency Plan:

- a. Name of the person responsible for responding in the event of an emergency incident;
- b. List of key contacts in the local community with phone numbers and addresses and the State and Federal agencies to be involved in the cleanup, as well as local emergency squads and hospitals;
- c. First aid and medical information, including names of personnel trained in first aid, a clearly marked map

275

4473-9098

with the location of medical facilities and all necessary emergency phone numbers for fire, rescue, and local hazardous material teams;

d. An air monitoring plan to assure that the VOC treatment system is meeting the requirements of the South Coast Air Quality Management District. Air monitoring may include personnel monitoring, on-site and/or off-site area monitoring. Trigger concentrations to implement the Contingency Plan shall be specified; and

e. A Spill Control and Countermeasures Plan which shall specify actions to be taken in the event of spills from material handling and/or transportation. The plan shall describe methods, means and facilities required to prevent contamination of soil; water; atmosphere; uncontaminated structures, equipment, or material. It shall specify provisions for equipment and personnel to perform emergency measures required to contain any spillage; to remove and properly dispose of any material that becomes contaminated due to spills; and to decontaminate structure, equipment, or material.

C. Items Triggered by Phase 2 System Operation Date:

- 1. Designation of O&M Contractor: Pursuant to Section VI (Performance of the Work) of the Consent Decree,

276

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

within six months after the Phase 2 System Operation Date, the Settling Work Defendant shall submit to EPA and the State in writing the name, title, and qualifications of its proposed O&M Contractor. Prior to this date, the Settling Work Defendant may submit to EPA and the State a list of contractors for pre-qualification. It is the Settling Work Defendant's responsibility to provide any pre-qualification information to EPA and the State in a time frame that allows for timely designation of the O&M Contractor. The factors to be considered in approving or disapproving the O&M Contractor shall include: professional and ethical reputation; professional certification and/or registration; demonstrated experience in the field of water treatment; ability to meet the requirements of the Staffing Plan to accomplish the O&M tasks in accordance with the Second Stage O&M Work Plan; sufficient business background and financial resources to provide uninterrupted services throughout the life of the project; and ability to provide insurance. Upon its approval of the O&M Contractor, EPA will issue an authorization to proceed.

2. Transition Activities: Commencing no later than one year after the Phase 2 System Operation Date, the Settling Work Defendant and Lockheed Martin shall jointly plan a series of

277

4473-9098

transition activities under which the Settling Work Defendant shall assume Operation and Maintenance of all Plant Facilities. The Settling Work Defendant shall assume Operation and Maintenance of all Plant Facilities on the Date of Commencement, which will occur approximately two years after the Phase 2 System Operation Date.<sup>1</sup>

D. Other Items:

1. Selection of Cost Consultant: Pursuant to Section XIV (Funding of Response Activities) of the Consent Decree, by January 1, 1999, Lockheed Martin and the Settling Work Defendant shall jointly notify EPA in writing of the name, title, and qualifications of the proposed Cost Consultant. Prior to this date, Lockheed Martin and the Settling Work Defendant may submit to EPA a list of consultants for pre-qualification. It is the joint responsibility of Lockheed Martin and the Settling Work Defendant to provide any pre-qualification information to EPA in a time frame that allows for timely designation of the Cost Consultant. The factors to be considered in approving or disapproving the Cost Consultant shall be based on: professional and ethical reputation; professional certification; experience in

<sup>1</sup>See Consent Decree for further detail.

278

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

the type of cost estimating and budgeting activities to be performed; sufficient capacity (professional, technical and support staff) to accomplish the project tasks according to the Work Schedule; and sufficient business background and financial resources to provide uninterrupted services.

2. Deliverables: The Settling Work Defendant shall submit three copies of each deliverable identified in the Work Schedule to the EPA Project Coordinator.

3. Final Inspection: At the end of the time period for which the Settling Work Defendant is required to perform O&M Activities pursuant to the Consent Decree, EPA shall conduct a final review of records and inspection of the Plant Facilities. The inspection shall be a necessary part of approving or disapproving the Certificate of Completion pursuant to Section XV (Certificate of Completion) of the Consent Decree.

4. Determination of Decommissioning/Dismantling of Plant Facilities: In conjunction with the process of reviewing the Certificate of Completion for the Burbank OU Interim Remedial Action, EPA will make a determination as to whether all or a portion of the Plant Facilities shall be decommissioned/dismantled. At least ninety days prior to the date that the Settling Work Defendant anticipates that the Work will have been

4473-9098

fully performed, the Settling Work Defendant and the Settling Defendants may voice their respective opinions to EPA on whether all or a portion of the Plant Facilities shall be decommissioned/dismantled. In order to facilitate this process, the Settling Work Defendant shall notify the Project Coordinators for the Settling Defendants at least ninety days prior to the date that the Settling Work Defendant anticipates that the Work will have been fully performed, that a written request for Certification of Completion has been submitted to EPA.

III. Operational Compliance Determinations

A. Period of Operation and Maintenance: The Settling Work Defendant shall perform Operation and Maintenance Activities on the Plant Facilities as required under Section VI (Performance of the Work) of the Consent Decree, for a period of eighteen years. This period of Operation and Maintenance shall commence on the Date of Commencement, which will occur approximately two years after the Phase 2 System Operation Date.<sup>2</sup>

B. Cumulative Pumping Credit: If the quantity of groundwater extracted as part of the Burbank OU Interim Remedy exceeds the requirements of the First and Second Consent Decrees,

<sup>2</sup>See Consent Decree for further detail.

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

then the excess quantity shall accumulate as a credit. This credit will be measured in units of gallons and will be known as the Cumulative Pumping Credit. The credit will accumulate and "carry over" from day to day and from year to year, and will be used for compliance determination purposes, as described below.

1. Status on the Date of Commencement: On the Date of Commencement, the Cumulative Pumping Credit that has been accumulated throughout Phase 1 and Phase 2 up to the Date of Commencement shall be credited in full to the Settling Work Defendant. Should the Cumulative Pumping Credit be a negative number upon assumption of O&M Activities by the Settling Work Defendant, the credit will be reset to zero on the Date of Commencement.

2. Additions to and Subtractions from the Cumulative Pumping Credit: On each non-Maintenance Day, beginning on the Date of Commencement, the sum of the amount of groundwater, in gallons, pumped from the Burbank OU Extraction Wellfield and the City of Burbank GAC Wellfield shall be compared with the amount, in gallons, required under Section VI (Performance of the Work) of the Consent Decree. For the purposes of making this comparison, the amount of pumpage, in gallons, required under the Consent Decree shall be the same each day and shall be calculated

281

4473-9098

as follows:

$$(9,000 \text{ gallons/minute}) \times (60 \text{ minutes/hour}) \times (24 \text{ hours/day}) = 12,960,000 \text{ gallons/day}$$

a. On each day when in excess of 12,960,000 gallons is pumped from a combination of the Burbank OU Extraction Wellfield and the City of Burbank GAC Wellfield, that excess amount will be added to the Cumulative Pumping Credit as follows:

$$PC' = PC + (GPBOU + GPGAC - 12,960,000)$$

where

PC' = new Cumulative Pumping Credit (gallons)

PC = old Cumulative Pumping Credit (gallons)

GPBOU = number of gallons pumped for the day from the Burbank Operable Unit wellfield

GPGAC = number of gallons pumped for the day from the City of Burbank GAC Wellfield

b. On days when less than a total of 12,960,000 gallons is pumped from a combination of the Burbank OU Extraction Wellfield and the City of Burbank GAC Wellfield, except on high nitrate days (see Section III.B.4. below), the difference between 12,960,000 gallons and the amount actually pumped will be

282

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

deducted from the Cumulative Pumping Credit as follows:

$$PC' = PC - (12,960,000 - GPBOU - GPGAC)$$

Where

PC' = new Cumulative Pumping Credit (gallons)

PC = old Cumulative Pumping Credit (gallons)

GPBOU = number of gallons pumped for the day from the Burbank Operable Unit wellfield

GPGAC = number of gallons pumped for the day from the City of Burbank GAC Wellfield

3. Effect of Maintenance Days on the Cumulative Pumping Credit: On each day which the Settling Work Defendant designates as a Maintenance Day (which need not be a full day, but may be a portion of a day), if the amount of groundwater pumped for the day exceeds 12,960,000 gallons, the amount in excess of 12,960,000 gallons shall be added to the Cumulative Pumping Credit according to Section III.B.2.a., but the Cumulative Maintenance Credit (see Section III.C. below) shall not change.

If the amount of groundwater pumped by the Settling Work Defendant on the designated Maintenance Day is less than

4473-9098

12,960,000 gallons, the Cumulative Pumping Credit shall not change, but the Cumulative Maintenance Credit will decrease as follows:

$$MC' = MC - (12,960,000 - GPBOU - GPGAC)$$

where

MC' = new Cumulative Maintenance Credit

MC = old Cumulative Maintenance Credit

GPBOU = number of gallons pumped for the day from the Burbank Operable Unit extraction wellfield

GPGAC = number of gallons pumped for the day from the City of Burbank GAC Wellfield

4. Effect of High Nitrate Days on the Cumulative Pumping Credit: A High Nitrate Day is defined as a day on which nitrate levels in groundwater pumped from the Burbank OU Extraction Wellfield (as measured at or near the Point of Delivery) are equal to or greater than 50 milligrams per liter as nitrate. On each High Nitrate Day when the quantity of groundwater pumped from a combination of the Burbank OU Extraction Wellfield and the City of Burbank GAC Wellfield exceeds 12,960,000 gallons, that excess amount shall be added to

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

the Cumulative Pumping Credit according to Section III.B.2.a.

On each High Nitrate Day when the quantity of groundwater pumped from a combination of the Burbank OU Extraction Wellfield and the City of Burbank GAC Wellfield falls below 12,960,000 gallons (due to high nitrate concentrations and not for other reasons, e.g. maintenance), the Cumulative Pumping Credit shall increase according to the following formula:

$$PC' = PC + I$$

where

PC' = new Cumulative Pumping Credit

PC = old Cumulative Pumping Credit

I = increase to the pumping credit (I will be set to zero should the following calculation yield a negative number)

and

$$I = CWD - 12,960,000$$

where

CWD = actual metered City Water Demand on the High Nitrate Day

5. Determining Compliance using the Cumulative

20

285

4473-9098

**Pumping Credit:** The Cumulative Pumping Credit shall be used to determine whether the Settling Work Defendant is meeting the groundwater extraction requirements under Section VI (Performance of the Work) of the Consent Decree. On a date one year following the Date of Commencement, the initial pumping compliance determination shall be made.

If the Cumulative Pumping Credit is zero or greater, the Settling Work Defendant shall be deemed to be in compliance with the groundwater extraction requirements. If on that date the Cumulative Pumping Credit is less than zero, the Settling Work Defendant shall be deemed to be out of compliance with the groundwater extraction requirements. 6.

**Calculation of Days Out of Compliance:** If the Cumulative Pumping Credit one year after the Date of Commencement is less than zero, the Settling Work Defendant shall be deemed to be out of compliance for the number of days calculated as follows:

$$DOC = \frac{- PC \text{ (gallons)}}{12,960,000 \text{ (gallons/day)}}$$

where

DOC = number of Days Out of Compliance

PC = Cumulative Pumping Credit

21

# Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

Days Out of Compliance shall be rounded down to the nearest whole number of days, and shall be the number of days the Settling Work Defendant will be deemed out of compliance for the year. The Settling Work Defendant shall be subject to stipulated penalties for days out of compliance (see Consent Decree).

This compliance calculation will be performed annually on the anniversary date of the Date of Commencement, except in the event of a High Precipitation Year (see Section III.B.7. below).

7. Effect of a High Precipitation Year on Determining Compliance Using the Cumulative Pumping Credit: The time frame for performing the compliance calculation described in Sections III.B.5. and III.B.6. above will change as follows in the event of a High Precipitation Year. If the one year period of time over which a compliance determination is being made is a year during which the precipitation amount, as measured at a local weather station, is greater than 125% of the mean annual rainfall locally, that year shall be designated a High Precipitation Year. This precipitation determination shall be made on the anniversary date of the Date of Commencement. In the event a High Precipitation Year is designated, the compliance calculation shall be suspended until a year-long compliance period occurs during which precipitation is less than 125% of the mean annual

4473-9098

rainfall, in which case the compliance determination for that year performed on the anniversary date of the Date of Commencement will be performed as in Section III.B.5. above.

C. Annual Maintenance Credit: The Annual Maintenance Credit shall be measured in units of gallons and shall be used as a means for the Settling Work Defendant to perform a certain amount of routine maintenance on the Plant Facilities without being penalized under the Consent Decree. The Annual Maintenance Credit will also be used as a means of measuring compliance with the limits set on suspension of operations (see below).

1. Status on the Date of Commencement: On the Date of Commencement, the Maintenance Credit that has been accumulated throughout Phase 1 and Phase 2 up to the Date of Commencement shall be credited to the Settling Work Defendant in an amount up to 648,000,000 gallons.<sup>3</sup> If this carryover amount does not exceed 648,000,000 gallons, the Annual Maintenance Allowance, described below, shall be added to the Maintenance Credit, except that the total Annual Maintenance Credit shall not exceed 648,000,000 gallons.

2. Annual Maintenance Allowance: On the Date of

<sup>3</sup>50 days x 12,960,000 gallons/day

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

Commencement, and at one year anniversaries from the Date of Commencement, the Settling Work Defendant will be credited with an Annual Maintenance Allowance of 648,000,000 gallons. There shall be no carryover of unused Maintenance Credits.

3. Subtractions from the Maintenance Credit: During the year following the Date of Commencement, on each day which the Settling Work Defendant designates as a Maintenance Day, the Maintenance Credit will decrease by the amount of gallons by which actual groundwater pumpage falls short of the daily goal of 12,960,000 gallons. The same procedure will hold for subsequent operating years, with the maximum possible Maintenance Credit at the beginning of the year being 648,000,000 gallons, with that number being reduced during the operating year as Maintenance Days are designated.

D. Maintenance Credit for Non-Routine Maintenance: "Non-routine maintenance," as used in this paragraph, shall include unplanned maintenance events which could not reasonably be anticipated by the Settling Work Defendant, or the timing of which could not reasonably be anticipated by the Settling Work Defendant in the ordinary course of operations.

1. At the outset of an event which requires non-routine maintenance, the Settling Work Defendant shall notify EPA

289

4473-9098

of the event, the projected maintenance requirements, and the projected timing for completion of such requirements.

2. EPA shall determine a reasonable time period for the maintenance to be completed based on, but not limited to, information provided by vendors and submitted to EPA by the Settling Work Defendant. EPA shall notify the Settling Work Defendant of the deadline for completion of the non-routine maintenance.

3. The deadline for completion of the non-routine maintenance established by EPA shall be binding upon the Settling Work Defendant unless extended by EPA or the Settling Work Defendant invokes the Dispute Resolution process of Section XX of the Consent Decree.

4. Invocation of the Dispute Resolution process, by itself, will not postpone any maintenance activities.

E. Suspension of Operations: The Settling Work Defendant may suspend operations by designating a maintenance day. Maintenance outages during the operating year shall not exceed the Annual Maintenance Credit, or the Settling Work Defendant shall be considered in violation of the Consent Decree. Maintenance days may not be designated for reasons other than maintenance. The Settling Work Defendant shall notify the EPA

290

Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

4473-9098

Project Coordinator in advance of a planned Maintenance Day and as soon as practicable when a Non-Routine Maintenance Day has occurred. Maintenance Days shall be specifically accounted for in the required Progress Reports.

## Response to Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022)

### 4473-9081

The commenter expresses its objection to approval of the HSR project and its implementation to the extent that the Authority did not consider the potentially significant environmental impacts to Lockheed Martin's remedial activities in the San Fernando Valley and the underlying soil and groundwater conditions in the cleanup area or plan for avoiding or mitigating impacts. The commenter's concerns are acknowledged. The Draft EIR/EIS did assess and disclose impacts associated with the construction of the Build Alternatives within contaminated sites. To clarify the discussion provided in the Draft EIR/EIS, the discussion contained within Section 3.10 of this Final EIR/EIS has been expanded to provide clarity related to the potential impacts of the project on the San Fernando Groundwater Basin Superfund Site and the ongoing remediation of the site. Refer to responses to comments #9082 through #9098 for detailed responses to Lockheed Martin's specific comments.

### 4473-9082

The commenter states that the Draft EIR/EIS does not identify impacts, mitigation, or alternatives related to soil and groundwater subject to Lockheed Martin's remediation activities, as well as safe drinking water supply to local communities. Lockheed Martin's remediation facilities are included in the list of PECs in Tables 5-6, 5-8, 5-12, 5-13, 5-14, and 5-19 of Appendix G of the Palmdale to Burbank Hazardous Materials and Wastes Technical Report (Authority 2019). Section 3.10.5.1 of the Draft EIR/EIS acknowledges that the project is within the San Fernando Groundwater Basin Superfund site Area 1. In addition, a reference to Appendix 3.10-A has been included in this section and information from this appendix, including details about remediation facilities for the San Fernando Groundwater Basin Superfund site, have been added to this Final EIR/EIS where appropriate. In addition, text has been added to EIR/EIS Section 3.10.6.3 stating that the Authority would coordinate the replacement of these wells with the USEPA as required under CERCLA. The replaced extraction wells would be installed and functional prior to the removal of any of the extraction wells for the San Fernando Valley Superfund site to avoid disruption of the ongoing remediation program for the Superfund site. Also, a new Appendix has been added to the Final EIR/EIS (Appendix 3.10-B) identifying the PECs.

The Authority received the same comment from the same commenter following circulation of the Burbank to LA Project Section Draft EIR/EIS. The Authority provided a similar response to this one as part of Response to Comment 898-1765 included in the Burbank to LA Project Section Final EIR/EIS, which is within Volume 4 on page 23-122 available on the Authority's website at: <https://hsr.ca.gov/programs/environmental-planning/project-section-environmental-documents-tier-2/burbank-to-los-angeles-project-section-draft-environmental-impact-report-environmental-impact-statement/>.

## Response to Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

### 4473-9083

The commenter states that there are 70 active groundwater monitoring wells and vapor intrusion barriers that could be affected by the HSR Palmdale to Burbank Section. The commenter provided Figure 1 as an attachment to the comment letter, which identifies 70 active groundwater monitoring wells within 1 mile of the Palmdale to Burbank alignment centerline. As stated by the commenter, construction of the HSR Project may require removal and/or relocation of affected monitoring wells. The commenter requests that potential impacts to the wells and vapor barriers be considered by the Authority, and states that any damage to this infrastructure would be the responsibility of the Authority. The commenter also states that the HSR Palmdale to Burbank Project Section could affect groundwater levels due to impermeable surfaces.

The Authority acknowledges that the project may impact infrastructure and remediation-related equipment, including wells, within the general area of the remediation activities, for which Lockheed Martin is responsible as a Superfund Site responsible party, and will minimize those impacts, as much as possible through design. Monitoring wells associated with PEC sites (including wells associated with Lockheed Martin's remediation) were considered and informed the EIR/EIS analysis as discussed in Section 6.2 and shown in Figures 5-15, 5-26 and 5-37 of the Palmdale to Burbank Project Section Hazardous Materials and Wastes Technical Report (Authority 2019). Additional details regarding remediation equipment, including vapor barriers, associated with the San Fernando Valley Superfund Site, Area 1, have been added to Section 3.10.6.3. The discussion under Impact HMW #2 in Section 3.10, Hazardous Wastes and Materials, including the San Fernando Valley Superfund Site, Area 1, has also been modified with details regarding previously identified impacts of interference with ongoing remediation at PEC sites.

As design progresses, to avoid impacts to wells and conveyance infrastructure being used to implement the cleanup of impaired groundwater at the San Fernando Valley Superfund Site, Area 1, the Authority would coordinate with the U.S. Environmental Protection Agency (USEPA), the Regional Water Quality Control Board –Los Angeles Region (RWQCB), the State Water Resources Control Board (SWRCB), the California Department of Toxic Substances Control (DTSC), the California Department of Water Resources (DWR), and the California Department of Health Services, Division of Drinking Water (DDW), along with additional relevant stakeholders consisting of the

### 4473-9083

Upper Los Angeles River Area (ULARA) Watermaster, the City of Burbank Water &Power (BW&P), the City of Glendale Water &Power (GW&P), City of Los Angeles, and Lockheed Martin and other parties named in consent decrees for the San Fernando Valley Superfund Site, Area 1. As required under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), the Authority would coordinate the relocation of wells associated with the remediation with the USEPA and RWQCB. In addition, HMW-IAMF#11, which was incorporated as part of the approved Burbank to Los Angeles Project Section, has been added to this Final EIR/EIS to confirm that that the Authority is required to coordinate with relevant stakeholders on an ongoing basis to review the project design, construction methods, and permitting requirements for proposed modifications to the extraction wells and ancillary infrastructure to ensure that municipal water supplies and the effectiveness of the Superfund site clean-up remedies are not impaired by construction and operation of the HSR Build Alternatives. The Authority would coordinate with the various agencies and relevant stakeholders listed above on issues such as ensuring system shutdowns occur within approved timeframes, maintaining operation of existing systems while testing new replacement systems, and providing additional groundwater or surface water supplies if needed.

Depending upon the scope of the potential modifications to the extraction wells and ancillary infrastructure, the Authority shall enter into enforceable agreements with the USEPA as the agency responsible for the Superfund Program. The Authority anticipates that any increased costs caused by the Project to the Burbank Operable Unit (BOU) groundwater remedy would be addressed in conjunction with and consistent with the outcomes of the stakeholder coordination required in HWM-IAMF#11.

The commenter also indicates its concern with reduced groundwater recharge due to an increase in impervious surfaces. Creation of new impervious surfaces could interfere with groundwater recharge, which could lead to increased pumping costs and the sustainability of the BOU remedy over time if an increase in impervious surfaces reduces the amount of water that can infiltrate into the groundwater basin below. As discussed under Impact HWR#4 (page 3.8-46 of the Draft EIR/EIS), new impervious surfaces would include drainage infrastructure designed to redirect storm water runoff and capture it for recharge, thus minimizing permanent impacts on groundwater recharge and a decline in water levels. While impervious surfaces would be utilized in

## Response to Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

### 4473-9083

the construction of both the Palmdale and Burbank Stations, impacts on groundwater recharge would be minimal at these station sites because they would be located in urbanized areas with large areas of existing impervious surfaces, and the net increase in the area of impervious surfaces would be minimal, resulting in no significant impact on groundwater recharge. For locations of proposed drainage infrastructure, please see Volume 3: PEPD Record Set REV02 Grading and Drainage Plans of the Draft EIR/EIS.

### 4473-9084

The commenter expresses concern that certain activities, such as tunneling and excavation, could cause migration of contaminants in soil and groundwater. Specifically, the commenter expressed concern that there is the potential for spreading or allowing migration of contaminants in soil and groundwater during soil disturbing activities, such as tunneling and excavation, if contaminants in soil or perched groundwater are encountered and disturbed.

To address this issue and as required by HMW-IAMF#1, historical and current contaminant information for the Superfund Site would be obtained and reviewed as part of a Phase 1 ESA and additional site characterization to evaluate potential impacts of contaminated soil, groundwater, or soil gas on project construction and operation. The characterization data would inform environmental controls required to be developed at the detailed design phase to minimize mobilization of existing contaminants. Procedures for managing known, suspected, and unanticipated contamination would be included in a CMP as required by HMW-IAMF#4 (Known, Suspected, and Unanticipated Environmental Contamination) for disturbance of contamination during construction. Equipment decontamination protocols, track-out controls, and other appropriate contamination prevention and reduction measures would be included in the CMP. The CMP would also include procedures for avoiding or reducing the potential for releases and foreseeable upset conditions that may result in contaminant migration. The CMP would be submitted to the Authority for review and approval and would also be approved by the environmental oversight agency or agencies, if required.

Following Authority and oversight agency approval of the CMP, the contractor would be contractually obligated to implement it to safely identify, and handle contamination encountered during construction. Groundwater is not anticipated to be encountered during construction because, as shown in Table 3.8-5 of the Draft EIR/EIS, depth to groundwater in the San Fernando Valley is approximately 250 feet below the ground surface, while maximum depth of the proposed tunnels in this area is up to approximately 150 feet below ground surface (see Drawing Nos. TN-Y1O2O-S14, TN-Y1O21-S14, TN-Y1O29-E1 through TN-Y1031-E1, TN-Y1O25-E2, and TN-Y1O26-E2 in Volume 3, Tunnel Plans of the Draft EIR/EIS), or approximately 100 feet above the groundwater table of the San Fernando Valley groundwater basin. Perched groundwater zones may be present and would be evaluated at the detailed design phase and, if

## Response to Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

### 4473-9084

appropriate, controls to prevent contaminant migration would be specified in the CMP. In the event a change in contaminant plumes is claimed with respect to the Lockheed Martin plume, the consequences of such a change would be discussed and evaluated by the Authority, appropriate regulatory agency(ies), and the Responsible Party.

As required by HMW-IAMF#11, Stakeholder Consultation for the San Fernando Valley Groundwater Basin Superfund Site, which was incorporated as part of the approved Burbank to Los Angeles Project Section and has been added to this Final EIR/EIS, the Authority would coordinate with stakeholders for the Superfund Site on an ongoing basis to review proposed project design and construction methods and determine appropriate environmental controls and permitting requirements to prevent contaminant migration and other potential impacts. The Authority anticipates that any increased costs caused by the Project to the Burbank Operable Unit (BOU) groundwater remedy would be addressed in conjunction with and consistent with the outcomes of the stakeholder coordination required in HWM-IAMF#11.

### 4473-9085

The commenter refers to an attached letter from CDM Smith "for additional specific comments" about potential impacts on the Burbank Operable Unit remediation efforts. These additional specific comments are addressed in Response to Comment #9087 through Comment #9096.

### 4473-9086

The commenter states that the Palmdale to Burbank Project Section Draft EIR/EIS did not identify or discuss alternatives and/or mitigation that could avoid or reduce the likely adverse impacts on Lockheed Martin's remediation efforts at the San Fernando Valley Superfund Site.

The Draft EIR/EIS considered potential impacts to the San Fernando Valley Superfund Site. Appendix 3.10-A in Volume 2 of the Draft EIR/EIS identified the San Fernando Groundwater Basin Superfund sites (including the Lockheed Martin site) on Figure 3.10-A-19 and those locations were identified on page 3.10-15 of the Draft EIR/EIS. As discussed in Section 3.10.5.3 of the Draft EIR/EIS, the six Build Alternatives are within portions of Area #1 (Figure 3.10-A-19) but do not encompass Area #2 through Area #4. Section 3.10.6.3 of this Final EIR/EIS has been revised to clarify the potential impacts of the HSR Build Alternatives to the remedies for the San Fernando Groundwater Basin Superfund site.

The commenter expresses concern that although the Draft EIR/EIS acknowledges existing contamination in the groundwater adjacent to and beneath the proposed project, evaluation of this contamination is not adequately addressed in the Draft EIR/EIS. Discussion in Impact HWR #2: Construction Activities Required for the Build Alternatives explains the likelihood of encountering groundwater during construction, as well as the various options for maintaining a dry excavation, including dewatering. If groundwater dewatering is deemed infeasible during final design, measures such as chemical or jet grouting or permeation grouting may be required to prevent groundwater flow into the vicinity of below-grade sections. A previously conducted alternatives analysis considered the Antelope Valley line as an alternative to tunneling under the Burbank Airport; however, as discussed in the Burbank Airport Station Options Screening Report–Draft 2 (Authority 2018), this alternative was not carried forward due to its impacts to existing operation of the Antelope Valley line.

The commenter also expresses concerns about potential vapor exposure from tunneling creating accumulation of vapor. HMW-IAMF#1, identified under Section 3.10.4.2 of the Draft EIR/EIS, calls for conducting Phase 1 environmental site assessments to characterize each parcel and Phase 2 environmental site assessments (e.g., soil, groundwater, and soil vapor subsurface investigations) if sites are determined to be

## Response to Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

### 4473-9086

contaminated. The Authority would also require implementation of HMW-IAMF#6 through HMW-IAMF#8, which require a variety of hazardous waste plans to address spill prevention and establish procedures for the handling of hazardous wastes generated during remediation activities.

Additionally, text has been added to Section 3.10.6.3 of the Final EIR/EIS stating that the Authority would coordinate the replacement of drinking water wells with the USEPA, as required under CERCLA. The replaced extraction wells would be installed and functional prior to the removal of any of the extraction wells for the San Fernando Valley Superfund site to avoid disruption of the ongoing remediation program for the Superfund site.

The constructed tunnels would be sealed and include appropriate ventilation systems, which would avoid the accumulation of vapors. Additionally, HMW-IAMF#1 calls for conducting Phase 1 environmental site assessments to characterize each parcel and Phase 2 environmental site assessments (e.g., soil, groundwater, and soil vapor subsurface investigations) if sites are determined to be contaminated. The project costs assume that contaminated soils encountered during construction will be required to be hauled off and disposed of at appropriate facilities. In addition, the project would mitigate impacts on the Hansen spreading grounds by replacing areas affected so that the recharge capacity of the facility would not be permanently altered.

### 4473-9087

The commenter, CDM Smith, provides an introduction to its subsequent comments that review potential impacts to the BOU Superfund Site remedy, Burbank's groundwater extraction wells, and soil and soil vapor conditions associated with the Burbank to Los Angeles project section. The detailed comments that follow are each responded to.

### 4473-9088

The commenter discusses issues in relation to the existing Lockheed Martin remediation efforts and concerns in relation to impacts on established infrastructure and contamination plume dispersion because of Project activities.

The Authority appreciates the commenter providing extensive background information. Section 3.10.5.3 of the Draft EIR/EIS provides summary information pertaining to PEC sites. Additional detail can be found in Sections 5.1.3, 5.2.3, and 5.3.3 of the Palmdale to Burbank Project Section Hazardous Materials and Wastes Technical Report (Authority 2019). The Authority agrees the potential for encountering groundwater is minimal, although localized perched zones may be present. Impacts to the crucial wells identified by Lockheed Martin in the immediate vicinity of the HSR alignment will be minimized to the extent feasible, with conflicts being identified and discussed once final alignment plans are approved. Implementation of HMW-IAMF#3: Work Barriers, described in Section 3.10.4.2 of the Draft EIR/EIS, describes the Authority's commitment to verify the use of work barriers prior to construction by requiring the contractor to prepare a technical memorandum. Nominal design variances, such as the addition of a plastic barrier beneath the ballast material to limit the potential release of volatile subsurface contaminants, may be implemented in conjunction with site investigation and remediation.

### 4473-9089

The comment expresses agreement the IAMFs associated with a reduction in impacts to hazardous materials and waste. No further response is required.

## Response to Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

### 4473-9090

Refer to Standard Response PB-Response-HYD-1: Impacts on the Hansen Dam and Hansen Spreading Grounds.

The commenter requests that mitigation measure HWR-MM#3 of the Draft EIR/EIS be revised to include identification of replacement land to ensure continued groundwater recharge is available for the San Fernando Basin.

As described in HWR-MM#3, the Authority would provide replacement groundwater recharge areas. The MWR-MM#3 has been revised to require that the replacement recharge areas be in the vicinity of the existing recharge ponds, in areas that would be acquired as part of the project footprint. The replacement recharge areas would compensate for new impervious areas of the HSR footprint within the Hansen Spreading Grounds for the Refined SR14, SR14A, E1, E1A Build Alternatives, and would provide for no net loss of recharge area or recharge capacity. The Authority has removed from HWR-MM#3 in the Final EIR/EIS the option to mitigate the reduced capacity of the Hansen Spreading Grounds by modifying operations at Hansen Dam that regulate discharges to the spreading grounds such that no loss in flood protection would occur.

For additional information, please refer to Standard Response PB-Response-HYD-1: Impacts on the Hansen Dam and Hansen Spreading Grounds.

### 4473-9091

Refer to Standard Response PB-Response-HAZ-2: Potential to Encounter PEC Sites with Known and/or Suspected Contamination during Construction.

The comment states that the Draft EIR/EIS identifies between 22 and 30 (depending on Build Alternative) "active groundwater monitoring wells" within 1 mile of the Build Alternatives, but there are about 70 monitoring wells (as depicted in Figure 1 provided with the comment) and that damage to, or loss of groundwater monitoring wells would be significant. The comment requests that the Draft EIR/EIS identify any monitoring wells potentially impacted and include mitigation measures for their replacement or protection.

As a matter of clarification, the 22 and 30 wells identified in the Draft EIR/EIS are not "active groundwater monitoring wells" but are identified in the Draft EIR/EIS as groundwater wells that are likely used for domestic purposes. As the level of project design progresses, the Authority would coordinate with regulatory agencies that may include the U.S. Environmental Protection Agency (USEPA), the RWQCB, the California Department of Toxic Substances Control, and local agencies, to avoid impacts to groundwater monitoring and extraction wells and conveyance infrastructure necessary to implement the cleanup of impaired groundwater in areas impacted by the build alternative. In accordance with previously adopted HMW-IAMF#11, which has been added, and as required under CERCLA, the Authority would coordinate the relocation of wells with the USEPA and would ensure that existing wells are operating during testing of new replacement systems. Implementation of HMW-IAMF#11 would ensure no effect to the ongoing remediation program for the Superfund site. Clarifying text regarding the Superfund site and the groundwater monitoring wells has been added to Impact HMW #2 in Section 3.10.6.3 of this Final EIR/EIS.

See also standard response PB-Response-HAZ-3: Impact HMW#2: Potential to Encounter PEC Sites with Known and/or Suspected Contamination during Construction, regarding coordinating HSR construction with site remediation activities to avoid damaging or interfering with remediation site controls and coordination with regulatory agencies required before construction could advance at known potentially hazardous sites through HMW-IAMF#8 (Permit Conditions).

## Response to Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

### 4473-9092

The comment states that the Draft EIR/EIS identifies the approximate locations of medium- and high-priority PEC sites on figures in Appendix 3.10-A, but does not identify the sites by name or type of PEC. The commenter states that the Draft EIR/EIS would be more effective if PEC sites were tabulated in the document. Section 3.10.5.3 of the Draft EIR/EIS presents summary information about PEC sites and refers the reader to the Palmdale to Burbank Project Section Hazardous Materials and Wastes Technical Report (Authority 2019) for a description of all PEC sites within the resource study area (RSA) (Draft EIR/EIS, Section 3.10, page 3.10-13, fn. 2). Appendix 3.10-B has been added to this Final EIR/EIS that provides a tabulation of the PEC sites within the Palmdale to Burbank Project Section RSA and a summary of the issues, status, and the priority ranking of the sites.

### 4473-9093

The commenter requests the addition of a statement to the Draft EIR/EIS that the Authority would be the responsible generator for the transport and treatment or disposal of spoils. The commenter's request for additional language about responsibility for spoils is acknowledged. The Authority or other entities may become generators as part of implementing the project and will comply with all applicable laws and regulations regarding hazardous wastes. The Authority would implement HMW-IAMF#7 (Storage and Transport of Materials), which requires compliance with applicable regulations, such as RCRA and the Hazardous Waste Control Law that apply to disposal of hazardous waste from the project. These laws and regulations define the generator of hazardous waste. No revisions have been made to this Final EIR/EIS in response to this comment.

### 4473-9094

The commenter suggests that the EIR/EIS include a discussion about protection against potential exposure to VOCs that may be present in soil and soil vapor adjacent to the Burbank Airport Station and tunnels. The commenter suggests that the Draft EIR/EIS include discussion of vapor exposure risk prevention, including mitigation of potential vapor intrusion pathways and appropriate tunnel and station vapor intrusion mitigation systems.

Soil vapor is discussed under Impact HMW#2 in Section 3.10, Hazardous Materials and Wastes, of the Palmdale to Burbank Project Section Draft EIR/EIS. As discussed under Impact HMW#2 in the Draft EIR/EIS (Section 3.10.6.3), the Build Alternatives will incorporate HMW-IAMF#1 (Property Acquisition Phase 1 and Phase 2 Environmental Site Assessments, Additional Preconstruction Investigations, and Associated Actions to Control Site Contamination), which requires Phase 1 and potential subsequent site investigation(s). The site investigations will serve to identify risks associated with contaminated media, including VOCs in soil vapor. The site characterization data obtained pursuant to HMW-IAMF#1, and any additional pre-construction site characterization data collected by the Authority's contractor, will be used to inform the design of required controls for mitigating potential vapor intrusion and appropriate tunnel and station vapor lining and/or ventilation requirements to be included in the detailed project design. The controls would be approved by regulatory agencies overseeing a specific site, as discussed in HMW-IAMF#1, and would protect the health of the staff, HSR passengers, and the public at large. Furthermore, application of HMW-IAMF#4 (Known, Suspected, and Unanticipated Environmental Contamination) will be implemented to address either known, suspected, or unanticipated contamination as identified prior to construction and also as encountered during construction.

The Burbank Airport Station was analyzed in the Burbank to Los Angeles Project Section Final EIR/EIS, and the Authority's Board of Directors approved the Burbank to Los Angeles Project Section (including the Burbank Airport Station) in January 2022. IAMFs identified in Section 3.10.4.2 of the Burbank to Los Angeles Project Section Final EIR/EIS (pages 3.10-12 and 3.10-13) related to soil vapor are consistent with the IAMFs identified in the Palmdale to Burbank Project Section EIR/EIS.

## Response to Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

### 4473-9095

The commenter requests that the Authority's plans maintain integrity of the vapor intrusion mitigation systems of the existing structures at the proposed Burbank Airport Station, should the HSR plan include "retention of the existing structures (i.e., Avion Burbank and/or Amazon buildings)."

As explained in response to comment 4473-9094, the Burbank Airport Station was analyzed and approved in the Burbank to Los Angeles Project Section Final EIR/EIS, and no change to the station is proposed in this EIR/EIS. IAMFs identified in Section 3.10.4.2 of the Burbank to Los Angeles Project Section Final EIR/EIS (pages 3.10-12 and 3.10-13) related to soil vapor controls are consistent with the IAMFs identified in the Palmdale to Burbank Project Section EIR/EIS. As discussed in Section 3.12, Socioeconomics and Communities of the Burbank to Los Angeles Project Section Final EIR/EIS, the Avion property is proposed to be acquired, and the existing structures would be demolished and replaced with station facilities and surface parking (see also Volume 3 of the Burbank to Los Angeles Project Section Final EIR/EIS, specifically Volume 7: HSR Burbank Airport Station plan set). HMW-IAMF#4 of the Palmdale to Burbank Project Section EIR/EIS requires preparation of a Construction Management Plan (CMP) that must address controls for construction activities in areas with contaminated media. Requirements for maintaining or repairing vapor barriers impacted during construction would be required in the CMP, which would be approved by regulatory agencies with oversight authority for the cleanup site. The Authority will also implement HMW-IAMF#3: Work and Vapor Barriers. This IAMF describes the Authority's commitment to verify the use of work barriers with the contractor prior to construction, by requiring the contractor to prepare a technical memorandum addressing the use of vapor barriers beneath the ballast material to limit the potential release of volatile subsurface contaminants or vapors. Vapor barriers and associated venting systems determined to be necessary to prevent intrusion of hazardous concentrations of volatile compounds into occupied project structures (e.g., stations or tunnels) shall be designed in accordance with standard engineering practices and reviewed and accepted by relevant stakeholders and regulatory agencies. See also Standard Response PB-Response-HAZ-2: Potential to Encounter PEC Sites with Known and/or Suspected Contamination during Construction, regarding coordinating HSR construction with site remediation activities to avoid damaging or interfering with remediation site controls and coordination with regulatory agencies required before construction could advance at

### 4473-9095

known potentially hazardous sites through HMW-IAMF#8 (Permit Conditions).

## Response to Submission 4473 (Kimberly Bick, Lockheed Martin Corporation, December 1, 2022) - Continued

### 4473-9096

The commenter states that Lockheed Martin has completed remediation of the soil and does not anticipate a need for additional investigation or remediation to protect human health for the current land uses, and states that should referenced land uses change or new contamination be discovered during construction of the project, additional actions may be needed to mitigate impacts related to hazardous materials and should be the responsibility of the Authority to mitigate.

The Authority is aware that certain land use restrictions are present in relation to impacted properties and recognizes that future changes in land use may result in modification of or addition to requirements by regulatory agencies. Through implementation of HMW-IAMF#11 (Stakeholder Consultation for the San Fernando Valley Groundwater Basin Superfund Site), the Authority would coordinate with USEPA, the RWQCB, and other relevant stakeholders on an ongoing basis regarding the project, and any design elements that are inconsistent with current restrictions on land use would require resolution prior to implementation. The Authority will also work with Lockheed Martin to discuss any potential impacts and necessary mitigation, if land use associated with the HSR project requires changes to existing restrictions or necessitates additional actions.

The Authority also acknowledges that construction crews may discover contaminants of concern during construction. As discussed under Impact HMW#2 (Section 3.10.6.3), information obtained from Phase 1 and Phase 2 Environmental Site Assessments (HMW-IAMF#1 in Appendix 2-E of this Final EIR/EIS), as needed, would inform the potential for discovery of contamination during construction, and procedures for managing unanticipated contamination would be included in a CMP prepared by the Construction Contractor and approved by the Authority in accordance with HMW-IAMF#4. Notification of regulatory agencies would be required by the CMP if new contamination is discovered.

### 4473-9097

The commenter provided along with its letter a copy of the 1989 Record of Decision for the San Fernando Valley Superfund Site Area 1, Burbank Operable Unit, in Los Angeles County, California, Developed in Accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (42 USC Section 9601 et. seq.) and the National Contingency Plan (40 CFR Section 300 et. seq.) project. The 1989 Record of Decision was considered during the preparation of the Draft EIR/EIS. The citation for the Record of Decision is included in Section 3.10.6.3 and has been added to the reference list in Chapter 12, References, of this Final EIR/EIS.

### 4473-9098

The commenter provides a copy of the Second Consent Decree in *United States v. Lockheed Martin Corp.*, No. 91-4527-MRP (Tx) (C.D. Cal. June 22, 1998). The commenter attached the Consent Decree to its letter. The document was considered in preparation of the Draft EIR/EIS. The citation for the Consent Decree is included in Section 3.10.6.3 and has been added to the reference list in Chapter 12, References, of this Final EIR/EIS.

## Submission 4480 (Andrea Howe, December 1, 2022)

Palmdale - Burbank - RECORD #4480 DETAIL		4480-8227
Status :	Action Pending	
Record Date :	12/2/2022	
Interest As :	Individual	
First Name :	Andrea	4480-8228
Last Name :	Howe	
<b>Stakeholder Comments/Issues :</b>		
4480-8221	I support the NO PROJECT ALTERNATIVE as the only feasible alternative.	
4480-8222	? * WATER: Tunneling jeopardizes critical groundwater sources in the mountains that provide drinking water to LA. - If you have horses or other animals, they need water to thrive. They are more important than providing water during and after construction. - We are in another epic drought and HSR will use hundreds of millions of gallons of water: to constantly spray their construction areas to mitigate fugitive dust, to provide water for tunneling operations, and they even have a plan to truck in tens of millions of gallons of water for the oak trees in the Angeles National Forest (ANF) if tunneling causes dewatering (which is a very real possibility).	4480-8229
4480-8223	* LIVING THROUGH CONSTRUCTION: Construction here will take AT LEAST 7 years, probably more than 10. - Construction staging areas nearby are proposed throughout our foothill area. - There will be noise, vibration, dust, and exhaust as millions of truck trips are needed to haul spoils out of bored tunnels. - Traffic will increase for these millions of truck trips on our local roads and the 5/210 freeways.	4480-8230 4480-8231 4480-8232
4480-8224	* SURFACE IMPACTS TO THE ANGELES NATIONAL FOREST AND THROUGHOUT OUR COMMUNITIES: Tunneling beneath the ANF does NOT mean there are no impacts to the Forest. This train means there will be manmade encroachments in the ANF where none exist now: - Adding buildings in the Forest used to access the tunnels and provide ventilation, plus access roads and power lines. Portals (twin tunnel openings, each 30' in diameter, from which the train will emerge) will be at borders to the ANF and in the Shadow Hills hillside on Wentworth for one route, E2. - Wilderness areas will be disrupted, including routes that cross the Pacific Crest Trail, Rim of the Valley Trail, San Gabriel Mountains National Monument. - Wildlife throughout the ANF, Hansen Dam, and throughout our area will be impacted by years of construction invading their habitat. - Additional fire hazards will be created due to construction and increased activity.	4480-8233 4480-8234
4480-8225	* SEISMICITY: Each/all routes cross the San Andreas, San Gabriel, Sierra Madre, and Verdugo Fault Zones.	
4480-8226	* AIR QUALITY: Construction will generate more greenhouse gases than it will recoup in 70 years of operation. CHSRA is a beneficiary of Cap & Trade funds as it claims it is a "green project," but the irony is that CHSRA will have to PURCHASE offset credits during construction as its pollution levels exceed AQMD standards.	
4480-8227	* AESTHETICS: Designated scenic corridors will be blighted with multi-acre construction staging areas to house construction equipment, concrete batch plants, and more. Portals aren't just tunnel openings; they have	

huge infrastructure with them, including 65' three-story buildings. One proposed route (E2) still includes a viaduct to carry the train out of the mountain and over the Big Tujunga Wash, and requires raising Wentworth Street 30 feet.

?

\* NON-ENVIRONMENTAL ISSUES YOU MAY BE INTERESTED IN:

- Instead of fully studying important topics (e.g., seismicity) prior to approving the project, the Authority places the brunt of the study work and planning on contractors to be hired AFTER the project is approved.
- The Authority employs a 15/85 design plan, which means that only 15% of the project needs to be designed before the project is approved.
- The total budget has ballooned from \$16.5 in 1996 to \$105 Billion in 2022, and not a single inch of track has been laid.
- Permanent forfeiture of property, sales, utility users and payroll taxes that fund schools, parks, public safety, libraries, Social Security/Medicare (and more) due to loss of businesses which currently generate this revenue.

I am concerned that tunnelling jeopardizes critical groundwater sources in the mountains that provide drinking water to LA and water for wildlife. How will you remedy the risk of dewatering in the Angeles National Forest and spreading grounds?

How will you mitigate the probable deforestation?

How will you prevent the loss of habitat of our wildlife?

How do you justify using hundreds of millions of gallons of water during the construction process while we are in an epic drought?

Millions of truck trips will be needed to haul spoils during the spoils hauling. How will you mitigate the noise, vibration, dust, and exhaust for the residents?

What is your plan to ease the traffic for local residents when traffic increases due to the millions of truck trips on our local roads and the 5/210 freeways during the ten years of the construction process?

How will you prevent fires in our National Forest as construction and eventual operation increases the fire danger in our area?

I am concerned that all proposed routes cross the San Andreas, San Gabriel, Sierra Madre, and Verdugo Fault Zones. What is the evacuation plan in the event of earthquakes?

What is the justification of promoting the High Speed rail as a "green project" when its construction will generate more greenhouse gases than it will recoup in 70 years of operation?

## Response to Submission 4480 (Andrea Howe, December 1, 2022)

### 4480-8221

Refer to Standard Response PB-Response-ALT-1: Alternatives Selection and Evaluation Process, PB-Response-GEN-4: General Opinions, Opposition or Support. The commenter indicates a preference for the No Build Alternative. The No Build Alternative would not meet the HSR purpose, need, or objectives described in Chapter 1, Project Purpose, Need, and Objectives of the EIR/EIS. For a response to comments on alternatives and their selection and evaluation process, refer to Standard Response PB-Response-ALT-1. For a response to comments expressing project opposition or support, refer to PB-Response-GEN-4.

### 4480-8222

Refer to Standard Response PB-Response-BIO-2: Construction and Operations Impacts to Special-Status Plants and Wildlife, PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, PB-Response-PUE-3: Water Demand and Usage.

The commenter expresses concern related to the effect of tunneling on groundwater sources, including water used for both human and animal consumption; and raises additional concerns regarding the quantity of water necessary to construct the project in the face of drought conditions. Refer to Standard Response PB-Response-PUE-3: Water Demand and Usage regarding water use during construction, including during dry and multi-dry years. See Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in the Angeles National Forest/Tunneling Impacts in the Angeles National Forest, for a discussion of hydrogeologic impacts that would result from tunneling under the ANF. Regarding the comment about groundwater impacts from tunneling, including potential effects on drinking water supply, the Authority understands that there are potential effects on groundwater associated with tunnel construction in the ANF. These potential impacts are analyzed in detail in Section 3.8, Hydrology and Water Resources, specifically in Impact HWR#5 (Changes in Hydrogeologic Conditions Associated with Tunnel Construction Beneath the ANF which May Affect Surface and Subsurface Water Resources) and HWR#6 (Project Operation Effects on Water). These potential impacts would be addressed by the Authority's use of state-of-the-art design features and construction methods to avoid and minimize impacts on hydrologic resources, including through the use of tunnel boring machines (TBMs) with features to reduce or prevent inflows and grouting and tunnel-lining approaches that have proven effective at controlling water seepage. These measures are identified in HYD-IAMF#5 (TBM Design Features), HYD-IAMF#6 (Tunnel Lining Systems), and HYD-IAMF#7 (Grouting). To address potentially significant impacts to surface water resources and wells, the Authority would also implement an Adaptive Management and Monitoring Plan (AMMP) as required by mitigation measure HWR-MM#4. The AMMP includes monitoring protocols to establish baseline conditions for surface water resources and to allow for the detection of changes in groundwater conditions related to tunnel construction to ensure timely implementation of remedial measures. The AMMP includes provisions for augmenting water supplies for wells and actions to restore affected resources, if necessary. See Standard Response PB-Response-HYD-2: Hydrogeologic Impacts in
